22. *X. glareosus*.

Stems 2-4 dm. high; bracts subulate, at least half as long as the calyx.

23. *X. inflexus*.

Pod sparingly villous, elongate; plant not canescent.

24. *X. Parryi*.

1. *X. stipularis* (M. E. Jones) Rydb. Stems 5-15 cm. long; leaflets 9-17, elliptic to obovate, 8-15 mm. long, rounded or retuse at the apex, silky beneath, glabrate above; raceme subcapitate, 5-12-flowered; calyx silky-villous with white hairs; tube about 1 cm. long, teeth lance-subulate, 4-5 mm. long; corolla purple, about 2 cm. long; pod 2.5-3 cm. long, 8-10 mm. thick, rounded at the base, short-acuminate at the apex, reticulate, glabrate. *Astragalus arietinus stipularis* M. E. Jones. Hills: s Colo. *Submont.* Je.

2. *X. cuspidocarpus* (Sheld.) Rydb. Stems 1-2 dm. high, decumbent at the base; leaflets 10-17, oblong to obovate, 8-12 mm. long, usually retuse, glabrous above, strigose beneath; raceme 7-9-flowered, subcapitate; calyx-teeth subulate, 1.5 mm. long; corolla ochroleucous, tinged with purple; legumes 2.5-3 cm. long, abruptly acute at both ends. *A. cuspidocarpus* Sheld. *A. thermalis* Greene. Hills: Mont.—n Wyo. *Submont.*—Mont. My—Je.

3. *X. cibarius* (Sheld.) Rydb. Stems 1-3 dm. long, decumbent at the base, strigose and striate; leaflets 11-17, oblong-obovate to nearly orbicular, rounded or retuse at the apex, 5-15 mm. long, glabrous above, strigose beneath; raceme short, 8-12-flowered; calyx-tube 6-8 mm. long; teeth subulate, 2 mm. long; corolla 12-18 mm. long, purplish or ochroleucous, with purple-tipped keel; pod cross-reticulate; lower suture sulcate. *A. cibarius* Sheld. *A. arietinus* M. E. Jones. Hills: Utah—Colo.—Mont. *Submont.*

4. *X. aragaloides* Rydb. Stems 1 dm. or less long, decumbent at the base; leaflets 11-19, lanceolate to elliptic, silky-canescens, 5-12 mm. long, acute; raceme short, 4-10-flowered; calyx ascending, strigose with black and white hairs; tube about 8 mm. long; teeth subulate, 3.5-4 mm. long; corolla purplish, about 2 cm. long; pod about 4 cm. long, tapering, rather deeply sulcate below, transversely reticulate; upper suture prominent. Arid regions: s Utah. *L. Son.*

5. *X. amphioxys* (A. Gray) Rydb. Stems spreading, 1-5 cm. long; leaflets 15-25, obovate or oval, 4-10 mm. long; raceme short, 8-12-flowered; calyx strigose with mixed white and black hairs; tube 7-8 mm. long; teeth subulate, about 2 mm. long; legume crescent-shaped, acute at both ends, 3-5 cm. long, strigose, cross-reticulate; lower suture deeply sulcate. *A. amphioxys* A. Gray. Gravelly hills: Tex.—Colo.—Utah—(? Ida.)—Ariz. *Son.*

6. *X. eurekensis* (M. E. Jones) Rydb. Stems less than 1 dm. high, sometimes almost wanting; leaflets elliptic or oval, about 1 cm. long, coarsely silky; calyx 6 mm. long; teeth subulate; corolla about 25 mm. long; keel tipped with purple; pod 3-5 cm. long, acuminate, appressed long-hairy, sulcate on both sutures. *A. glareosus* M. E. Jones. *A. eurekensis* M. E. Jones. Valleys and hillsides among sage brush: Utah. *Son.* My.

7. *X. Shortianus* (Nutt.) Rydb. Stem 1-10 cm. long; leaflets 11-15, obovate or oval, 1-2.5 cm. long; peduncles shorter than the leaves; raceme short, 5-15-flowered; calyx strigose, usually with white hairs; tube 8-10 mm. long; teeth lance-subulate, about 3 mm. long; corolla violet or purple, 18-25 mm. long; pod elongate-ovoid, arcuate, 3-5 cm. long, 12-14 mm. wide, sulcate on the lower suture, strigose. *A. Shortianus* Nutt. Plains and mesas: Neb.—Ariz.—Wyo. *Plain*—Mont. My—Je.

8. *X. Zionis* (M. E. Jones) Rydb. Stems spreading or prostrate, 5-30 cm. long; leaflets about 21, ovate to lanceolate, about 12 mm. long, acute; peduncles as long as the leaves; calyx-tube about 6 mm. long; corolla pink-purple; legume arcuate, abruptly long-acuminate, about 3 cm. long, slightly sulcate, triangular in cross-section; ventral suture prominent. *A. Zionis* M. E. Jones. Sandy or gravelly places: Utah. *Son.*—*Submont.* Mr—My.

9. *X. puniceus* (Osterhout) Rydb. Stems decumbent, about 4 dm. long; leaflets elliptic or oblong, 8-15 mm. long, rounded or retuse at the apex, ashy-pubescent beneath, sparingly strigose above; raceme about 10-flowered; calyx silky-hirsute; tube 5-6 mm. long; teeth subulate, 2 mm. long; corolla purple, about 15 mm. long; pod elongate-ovoid, 15-20 mm. long, 7 mm. wide, pubescent; lower suture slightly sulcate. *A. puniceus* Osterhout. Dry hills: Colo. *Submont.* Je.

10. *X. argophyllus* (Nutt.) Rydb. Stems short, decumbent, 5-10 cm. long; leaflets 15-17, lanceolate, 8-15 mm. long, acute; raceme 3-8-flowered; calyx-tube 8-10 mm. long; teeth subulate, about 4-5 mm. long; corolla 15-20 mm. long, purplish; pod oblong-ovoid, with a curved point, about 2 cm. long, transversely wrinkled, rounded on both sutures. *A. argophyllus* Nutt. Hills and valleys: Mont.—Wyo.—Utah—Nev. *Submont.* Je-Jl.

11. *X. uintensis* (M. E. Jones) Rydb. Stems prostrate or decumbent, 5-10 cm. long; leaflets lance-oblong to elliptic, 5-10 mm. long, acute; raceme short, few-flowered; calyx-tube about 8 mm. long; teeth subulate, 1.5-2 mm. long; corolla purple, 2-2.5 cm. long; pod ovoid, 2-2.5 cm. long, obcompressed; ventral suture slightly sulcate. *A. uintensis* M. E. Jones. Dry ground: Colo.—Nev.—Ariz. *Son.—Submont.* My-Je.

12. *X. vespertinus* (Sheld.) Rydb. Stems 4-6 cm. high, decumbent, striate; leaflets 11-13, obovate-elliptic, obtuse, 4-12 mm. long; raceme short, 3-6-flowered; calyx strigose with mixed black and white hairs; tube about 8 mm. long; teeth subulate, about 1.5 mm. long; corolla 2-3 cm. long, purplish; pod 2.5-3 cm. long, coriaceous, oblong, obcompressed-triangular in section; upper suture prominent. *A. vespertinus* Sheld. (?) *A. panguicensis* M. E. Jones. Dry hills: Colo.—N.M. *Submont.* My.

13. *X. missouriensis* (Nutt.) Rydb. Stems 5-10 cm. long; leaflets 11-21, elliptic to obovate, 5-15 mm. long; raceme short, 5-15-flowered; calyx-tube 7-8 mm. long; teeth subulate, 2-2.5 mm. long; corolla purple, 15-20 mm. long; pod oblong, 1.5-2.5 cm. long, 7-8 mm. broad, neither suture sulcate, rather prominent in age. *A. missouriensis* Nutt. Plains and hills: Sask.—Kans.—N.M.—Mont. *Plain—Mont.* My-Je.

14. *X. cymboides* (M. E. Jones) Rydb. Stems decumbent, 5-15 cm. long, and matted; leaflets 9-11, elliptic, obtuse, usually about 6 mm. long; calyx-tube about 6 mm. long; legume oblong-ovoid, 6 mm. wide, 16 mm. long, somewhat 4-angled, with rather prominent sutures in age. *A. cymboides* M. E. Jones. Gravelly or clayey ground: Utah. *Submont.* Je-Jl.

15. *X. pygmaeus* (Nutt.) Rydb. Plant almost stemless; leaflets 7-11, broadly oval, obovate, or orbicular, 5-10 mm. long; raceme short, subcapitate, few-flowered; calyx strigose with short, partly black hairs; tube about 8 mm. long; teeth 2 mm. long; corolla ochroleucous or purple, about 1.5 cm. long; pod obliquely ovoid, 2-3 cm. long, somewhat mottled, pulpy when young, in age with a membranous, transversely reticulate outer coat and a thicker inner one. *Phaca pygmaea* Nutt. *Astragalus Chamaeluce* A. Gray. *A. Cicadae* M. E. Jones. Hills: Colo.—Wyo.—Utah. *Submont.* My.

16. *X. musinensis* (M. E. Jones) Rydb. Plant nearly acaulescent; leaflets 1-3, lanceolate, or elliptic-lanceolate, 2 cm. or less long; pod ovate, 18 mm. long, 6-8 mm. broad, strigillose, with incurved acute apex, sulcate ventrally at the base; outer coat loose. *A. musinensis* M. E. Jones. Clayey slopes: Utah. *Submont.* Je.

17. *X. Newberryi* (A. Gray) Rydb. Subacaulescent; leaflets 3-7, obovate, 6-10 mm. long; raceme short, 2-6-flowered; calyx-tube about 12 mm. long; teeth subulate, 3 mm. long; corolla 2.5-3 cm. long, ochroleucous, tipped with purple; pod ovoid, about 2 cm. long, somewhat curved, not sulcate. *A. Newberryi* A. Gray. Dry hills: sw Colo.—N.M.—Ariz.—Utah. *Son.* Ap.

18. *X. consectus* (Sheld.) Rydb. Subacaulescent; leaflets 5-11, oblanceolate, acute, 1-2 cm. long; raceme short, 6-8-flowered; calyx-tube about 10 mm. long; teeth subulate, 3-4 mm. long; corolla about 2 cm. long, purplish or ochroleucous tipped with purple; legume ovoid, about 2.5 cm. long, with rather long beak, neither suture sulcate. *A. consectus* Sheld., in part. *A. eriocarpum* M. E. Jones, not S. Wats. Dry ground: Utah. *Son.—Submont.* Ap-My.

19. *X. Watsonianus* (Kuntze) Rydb. Subacaulescent; leaflets broadly obovate-cuneate, rounded or retuse at the apex, 10-15 mm. long; flowers capitate; calyx villous with black hairs; tube 12-15 mm. long; teeth subulate, 5 mm. long; corolla purplish, nearly 3 cm. long; pod 2.5 cm. long, strongly curved above

the middle, scarcely sulcate. *A. eriocarpus* S. Wats. Mountains: Nev.—(? Utah). *Submont.* My.

20. *X. utahensis* (T. & G.) Rydb. Stems usually less than 1 dm. long, densely floccose; leaflets 9–17, obovate or orbicular, rounded at the apex, 5–10 mm. long, densely white-floccose; raceme 3–10-flowered, dense; calyx densely villous; tube about 12 mm. long; teeth subulate, about 4 mm. long; corolla 25–28 mm. long, violet or purple; pod ovoid, about 2 cm. long, somewhat curved, only slightly sulcate on the sutures. *A. utahensis* T. & G. *A. nudisiliquus* A. Nels. *PINK LADY-FINGERS.* Hills and benchlands: Mont.—Wyo.—Utah—Nev. *Submont.* Ap—My.

21. *X. Purshii* (Dougl.) Rydb. Stems usually less than 5 cm. long, villous; leaflets 9–13, oblanceolate or oblong, acute, 8–15 mm. long, villous; calyx densely villous; tube about 1 cm. long; teeth subulate, about 3 mm. long; corolla 2–2.5 cm. long, ochroleucous; keel tipped with purple; pod ovoid, densely woolly, about 2 cm. long, slightly curved, scarcely sulcate. *A. Purshii* Dougl. *A. Booneanus* A. Nels., in part. Dry plains and hills: Mont.—Colo.—Calif.—B.C. *Son.*—*Submont.* My—Je.

22. *X. glareosus* (Dougl.) Rydb. Stems usually less than 1 dm. long; leaflets 11–17, oblong, canescent-hirsute, 4–10 mm. long, acute; peduncles very short; racemes 3–8-flowered; calyx-tube 8–9 mm. long; teeth subulate, 2 mm. long; corolla purple, about 2 cm. long; pod villous, ovoid, about 2.5 cm. long. *A. glareosus* Hook. *A. Booneanus* A. Nels., in part. Hills and flats: Wash.—Mont.—Wyo.—Utah. *Plain*—*Submont.* My—Je.

23. *X. inflexus* (Dougl.) Rydb. Stems 2–4 dm. long, decumbent, white-villous; leaflets 15–25, obovate or elliptic to oblanceolate, 7–15 mm. long, white-villous; raceme 5–10-flowered, capitate, calyx long-villous; tube 10–12 mm. long; teeth subulate-setaceous, 6–7 mm. long; corolla light purple, 20–25 mm. long; pod oblong-ovoid, strongly curved, villous, deeply sulcate on both sutures, 2.5 cm. long. *A. inflexus* Dougl. Plains and river-bars: Wash.—Mont.—Ore. *Son.*—*Plain.* My—Je.

24. *X. Parryi* (A. Gray) Rydb. Stems 0.5–2 dm. long, hirsute-villous; leaflets 15–27, obovate or oblong, 4–15 mm. long, sparingly hirsute on both sides; raceme short, 6–10-flowered; calyx sparingly hirsute; tube 5–6 mm. long; teeth 4–5 mm. long; corolla ochroleucous, 15–18 mm. long; keel tipped with purple; pod 2.5–3 cm. long, 7 mm. broad, long-beaked, arcuate, hirsute; lower suture slightly more sulcate than the upper. Mountains: Wyo.—Colo.—n Tex. *Submont.*—*Mont.* My—Jl.

31. MICROPHACOS Rydb.

Subcinerous perennials, with very slender stems. Leaves pinnate, with 7–21 linear to oblong leaflets; stipules very broad, triangular, free from the petioles and only the lower more or less united with each other. Racemes many-flowered. Calyx short-campanulate, about 2 mm. long, with very short and broad teeth. Corolla purple, 5–6 mm. long, all petals strongly curved. Pod 6–8 mm. long, coriaceous, cross-wrinkled, wholly 1-celled, 6–7-ovuled, boat-shaped, *i. e.*, upper suture prominent, strongly curved, lower suture nearly straight or curved upwards, flat or slightly sulcate.

Pod slightly sulcate on the lower suture, transversely veined; leaflets narrowly linear-obtuse.

Pod merely flattened on the lower suture, cross-wrinkled; leaflets linear-oblong or linear-cuneate, truncate or emarginate.

1. *M. parviflorus*.

2. *M. microlobus*.

1. *M. parviflorus* (Pursh) Rydb. Stem minutely strigose, 3–6 dm. high; leaflets 11–21; racemes very slender, lax; calyx-tube 1 mm. long; teeth triangular, 0.5 mm. long; corolla purplish, 5–6 mm. long; pod pendent, straight, ovoid, 5–7 mm. long. *Astragalus gracilis* Nutt. Plains and hills: N.D.—Tex.—Wyo. *Plain.* Je—Jl.

2. *M. microlobus* (A. Gray) Rydb. Stem branched, 3–4 dm. high, finely strigose; leaflets 7–17, minutely strigose; raceme lax, short; calyx-tube 1.5–2 mm. long; teeth triangular, 0.5 mm. long; corolla about 7 mm. long, purplish; pod

6-10 mm. long, ovoid. *A. microlobus* A. Gray. Plains and hills: S.D.—Kans.—Colo.—Mont. *Plain—Submont.* Je—Jl.

32. PTEROPHACOS Rydb.

Perennial glabrous or strigose herbs. Leaves alternate, odd-pinnate, with nearly free and distinct stipules; leaflets linear or linear-filiform, scarcely broader than the rachis. Flowers perfect, in short racemes. Calyx-tube oblong-campanulate, with short subulate-setaceous teeth. Corolla white; banner narrow. Stamens 10; filaments diadelphous; anthers alike. Legume woody, one-celled, 2-valved, the valves winged on the back, the sutures acute or even winged. Seeds many.

1. *P. tetraapterus* (A. Gray) Rydb. Stem about 3 dm. high, glabrous, striate; leaflets 15-21, narrowly linear, 12-20 mm. long, 1-2 mm. wide; raceme short, 5-9-flowered; calyx-teeth setaceous-subulate, about half as long as the tube; corolla white, about 15 mm. long; pod 3-4 cm. long, arcuate, glabrous, 4-winged, 8 mm. wide. *A. tetraapterus* A. Gray. Dry ground: s Utah. *Son.*

33. ATELOPHRAGMA Rydb.

Caulescent leafy slender perennial herbs, with rootstocks. Stipules nearly free both from each other and from the petioles. Leaves pinnate, usually with numerous leaflets. Inflorescence a spike-like raceme. Calyx short, campanulate; lobes slender, subulate. Corolla white or purplish. Pod membranous or papery, more or less compressed laterally, in the typical species decidedly flattened and stipitate; dorsal suture intruding in the pod and forming a partial partition.

Pod stipitate, flat.

Partial partition broad, making the pod almost 2-celled.

Partial partition narrow, less than one-third the width of the pod.

Pod long-stipitate, glabrous at least in age.

Plant loosely short-villous.

Plants appressed-silky or glabrous.

Leaflets oblong.

Leaflets linear.

Plant grayish silky.

Plant glabrous or with a few scattered hairs.

Pod short-stipitate, hairy.

Upper leaves not reduced; pod black-hairy.

Upper leaves reduced, often unifoliate; pod not black-hairy.

Pod sessile, more turgid.

Racemes many-flowered; leaflets oblong; partition of the pod narrow.

Racemes elongate; pod short-obovoid.

Racemes short; pod oblong.

Racemes few-flowered; leaflets linear; partition of the pod broad.

1. *A. Arthuri*.

2. *A. aboriginum*.

3. *A. Forwoodii*.

4. *A. lineare*.

5. *A. glabriusculum*.

6. *A. Macounii*.

7. *A. ibapense*.

8. *A. elegans*.

9. *A. Shearii*.

10. *A. Brandegei*.

1. *A. Arthuri* (M. E. Jones) Rydb. Stems 3-4 dm. high, finely strigose; leaflets 21-35, oblong-elliptic, obtuse or retuse, 5-10 mm. long, glabrous above, minutely strigose beneath; racemes about 1 dm. long; calyx black-hairy; tube 5 mm. long; teeth 3 mm. long; corolla 10-12 mm. long, white; pod strigose; stipe 8-10 mm. long; body linear, 3-3.5 cm. long, tapering at both ends. *Astragalus Arthuri* M. E. Jones. Basalt hillsides: Ida. *Son.—Submont.* Je.

2. *A. aboriginum* (Richards.) Rydb. Stems 2-4 dm. high, short-villous; leaflets 9-15, linear-oblong to elliptic or lanceolate, 1-2 cm. long; raceme short; calyx more or less black-hairy; tube 3-4 mm. long; teeth 2-3 mm. long; corolla ochroleucous, 9-11 mm. long; pod glabrous; stipe 5-8 mm. long; body oblanceolate, acute at both ends, 1.5-2 cm. long; lower suture almost straight. *Astragalus aboriginum* Richards. Mountains: Sask.—Colo.—Nev.—Yukon. *Submont.—Mont.* My—Je.

3. *A. Forwoodii* (S. Wats.) Rydb. Stems ascending, minutely strigose, 1-3 dm. high; leaflets 9-17, oblong or oblanceolate, strigose on both sides or glabrous above, 1-1.5 cm. long; raceme short; calyx more or less black-hairy; tube 3 mm. long; teeth 2 mm. long; legume glabrous, flat; stipe 3-5 mm. long; body 2-2.5 cm. long, lunate-oblanceolate; lower suture usually somewhat concavely

curved. *Astragalus Forwoodii* S. Wats. Hills: S.D.—Wyo.—Mont. *Submont.*—Mont. Je—Jl.

4. **A. lineare** Rydb. Stem grayish strigose, often tinged with purple, 2–4 dm. high; leaflets 9–15, linear, 1–2 cm. long, 1–2 mm. wide, grayish strigose; raceme short; calyx densely black-hairy; tube 3 mm. long; teeth 2 mm. long; corolla about 8 mm. long, ochroleucous or tinged with purple; keel tipped with dark purple; legume glabrous, stipitate; stipe 4–5 mm. long; body 25–28 mm. long, convexly curved on both sutures, but much more strongly so on the upper. Dry slopes: Man.—Alta.—Yukon. *Boreal*—Mont. Je.

5. **A. glabriusculum** (Hook.) Rydb. Stem 2–4 dm. high; leaflets linear or nearly so, 15–25 mm. long, glabrous or nearly so; raceme short, in fruit elongate; calyx black-hairy; tube 3 mm. long; corolla ochroleucous, 8 mm. long; keel tipped with dark purple; pod glabrous; stipe 4–5 mm. long; body 2 cm. long; lower suture straight or nearly so. *Phaca glabriuscula* Hook. *A. glabriusculum* A. Gray. Gravelly slopes: Alta.—S.D.—Wyo. *Submont.*—Mont. Je.

6. **A. Macounii** Rydb. Stem 5–6 dm. high, finely and sparingly strigose or glabrate; leaflets 9–17, very thin, oblong or oval, 15–25 mm. long, obtuse, glabrous above, sparingly strigose beneath; calyx black-hairy; tube about 3 mm. long; teeth 1 mm. long; corolla about 8 mm. long, cream-colored or white, tinged with purple; stipe of the pod 2–3 mm. long; body acute at both ends, 15–18 mm. long, 5 mm. wide. *Astragalus Macounii* Rydb. Mountains: B.C.—Alta.—Colo. *Submont.*—Mont. My—Jl.

7. **A. ibapense** (M. E. Jones) Rydb. Stem slender, grooved, minutely strigose; leaflets 1–7, elliptic or linear, the lower obtuse, the upper acute, 4–12 mm. long, minutely strigose, or the single one of the upper leaves 2.5–4 cm. long; raceme 1–3-flowered; calyx strigose; tube 2 mm. long; teeth 1 mm. long; corolla 6 mm. long, white; keel purple-tipped; pod short-stipitate, 12 mm. long, 3 mm. wide, densely strigose, flat; lower suture straight. *Astragalus ibapensis* M. E. Jones. Mountains: w Utah. Je.

8. **A. elegans** (Hook.) Rydb. Stem finely strigose or glabrous, erect or decumbent at the base, 2.5–6 dm. high; leaflets 9–17, oblong to linear, 15–20 mm. long, obtuse; raceme lax, 5–10 cm. long, in fruit even 15–20 cm. long; calyx black-hairy; tube 2.5 mm. long; teeth 1 mm. long; corolla 6–8 mm. long, purple, or ochroleucous and tinged with purple; pod ellipsoid, pendent, slightly inflated, sessile, black-hairy, 8–15 mm. long. *Phaca elegans* Hook. *Astragalus oroboides americanus* A. Gray. *A. minor* M. E. Jones. *A. eucomus* B. L. Robins. Mountains and woods: Lab.—Que.—S.D.—Colo.—Ida.—Alta. *Submont.*—Alp. Je—Jl.

9. **A. Shearii** Rydb. Stems slender, strigose and striate, about 2 dm. high; leaflets 13–19, 5–8 mm. long, oblong, obtuse or retuse at the apex, glabrate above, grayish strigose beneath; raceme short, 5–10-flowered; calyx-tube about 4 mm. long, strigose, partly with black hairs; teeth short; corolla reddish purple, nearly 1 cm. long; pod oblong, 12–14 mm. long, glabrous, reticulate, sessile. *Astragalus Shearii* Rydb. Mountains: Colo. *Mont.* Au.

10. **A. Brandegei** (Porter) Rydb. Stems adscurgent or ascending, branched, strigose; leaflets 9–11, distant, linear, obtuse, 5–15 mm. long, glabrous above, strigose beneath; raceme short, 2–5-flowered; calyx strigose; tube scarcely 2 mm. long; teeth 1 mm. long or less; corolla about 5 mm. long, white or cream-colored, tinged with purple; legume oblong, 10–12 mm. long, strigose. *A. Brandegei* Porter. Hills and bluffs: Colo.—Utah—Ariz. *Submont.* Je—Jl.

34. HOMÁLOBUS Nutt.

Perennial herbs, with rootstocks or woody caudices. Leaves alternate, odd-pinnate, or sometimes simple. Flowers racemose, purple or ochroleucous. Calyx campanulate. Keel obtuse. Pod several- or many-seeded, usually narrow, perfectly 1-celled, without trace of a partition, with both sutures prominent, usually more or less compressed, often flat.

Legumes decidedly flattened laterally.

Leaves simple or some of them rarely 3-foliolate; plants pulvinate-caespitose; pod sessile. I. SIMPLICIFOLII.

Leaves several-foliolate.

Pod sessile or short-stipitate; stipe seldom exceeding the calyx.

Legume oval, ovate, broadly oblong, or elliptic.

Pod without long black hairs.

Pod with long black hairs.

Legume linear, 1.5 cm. long or longer.

Pod long-stipitate; stipe decidedly longer than the calyx.

Calyx not gibbous at the base, less than half as long as the corolla; pod membranous; leaflets linear or filiform. V. STENOPHYLLI.

Calyx strongly gibbous at the base, more than half as long as the corolla; pod more coriaceous. VI. COLLINI.

Legumes nearly terete.

Pod sessile or short-stipitate; stipe if any shorter than the calyx.

Pod long-stipitate; stipe longer than the calyx. VII. FLEXUOSI.
VIII. MACROCARPI.

I. SIMPLICIFOLII.

Calyx-teeth about half longer than the calyx-tube; corolla ochroleucous or whitish.

Calyx glabrous.

1. *H. ligulatus*.

Calyx pubescent.

Leaves almost filiform, sparingly hairy, pungent-pointed; pods mottled.

2. *H. exilifolius*.

Leaves narrowly linear-oblongate, canescent, not pungent; pods not mottled.

3. *H. simplicifolius*.

Calyx-teeth about as long as the tube; corolla purple or pink.

Peduncles 1-flowered; bracts subulate, longer than the flowers. 4. *H. uniflorus*.

Peduncles 3-10-flowered; bracts ovate to narrowly lanceolate, shorter than the flowers.

Pods long-acute; bracts narrowly lanceolate; leaves usually narrowly oblongate.

5. *H. caespitosus*.

Pods abruptly acute; bracts short, ovate to lanceolate, very scarious; leaves oblongate or spatulate. 6. *H. brachycarpus*.

II. TENELLI.

Pod strictly sessile

Leaflets narrowly linear, often wanting.

8. *H. lanceolarius*.

Leaflets oblong to oval.

Stems densely caespitose, 1-2 dm. high; racemes short, few-flowered.

Racemes 2-6-flowered, shorter than the leaves; leaflets oblong to oblongate, acute, canescent. 9. *H. exiliflexus*.

Racemes 5-12-flowered, exceeding the leaves; leaflets oblong to elliptic, green, glabrate above. 10. *H. miser*.

Stems more simple, 2 dm. high or more; racemes elongate.

Pods erect, on long pedicels.

11. *H. grallator*.

Pods spreading or reflexed, on short pedicels.

Pods glabrous; plant canescent.

12. *H. wingatanus*.

Pods hairy; plant green.

13. *H. Clementis*.

Pod short-stipitate.

Corolla white, tinged with purple.

Both sutures of the pod curved.

Lower suture of the pod straight.

14. *H. acerbus*.

Corolla ochroleucous.

15. *H. Dodgeanus*.

Legume glabrous.

Stipe rarely exceeding the tube of the calyx; leaves usually spreading in age; leaflets oblong to oval, obtuse and mucronate. 16. *H. dispar*.

Stipe of the mature legume usually exceeding the calyx-teeth; leaves strongly ascending; leaflets narrowly linear to linear-oblong, mostly acute.

Stipe 3-4 mm. long; leaflets linear or linear-oblong; stem usually conspicuously strigose; calyx-teeth half as long as the tube. 17. *H. tenellus*.

Stipe 5-7 mm. long; leaflets narrowly linear; stem glabrous or nearly so; calyx-teeth usually nearly equalling the tube. 18. *H. stipitatus*.

Legume strigose. 19. *H. strigulosus*.

III. DEBILES.

Stem very slender, filiform and decumbent; pod sessile, ovate or oval.

20. *H. debilis*.

Stem erect or ascending; pods stipitate and long-acute at both ends.

21. *H. Bourgovii*.

IV. CAMPESTRES.

Corolla ochroleucous, usually without any tinge of purple; upper leaves reduced to filiform phyllodes or the rachis greatly produced, without a terminal leaflet; canescent rush-like plants, with deep-seated roots and stem branched below the surface; calyx-lobes less than half as long as the tube.

Calyx more or less black-hairy; legumes tapering towards the base.

Calyx-lobes subulate, much longer than broad; leaves linear-subulate to linear, very acute. 22. *H. campestris*.

- Calyx-teeth about as broad as long, triangular; leaflets linear or linear-oblong, obtuse. 23. *H. junciiformis*.
 Calyx white-hairy; teeth triangular; legumes linear; leaflets, if any, narrowly linear to filiform. 24. *H. junceus*.
 Corolla white, pink, purplish, or rarely ochroleucous, at least the keel tipped with dark purple; terminal leaflet usually well developed; leafy plants with a caespitose caudex.
 Legume strigose, rarely becoming glabrate in age.
 Legume arcuate.
 Leaflets 5; plant pulvinate-caespitose. 7. *H. detritalis*.
 Leaflets 7-11; plant caespitose, decumbent, but not pulvinate. 25. *H. decumbens*.
 Legume straight, or the end slightly curved upwards in *H. oblongifolius*.
 Leaflets strigose on both sides, usually densely canescent.
 Leaflets narrowly linear or narrowly lance-linear.
 Calyx-teeth almost as long as the tube; corolla purplish; plant 2-4 dm. high. 26. *H. strigosus*.
 Calyx-teeth much shorter than the tube; corolla ochroleucous, only the keel tipped with purple; plant less than 2 dm. high. 27. *H. tenuifolius*.
 Leaflets narrowly lanceolate or lance-oblong, 4-8 mm. long, 1-2.5 mm. wide; plant less than 1 dm. high. 28. *H. divergens*.
 Leaflets usually glabrous above, green.
 Calyx white-hairy, its teeth one-third as long as the tube; leaflets linear to lance-oblong; racemes long and lax. 29. *H. serotinus*.
 Calyx usually black-hairy, its teeth fully half as long as the tube.
 Legumes 2-2.5 cm. long; corolla about 1 cm. long; leaflets ample; plant erect, 2-4 dm. high.
 Leaflets elliptic or oblong, obtuse, the terminal one short-stalked and similar to the rest; lower suture of the legume decidedly curved. 30. *H. oblongifolius*.
 Leaflets lanceolate or oblanceolate, somewhat falcate, the terminal one long-stalked, longer and tapering into the rachis without a distinct articulation. 31. *H. decurrens*.
 Legumes less than 2 cm. long; corolla 6-8 mm. long; leaflets small, less than 1 cm. long; plant decumbent-caespitose, less than 2 dm. high.
 Leaflets 1-5, the terminal narrowly oblanceolate, falcate, gradually tapering into the rachis. 32. *H. paucijugus*.
 Leaflets 7-17, the terminal one resembling the rest, short-stalked.
 Legumes linear with parallel sutures, 3 mm. wide. 33. *H. microcarpus*.
 Legumes obliquely oblanceolate, fully 3.5 mm. wide near the apex. 34. *H. humilis*.
 Legume glabrous from the beginning.
 Legumes about 1.5 cm. long; calyx-teeth less than half as long as the tube; leaflets linear or narrowly lance-linear. 35. *H. palliseri*.
 Legumes 2-2.5 cm. long; calyx-teeth more than half as long as the tube; leaves lanceolate to oval. 36. *H. hylophilus*.

V. STENOPHYLLI.

- Calyx-teeth obtuse; leaflets many, the terminal one present. 37. *H. stenophyllus*.
 Calyx-teeth very acute; leaflets few, the terminal one wanting or continuous with the rachis. 38. *H. episcopus*.

VI. COLLINI.

- Pod straight. 39. *H. collinus*.
 Pod curved one-half to two-thirds of a circle. 40. *H. curvicaupus*.

VII. FLEXUOSI.

- Pod oblong, over 5 mm. in diameter.
 Inflorescence short; flowers about 15 mm. long; pod glabrous. 41. *H. Hallii*.
 Inflorescence elongate and lax; flowers about 10 mm. long; pod pubescent. 42. *H. Fendleri*.
 Pod linear, 2-3 mm. in diameter.
 Pod abruptly contracted into a short or obsolete stipe.
 Stem decumbent; stipe minute or obsolete. 43. *H. flexuosus*.
 Stem erect; stipe almost equalling the calyx. 44. *H. proximus*.
 Pod gradually tapering into the short stipe. 45. *H. Salidae*.

VIII. MACROCARPI.

- One species. 46. *H. macrocarpus*.

1. ***H. lingulatus*** (Sheld.) Rydb. Leaves numerous, simple, 2-3.5 cm. long, lingulate or linear-spatulate; peduncles slender, shorter than the leaves, 1-2-flowered; calyx-tube striate; teeth subulate, spreading; corolla about 1 cm. long. *Astragalus lingulatus* Sheld. Foot-hills: Wyo. *Submont*.

2. ***H. exilifolius*** (A. Nels.) Rydb. Leaves numerous, narrowly linear to filiform, pungent, 2-4 cm. long, sparingly strigose; peduncles about equalling

the leaves, 1-2-flowered; calyx sparingly strigose; tube 3-4 mm. long; teeth subulate, 2 mm. long; corolla 15-20 mm. long, whitish, tipped with purple; pod oblong, 12-15 mm. long, mottled. *A. exilifolius* A. Nels. Desert regions: Wyo. *Submont.* My-Jl.

3. *H. simplicifolius* (Nutt.) Rydb. Leaves linear-oblanceolate, 5-10 mm. long, canescent-strigose; peduncles very short, 1-2-flowered; calyx strigose; tube 3 mm. long; teeth 1 mm. long; corolla ochroleucous, about 8 mm. long, tipped with purple; pod glabrate, slightly longer than the calyx. *A. simplicifolius* Nutt. Dry hills: Wyo.—Ida. *Submont.* Je-Jl.

4. *H. uniflorus* Rydb. Leaves oblanceolate or linear-spatulate, appressed silky-canescens, 1-2 cm. long, 1-3 mm. wide; peduncles 1-2 cm. long; calyx silky-canescens; tube 2 mm. long; teeth subulate, of about the same length; corolla 8 mm. long. Dry hillsides: Wyo. *Plain—Submont.* My.

5. *H. caespitosus* Nutt. Leaves 2-5 cm. long, appressed silky-canescens, either simple, linear-oblanceolate, or some of them with 3-5, linear-oblanceolate leaflets; peduncles 3-7 cm. long; racemes short, 2-10-flowered; calyx strigose; tube 2 mm. long; teeth of about the same length; corolla about 8 mm. long; pod lance-oblong, about 1 cm. long, acute, finely strigose. *A. caespitosus* A. Gray. *A. spatulatus* Sheld. Dry hills and plains: Sask.—Neb.—Colo.—Utah—Mont. *Plain—Submont.* My-Je.

6. *H. brachycarpus* Nutt. Leaves spatulate or oblanceolate, 1-2 cm. long, silky-canescens; peduncles 2-4 cm. long; racemes short, 2-7-flowered; calyx silky-strigose; tube 2 mm. long; teeth subulate, almost as long; corolla 7-8 mm. long; pod oblong, abruptly acute, about 7 mm. long, strigose. Dry plains: Wyo.—Utah. *Submont.* My-Je.

7. *H. detritalis* (M. E. Jones) Rydb. Cespitose perennial, growing in small mats; stems prostrate, 3-5 cm. long, ashy-strigose; leaves basal, 5-7 cm. long; leaflets mostly 5, cinereous-strigose, linear-oblanceolate, about 18 mm. long, aristately-tipped, or those of the earlier leaves oblanceolate, 6-8 mm. long; flowers few; calyx-tube 4 mm. long, acute at the base; teeth subulate; corolla purple, 15-16 mm. long; pod arcuate, about 2.5 cm. long, 2 mm. wide, mottled with brown spots. *A. detritalis* M. E. Jones. Clayey slopes: Utah. *Son.*

8. *H. lanceolarius* (A. Gray) Rydb. Stems erect, flexuose, branched, glabrous, 4-5 dm. high; leaflets 5-9, 1-2 cm. long, about 1 mm. wide, cinereous-puberulent, sometimes lacking, especially the terminal one, when the rachis is produced; racemes elongate, many-flowered; calyx sparingly short-hairy; tube 3 mm. long; teeth triangular-subulate, 1 mm. long; corolla 8 mm. long, white, tipped with purple; legume oblong, 15-20 mm. long, 6 mm. wide, acute at both ends, glabrous. *A. lanceolarius* A. Gray. Dry places: Utah—Ariz.—(? Colo.) *Son.*

9. *H. vexilliflexus* (Sheld.) Rydb. Stems strigose-canescens, decumbent, branched, 1-3 dm. high; leaflets 7-11, strigose-canescens, oblong or oblanceolate, acute, 5-18 mm. long; calyx strigose; tube 1.5 mm. long; teeth subulate, 1.5 mm. long; corolla purplish, 6-8 mm. long; pod oblong, strigose, abruptly acute, 8 mm. long, 3 mm. wide. *A. pauciflorus* Hook. *A. vexilliflexus* Sheld. Hills and mountains: Sask.—Wyo.—B.C. *Plain—Submont.* My-Jl.

10. *H. miser* (Dougl.) Rydb. Stems 1-3 dm. high, sparingly strigose; leaflets 11-15, linear-oblong to elliptic, obtuse, sparingly strigose below, glabrate above, 8-12 mm. long, 2-4 mm. wide; calyx as in the preceding; corolla purple, about 8 mm. long; pod similar to that of the preceding, but more acute. *A. miser* Dougl. (?) *A. amphidoxus* Blankinship. Stony banks and hills: w Mont. —Wash. *Submont.* Jl—Au.

11. *H. grallator* (S. Wats.) Rydb. Stem decumbent, about 5 dm. high, glabrous; leaflets about 20, finely strigose or glabrate, 1-2 cm. long, oblong; racemes loose, exceeding the leaves; calyx-teeth narrow, shorter than the tube; corolla white or pale rose-colored, 6 mm. long; pod 1 cm. long, transversely rugose, glabrous. *A. grallator* S. Wats. River banks: Colo. *Submont.* Jl.

12. *H. wingatanus* (S. Wats.) Heller. Stems 1-3 dm. high, finely strigose; leaflets 7-13, linear to oblong, 5-15 mm. long, sparingly strigose beneath, glabrate above; raceme 7-12-flowered; calyx strigose, with mixed black and white hairs; tube 1.5 mm. long; teeth subulate, 1 mm. long or less; corolla purplish, 6 mm. long; pod oblong, sessile, about 1 cm. long, 4 mm. wide. *A. wingatanus* S. Wats. Dry hills: N.M.—Colo.—Utah. *Submont.*

13. *H. Clementis* Rydb. Stem glabrate or slightly strigose, about 2 dm. high; leaflets 11-21, oblong or lanceolate, acute, 7-12 mm. long, glabrous above and sparingly strigose beneath; inflorescence 8-12-flowered; calyx-tube about 3 mm. long, strigose with black hairs; teeth lanceolate-subulate, about half as long; corolla bluish-purple, about 8 mm. long; pod oblong, about 1 cm. long, 3-4 mm. wide, black-hairy, with very short hairs. Mountains: Colo. *Mont.* Jl.

14. *H. acerbus* (Sheld.) Rydb. Stems erect, strigose, branched, 3-4 dm. high; leaflets 5-7, linear, 4-20 mm. long, 1-2 mm. wide; raceme lax, 5-14-flowered; calyx strigose; tube slightly over 1 mm. long; teeth triangular-subulate, 0.5 mm. long; corolla 5 mm. long; legume glabrous; body oblong, 10-12 mm. long; stipe about 1 mm. long. *A. acerbus* Sheld. Hills: Colo.—N.M. *Submont.*—*Mont.* Je.

15. *H. Dodgeanus* (M. E. Jones) Rydb. Stems slender, flexuose, 1.5-6 dm. high, minutely pubescent; leaflets 9-11, narrowly elliptic to linear, 5-10 mm. long; racemes lax; calyx strigose, with black hairs; teeth triangular; corolla about 8 mm. long; keel purple-tipped; pod short-stipitate, linear-oblong. *A. Dodgeanus* M. E. Jones. Rocky slopes: Utah—Colo. *Submont.* My.

16. *H. dispar* Nutt. Stem 3-4 dm. high, sparingly strigose or glabrate; leaflets oblong to oval, rarely linear-oblong, obtuse, often mucronate, glabrous above, sparingly strigose beneath, 8-20 mm. long; raceme 5-15-flowered; calyx strigose or glabrous; tube nearly 2 mm. long; teeth lance-subulate, 1 mm. long; corolla 8-10 mm. long; legume short-stipitate; body oblong, 10-13 mm. long, abruptly contracted into the stipe. Hills and mountains: w Neb.—Colo.—Utah. *Plain*—*Mont.* Je—Jl.

17. *H. tenellus* (Pursh) Britton. Stems erect, 2-4 dm. high, more or less strigose, branched; leaflets 6-10 pairs, linear or linear-oblong, glabrous above, more or less strigose beneath, 8-15 mm. long, 1-4 mm. wide; racemes 4-20-flowered; calyx strigose; tube nearly 2 mm. long; teeth triangular-subulate, 1 mm. long or less; corolla 8-9 mm. long; body of the pod oblong, 8-12 mm. long, 3-5 mm. wide, gradually tapering into the stipe. *A. multiflorus* (Pursh.) A. Gray. Hills and mountain sides: Sask.—Neb.—Colo.—Utah—Yukon. *Plain*—*Mont.* Je—Jl.

18. *H. stipitatus* Rydb. Stems slender, 3-4 dm. high, erect; leaflets 9-15, narrowly linear, 1-2 cm. long, 1-2.5 mm. wide, glabrous or sparingly strigose beneath; racemes lax, 5-20-flowered; calyx strigose; tube about 1.5 mm. long; teeth subulate, about as long; corolla 8-10 mm. long; body of the pod oblong, about 1 cm. long, 3 mm. wide, acute, gradually tapering into the stipe. Dry hills: Sask.—Minn.—S.D. *Plain.*

19. *H. strigosus* Rydb. Stems erect or ascending, 1-3 dm. high, strigillose; leaflets linear, acute, 8-12 mm. long, 1-2 mm. wide, thick, glabrous above, strigose beneath; raceme lax, 4-7-flowered; calyx strigillose; tube 1.5 mm. long; teeth subulate, less than 1 mm. long; corolla about 6 mm. long; body of the pod oblong, 7-8 mm. long, 3 mm. wide, rather gradually contracted into the stipe, which is about 3 mm. long. Dry places: Utah—Nev. *Son.*

20. *H. debilis* (Nutt.) Rydb. Stem 1-2 dm. long, sparingly strigose; leaflets cuneate-oblong or elliptic, truncate or emarginate, minutely strigose beneath; raceme short, subcapitate; calyx strigose, with grayish or blackish hairs; tube 2 mm. long; teeth subulate, about as long; corolla purple, 8-10 mm. long; pod black-hairy, with rounded base, acute. *A. debilis* (Nutt.) A. Gray. Along streams: Wyo.—Ida.—Yukon—Mack. *Boreal*—*Mont.* Jl.

21. *H. Bourgovi* (A. Gray) Rydb. Stems numerous, decumbent or ascending, 0.5-3 dm. long, minutely strigose; leaflets oblong or elliptic to lance-linear, 4-12 mm. long, strigose; raceme lax, 3-10-flowered; calyx strigose, with black

hairs; tube about 3 mm. long; teeth 1-2 mm. long, subulate; corolla 8-10 mm. long, dark purple; pod lance-oblong, slightly stipitate, about 15 mm. long, black-hairy, with a round ridge on each side. *A. Bourgovi.* A. Gray. Mountains: Alta.—S.D.—Mont.—B.C. *Submont.*—Mont. Jl—Au.

22. *H. campestris* Nutt. Stems often single, 2-4 dm. high, branched; rachis of the leaves 5-10 cm. long, sometimes broadened at the end into a narrowly oblanceolate blade, but usually long-attenuate; lateral leaflets of the lower leaves narrowly linear or linear-subulate, 5-30 mm. long, those of the upper leaves usually lacking; raceme lax, 3-10-flowered; calyx-tube 3 mm. long; teeth 1 mm. long; corolla about 1 cm. long; pod about 3 cm. long, 3-4 mm. wide, strigose. *A. campestris* A. Gray. *A. convallarius* Greene. Sandy plains and bench-land: Wyo.—Colo.—Utah. *Plain*—*Submont.* Je.

23. *H. junciformis* (A. Nels.) Rydb. Stems several, 2-4 dm. high, branched; leaves either reduced to a naked slender rachis, 4-7 cm. long, or bearing 5-7 distant linear-oblong or linear leaflets, 8-15 mm. long; raceme lax, 3-10-flowered; calyx-tube 3 mm. long; teeth triangular, 0.5 mm. long; corolla about 1 cm. long; pod about 3 cm. long, strigose. *A. junciformis* A. Nels. Sandy or stony plains: Wyo. *Submont.* Je.

24. *H. juncus* Nutt. Stems single or few, 3-6 dm. high, canescent-strigose, branched; lower leaves with 3-5, narrowly linear or oblanceolate-linear leaflets 1-3 cm. long, the upper usually reduced to the long slender rachis, curved at the tip; racemes 3-10-flowered, lax; calyx-tube 3 mm. long; teeth triangular, 1 mm. long or less; pod strigose, linear, 2.5-3 cm. long, 4 mm. wide. *A. juncus* A. Gray. *A. diversifolius* A. Gray. Sandy plains: Mont.—Wyo.—(? Colo.)—Ariz.—Ida. *Plain*—*Submont.* Je—Jl.

25. *H. decumbens* Nutt. Stems decumbent, 1-2 dm. high, sparingly strigose or glabrate; leaflets 7-11, narrowly linear-lanceolate, 5-10 mm. long, about 1 mm. wide, strigose on both sides; raceme short, but loose, 5-10-flowered; calyx-tube about 2 mm. long; teeth subulate, scarcely 1 mm. long; corolla ochroleucous, tipped with purple; pod linear, arcuate, 2-2.5 cm. long, 3 mm. wide, finely strigillose. *A. decumbens* A. Gray. Sandy plains: Wyo.—Mont.—Wash. Je—Jl.

26. *H. strigosus* (Coul. & Fish.) Rydb. Stems decumbent or ascending, 1.5-3.5 dm. high, strigose; leaflets 13-21, narrowly linear or linear, 1-2 cm. long, strigose on both sides; raceme slender, lax, 10-20-flowered; calyx-tube 2.5 mm. long; teeth subulate, of the same length; corolla 1 cm. long; pod sessile, linear, about 2 cm. long, 3-3.5 mm. broad, strigose. *A. strigosus* Coul. & Fish. *A. griseopubescens* Sheld. Dry ground: Mont.—Wash. *Plain*—*Submont.* Je—Jl.

27. *H. tenuifolius* Nutt. Stems decumbent, less than 2 dm. high, strigose-canescenscent; leaflets 7-13, linear or subulate, 5-15 mm. long, about 1 mm. wide, strigose-canescenscent on both sides; raceme short, lax, 3-8-flowered; calyx-tube campanulate, about 2 mm. long; teeth 0.5-0.7 mm. long; corolla 6-8 mm. long; pod linear, strigose, 12-15 mm. long, 2.5-3 mm. wide. *A. campestris* Coul. & Nels., not A. Gray. Dry hills and mountains: Mont.—Colo.—Utah. *Submont.*—Mont. Je—Jl.

28. *H. divergens* (Blankinship) Rydb. Stems numerous, 1-1.5 dm. (rarely 2 dm.) high, grayish strigose, decumbent; leaflets 9-15, canescent-strigose, linear to lance-oblong, 4-8 mm. long, 1-2.5 mm. wide; racemes 6-15-flowered; calyx strigose with dark hairs; tube scarcely 2 mm. long; teeth subulate, fully 1 mm. long; corolla 6 mm. long, white, purple-tinged, with purple veins and purple-tipped keel; pod linear, 12-15 mm. long, 2-2.5 mm. wide. *A. divergens* Blankinship. *Homalobus camporum* Rydb., in part. Dry hills and mountain tops: Mont.—Wyo.—Utah. *Plain*—Mont.

29. *H. serotinus* (A. Gray) Rydb. Stems ascending or erect, slender, 2-4 dm. high, strigose; leaflets 9-21, linear to lance-oblong, acute, glabrous above, strigose beneath, 1-3 cm. long, 2-4 mm. wide; racemes lax, 5-15-flowered; calyx-tube about 2.5 mm. long; teeth subulate, less than 1 mm. long; corolla purplish,

1 cm. long; keel with a deeply purple tip; pod 2-2.5 mm. long, 3 mm. wide, minutely strigose or in age glabrous. *A. serotinus* A. Gray. Mountain slopes: B.C.—Wash.—Mont. *Submont.* My-Jl.

30. *H. oblongifolius* Rydb. Stems ascending, branched, 2-3 dm. high, glabrous or nearly so; leaflets 11-19, usually oblong, but varying from elliptic to linear-oblong, 1-2 cm. long, 3-6 mm. wide, glabrous above, sparingly strigose beneath, rounded at the apex; raceme short, 5-10-flowered; calyx-tube 2-2.5 mm. long; teeth subulate, fully 1 mm. long; corolla 1 cm. long, white, tinged with purple; keel with a narrow dark-purple tip; pod 2-2.5 cm. long, strigose, 4 mm. wide. Mountains: Colo. *Mont.* My-Je.

31. *H. decurrens* Rydb. Stems erect, 3-4 dm. high, slightly strigose and angled; leaflets 11-15, 2-4 cm. long, linear-oblong to oblanceolate, sparingly strigose below, glabrate above; racemes slender, lax, 5-10-flowered; calyx-tube about 2.5 mm. long; teeth nearly 2 mm. long and subulate; pod fully 2 cm. long and 3 mm. wide, at length often glabrous. Wooded hills: Colo. *Mont.* Je-Au.

32. *H. paucijugus* Rydb. Stems 1-2 dm. high, sparingly strigose; leaflets 1-5, the lateral ones lanceolate to linear-subulate, 1 cm. or less long, glabrous above, sparingly strigose beneath, or none, the terminal one 1-2 cm. long, linear or linear-oblanceolate; racemes short, 3-6-flowered; calyx strigose with black hairs; tube about 2 mm. long; teeth subulate, fully 1 mm. long; pod 12-15 mm. long, 2 mm. wide. Sheltered places in the mountains: Utah. *Mont.—Subalp.*

33. *H. microcarpus* Rydb. Stems decumbent, about 1 dm. high, strigose; leaflets 9-15, elliptic to linear, 5-15 mm. long, 1-3 mm. wide, glabrous above, sparingly strigose beneath; racemes short, 3-8-flowered; calyx strigose with black hairs; tube about 2 mm. long; teeth about 1 mm. long, subulate; pod 12-18 mm. long, 3 mm. wide. *H. camporum* Rydb., in part. Mountains: Colo. *Submont.—Mont.*

34. *H. humilis* Rydb. Stems 2-10 cm. long, grayish strigose, decumbent or spreading; leaflets 11-15, oblong, 3-6 mm. long, about 2 mm. wide, grayish strigose beneath, glabrate above; raceme short, 3-8-flowered; calyx strigose with black hairs; tube 1.5-2 mm. long; teeth triangular or triangular-subulate, 1-1.5 mm. long; corolla purple, 7-8 mm. long; pod about 1.5 cm. long, 3 mm. wide. Mountains: Utah. *Mont.—Subalp.*

35. *H. Palliseri* (A. Gray) Rydb. Stems adsurgent, 2-4 dm. high, sparingly strigose; leaves 8-12 cm. long; leaflets 9-19, linear or lance-linear, sparingly strigose below, glabrate above, 1-2 cm. long; raceme 7-12-flowered, lax; calyx strigose with black hairs; tube 2.5 mm. long; teeth triangular-subulate, 0.5 mm. long; pod linear, about 1.5 cm. long, 2 mm. broad, glabrous, tapering at both ends. Mountains: Alta.—B.C.—Wash.—Mont. *Submont.* Jl.

36. *H. hylophilus* Rydb. Stems slender, leafy, sparingly strigose; leaflets 13-25, elliptic to lance-oblong, 1-2 cm. long, glabrous above, sparingly strigose beneath; raceme short, 6-12-flowered; calyx strigose, with dark hairs; tube 3 mm. long; teeth subulate, 1-1.5 mm. long; corolla about 1 cm. long, white, tinged with purple at the tip; keel purple-tipped; pod linear, 2-2.5 cm. long, 3-4 mm. wide. Open woods: Mont.—Wyo.—Utah—Ida. *Submont.—Mont.* Je-Au.

37. *H. stenophyllus* (T. & G.) Rydb. Stem erect, glabrous, 5-7 dm. high; leaflets 9-17, narrowly linear, glabrous or sparingly strigose, 1-1.5 cm. long, 1-2 mm. wide; raceme lax, many-flowered; calyx-tube 3-4 mm. long; teeth triangular, 1 mm. long; corolla ochroleucous or white, about 2 mm. long; stipe of the pod about 1 cm. long; body oblong, about 2 cm. long, 4 mm. wide. *A. stenophyllus* T. & G. Plains: Mont.—B.C.—Ore.—(? Utah). *Son.—Plain.* Je.

38. *H. Episcopus* (S. Wats.) Rydb. Stems glabrous or slightly appressed-hairy, 4-6 dm. high, branched; leaflets 0-7, narrowly linear, 8-12 mm. long, sparingly strigose; raceme lax; calyx strigose, with more or less blackish hairs; tube about 4 mm. long; teeth subulate, about 1 mm. long; corolla reddish purple, 12-15 mm. long; pod glabrous; stipe 5-8 mm. long; body linear-oblanceolate,

2.5-3 cm. long, about 5 mm. wide. *A. Episcopus* S. Wats. *A. Coltoni* M. E. Jones. Hills: Utah. *Son.*

39. *H. collinus* (Dougl.) Rydb. Stems erect, cinereous-pilose; leaflets 15-23, linear or linear-oblong, obtuse or retuse, 7-15 mm. long, villous-hirsutulous beneath, glabrate above; raceme 5-10 cm. long; calyx villous; tube about 8 mm. long; lower teeth lance-subulate, the upper triangular, all about 2 mm. long; corolla ochroleucous, about 15 mm. long; pod densely pilose; stipe about 1 cm. long; body linear, straight, about 2 cm. long, tapering at both ends. *A. collinus* Dougl. Mountain sides: B.C.—Ida.—Ore. *Son.* My-Je.

40. *H. curvicaupus* (Sheld.) Heller. Stem 3-6 dm. high, cinereous-pilose, with crisp hairs, branched and often flexuose; leaflets 9-17, obovate or obovate-cuneate, truncate to emarginate at the apex, 8-15 mm. long, more or less pubescent on both sides, with crisp hairs; calyx densely pilose; tube 7-8 mm. long; teeth triangular, 1-1.5 mm. long; pod finely pubescent; stipe 10-12 mm. long; body curved, 3 cm. long, 4 mm. wide, tapering at both ends. *A. speiroparpus falciformis* A. Gray. Sandy or dry soil: Ida.—Nev.—Calif.—Wash. *Son.* My-Jl.

41. *H. Hallii* (A. Gray) Rydb. Stems adsurgent, 2-4 dm. high, strigose, leafy; leaflets 19-25, linear-oblong to elliptic-cuneate, truncate or retuse, 5-10 mm. long, strigose beneath, glabrous above; raceme dense; calyx strigose; tube 4-5 mm. long; teeth triangular-subulate, 1 mm. long; corolla purple, 12-15 mm. long; pod 2-2.5 cm. long, oblong-elliptic, tapering at both ends, short-stipitate, glabrous, 5 mm. thick. *A. Hallii* A. Gray. Mountains: Colo. *Submont.*—*Mont.* Jl—Au.

42. *H. Fendleri* (A. Gray) Rydb. Stems adsurgent, 3-5 dm. high, glabrous or nearly so; leaflets 13-25, oblong or linear-oblong, obtuse or retuse, 8-20 mm. long, sparingly strigose beneath, glabrous above; calyx strigose, with dark hairs; tube 3 mm. long, lanceolate or triangular, 1 mm. long; corolla 10-12 mm. long, purple; pod oblong-obovoid, about 2 cm. long, 7-8 mm. in diameter, strigillose or glabrate. *Phaca Fendleri* A. Gray. *A. Fendleri* A. Gray. River bottoms in the mountains: N.M.—Colo. *Submont.* My-Je.

43. *H. flexuosus* (Dougl.) Rydb. Stems erect to decumbent, usually flexuose, strigose, 3-6 dm. long; leaflets 13-21, linear-oblong to elliptic-cuneate, obtuse or retuse, glabrous above, strigose beneath, 5-15 mm. long; racemes lax; calyx strigose; tube 3 mm. long; teeth subulate, 1 mm. long; corolla purple, or white tinged with purple; pod cylindric, 1.5-2 cm. long, 4 mm. thick, strigose, acute at both ends, straight or slightly curved. *Phaca elongata* Hook. *A. flexuosus* Dougl. Dry plains: Sask.—Minn.—Kans.—N.M.—Utah—Alta. *Plain*—*Mont.* My-Jl.

44. *H. proximus* Rydb. Stems erect, 2-3 dm. high, grayish strigose; leaflets 5-11, linear or linear-oblong, obtuse, 5-11 mm. long, grayish strigose; calyx about 2.5 mm. long, strigose; corolla 4-5 mm. long, white or ochroleucous; pod oblong-linear, terete, glabrous, about 12 mm. long and 3 mm. in diameter. Dry places: Colo. *Submont.* Je.

45. *H. Salidae* Rydb. Stem 3 dm. or more long; leaflets 15-21, oblong-oblanccolate to narrowly linear, 8-15 mm. long, strigose; racemes lax; calyx strigose and slightly black-hairy, about 3 mm. long; teeth short, triangular; corolla about 8 mm. long, purple-veined; pod narrowly linear-oblanccolate, terete or nearly so, 2-2.5 cm. long, 2 mm. in diameter, finely strigose, very acute at the apex. Dry places: Colo. *Submont.* Au.

46. *H. macrocarpus* (A. Gray) Rydb. Stems 4-8 dm. high, strigose-canescens; leaves 5-10 cm. long, the upper often reduced to filiform phyllodes; leaflets 0-5, linear to filiform, strigose-canescens, 1-3 cm. long; raceme lax, 2-4 dm. long; calyx strigose-canescens; tube about 7 mm. long; teeth lanceolate, 1.5-2 mm. long; pod long-stipitate, glabrous; stipe about 1 cm. long; body lance-linear, tapering at both ends, 3-4 cm. long, 4-5 mm. thick. *A. louhocarpus* A. Gray. (?) *A. duchesnensis* M. E. Jones. *A. macer* A. Nels. Sandy places: N.M.—Colo.—Utah. My-Je.

35. **KENTRÓPHYTA** Nutt.

Perennial, diffusely branched herbs. Leaves pinnately 3-7-foliolate; leaflets linear or subulate, inarticulate, rigid, spinulose-tipped; stipules more or less united. Flowers small, 2 or 3 together in the axils. Calyx campanulate, deeply 5-cleft; teeth equal, subulate. Corolla ochroleucous or purplish; banner oblong, reflexed; keel obtuse, shorter than the wings. Legume ovate, one-celled, flat, with both sutures prominent, 1- or 2-seeded.

Stipules united only at the base, more or less herbaceous.

Plant 3-4 dm. high, usually erect; stipules lanceolate, with long spinulose tips.

Plant low; stipules lance-subulate, not spinulose-tipped.

Stipules united for about half their length, scarious.

Leaflets linear-filiform, scarcely narrowed at the base; corolla ochroleucous, subsessile in the axils of the leaves.

Leaflets lanceolate or oblanceolate, distinctly narrowed at the base.

Corolla ochroleucous, about 4 mm. long, the keel usually purple-tipped; leaflets less than 5 mm. long.

Flower-clusters subsessile or short-peduncled; calyx-lobes shorter than the tube.

Leaves short-hairy; stipules with long spreading tips; leaflets about 3 mm. long.

Leaflets long-hairy; stipules not with spreading tips; leaflets 4-5 mm. long.

Flower-clusters on peduncles much exceeding the leaves; calyx-lobes equalling or exceeding the tube.

Corolla purple, about 6 mm. long; leaflets over 5 mm. long.

1. **K. impensa** (Sheld.) Rydb. Stems erect or ascending, 3-4 dm. high, simple or with short branches; leaflets 5-7, subulate or linear-lanceolate, 8-15 mm. long, strigose, strongly ribbed and pungent; calyx-tube 1.5 mm. long; teeth 1 mm. long; corolla ochroleucous, 4 mm. long. *Astragalus Kentrophyta elatus* S. Wats. *A. viridis impensus* Sheld. Dry valleys: Nev.—w Colo.—Ariz. Son.—Submont. My-S.

2. **K. viridis** Nutt. Stems diffusely spreading and much branched, 1-3 dm. long; leaflets usually 5, subulate, pungent, 8-18 mm. long; calyx-tube 1.5-2 mm. long; teeth 1.5 mm. long; corolla ochroleucous, 5 mm. long. *A. Kentrophyta* A. Gray, in part. Plains, bad-lands, and hills: Wyo.—Colo. Plain—Submont. My-Je.

3. **K. montana** Nutt. Stems diffusely spreading, and intricately branched; stipules ovate, 1-3 mm. long; leaflets 5-7, subulate, pungent, 8-15 mm. long; calyx-tube 1.5-2 mm. long; teeth 1 mm. long; corolla ochroleucous, 4-5 mm. long. *A. Kentrophyta* A. Gray, in part. Bad lands, cañons, and sandy hills: Sask.—Neb.—Utah—Alta. Plain—Submont. Je—Au.

4. **K. minima** Rydb. Perennial forming cushions 1 dm. in diameter; stems 1-2 cm. high; stipules lanceolate, 1-3 mm. long; leaflets 5-9, linear-lanceolate, conduplicate, pungent, 3-4 mm. long; flowers usually solitary; calyx-tube 1-1.5 mm. long; teeth scarcely 1 mm. long; corolla about 3 mm. long. Mountains: Yellowstone Park, Wyo. Mont. Au.

5. **K. Wolfii** Rydb. Stems intricately branched, less than 1 dm. long; stipules triangular; leaflets 5, approximate, 3-4 mm. long, lanceolate, strongly conduplicate; calyx-tube scarcely 2 mm. long; teeth about 1 mm. long; corolla about 4 mm. long. High mountains: Colo. Mont.—Subalp. Jl.

6. **K. tegetaria** (S. Wats.) Rydb. Stems diffuse-procumbent, 5-15 cm. long, much branched; stipules lanceolate, acuminate, 3-5 mm. long; leaflets 7-11, narrowly linear-lanceolate, pungent, 4-6 mm. long; calyx-tube scarcely 1.5 mm. long; teeth fully 1.5 mm. long; corolla 4-5 mm. long. *A. tegetarius* S. Wats. Mountains: Nev.—(? Utah). Mont. Jl.

7. **K. aculeata** (A. Nels.) Rydb. Stems less than 1 dm. long, diffusely spreading or decumbent; stipules ovate, 4-5 mm. long; leaflets 5-9, narrowly linear-lanceolate, conduplicate, 4-8 mm. long; calyx-tube about 1.5 mm. long; teeth subulate, 1 mm. long; corolla 5-6 mm. long. *A. aculeatus* A. Nels. *A. tegetarius implexus* Canby. High mountains: Mont.—Colo.—Utah—Ida. Submont.—Mont. Jl—Au.

36. OROPHACA (T. & G.) Britton.

Cespitose, silvery or villous perennials, with branched woody caudices and deep roots. Leaves crowded, digitately 3-foliolate (rarely 5-foliolate), with scarious sheathing stipules. Flowers few, capitate or racemose. Calyx campanulate to cylindric. Corolla yellowish or purplish. Keel blunt. Pod coriaceous, 1-celled, without partition, ovoid or elliptic, few-seeded, villous or puberulent, partly included in the calyx.

Flowers sessile in the axils of the leaves, 12 mm. or more long; corolla ochroleucous; calyx-tube longer than the teeth; plant pulvinate-cespitose.

Corolla 2 cm. or more long, glabrous; calyx-tube cylindrical, more than thrice as long as the teeth. 1. *O. caespitosa*.

Corolla 15-18 mm. long, pubescent on the outside; calyx-tube short-cylindric, about twice as long as the teeth. 2. *O. argophylla*.

Flowers in small, peduncled 1-3-flowered racemes, purple or turning yellowish in age, less than 10 mm. long; calyx-tube campanulate, not longer than the tube-teeth.

Plant pulvinate-cespitose; flowers 8-10 mm. long; inflorescence not exceeding the leaves.

Flowers about 10 mm. long; pods puberulent.

3. *O. tridactylica*.

Flowers about 8 mm. long; pods hoary.

4. *O. aretioides*.

Plant broadly cespitose, with prostrate branches; flowers about 6 mm. long; peduncles usually exceeding the leaves; pods hoary.

5. *O. sericea*.

1. ***O. caespitosa*** (Nutt.) Britton. Stems 5 cm. or less, densely covered with leaves and scarious stipules; leaflets elliptic to narrowly oblanceolate, 0.5-2 cm. long, appressed silvery-silky on both sides; calyx silky; tube cylindric, 10-15 mm. long; teeth 3-4 mm. long; corolla 2-3 cm. long; legume oblong-ovate, terete, silky-villous. *Phaca caespitosa* Nutt. *Astragalus triphyllus* Pursh. Dry gravelly hills: Sask.—Neb.—Wyo.—Mont. *Plain*. My-Je.

2. ***O. argophylla*** (Nutt.) Rydb. Stems less than 5 cm. high, densely covered with scarious, ovate stipules; leaflets elliptic or obovate to oblanceolate, 5-15 mm. long, 3-5 mm. wide, appressed white-silky on both sides; calyx white silky-villous; tube cylindric, 6-8 mm. long; teeth subulate, 3 mm. long; corolla 15-18 mm. long; legume short and rounded-ovate, densely villous. *Phaca argophylla* Nutt. *Astragalus hyalinus* M. E. Jones. Dry hills and bad lands: w Neb.—Wyo.—Colo. *Plain*. Jl-Au.

3. ***O. tridactylica*** (A. Gray) Rydb. Stems less than 5 cm. high, densely covered with leaves and scarious, pubescent stipules; leaflets broadly or narrowly oblanceolate, 0.5-2 cm. long, 3-4 mm. wide, densely silky on both sides; calyx silky; tube 3 mm. long; teeth 4 mm. long, subulate; corolla about 1 cm. long; legume globose-ovoid, 6-8 mm. long. *A. tridactylicus* A. Gray. Hills and plains: Colo. *Submont*. My-Je.

4. ***O. aretioides*** (M. E. Jones) Rydb. Stems more elongate than in the preceding; leaflets broadly oblanceolate, 0.5-1 cm. long, 3-4 mm. wide; calyx densely silky; tube about 2 mm. long; teeth subulate, 2 mm. long; corolla 7-8 mm. long; legume ovoid. *A. sericoleucus aretioides* M. E. Jones. Dry hills: Wyo.—Colo. *Submont*. My-Je.

5. ***O. sericea*** (Nutt.) Britton. Branches of the caudex often 1-2 dm. long; annual branches 2-4 cm. long, densely covered with leaves and ovate scarious pubescent stipules; leaflets oblanceolate to cuneate-obovate, 5-8 mm. long, 2-3 mm. wide, densely white-silky; calyx densely silky; tube 1.5 mm. long; teeth about 1.5 mm. long; corolla purple, 6-7 mm. long; legumes ovoid. *Phaca sericea* Nutt. *A. sericoleucus* A. Gray. Dry hills: Neb.—Wyo.—Colo. *Plain—Submont*.

37. ARAGÁLLUS Necker. LOCO-WEED.

Perennial herbs, mostly acaulescent. Leaves alternate, odd-pinnate. Flowers racemose or spicate. Calyx campanulate, its teeth almost equal. Petals clawed; banner erect, ovate or oblong; wings oblong; keel produced at the apex into a porrect point. Stamens 10, diallephous; anthers all alike. Pods sessile or stipitate, coriaceous, often more or less 2-celled by the intrusion of the upper suture. [*Oxytropis* DC.]

Stipules adnate to the petioles only slightly at the base; pods pendent, 1-celled, many times exceeding the calyx; plant often caulescent. I. DEFLEXI.

Stipules decidedly adnate to the petioles; pods not pendent; plant acaulescent.

Leaves strictly pinnate; leaflets opposite.

Fruiting calyx inflated, enclosing the fruit; plants densely caespitose, less than 1.5 dm. high. II. NANI.

Fruiting calyx not inflated, much exceeded by the pod.

Inflorescence 1-3-flowered; plants dwarf, pulvinate.

Pods inflated, 1-celled, ovoid. III. INFLATI.

Pods not inflated, oblong, almost 2-celled. IV. PARRYANI.

Inflorescence many-flowered; plants mostly over 1.5 dm. high, not pulvinate; V. CAMPESTRES.

pod oblong, not inflated.

Leaflets verticillate. VI. VERTICILLARES.

I. DEFLEXI.

Plant more or less caulescent; racemes at least in fruit elongate; pods 1.5-1.8 cm. long.

1. *A. deflexus*.

Plant subacaulescent; racemes short and head-like; pods about 1 cm. long.

2. *A. foliolosus*.

II. NANI.

Peduncles scarcely exceeding the leaves, 1-3-flowered; bracts broadly ovate.

Leaflets 5-10 mm. long; corolla 20-25 mm. long.

3. *A. multiceps*.

Leaflets 3-6 mm. long; corolla about 15 mm. long.

4. *A. minor*.

Peduncles decidedly exceeding the leaves, many-flowered; bracts lanceolate or ovate-lanceolate.

Pubescence of the peduncles appressed or merely ascending; pods included in the calyx.

Peduncles erect, strict; spike oblong, over 2 cm. long.

Corolla yellow or whitish, more than 2 cm. long.

5. *A. collinus*.

Corolla purple, less than 2 cm. long.

6. *A. Blankinshipii*.

Peduncles ascending, curved; spike subcapitate.

7. *A. nanus*.

Pubescence of the peduncles loosely spreading; pods usually somewhat exserted.

8. *A. Lagopus*.

III. INFLATI.

Leaflets 11-23.

Leaflets sparingly appressed-hirsute.

Leaflets densely canescent.

9. *A. podocarpus*.

Leaflets 5-11, densely canescent.

10. *A. Hallii*.

11. *A. oreophilus*.

IV. PARRYANI.

One species.

V. CAMPESTRES.

12. *A. Parryi*.

Plant not viscid.

Corolla purple, rarely white.

Calyx with spreading hairs.

Calyx white-hairy; corolla usually light purple.

Plant loosely pubescent; peduncles with long spreading hairs.

8. *A. Lagopus*.

Plant silky-canescant; peduncles with appressed hairs.

Plant low, densely caespitose; peduncles ascending, curved, less than 5 cm. high; spike capitate.

13. *A. argophyllus*.

Plant taller, over 1 dm. high; spike elongate.

Calyx long-hairy; wings broad.

14. *A. Besseyi*.

Calyx short-hairy; wings narrow.

15. *A. albertinus*.

Calyx black-hairy; corolla dark, bluish purple.

Plant white or grayish villous.

16. *A. atropurpureus*.

Plant silky, with appressed hairs, green.

16. *A. melanodontus*.

Calyx with appressed hairs.

Legumes about 3 cm. long, short-stipitate and long-acuminate; corolla over 2 cm. long.

17. *A. Bigelovii*.

Legume 2 cm. long or less, sessile.

Legumes villous, almost 2-celled; caudices densely white-hairy; corolla 12 mm. long.

18. *A. plattensis*.

Legumes appressed-silky or short-hairy; caudices not conspicuously white-hairy.

Legume nearly 2-celled; leaves white-silky.

Corolla 12-15 mm. long; wings slightly emarginate.

19. *A. monticola*.

Corolla about 2 cm. long; wings broadly and deeply emarginate.

20. *A. sericeus*.

Legumes only half 2-celled.

Leaves white-silky beneath; corolla 15 mm. long; pod ascending.

21. *A. albertinus*.

Leaves green or only slightly silky.

Legumes spreading; leaves elliptic or oblong; corolla 15 mm. long.

22. *A. dispar*.

Legumes erect or strongly ascending; leaflets lanceolate or linear-lanceolate, very acute.

Leaves spreading; pod 15 mm. long, abruptly contracted into a short spreading beak; corolla 15 mm. long.

23. *A. angustatus*.

Leaves erect; pod 20 mm. long, long-acuminate, nearly straight; corolla 18-20 mm. long.

24. *A. Lambertii*.

Corolla yellow, ochroleucous or white, with a purple spot on the keel.

Peduncles decumbent, curved, 1 dm. long or less.

25. *A. alpicola*.

Peduncles erect, 2 dm. high or more.

26. *A. villosus*.

Peduncles with long loose hairs.

Peduncles appressed-hairy.

Flowers 12–15 mm. long.

Lower leaves with conspicuously shorter and broader leaflets; flowers more or less spreading.

22. *A. dispar*.

Lower leaves similar to the upper or nearly so; flowers strongly ascending.

27. *A. gracilis*.

Flowers 18–25 mm. long; pods coriaceous.

Corolla yellow; banner and wings narrower than in the next, slightly notched; legume nearly 2-celled.

28. *A. spicatus*.

Corolla white or straw-colored, banner and wings fully 1 cm. wide, deeply notched; legume half 2-celled.

29. *A. albiflorus*.

Plant more or less viscid.

Calyx not black-hairy; pods abruptly acuminate; base of the plant with long yellow hairs.

30. *A. viscidus*.

Calyx black-hairy; pods long-acuminate; base of the plant not yellow-hairy.

31. *A. viscidulus*.

VI. VERTICILLATI.

Bracts usually shorter than the flowers.

Leaflets lance-oblong to elliptic, densely silky-pubescent.

32. *A. Richardsonii*.

Leaflets linear-lanceolate, rather sparingly silky.

33. *A. galioides*.

Bracts much exceeding the flowers.

34. *A. splendens*.

1. ***A. deflexus*** (Pall.) Heller. Stem 1–4 dm. high, villous, flexuose; leaflets 25–41, lanceolate or ovate, green, loosely villous, 5–20 mm. long, rounded at the base, acute at the apex; raceme usually lax, 5–10 cm. long; calyx black-hairy, tube 4 mm. long; teeth subulate, 3 mm. long; corolla 6–9 mm. long, dirty white below, blue at the apex; pod oblong, black-hairy. *O. deflexa* (Pall.) DC. Damp places: Sask.—S.D.—N.M.—Ida.—Alaska. Mont.—Subalp. Je—Au.

2. ***A. foliolosus*** (Hook.) Rydb. Subacaulescent; leaflets 13–31, ovate or elliptic, 3–8 mm. long, villous, green, acutish or obtuse; calyx black-villous; tube 5–6 mm. long; teeth subulate, 3 mm. long; corolla bluish purple, 8–10 mm. long; legume ellipsoid, black-hairy. *O. foliolosa* Hook. High mountains: Alta.—Colo.—Yukon. Subalp. Ji—Au.

3. ***A. multiceps*** (Nutt.) Heller. Pulvinate perennial; leaflets 7–9, elliptic to lanceolate, densely canescent, with appressed silky hairs, 5–10 mm. long, acute; peduncles 1–4 cm. long, 2–3-flowered; calyx silky-villous; tube 8–10 mm. long; teeth lanceolate, 3 mm. long; corolla reddish purple; keel with a very short porrect beak; legume ellipsoid, silky-strigose, 1 cm. long, with a very narrow partial partition. *O. multiceps* Nutt. Hills and mountains: Neb.—(? Mont.)—Wyo.—Colo. Plain—Submont. My—Je.

4. ***A. minor*** (A. Gray) Cockerell. Pulvinate perennial; leaflets 5–9, lanceolate or oblong, 3–6 mm. long, acute, silky, but pubescence somewhat looser than in *A. multiceps*; peduncles 0.5–3 cm. long; calyx silky-villous; tube 6–7 mm. long; teeth lanceolate, 2–3 mm. long; corolla dark purple; keel with a slender ascending beak; legume ovoid, thin, silky, about 8 mm. long; partial partition narrow. *O. multiceps minor* A. Gray. High mountains: Colo.—Wyo. Submont.—Mont. My—Jl.

5. ***A. collinus*** A. Nels. Plant very hairy at the base; leaflets 7–13, oblong to linear-lanceolate, acute, 1–3 cm. long, densely white-silky, with long appressed hairs; scapes several, 1–2 dm. high; spike 10–20-flowered; calyx villous with long silky hairs; tube 7 mm. long; teeth lanceolate, 3 mm. long; corolla 18–20 mm. long; keel with a dark spot and a short porrect tip; legume oblong-elliptic, villous, nearly filling the calyx. Mountains: Wyo.—(? Mont.). Submont. Jl.

6. ***A. Blankinshipii*** A. Nels. Leaflets 7–17, oblong, acute at both ends, 8–16 mm. long, canescent with appressed hairs; scapes erect, 5–10 cm. long; spike in fruit 2–5 cm. long; calyx villous with long hairs; tube 6–7 mm. long; teeth triangular or lanceolate, 2–3 mm. long; corolla dark purple, about 15 mm. long; legumes ovoid, about 1 cm. long, coriaceous, only partly 2-celled. Hills and plains: Mont.—Wyo.—Ida. Submont. My—Je.

7. ***A. nanus*** (Nutt.) Greene. Pulvinate perennial; leaves usually spreading; leaflets 7–13, oblong or lanceolate, 5–10 mm. long, appressed silky; peduncles decumbent or ascending, 2–5 cm. long; calyx villous, often with partly black hairs; tube about 6 mm. long; teeth lanceolate, 3 mm. long; corolla dark purple,

15 mm. long; legume ovoid, 1 cm. long, densely villous, nearly half 2-celled. *O. nana* Nutt. Mountains: Mont.—Wyo. *Plain*—*Submont.* Je.

8. *A. Lagopus* (Nutt.) Greene. Pulvinate perennial; leaflets 9–15, elliptic, oblong or lanceolate, acute, 5–15 mm. long, loosely canescent; scape 2–7 cm. long, silky villous, decumbent to erect; spike head-like; calyx densely long-villous; tube about 6 mm. long; teeth often dark, subulate, 3 mm. long; corolla dark bluish purple; legume long-villous, oblong-ovoid, long-acuminate, 15 mm. long or less, thin, half 2-celled. *O. Lagopus* Nutt. Dry hills and bench lands: Mont.—Wyo.—Ida. *Plain*—*Submont.* My—Je.

9. *A. podocarpus* (A. Gray) Greene. Pulvinate perennial; leaflets 11–33, linear-lanceolate or oblong, 3–8 mm. long, acute; peduncles 1–3 cm. long, sparingly hairy, 1–2-flowered; calyx dark, villous with white hairs; tube 6–7 mm. long; teeth lanceolate, 2–3 mm. long; corolla dark bluish purple, about 15 mm. long; legume stipitate, finely black-hairy; body ellipsoid, 15–20 mm. long, abruptly contracted into a short beak. *O. podocarpa* A. Gray. Arctic-alpine regions: Lab.—Alta.—Colo.—Ida.—B.C.—Yukon. *Subalp.*—*Alp.* Je—Jl.

10. *A. Hallii* (Bunge) Rydb. Pulvinate perennial; leaflets 11–19, narrowly oblong or lanceolate, densely silky-canescens, about 5 mm. long; peduncles 1–3 cm. long, grayish strigose; calyx black, villous with white hairs; tube scarcely 5 mm. long; teeth lanceolate; corolla bluish purple, about 1 cm. long. *O. Hallii* Bunge. High mountains: Colo. *Subalp.*—*Alp.* Je.

11. *A. oreophilus* (A. Gray) A. Nels. Pulvinate perennial; leaflets 7–11, lanceolate or oblong, densely white-silky, 4–8 mm. long; peduncles 1–3 cm. long; spike 3–8-flowered, capitate; calyx densely hirsute-villous, partly black-hairy; tube about 5 mm. long; teeth subulate, 2–3 mm. long; corolla purple, 10–12 mm. long; legumes papery, grayish villous, about 1 cm. long. *O. oreophila* A. Gray. Mountains: Utah—Ida. *Mont.*—*Subalp.* Jl.

12. *A. Parryi* (A. Gray) Greene. Pulvinate perennial; leaflets 15–19, oblong-lanceolate, 4–8 mm. long, acute, grayish silky-strigose; peduncles 1–5 cm. long, decumbent or ascending, 1–4-flowered; calyx villous, partly with black hairs, 6–7 mm. long; teeth subulate, 3 mm. long; corolla purple, about 15 mm. long; pod cylindric, coriaceous, densely canescent, about 2 cm. long, 6 mm. thick. *O. Parryi* A. Gray. High mountains: N.M.—Colo.—(? Mont.). *Mont.*—*Alp.* Jl.

13. *A. argophyllus* Rydb. Leaflets 7–11, linear-lanceolate, generally less than 1 cm. long, silvery white, with appressed pubescence, mostly involute; calyx silky villous, 6–7 mm. long; teeth subulate, 3–4 mm. long; corolla purple; wings rather narrow, deeply emarginate; pod similar to that of the next, but scarcely 15 mm. long. Dry hillsides: Mont. *Submont.* Je—Jl.

14. *A. Besseyi* Rydb. Leaflets 11–25, oblong-lanceolate, 1–2 cm. long, acute, silky-canescens; scape 1–2 dm. high; spike dense, 3–5 cm. long; calyx silky-villous with long hairs; tube 5–6 mm. long; teeth subulate, 4–5 mm. long; corolla purple, about 2 cm. long; wings very broad, deeply emarginate; pod ovate-oblong, nearly 2 cm. long, 5 mm. thick, silky-villous, half 2-celled. *O. argentata* Pursh, not Pers. *A. Blankinshipii* A. Nels., in part. *A. ventosus* Greene. Dry hill-sides: Mont.—Wyo. Je—Jl.

15. *A. atropurpureus* Rydb. Leaflets oval to oblong, canescently silky-villous, 5–15 mm. long, obtuse or acute; scape 6–10 cm. long, loosely villous; raceme short and head-like; calyx dark, villous, with mixed black and white hairs; teeth black-hairy, subulate, 4 mm. long; corolla dark-purple, about 15 mm. long; wings deeply emarginate; pod ovoid, less than 1.5 cm. long, with a spreading beak, villous, thin, half 2-celled. Mountains: Wyo. *Submont.* Jl.

16. *A. melanodontus* Greene. Leaflets elliptic, often obtuse, 5–10 mm. long, appressed silky; scape 1–2 dm. high, minutely strigose; raceme 2–3 cm. long; calyx densely pubescent, with partly black hairs; tube 5 mm. long; teeth lanceolate, 2 mm. long; corolla purple, about 12 mm. long; wings rather narrow, slightly emarginate; keel with a porrect tip. *Oxytropis Lambertii* β Hook. Dry banks: Sask.—Alta. *Plain.*

17. *A. Bigelovii* (A. Gray) Greene. Leaflets 9-17, lanceolate or oblong-lanceolate, acute at both ends, 2-3 cm. long, 5-8 mm. wide, green, short-strigose on both sides; peduncles 2-3 dm. high, finely strigose; raceme 1-2 dm. long; flowers more or less spreading; calyx-tube about 7 mm. long; teeth lanceolate, 2-3 mm. long; corolla purple, 20-22 mm. long; wings very broad, slightly emarginate; legume stipitate, ascending, lance-cylindric, about 3 cm. long, fully half 2-celled. *Oxytropis Lambertii Bigelovii* A. Gray. Plains and hillsides: w Tex.—s Colo. *Submont.*—*Mont.* Je-Jl.

18. *A. plattensis* (Nutt.) Rydb. Leaflets 11-15, elliptic or oblong-lanceolate, 4-10 mm. long, densely silky-canescens, with rather loose hairs, acute; scape 4-8 cm. long, with rather loose hairs; raceme 3-5 cm. long; calyx-tube 5 mm. long; teeth subulate, 2 mm. long; corolla purple, about 12 mm. long; legume villous, about 15 mm. long, coriaceous, half 2-celled. *O. plattensis* Nutt. Dry hills: Wyo.—Neb. *Submont.* Je.

19. *A. monticola* (A. Gray) Greene. Leaflets 7-11, elliptic, or oblong, 6-20 mm. long, sericeous-canescens; scape 5-15 cm. high; raceme short, 3-6 cm. long; calyx densely and finely silky-strigose; tube 5 mm. long; teeth triangular, 1.5 mm. long; corolla purple, 12-15 mm. long; wings slightly emarginate; legume erect, lance-cylindric, nearly 2 cm. long, long-acuminate, rather thin, sulcate on the upper suture, 2-celled. *O. monticola* A. Gray. Dry plains and bottom land: Wyo.—Colo. *Submont.* Jl.

20. *A. sericeus* (Nutt.) Greene. Leaflets 7-13, elliptic or oblong, 1-3 cm. long, shining, with white silky-appressed hairs; scape 1-1.5 dm. high, stout; raceme 5-10 cm. long; flowers rather spreading; calyx about 7 mm. long; teeth lanceolate, about 3 mm. long; corolla light purple; wings very broad and deeply emarginate; pod cylindric, erect, about 2 cm. long, long-acuminate, nearly 2-celled. *O. sericea* Nutt. Hills: Neb.—Colo.—Wyo. *Plain.* My-Jl.

21. *A. albertinus* Greene. Leaflets 17-23, lanceolate, broadest near the base, 15-20 mm. long, sparingly silky and light green above, densely silky beneath, the margins somewhat involute; scape slender, 1-2 dm. high; raceme about 1 dm. long; calyx short-silky, with rather loose hairs; tube 5-6 mm. long; teeth 2-3 mm. long; corolla about 15 mm. long, white below, sky-blue at the end; pod lance-ovoid, erect, dark, long-acuminate, thin, half 2-celled. Exposed rocky places: Man.—Sask. *Plain.* Au.

22. *A. dispar* A. Nels. Leaves spreading or ascending; leaflets 9-17, elliptic or oblong, acutish at both ends, 1-2 cm. long, 4-6 mm. wide, those of the lower leaves often shorter and broader, somewhat silvery, with closely appressed hairs; scape 1-1.5 dm. high; raceme short; bracts linear-lanceolate to lanceolate, 5-8 mm. long; flowers usually spreading; calyx sparingly appressed-silky with short hairs, often somewhat tinged with purple above; tube 5-7 mm. long; teeth subulate, 3 mm. long; corolla dark bluish purple to rarely ochroleucous, about 15 mm. long; wings broad, slightly emarginate; keel with a very dark purple spot; pod ascending-spreading, thin-coriaceous, nearly straight, less than 2 cm. long, long-acuminate, minutely strigose, half 2-celled. *A. patens* Rydb. *A. formosus* Greene, a coarse form. Plains and hills: N.D.—Neb.—Colo.—Wyo. *Plain—Submont.* My-S.

23. *A. angustatus* Rydb. Leaflets 7-13, narrowly linear-lanceolate to narrowly linear, 1-2 cm. long; scape about 1 dm. high; raceme 3-5 cm. long; calyx finely silky-strigose; tube 5-6 mm. long; teeth subulate; wings broad and slightly emarginate; legume ovoid, coriaceous, half 2-celled. *A. Aven-Nelsonii* Lunell. Plains and hills: N.D.—Neb.—Colo. *Plain—Submont.* Jl—Au.

24. *A. Lambertii* (Pursh) Greene. Leaflets 11-17, narrowly lanceolate, 1.5-4 cm. long, 3-5 mm. wide, acute at both ends, green, silky on both sides; scape 1.5-2 dm. high; racemes elongate, 5-10 cm. long; flowers usually somewhat ascending; calyx-tube about 7 mm. long; teeth subulate, 2 mm. long; corolla usually dark bluish purple; wings slightly emarginate; legume almost erect, lance-oblong, half 2-celled. *Oxytropis Lambertii* Pursh. *A. falcatus* Greene. Dry plains and prairies: Minn.—Mo.—Colo.—Mont. *Plain—Submont.* My—Au.

25. *A. alpicola* Rydb. Depressed acaulescent perennial; leaflets 9-13, oblong or elliptic, obtuse or acutish, 5-8 mm. long, white silky-strigose; scapes 2-6 cm. long, strigose; spike short, 3-8-flowered, subcapitate; calyx usually very dark from the intermixed black hairs; tube 5-6 mm. long; teeth subulate, 2 mm. long; corolla ochroleucous, about 15 mm. long; wings broad and broadly emarginate; pod about 15 mm. long, subcoriaceous, ovoid, short-beaked, nearly 2-celled. High mountains: Alta.—Mont.—B.C. *Mont.—Alp.* Je-Au.

26. *A. villosus* Rydb. Leaflets 25-31, rather crowded, 1-1.5 cm. long, lanceolate, very acute, densely but somewhat loosely silky; scape about 1.5 dm. long, loosely silky; spike dense, 4-5 cm. long; calyx white silky-villous; tube 6 mm. long; teeth very short, about 2 mm. long; corolla ochroleucous, without any purple, 12-15 mm. long; pod thin, almost perfectly 2-celled, white-silky, about 1.5 cm. long. *A. invenustus* Greene. Hills: Mont.—S.D. *Submont.—Mont.* Je.

27. *A. gracilis* A. Nels. Leaves erect; leaflets 21-31, oblong-lanceolate, appressed-silky, 1-2.5 cm. long, acute; scapes 2-4 dm. high; spike elongate, 5-10 cm. long; calyx densely silky, sometimes somewhat blackish; tube 6-7 mm. long; teeth linear-subulate, 3-4 mm. long; corolla ochroleucous, about 15 mm. long; wings slightly emarginate; pod oblong-ovate, about 2 cm. long, semi-membranous, nearly 2-celled. *A. albertinus* Greene, in part. Open woodlands: Man.—S.D.—Ida.—Alta. *Submont.—Mont.* Je-Jl.

28. *A. spicatus* (Hook.) Rydb. Leaflets oval to oblong, 8-25 mm. long, 4-8 mm. wide, usually obtuse, silky-strigose; scape 1-1.5 dm. long; spike 4-10 cm. long; calyx densely silky, often with intermixed black hairs; tube 6-7 mm. long; teeth lanceolate, 3 mm. long; corolla 18-20 mm. long; pod short-hairy, often with some black hairs, oblong, about 2 cm. long. *O. campestris spicata* Hook. *A. cervinus* Greene. *A. Macounii* Greene. Plains and hills: Sask.—S.D.—Wyo.—Alta. *Plain—Mont.* My-Jl.

29. *A. albiflorus* A. Nels. Leaflets 13-21, oblong, elliptic, or lanceolate, 1.5-2.5 cm. long, grayish strigose; scape 1.5-3 dm. long; spike elongate, 5-10 cm. long; calyx silky, with intermixed black hairs; tube 7-8 mm. long; teeth lanceolate, 3 mm. long; corolla 2-2.5 cm. long; keel with a deep purple blotch; pod densely pubescent, oblong, about 2 cm. long, rather abruptly acuminate, about half 2-celled. *A. saximontanus* A. Nels. *A. majusculus* Greene. Plains: Mont.—Colo. *Submont.—Mont.* My-Jl.

30. *A. viscidus* (Nutt.) Greene. Leaflets 31-57, oblong-lanceolate, acute or rarely ovate and rounded at the apex; scape 5-15 cm. long, erect, hirsute-villous; spike 3-8 cm. long, calyx villous; tube about 5 mm. long; teeth subulate, 3 mm. long; corolla violet, rarely white, about 12 mm. long; pod oblong, ovoid, 12-15 mm. long, minutely pubescent; partition narrow. *O. viscida* Nutt. Mountains: Mont.—Wyo.—Nev. *Mont.* Jl-Au.

31. *A. viscidulus* Rydb. Leaflets 17-31, oblong, obtuse or acutish, 5-10 mm. long, sparingly villous; scape 0.5-2 dm. high, sparingly silky-villous; spike dense, 2-5 cm. long; calyx densely hairy, viscid and more or less blackish; tube about 5 mm. long; teeth lanceolate, 2.5 mm. long, glandular; corolla dark bluish purple, with yellowish base, about 12 mm. long; pod membranous, oblong-ovate, 1-1.5 cm. long, finely black-hairy, about half 2-celled. Hills and mountains: Alta.—Wyo.—Utah—Yukon. *Mont.*

32. *A. Richardsonii* (Hook.) Greene. Leaflets numerous, verticillate, elliptic to lance-oblong, acute or obtuse, 8-20 mm. long, densely silky; scape 1-2 dm. high, villous; spike dense, 5-10 cm. long; bracts linear or lanceolate, often obtuse; calyx densely villous; tube 5 mm. long; teeth 2 mm. long; corolla dark blue, 10-12 mm. long; legume ovoid, densely villous, 12-15 mm. long, practically 2-celled. *O. splendens Richardsonii* Hook. Mountains: Sask.—Colo.—Yukon. *Submont.—Mont.* Je-Au.

33. *A. galioides* Greene. Leaflets rather sparingly silky, numerous, verticillate, linear-lanceolate, very acute, 5-15 mm. long; scape slender, 2-3 dm. high, villous; spike 5-10 cm. long, rather lax; bracts narrowly linear or subulate;

calyx villous; tube 5 mm. long; teeth subulate, about 2.5 mm. long; corolla dark blue, about 12 mm. long; pod ovoid, villous, about 1 cm. long, nearly 2-celled. Banks and hills: n Sask.—Alta.—Yukon. *Mont.*—*Boreal.* Je-Jl.

34. *A. splendens* (Dougl.) Greene. Leaflets very numerous, linear-lanceolate, 1–2.5 cm. long, very acute, white, silky-villous; scape 2–3 dm. high; spike dense or in age laxer, 4–10 cm. long; bracts narrowly linear to subulate, silky-villous, 1–2 cm. long; calyx densely white-villous; tube about 6 mm. long; teeth about 5 mm. wide; corolla 12–15 mm. long, dark blue; legume densely long-villous, 1 cm. long, ovoid, short-beaked, nearly 2-celled. *O. splendens* Dougl. *A. caudatus* Greene. Plains and hills: Man.—Minn.—Mont.—B.C. *Boreal*—*Mont.* Jl.

38. **GLYCYRRHIZA** (Tourn.) L. LIQUORICE.

Perennial herbs, with thick sweet roots and glandular-dotted foliage. Leaves odd-pinnate. Flowers perfect, in spikes or heads. Calyx with the two upper teeth somewhat shorter and partly united. Banner oblong or narrowly ovate, clawed; keel acute or obtuse. Stamens diadelphous, 9 and 1; anthers alternately smaller and larger. Pod sessile, indehiscent, covered with prickles or in exotic species with glands.

1. *G. lepidota* Nutt. Tall leafy perennial, 3–10 dm. high; leaflets 11–19, lanceolate or oblong, entire, 2–3.5 cm. long, mucronate-pointed, scaly when young; spikes many-flowered; corolla yellowish white, 12–13 mm. long; pod 12–15 mm. long, with hooked prickles. Copses and rich meadows: Ont.—N.Y.—Ariz.—Calif.—Wash.; Mex. *Son.*—*Plain*—*Submont.* My—Au.

39. **HEDYSARUM** (Tourn.) L. HEDYSARUM.

Perennial herbs, rarely shrubby, with odd-pinnate leaves, with several leaflets and no stipels. Flowers showy, in axillary, peduncled racemes, perfect. Calyx praeceolate, campanulate, nearly equally 5-toothed. Banner obovate or orbicular, clawed; wings oblong, shorter than the other petals; keel obliquely truncate, obtuse. Stamens diadelphous (9 and 1). Legume flat, divided transversely into rounded or subrhombic indehiscent internodes.

Calyx-teeth shorter than the tube; reticulations of the pods polygonal.

Corolla sulphur-yellow; fruit glabrous.

Corolla purple, rose, or rarely white.

Fruit glabrous, except as to a few hairs on the margins; internodes 6–8 mm. long.

Fruit distinctly appressed-pubescent; internodes 8–15 mm. long.

Corolla 12–15 mm. long; bracts linear-subulate, 5 mm. or more long.

Leaflets oblong, elliptic, or oval, less than 3 cm. long.

Leaflets lanceolate, fully 3 cm. long.

Corolla 15–20 mm. long; bracts lanceolate, 2–4 mm. long.

Calyx-teeth subulate, longer than the tube; reticulations of the pods transversely elongate, usually reaching from the middle to the margins, without cross-veins.

Flowers 15–20 mm. long.

Calyx sparingly strigose; loment with 4–7 internodes; nodes more than half as wide as the internodes.

Calyx canescent; loment with 2–5 internodes; nodes less than half as broad as the internodes.

Flowers 10–15 mm. long.

Leaves glabrous above, at least in age.

Leaflets elliptic-oblong, not fleshy; flowers 12–15 mm. long, purple; bracts lanceolate-subulate, 3–5 mm. long; internodes of the loment 3–5.

Leaflets linear-oblong, somewhat fleshy; flowers about 10 mm. long, rose-purple; bracts lanceolate, 1.5–2 mm. long; internodes

of the fruit 1–3.

Leaves canescent on both sides.

Leaves glabrous above, at least in age.

Leaves canescent on both sides.

1. *H. sulphurescens* Rydb. Stem erect, 3–5 dm. high, glabrous or sparingly strigose; leaflets 11–15, oblong or elliptic or oval, 1–4 cm. long, glabrous or nearly so, shining; racemes lax; calyx-tube about 3 mm. long; teeth lanceolate, 1–2 mm. long; corolla about 15 mm. long; loment glabrous; internodes 2 or 3, 8–15 mm. long, 6–8 mm. wide, wing-margined; nodes 2.5–4 mm. wide. *H. flavescens* Coult. & Fish. Open woods and copses: Alta.—Wyo.—Ida.—B.C. *Submont.*—*Mont.* Je-Jl.

2. **H. americanum** (Michx.) Britton. Stem 2-7.5 dm. high, glabrous or nearly so; leaflets 11-21, oblong, 1.5-3 cm. long, rounded at both ends, glabrous above, sparingly hairy beneath; raceme lax; calyx-tube 2 mm. long; teeth triangular, 1-2 mm. long; corolla violet, rarely white, 12-18 mm. long; loment glabrous or nearly so; internodes 3-5, about 5 mm. wide. *H. alpinum americanum* Michx. *H. philoscia* A. Nels., a white-flowered form. Rocky places and open woods: Lab.—Vt.—S.D.—Wyo.—Alaska. *Boreal*—Mont. Je—Au.

3. **H. boreale** Nutt. Stem 3-7 dm. high, strigose especially above; leaflets oblong or lanceolate, rounded to acute at the apex, 1.5-3 cm. long, glabrous above, sparingly pubescent or glabrate beneath; racemes lax; calyx-tube 2 mm. long; teeth triangular, 1-1.5 mm. long; corolla violet or reddish purple to nearly white; loment finely strigose; internodes 2-4, 6-8 mm. long, 5-6 mm. wide. Banks and thickets: Sask.—S.D.—Wyo.—Mack. *Boreal*—Mont. Jl—Au.

4. **H. lancifolium** Rydb. Stem 5 dm. high or more, sparingly strigose; leaflets 13-21, lanceolate, acute, about 3 cm. long, 8 mm. wide, slightly strigose or glabrate; raceme lax; calyx strigose; tube about 3 mm. long; lower teeth 2.5 mm. long, the upper shorter; corolla about 15 mm. long, rose-purple; loment somewhat strigose; internodes 2-4, broadly oval, 12-15 mm. long, 8 mm. wide. Mountain woods: Mont.—Alta. *Mont.* Jl.

5. **H. marginatum** Greene. Stem 6-10 dm. high, minutely strigose; leaflets 11-23, from oblong to oval or ovate, obtuse to emarginate, 1-3 cm. long, minutely appressed-pubescent on both sides or glabrate above; racemes rather short; calyx-tube 3 mm. long; upper teeth triangular, 1 mm. long, the lowest lanceolate, 2 mm. long; corolla rose-purple; loment strigose; internodes 2-5, 8-15 mm. long, 6-8 mm. wide. *H. uintahense* A. Nels. Draws and copses: Wyo.—Colo. *Mont.* Je—Jl.

6. **H. Mackenzii** Richards. Stem 2-4 dm. high, strigose above; leaflets 7-15, elliptic, 1-2.5 cm. long, finely grayish strigose beneath, glabrate above; raceme short; calyx-tube 3 mm. long; teeth 4-5 mm. long; corolla 18-20 mm. long, rose-purple; loment minutely strigose; internodes 5-7 mm. long, about 5 mm. wide. Meadows: N. W. Terr.—Alta.—Yukon. *Boreal*—Subarct. Je.

7. **H. utahense** Rydb. Stem 4-6 dm. high, finely strigose; leaflets 11-17, elliptic, oval, or oblong, usually rounded at both ends, 1-3 cm. long, glabrous above, finely cinereous-strigose beneath; calyx-tube nearly 3 mm. long; teeth 5 mm. long, attenuate; corolla rose-purple, 15-18 mm. long; loment minutely strigose; internodes 6-8 mm. long, 5-6 mm. wide. Hills among bushes: Utah—Ida. *Submont.*—Mont. My—Jl.

8. **H. pabulare** A. Nels. Stems 4-7 dm. high, finely strigose; leaflets 9-15, oblong or elliptic, 1-2 cm. long, glabrous above, cinereous-strigose beneath; calyx-tube about 2 mm. long; teeth 3-4 mm. long; loment minutely puberulent; internodes 5-7 mm. long, 5-6 mm. wide. Copses, cañons, and among sage-brush: Mont.—N.M.—Utah. *Submont.* My—Jl.

9. **H. carnosulum** Greene. Stems flexuose, 2-4 dm. high; leaflets 9-11, pale green, thick, linear-oblong to elliptic, 6-15 mm. long, glabrous above, cinereous-strigose beneath; raceme lax; calyx-tube 2 mm. long; teeth 2-3 mm. long; loment minutely strigose; internodes 7-8 mm. long, 5-6 mm. wide. Dry hills: Colo.—Utah—N.M. *Submont.* Je—Jl.

10. **H. cinerascens** Rydb. Stems 3-5 dm. high, strigose-canescens or glabrate below; leaflets 9-15, oblong or elliptic, 1-2 cm. long, silvery canescens-strigose on both sides; calyx-tube about 3 mm. long; teeth 5 mm. long; corolla reddish-purple, about 15 mm. long; loment strigose; internodes 3-4, 6-8 mm. long, about 6 mm. wide. *H. canescens* Nutt., not L. Dry hills: Sask.—N.D.—Wyo.—Utah—Ida.—Alta. *Submont.* Je—Jl.

40. ONOBRÏCHIS Scop. SAND-FOIN.

Herbs or undershrubs. Leaves odd-pinnate, without stipels. Flowers perfect, in spikes or racemes. Calyx-tube campanulate; teeth subulate, subequal, the lower smaller. Banner obcordate or obovate, sessile; wings shorter;

keel equalling the banner. Stamens partly diadelphous, *i. e.*, the tenth stamen united with the rest at the middle, but free at the base. Legume flat, 1-2-seeded, half-round, or spirally coiled, not jointed, pectinately prickly.

1. *O. Onobrychis* (L.) Rydb. Perennial herb; stem erect, 3-5 dm. high; leaflets 11-23, elliptic; calyx-lobes subulate, subequal; corolla rose-colored, striate; wings about half as long as the banner; legume brown, obliquely semi-orbicular, keeled above, the lower suture and apex with short broad prickly-points. *O. sativa* Lam. Cultivated and occasionally escaped: Mont.—Colo.—Utah—Ida.

41. **MEIBOMIA** Heister. TICK-TREFOIL, BEGGAR'S TICKS.

Herbs (all ours), shrubs or vines. Leaves alternate, pinnately 3-foliolate, rarely 1- or 5-foliolate; leaflets stipellate. Flowers perfect, in racemes or panicles. Calyx with bractlets at the base, campanulate; lobes unequal, the two upper ones more or less united. Corolla in ours reddish purple; banner more or less clawed; wings oblique, more or less coherent with the keel. Stamens monadelphous or partly diadelphous; anthers alike. Pod divided transversely into several indehiscent internodes, flat, in ours retrorsely hispid. [*Desmodium* Desv.]

Leaflets neither coriaceous nor strongly reticulate beneath.
Leaflets coriaceous, strongly reticulate beneath.

1. *M. canadensis*.
2. *M. illinoensis*.

1. *M. canadensis* (L.) Kuntze. Stem erect, 5-20 dm. high, pubescent; leaflets elliptic or oblong-lanceolate, appressed-pubescent and paler beneath, hispidulous or glabrate above; flowers paniculate, 11-17 mm. long, purple; loments about 2.5 cm. long; internodes 3-5, somewhat triangular, straight or nearly so on the upper suture, uncinately pubescent. *Desmodium canadense* (L.) DC. Thickets and river banks: N.B.—N.C.—Okla.—(Black Hills) S.D.—Man. Plain—Submont. JI-S.

2. *M. illinoensis* (A. Gray) Kuntze. Stem 5-12 dm. high, uncinately pubescent; leaflets lanceolate or ovate-lanceolate, hispidulous above, cinereous beneath, 2.5-9 cm. long; flowers paniculate, 6-9 mm. long, purple; loments 1-2.5 cm. long; internodes 3-6, oval or orbicular, densely uncinately. *D. illinoense* A. Gray. Prairies: Ill.—Kans.—S.D. Plain. Je-S.

42. **VÍCIA** L. VETCH, WILD PEA.

Perennial or annual herbaceous vines. Leaves alternate, abruptly pinnate, usually with tendrils or these represented by a tip. Flowers axillary, racemose or sessile. Calyx somewhat oblique and gibbous at the base, the upper two teeth shorter. Banner obovate or oblong, emarginate; wings obliquely oblong, adherent to the curved keel. Stamens diadelphous (9 and 1); tube oblique at the summit; anthers all alike. Style slender, with a tuft or ring of hairs at the summit. Pod flat, dehiscent, 2-valved, few- or several-seeded.

Racemes 3-40-flowered; flowers 1-2.5 cm. long.

Racemes one-sided, dense, 15-40-flowered.

Racemes lax, 3-10-flowered.

Leaflets linear to oblong; stipules usually narrow, semi-sagittate and often entire.

Leaves decidedly pubescent, rather thick and strongly veined.

Stem low; leaflets linear to oblong.

Stem tall; leaflets oblong or elliptic, only those of the lower leaves sometimes linear.

Leaves glabrous or slightly pubescent when young.

Leaflets elongate, narrowly linear; plant low and erect.

Leaflets, at least the upper ones, oblong or linear-oblong; plant tall and climbing.

Leaflets broad; stipules broadly semi-sagittate or semi-orbicular in outline, sharply toothed.

Leaflets usually oval, thin and not strongly veined, mostly entire and acute or rounded at the apex.

Leaflets obovate-cuneate, firmer and more strongly veined, truncate and toothed at the apex.

Racemes 1-2-flowered.

Flowers 1-1.8 cm. long, subsessile in the axils; annual.

Flowers 6-8 mm. long, on a distinct peduncle; perennial.

1. *V. cracca*.

2. *V. trifida*.

3. *V. oregana*.

4. *V. sparsifolia*.

5. *V. dissitifolia*.

6. *V. americana*.

7. *V. pumila*.

8. *V. angustifolia*.

9. *V. producta*.

1. **V. cracca** L. Stem weak, 3-12 dm. high; stipules narrowly semi-sagittate, entire; leaflets 18-24, thin, linear or linear-oblong, mucronate, 1.5-2 cm. long, finely pubescent; corolla bluish purple, 11-13 mm. long; pod 1.8-2.5 cm. long. Dry soil: Newf.—N.J.—Kans.—Ida.—B.C.; nat. from Eu. Je-Au.

2. **V. trifida** Dietr. Stem low, 1-4 dm. high, more or less pubescent when young; stipules broadly semi-sagittate, often toothed; leaflets 8-12, linear or narrowly oblong, acute at both ends or truncate at the apex, mucronate or cuspidate, dark green; racemes 3-6-flowered; corolla bluish purple, 15-18 mm. long; pod 2 cm. long, puberulent or glabrate. *V. tridentata* Schwein. *V. caespitosa* A. Nels., a depauperate form. *V. callianthemum* Greene. Wet meadows: w Ont.—Kans.—Tex.—Nev.—B.C. Plain—Mont. My-Au.

3. **V. oregana** Nutt. Stem 3-8 dm. high, somewhat pubescent when young, or glabrate, angled; stipules usually narrowly semi-sagittate, mostly toothed; leaflets 8-12, elliptic or those of the lower leaves linear, often truncate and somewhat toothed at the apex, 1-2.5 cm. long, dark green, appressed-pubescent, at least below; raceme 3-8-flowered; corolla pink-purple or bluish purple, 15-20 mm. long; pod about 3 cm. long. *V. vexillaris* Greene. Meadows: Sask.—N.M.—Calif.—B.C. Plain—Mont. My-Au.

4. **V. sparsifolia** Nutt. Stem low, 2-5 dm. high, glabrous; leaflets 8-12, narrowly linear, firm, strongly veined, acute at both ends, mucronate, glabrous or nearly so, 2-4 cm. long, 1-3 mm. wide; raceme 2-6-flowered; corolla bluish purple, about 18 mm. long; pod 3 cm. long, 6-7 mm. broad. *V. linearis* (Nutt) Greene. Prairies and plains: Man.—Okla.—N.M.—Calif.—B.C. Plain—Mont. My-Au.

5. **V. dissitifolia** (Nutt.) Rydb. Stem tall, slender, 3-7 dm. high, glabrous; leaflets 8-12, linear or narrowly oblong, 1.5-5 cm. long, 2-5 mm. wide, rather thin, not strongly veined, acute at both ends, mucronate; raceme 3-6-flowered; corolla violet-purple, 15-18 mm. long. *Lathyrus dissitifolius* Nutt. Confused with and grading into *V. oregana*. Valleys: w Neb.—Colo.—Utah. Plain—Mont. Je-Au.

6. **V. americana** Muhl. Stem glabrous or nearly so, 3-10 dm. high; leaflets 8-12, oval or elliptic, or those of the lower leaves linear-oblong, thin, glabrous, usually rounded at both ends or retuse at the apex, mucronate, 1.5-3.5 cm. long, not strongly veined; racemes shorter than the leaves, 3-9-flowered; corolla bluish purple, 15-20 mm. long; pod glabrous, 2.5-3 cm. long. Meadows: N.B.—Va.—Ariz.—B.C. Plain—Mont. My-Au.

7. **V. pumila** Heller. Stem low, 2-4 dm. high, ascending, sparingly pubescent; leaflets 6-14, 10-15 mm. long, 4-6 mm. wide, truncate, cuspidate, and sometimes toothed at the apex, appressed-pubescent on both sides, prominently veined; racemes 3-6-flowered; corolla violet-purple, 15-18 mm. long. *V. californica* Rydb., not Greene. Valleys and river banks: Colo.—Calif.—B.C. Submont. Je-Au.

8. **V. angustifolia** (L.) Reichenb. Annual; stem glabrous, 3-5 dm. high; leaflets 5-11, those of the lower leaves oblong, truncate, those of the upper linear, mucronate, 1.5-3 cm. long; corolla purple or rose-colored; pod 4-5.5 cm. long, 5-7 mm. wide. Fields, meadows, and waste places: Ida.; also in the East; nat. from Eu.

9. **V. producta** Rydb. Stems slender, decumbent or ascending, 2-3 dm. high; stipules narrow, semi-hastate, entire; leaflets 7-11, oblong to linear, 5-15 mm. long, obtuse, mucronate; peduncles 2-4 cm. long, produced beyond the upper flowers; corolla yellowish white, tipped and tinged with purple. *V. Thurberi* S. Wats., in part. Among bushes: Colo.—N.M.—Ariz.—Utah. Submont. My-Je.

43. LATHYRUS (Tourn.) L. VETCHLING.

Herbaceous vines, rarely erect herbs, mostly perennials, with horizontal rootstocks. Leaves alternate, abruptly pinnate, the rachis usually tendrill-bearing at the apex, or the tendril represented by a tip or an appendage. Flowers

racemose (raceme sometimes 1-flowered), perfect. Calyx obliquely campanulate, gibbous at the base, its teeth nearly equal, or the upper shorter. Banner obovate, emarginate, clawed; wings obliquely oblong, adherent to the shorter curved keel. Stamens diadelphous (9 and 1), monadelphous below; tube usually truncate at the apex. Style curved, flattened, hairy along its inner side. Legumes linear, more or less flattened, dehiscent, 2-valved. Seeds usually several.

Corolla purple.

Stem winged; leaflets linear, lanceolate, or oblong; flowers about 15 mm. long.

1. *L. palustris*.

Stem wingless.

Racemes 1-flowered.

11. *L. Torreyi*.

Racemes several- to many-flowered.

Tendrils much reduced; stem mostly erect.

Leaflets 1 or 2 pairs; flowers 8–10 mm. long.

Leaflets narrowly linear.

2. *L. Sandbergi*.

Leaflets oval or oblong.

3. *L. bijugatus*.

Leaflets 3 or 6 pairs; flowers 20–25 mm. long.

Plant glabrous or nearly so.

4. *L. ornatus*.

Plant decidedly villous-pubescent.

5. *L. incanus*.

Tendrils usually well developed; plant more or less climbing.

Corolla less than 18 mm. long.

Leaflets linear to oblong-elliptic, thick, veiny.

6. *L. coreaceus*.

Leaflets oblong-elliptic.

7. *L. graminifolius*.

Leaflets linear.

Leaflets broadly oval or ovate.

Tendrils usually 3-cleft; leaflets moderately firm, strongly veined.

Stipules large, often half as long as the small, 1–3 cm. long leaf-

8. *L. Schaffneri*.

lets. Stipules very small in comparison with the large 2–7 cm. long

9. *L. venosus*.

leaflets. Tendrils simple; leaflets not strongly veined.

10. *L. Nuttallii*.

Corolla 2 cm. long or more.

Stipules large and broad, about half as long as the leaflets.

Leaflets not linear.

Leaflets rounded-oval, obtuse or rounded and mucronate at the apex.

12. *L. utahensis*.

Leaflets elliptic, acute at both ends, cuspidate at the apex.

13. *L. pauciflorus*.

Leaflets narrowly linear.

14. *L. tenuior*.

Stipules narrow, less than half as long as the leaflets.

15. *L. decaphyllum*.

Leaflets elliptic to oval.

16. *L. brachycalyx*.

Leaflets linear-oblong or oblanceolate.

Corolla white or yellowish.

Tendrils well developed.

Stipules large and broad, often half as long as the leaflets; corolla about 15 mm. long.

17. *L. ochroleucus*.

Stipules smaller, much less than half as long as the leaflets; corolla about 20 mm. long.

18. *L. laetivirens*.

Tendrils reduced; stipules narrow and small.

Corolla about 15–20 mm. long.

Leaflets ovate or oval or obovate.

19. *L. obovatus*.

Leaflets linear or lance-linear.

4. *L. ornatus*.

Corolla 10–15 mm. long.

Leaflets oval.

20. *L. leucanthus*.

Leaflets linear.

21. *L. arizonicus*.

1. ***L. palustris*** L. Stem glabrous or nearly so, 3–6 dm. high; leaflets 2–4 pairs, 2.5–6 cm. long; tendrils usually branched; inflorescence 7–15 cm. long, 2–6-flowered; corolla purple, 12–15 mm. long; pod linear, 4–5 cm. long. Wet places: Lab.—N.Y.—S.D.—Ore.—Alaska; Eurasia. *Plain—Submont.* My—Au.

2. ***L. Sandbergi*** (White) Howell. Stem 2–3 dm. high, angled, glabrous, erect; leaflets 5–10 cm. long, 2–4 mm. wide, glabrous; inflorescence 2–5 mm. long, 1–3-flowered; corolla purplish, about 1 cm. long, *L. bijugatus Sandbergi* White. Hillsides and copses: Ida.—Wash. *Submont.* My—Je.

3. ***L. bijugatus*** White. Stem erect or decumbent at the base, 2–3 dm. high, glabrous; leaflets thin, 2–5 cm. long, 6–12 mm. wide, mucronate; inflorescence 2–5 cm. long, 1–2-flowered; corolla purplish, 8–10 mm. long; pod 6-seeded. Hillsides and rocky ground: Mont.—Ida.—Wash. *Submont.* Je.

4. ***L. ornatus*** Nutt. Stem erect, glabrous or nearly so, 2–4 dm. high; leaflets linear or lance-linear, 1.5–4 cm. long, 3–5 mm. wide, glabrous; peduncles

about 5 cm. long; raceme 3-5-flowered; corolla purple or rarely yellowish, 2-2.5 cm. long; pod 4-5 cm. long. Plains and prairies: S.D.—Okla.—Colo.—Wyo. *Plain—Submont.* My-Jl.

5. ***L. incanus*** (Smith & Rydb.) Rydb. Stem erect, 1-3 dm. high, more or less densely villous with short hairs; leaflets 3-4 pairs, linear or linear-oblong, 1-4 cm. long, 3-5 mm. wide, usually densely villous with short hairs; corolla as in the preceding; pod 3-4 cm. long. *L. ornatus incanus* Smith & Rydb. Dry sandy plains: Neb.—Colo.—Wyo. *Plain—Submont.* My-Jl.

6. ***L. coreaceus*** White. Stem flexuose, quadrangular, 2-6 dm. high, glabrous; leaflets 3-6 pairs, thick and coriaceous, strongly venulose, elliptic to linear-lanceolate, 3-6 cm. long, 6-15 mm. wide; tendrils branched, but usually short; inflorescence 1 dm. long or less, 3-10-flowered; corolla 10-15 mm. long, purple or nearly white. Open woodlands, in the mountains: Utah—Ore.—Nev. *Submont.—Mont.* Je-Jl.

7. ***L. graminifolius*** (S. Wats.) White. Stem erect, 3-6 dm. high, nearly terete, glabrous; leaflets 1-3 pairs, narrowly linear, 5-10 cm. long, 1-3 mm. wide; glabrous, firm; tendrils of the lower leaves reduced, of the upper ones branched; raceme 2-4-flowered; corolla about 1 cm. long; pod linear, 4-6 cm. long. Hillsides: N.M.—Utah—Ariz. *Submont.* My-S.

8. ***L. Schaffneri*** Rydb. Stem angled, glabrous, erect or decumbent, 3-6 dm. long; leaflets 4-6 pairs, oval or rhombic-oval, or elliptic, 1-3 cm. long, thick and veiny; peduncles 5-10 cm. long; raceme 6-12-flowered; corolla purple, 12-18 mm. long; pod 3-4 cm. long, glabrous. *L. parviflorus* S. Wats. Meadows: s Utah—Calif.—Mex. *Son.* Je-S.

9. ***L. venosus*** Muhl. Stem 6-10 dm. high, erect, usually finely villous, 4-angled; leaflets 4-7 pairs, oval, often very veiny, glabrous above, finely pubescent beneath; peduncles 5-10 cm. long; raceme short and dense, 12-16-flowered; corolla purple, 12-15 mm. long; pod 4-5 cm. long, glabrous. River banks and wet places: Ont.—Ga.—La.—Kans.—Mont.—Sask. *Plain—Submont.* My-Jl.

10. ***L. Nuttallii*** S. Wats. Stem 3-6 dm. high, more or less villous-pubescent, angled; leaflets 3-6 pairs, elliptic or oval, acutish, 2-4 cm. long, 1-2 cm. wide, nearly glabrous above, more or less villous beneath; peduncles 3-6 cm. long; raceme 3-6-flowered, short; corolla purple, 12-16 mm. long; pod glabrous, 2.5-4 cm. long. Woods and meadows: Calif.—Ida.—B.C. *Submont.* Ap-Jl.

11. ***L. Torreyi*** S. Wats. Stem decumbent, branched from the base, pubescent, 1-3 dm. high; leaflets 4-6 pairs, broadly oval, 5-15 mm. long, mucronate, villous-pubescent on both sides; tendrils reduced to short tips; corolla about 1 cm. long, blue with white keel; pod oblong, 2.5-3 cm. long. Woods: Wash.—Calif.—Ida. Ap-Jl.

12. ***L. utahensis*** M. E. Jones. Stem angled, glabrous, about 1 m. high or more; leaflets 4-6 pairs, broadly oval, 2-5 cm. long, 1-3 cm. wide, firm and veiny, glabrous; peduncles 5-15 cm. long; racemes 3-8-flowered; corolla purple, rarely white, about 2 cm. long; pod glabrous, 5-6 cm. long. *L. Bradfieldianus* A. Nels. Woods: Ida.—Utah—Colo. *Submont.* My-Jl.

13. ***L. pauciflorus*** Fernald. Stem glabrous, 4-6 dm. high or more, angled; leaflets 3-6 pairs, thick, veiny, elliptic, acute and cuspidate, 1-4 cm. long; peduncles 5-10 cm. long; raceme 2-5-flowered; corolla about 2 cm. long; pod 5-6 cm. long. Hillsides: Wash.—Ida.—Ore. *Son.—Submont.* Ap-Je.

14. ***L. tenuior*** (Piper) Rydb. Stem flexuose, 3-6 dm. high, glabrous, angled; leaflets 3-5 pairs, narrowly linear, 3-7 cm. long, 4-10 mm. wide, glabrous or nearly so; peduncles 5-10 mm. long; raceme short, 2-5-flowered; corolla purple, about 2 cm. long; pod glabrous, about 4 cm. long. *L. pauciflorus tenuior* Piper. Hillsides: Ore.—Ida.—Wash. *Son.—Submont.* Je.

15. ***L. decaphyllus*** Pursh. Stem erect, 2-5 dm. high, angled; leaflets 2-5 pairs, thick and veiny, elliptic or lance-oblong, acute, somewhat glaucous, glabrous, or finely pubescent beneath; stipules of the lower leaves reduced; peduncles

5-10 cm. long; racemes short, 3-5-flowered; corolla purple, 2.5-3 cm. long; pod 4-5 cm. long. Plains and prairies: Neb.—N.M.—Ariz. *Plain—Submont.* My-Jl.

16. *L. brachycalyx* Rydb. Stem simple or slightly branched, 1.5-3 dm. high, usually finely pubescent, sharply 4-angled; leaflets 2-5 pairs, linear-oblong or oblanceolate, firm, strongly veined, finely pubescent, 1-3 cm. long, 2-8 mm. wide; tendrils of the lower leaves reduced to mere tips; peduncles 5-10 cm. long; raceme short, 2-6-flowered; corolla purple, 2-2.5 cm. long; pod glabrous, 3-4 cm. long. Mountains: Utah. *Submont.—Mont.* Je—Au.

17. *L. ochroleucus* Hook. Stem 4-10 dm. high, terete, glabrous; leaflets 3-4 pairs, broadly oval or ovate, 2-5 cm. long, thin, glabrous, somewhat glaucous beneath; peduncles 2-5 cm. long; racemes 5-10-flowered; corolla ochroleucous, about 15 mm. long; pod about 4 cm. long, glabrous. Woods and river banks: Hudson Bay—Que.—N.J.—Wyo.—B.C.—Mack. *Plain—Submont.* My—Au.

18. *L. laetivirens* Greene. Stem branched, climbing, 4-6 dm. high; leaflets 3-5 pairs, oval or ovate, obtuse and mucronate, light green and glabrous, 2-5 cm. long, 1-2.5 cm. wide; peduncles about 5 cm. long; raceme short, 3-6-flowered; corolla ochroleucous, about 2 cm. long; pod about 4 cm. long. Mountains: Colo. *Submont.—Mont.* Je.

19. *L. obovatus* (Torr.) White. Stem finely pubescent or glabrous, 2-4 dm. high; leaflets 2-4 pairs, ovate or oval, 2-5 cm. long, obtuse or acute, thin; corolla white or nearly so, 15-20 mm. long; pod about 4 cm. long. *L. nevadensis* S. Wats., in part. Mountains: Wash.—Ida.—Calif. *Son.* My—Je.

20. *L. leucanthus* Rydb. Stem about 3 dm. high, angled, glabrous; leaflets 2-4 pairs, elliptic, veiny, glaucous, acute, mucronate, 1-3 cm. long, 3-10 mm. wide; inflorescence short, in the axils of the middle leaves, 3-4 cm. long, 2-4-flowered; corolla white, about 15 mm. long. Open woods: Wyo.—N.M. *Mont.* My—Jl.

21. *L. arizonicus* Britton. Stem 2-4 dm. high, glabrous; leaflets usually 2 pairs, glabrous or nearly so, narrowly linear, 3-8 cm. long, 2-10 mm. wide; peduncles 2-4 cm. long; racemes 2-3-flowered; corolla white, 10-15 mm. long. Open woods: Colo.—N.M.—Ariz. *Mont.—Subalp.* My—Jl.

44. *ÄPIOS* Moench. GROUND-NUT.

Twining vines, with large tuberous roots. Leaves alternate, pinnate, with small stipules. Flowers perfect, in racemes. Upper two calyx-teeth united, the lateral ones very small, and the lowest one longer. Corolla red, purple, or brown; banner reflexed; keel elongate, spirally twisted. Stamens diadelphous. Style glabrous. Pod elongate, curved, flattened.

1. *A. Apios* (L.) MacMill. Stem 3-20 dm. long; leaflets 5-9, ovate to lanceolate, 3-10 cm. long, acute or acuminate; calyx-tube 2-4 mm. long; corolla brownish purple; banner with a broad blade, about 1 cm. long; pod linear, 6-12 cm. long. *A. tuberosa* Moench. Thickets: N.B.—Fla.—Tex.—Colo.—Minn. *Plain—Submont.*

45. *STROPHOSTYLES* Ell. WILD BEAN.

Herbaceous vines, twining or trailing. Leaves alternate, pinnately 3-foliolate, with stipules. Flowers perfect, in dense clusters on long axillary peduncles. Calyx subequally 5-toothed, or the upper two teeth partially united. Corolla white or purplish; banner with a broad blade; keel curved. Stamens diadelphous. Style bearded, bent. Pod narrow, flat, straight or nearly so. Seeds truncate.

1. *S. pauciflora* (Benth.) S. Wats. Annual; stem 3-10 dm. long; leaflets linear to lanceolate, 1.5-3.5 cm. long, rarely sinuately lobed; peduncles longer than the leaves; calyx 1.5 mm. long; lobes subequal; corolla pale purple; pod 2-3 cm. long, strigose. *Phaseolus pauciflorus* Benth. River banks: Minn.—Ind.—La.—Tex.—Colo. *Plain.*

FAMILY 66. **GERANIACEAE.** GERANIUM FAMILY.

Herbs, with opposite leaves with stipules; blades in ours palmately lobed or divided. Flowers perfect, regular, cymose, or subumbellate. Sepals 5, imbricate. Petals 5, deciduous. Stamens 10, rarely 5; filaments monadelphous. Gynoecium of 5 carpels, the styles of which are adnate to an elongate central column, from which they separate at maturity. Carpels 2-ovuled, but 1-seeded.

Carpels rounded, their tails (styles) glabrous within, merely recoiling at maturity; leaves in ours palmately veined and lobed. 1. GERANIUM.
Carpels spindle-shaped, their tails (styles) pubescent within, spirally coiled at maturity; leaf-blades in ours pinnately veined, pinnately lobed or dissected. 2. ERODIUM.

1. GERANIUM (Tourn.) L. CRANEBILL, WILD GERANIUM.

Annual or perennial herbs, with opposite leaves. Leaf-blades palmately lobed or parted. Flowers cymose, perfect, regular. Sepals 5, usually awn-tipped. Petals 5, often pubescent near the base, not clawed. Stamens 10, rarely only 5; filaments ciliate at the base, more or less united, monadelphous. Style column usually beaked, the styles glabrous within, recoiled but not spirally twisted, when freed from the axis. Carpels turgid, permanently attached to the styles. Seeds smooth, reticulate or pitted.

Petals 2-7 mm. long, at most slightly exceeding the calyx; plants annual or biennial, or sometimes perennial in *G. thermale*.

Sepals not bristle-tipped; seeds smooth.

Carpels wrinkled; stamens 10.

Carpels finely pubescent; stamens 5.

Sepals awn-tipped; seeds reticulate or pitted.

Awn-tips less than 1 mm. long.

Seeds reticulate; pedicels slightly hirsute, not glandular. 3. *G. thermale*.

Seeds pitted; pedicels glandular-pubescent. 4. *G. rotundifolium*.

Awn-tips 1-2 mm. long.

Beak and branches of the style less than 3 mm. long. 5. *G. carolinianum*.

Beak and branches of the style more than 4 mm. long; inflorescence open. 6. *G. Bicknellii*.

Petals 1-3 cm. long; plants perennial, with rootstocks or caudices; seed reticulate.

Petals white; style-column and carpels glandular.

Leaf-blades thin, sparingly hirsute beneath; upper petioles retrorsely hirsute or glabrous; sepals slightly if at all glandular. 7. *G. Richardsonii*.

Leaf-blades thick, strigillose beneath; upper petioles canescent; sepals densely glandular-pubescent.

Leaf-blades with long lanceolate lobes; veins of the petals very strong.

8. *G. nervosum*.

Leaf-blades with short ovate lobes; veins of the petals rather weak.

17. *G. Cowenii*.

Petals purple or rose.

Plants with simple rootstocks or caudices; stem erect and simple below; style-column glandular-pubescent.

Stem and petioles glandular-viscid; petals strongly veined.

9. *G. viscosissimum*.

Stem and petioles retrorsely hairy, not glandular-viscid.

Petioles of the upper leaves minutely puberulent; petals strongly veined.

10. *G. strigosum*.

Petioles of the upper leaves with long hairs; petals faintly veined.

Stem nearly glabrous, sparingly hirsute; leaves short-strigose; inflorescence open.

11. *G. incisum*.

Stem and leaves densely hairy; inflorescence congested.

12. *G. canum*.

Plants with caespitously branched caudices; stems usually diffusely branched.

Petals obcordate to broadly obovate, light purple, with darker veins.

Stem glandular-villous with long spreading hairs.

Divisions of the leaves much longer than broad, with ovate or lanceolate, acute teeth. 13. *G. Parryi*.

Divisions of the leaves about as broad as long, with broadly ovate, abruptly short-acuminate teeth. 14. *G. Pattersonii*.

Stem, petioles, and calyx with short grayish pubescence.

Pedicels and style-column densely glandular-pubescent.

Leaves with broadly ovate teeth; petals distinctly emarginate.

15. *G. Fremontii*.

Leaves with lanceolate or lance-ovate teeth; petals scarcely emarginate. 16. *G. caespitosum*.

Pedicels not glandular-pubescent; style-column rarely so.

Basal leaves 4-6 cm. broad; middle division broadly spatulate, 3-lobed; lobes notched; sepals over 1 cm. long.

17. *G. Covenii*.

Basal leaves 2-3 cm. broad; middle division cuneate, 3-toothed at the apex; sepals less than 1 cm. long.

18. *G. marginale*.

Petals narrowly obovate or oblong, dark purple.

19. *G. atropurpureum*.

1. *G. molle* L. Stem spreading or decumbent, branched, 1-5 dm. long, finely pubescent; leaf-blades reniform or rounded-reniform, 2-6 cm. broad, the lower 6-9-cleft, the upper 3-5-cleft or parted, the divisions toothed or lobed at the apex; sepals elliptic or ovate, 3-4 mm. long; petals deep-purple, obovate, truncate or emarginate; style-column short-beaked. Waste places and around dwellings: Me.—B.C.—Calif.—N.C.; nat. from Eu. My-Jl.

2. *G. pusillum* Burm. Stem decumbent or prostrate, branched, 1-5.5 dm. long, puberulent; leaf-blades reniform, 1.5-5 cm. broad, 5-7-parted, the divisions toothed or lobed at the apex; sepals elliptic, 2.5-4 mm. long; petals violet, often pale, cuneate, notched; style-column short-beaked. Waste places: Ont.—B.C.—Utah—Va.; nat. from Eu. Plain. My-Au.

3. *G. thermale* Rydb. Stem branched at the base, with diffusely spreading branches 1-1.5 dm. long, puberulent and finely pubescent; leaf-blades 1-2 cm. broad, mainly 3-parted, the divisions more or less deeply lobed; sepals broadly ovate or oval, about 0.5 mm. long; petals rose-purple, hardly as long as the sepals; carpels villous-hirsute and puberulent. Around warm springs: Lo-Lo Hot Springs, Mont. Submont.

4. *G. rotundifolium* L. Stems decumbent, branched, 1-6 dm. long, softly pubescent with gland-tipped hairs; leaf-blades rounded-reniform in outline, 1.5-4 cm. broad, cleft to about the middle; divisions 3-5-toothed at the apex; sepals 4-5.5 mm. long, oblong or elliptic; tips minute; petals purple, longer than the sepals; style-column 12-15 mm. long, minutely glandular; carpels glandular-pubescent. Waste places: N.Y.—Mich.—Colo.; adv. from Eu. Plain—Submont. Mr-S.

5. *G. carolinianum* L. Stem branched above, more or less glandular-pubescent; leaf-blades 3-6 cm. broad, reniform in outline; divisions cleft or parted, with oblong or linear-oblong lobes; inflorescence congested; sepals ovate, with long awn-tips; petals pink or whitish; style-column with spreading glandular hairs; carpels pilose; seeds reticulate. Meadows and waste places: Newf.—Alaska—Calif.—Fla.; Mex. and W. Ind. Plain—Submont. Ap-Jl.

6. *G. Bicknellii* Britton. Stem with ascending branches and loose spreading hairs; leaf-blades pentagonal or the lower rounded, 2-7 cm. broad, the division incised or cleft into oblong or lanceolate segments; petioles, peduncles, and pedicels glandular-pubescent; sepals lanceolate or oblong-lanceolate; petals rose-purple, about as long as the sepals; style-column glandular-hirsute; carpels sparingly hirsute. *G. carolinianum longipes* S. Wats. *G. longipes* Goodding. Meadows: N.S.—N.Y.—Utah—Wash.—B.C.—Yukon. Plain—Submont. My-Au.

7. *G. Richardsonii* Fisch. & Trautv. Stems erect, 4-9 dm. high, pubescent with spreading hairs or glabrous; leaf-blades thin, pentagonal in outline, 3-5 parted, the divisions incised or toothed; pedicels glandular-pubescent; sepals awn-tipped, 8.5-11.5 mm. long, elliptic, pubescent and sometimes glandular-ciliate; petals white, 12-20 mm. long; style-column 19-23 mm. long. *G. albidiflorum* Hook. *G. gracilentum* Greene. Mountain valleys: Sask.—S.D.—N.M.—Calif.—B.C. Mont.—Submont. My-Au.

8. *G. nervosum* Rydb. Stems 4-8 dm. high, minutely retrorsely strigose, in age more glabrate; leaf-blades reniform in outline, 8-12 cm. in diameter, divided to near the base into 5-7 obovate-cuneate or oblanceolate-cuneate 2-3-cleft and coarsely toothed divisions; sepals oval, 8-9 mm. long, awn-tipped; petals broadly obovate, 15-18 mm. long, pale violet or almost white, with dark purple streaks; column nearly 2 cm. long. Mountains: Wyo.—Colo.—Ore. Mont.—Submont. Jl.

9. *G. viscosissimum* F. & M. Stem 2.5–6 dm. high; leaf-blades pentagonal in outline, 4–11 cm. wide, hirsute, 3–5-parted, the divisions sharply and irregularly incised; sepals 12–15 mm. long, oblong-lanceolate, finely hirsute, awn-tipped; petals pink-purple, 17–20 mm. long; carpels glandular-pilose. Woods and among bushes: S.D.—Colo.—Calif.—B.C. *Mont.*—*Submont.* My-S.

10. *G. strigosum* Rydb. Stem 4–8 dm. high; leaf-blades reniform in outline, 5–12 cm. in diameter, finely strigose on both sides, deeply 3–7-cleft; divisions rhombic in outline, 3-cleft and toothed; sepals densely glandular, oval, about 8 mm. long; bristle-tipped; petals broadly obovate, rose or light violet; carpels glandular-hirsute. Woods: Sask.—Colo.—Nev.—Wash. *Mont.*—*Submont.* My-Au.

11. *G. incisum* Nutt. Stem 3–9 dm. high; leaf-blades pentagonal in outline, 6–15 cm. broad, 5-parted, the divisions cleft and coarsely toothed; pedicels glandular-hirsute; sepals awn-tipped, 11–12 mm. long, lanceolate, short-hirsute; petals purple, 15–23 mm. long; carpels 5 mm. long, sparingly pubescent. *G. oreganum* Howell. Mountain valleys: B.C.—Mont.—n Calif. *Submont.* My-Au.

12. *G. canum* Rydb. Stem 3–7 dm. high; leaf-blades suborbicular in outline, 6–12 cm. wide, densely hoary, 3–5-parted, the divisions sharply incised; pedicels glandular-hirsute; sepals awn-tipped, 13–15 mm. long, lanceolate, glandular-ciliate; petals purple, 13–18 mm. long; carpels 5 mm. long, minutely pubescent. *G. incisum* Howell, not Nutt. Valleys: Wash.—Ore.—Wyo.—Alta. *Submont.* Je-Jl.

13. *G. Parryi* (Engelm.) Heller. Stems tufted, 2–6 dm. long; leaf-blades thickish, pentagonal, 2.5–6 cm. broad, canescent-strigillose, more or less glandular, 3–5-parted, the divisions incised or lobed; pedicels glandular-hirsute; sepals awn-tipped, 8.5–9.5 mm. long, elliptic to ovate, glandular-ciliate; petals pink-purple, 12–15 mm. long; style-column 18–23 mm. long; carpels glandular-hirsute. *G. Fremontii* Parryi Engelm. Mountains: Wyo.—Colo.—Ariz. *Mont.*—*Submont.* Je-Au.

14. *G. Pattersonii* Rydb. Stems ascending or diffuse, 2–4 dm. long; leaf-blades reniform in outline, about 3 cm. broad, glandular-villous on both sides, deeply 5–7-cleft; lobes broadly obovate-cuneate, 3-toothed; pedicels and calyx glandular long-villous; sepals long, oval, with a short bristle-tip; petals obovate, about 1 cm. long, light purple or rose, with darker veins; style-column about 2 cm. long; carpels pubescent. Mountains: Colo. *Mont.*—*Subalp.* Je-S.

15. *G. Fremontii* T. & G. Stems tufted, 2–5 dm. long, ascending or spreading, retrorsely pubescent, somewhat glandular above; leaf-blades thick, pentagonal, 2–4.5 cm. wide, 3–5-parted, canescent, the divisions coarsely toothed or lobed; sepals awn-tipped, 10–11 mm. long, oblong or oblong-lanceolate, ciliate and glandular; petals pink-purple, 12–15 mm. long; style-column 2–2.5 mm. long; carpels pilose. Mountains: Colo.—N.M.—Ariz.—Utah. *Submont.* Jl-S.

16. *G. caespitosum* James. Stems 1.5–4 dm. long, retrorsely pubescent; leaf-blades thick, pentagonal or suborbicular, 2–6 cm. wide, canescent or strigillose, 3–5-parted, the divisions incised or lobed; sepals awn-tipped, 9–11 mm. long, oblong-elliptic, ciliate; petals rose-purple, 14–17 mm. long; style-column 18–20 mm. long. Plains, foot-hills, and the lower mountains: Colo.—Wyo.—Utah. *Plain*—*Mont.* My-Jl.

17. *G. Cowenii* Rydb. Stems few, erect, 3–5 dm. high, retrorsely pubescent; leaf-blades pentagonal in outline, 2.5–6 cm. wide, 3–5-parted, the divisions cleft or toothed, canescent; pedicels more or less hirsute; sepals awn-tipped, 10–12 mm. long, elliptic, ciliate; petals pink-purple, 12–18 mm. long; style-column 15–18 mm. long, pubescent and sparingly glandular. Mountains: Colo.—Wyo. *Submont.* Je-Jl.

18. *G. marginale* Rydb. Stems erect or ascending, 1–4 dm. high, minutely retrorsely strigose; leaf-blades pentagonal in outline, 2–3 cm. wide, minutely pubescent, 3–5-parted, the divisions, at least the terminal one, cuneate, and mostly

3-toothed at the apex; pedicels retrorsely pubescent; sepals awn-tipped, 8-9.5 mm. long, elliptic-lanceolate, minutely pubescent; petals light pink or rose-colored, 12-15 mm. long; style-column 15-18 mm. long, minutely hirsute; carpels sparingly pubescent. Mountain plateaus: Utah. *Mont.* Au.

19. *G. atropurpureum* Heller. Stems tufted, spreading, 1-9 dm. long, retrorsely pubescent; leaf-blades thick, 3-5-parted, strigillose-pubescent, 2-5 cm. wide, the lower reniform, the upper pentagonal in outline; divisions incised or coarsely toothed; pedicels retrorsely pubescent, not glandular; sepals awn-tipped, 10-11.5 mm. long, oblong, finely pubescent and ciliate; petals purple, 12-15 mm. long, oblong or narrowly obovate, not notched; style-column 19-23 mm. long, minutely pubescent; carpels pilose. *G. gracile* Engelm., not Ledeb. Plains and hills: Colo.—Utah—N.M.—n Mex. *Submont.* Je-S.

2. *ERÏDIUM* L'Her. STORKBILL, ALFILARIA, PIN CLOVER, FILAREE.

Annual or perennial herbs, with opposite leaves. Leaf-blades pinnately divided or lobed, or if merely toothed, pinnately veined, long-petioled. Sepals 5, usually awn-tipped. Petals 5, those of the later flowers often reduced. Stamens 5, alternating with 5 staminodia. Style-column very elongate, the styles pubescent within, and spirally coiled, when freed from the central axis. Carpels narrow, spindle-shaped. Seeds smooth.

1. *E. cicutarium* (L.) L'Her. An annual, with low spreading stem; leaf-blades pinnately divided; segments oblong to ovate, pinnatifid or incised; peduncles and pedicels more or less hirsute, rarely glandular, sepals oblong, 6-7 mm. long, the short tips with 1 or 2 bristle-like appendages; petals slightly longer than the sepals, pink, with darker veins; anther-bearing filaments toothless; style-column 3-4 cm. long. Waste places and fields: N.S.—N.J.—N.M.—Calif.—B.C.—Alta.; Mex. and C. Am.; nat. from Eu. *Plain—Submont.* My—Au.

FAMILY 67. OXALIDACEAE. WOOD-SORREL FAMILY.

Mostly herbs, with elongate or bulb-like rootstocks. Leaves alternate, sometimes all basal, compound, in ours palmately trifoliate. Flowers perfect, regular or nearly so, cymose. Sepals and petals 5. Stamens 10, in 2 series, monadelphous. Gynoecium of 5 united carpels; styles distinct or coherent. Fruit a valvate capsule.

Acaulescent herbs, with bulb-like rootstocks; petals violet or purple. 1. *IONOXALIS*.
Caulous plants, with slender horizontal rootstocks or with an annual taproot; petals yellow. 2. *XANTHOXALIS*.

1. *IONOXALIS* Small. VIOLET WOOD-SORREL.

Perennial succulent herbs, with scaly bulbs, scapose. Leaves basal, with elongate petioles; blades palmately 3-9-foliate. Flowers in umbel-like cymes, subtended by several bracts. Sepals 5, each with one or two pairs of apical tubercles. Petals 5, violet, blue, red, or white. Stamens 10; filaments united at the base, the longer sometimes appendaged on the back. Capsules erect.

1. *I. violacea* (L.) Small. Plant 1-4 dm. high; bulb-scales 3-ribbed; petioles glabrous; leaflets 3, obreniform, 1-2.5 cm. broad, glabrous, bright green above, slightly paler beneath; scape and pedicels glabrous, the former 4-19-flowered; sepals oblong to ovate-oblong, 4-6 mm. long, glabrous; petals violet, 14-20 mm. long; filaments pubescent; capsule globose-ovoid, 4-5 mm. long. *Oxalis violacea* L. Rich soil: Me.—Fla.—Tex.—Colo. *Plain—Submont.* Ap-S.

2. *XANTHOXALIS* Small. YELLOW WOOD-SORREL.

Herbs, perennial, with horizontal rootstocks or annual taproots, or rarely shrubs. Stem leafy. Leaves alternate, sometimes clustered at the nodes. Leaves palmately 3-foliate; leaflets mostly obovate (in our species), or rarely broadest at the base, sessile. Flowers in umbel-like or dichotomous cymes. Sepals 5, herbaceous or petaloid. Petals 5, yellow or purplish, deciduous.

Stamens 10; filaments united into a tube at the base. Ovary elongate; styles filiform or subulate. Capsule columnar or oblong, prismatic, erect.

Stem appressed-pubescent; capsule pubescent.

Stem loosely pubescent, or nearly glabrous; capsule glabrous.

1. *X. stricta*.

2. *X. bushii*.

1. *X. stricta* (L.) Small. Stems erect or decumbent in age, 0.5–5 dm. long, strigillose; leaflets 15–20 mm. wide; peduncles longer than the petioles; sepals 4–5 mm. long; petals pale yellow, 5–10 mm. long; capsule columnar, 16–30 mm. long, rather abruptly pointed. *Oxalis stricta* L. Woods, roadsides, and cultivated grounds: N.S.—Fla.—N.M.—Wyo.; Mex. *Plain—Submont.* Ap-N.

2. *X. bushii* Small. Stem slender, erect, 1–2 dm. high, villous; leaflets broadly obcordate, glabrous, 8–20 mm. long; peduncles very slender, about 5 cm. long; inflorescence cymose, but often reduced to 2–3 flowers and umbel-like; sepals 4–5 mm. long, oblong; petals 6–7 mm. long; capsule columnar, 12–15 mm. long. *Oxalis bushii* Small. *Oxalis* and *Xanthoxalis coloradensis* Rydb. River bottoms: N.S.—Ga.—Colo.—S.D. *Plain—Mont.* My-Au.

FAMILY 68. LINACEAE. FLAX FAMILY.

Herbs with alternate leaves, with or without stipules. Flowers perfect, regular, racemose or paniculate. Sepals and petals 5, rarely 4 or 6. Stamens as many as the sepals, monadelphous. Gynoecium of 5, sometimes 2 or 3, united carpels. Fruit a capsule, opening by twice as many valves as there are carpels.

Stigmas introrse and more or less elongate; sepals glandless; flowers in ours blue, rarely white.

Stigmas terminal and capitate; sepals, at least the inner ones, with marginal glands; flowers in ours yellow.

1. LINUM.

2. CATHARTOLINUM.

1. LINUM L. FLAX, BLUE FLAX.

Annual or perennial glabrous plants, sometimes woody at the base. Leaves alternate, without stipules or stipular glands, narrow, entire. Sepals 5, persistent. Petals 5, in ours blue, or rarely white, unappendaged and entire at the base. Stamens 5; filaments dilated and united at the base, each sinus with a short staminodium. Gynoecium 5-carpellary, not cartilaginous at the base; styles 5, elongate, distinct or united; stigmas elongate, introrse. Capsules 5-celled, the carpels with incomplete false partitions. Seeds flat, elongate-lenticular.

Inner sepals ciliate; stigmas much elongate; introduced annual. 1. *L. usitatissimum*.
Sepals not ciliate; stigmas rather short; native perennials.

Sepals over 5 mm. long at maturity, more than one-half as long as the capsule.

2. *L. Lewisii*.

Sepals less than 5 mm. long, less than one-half as long as the capsule.

3. *L. pratense*.

1. *L. usitatissimum* L. Stem 2–8 dm. high, glabrous; leaves narrowly linear-lanceolate, 3-nerved, sessile; sepals acuminate, the outer elliptic or elliptic-lanceolate, the inner elliptic-ovate or ovate, ciliate, 7–9 mm. long, all 3-nerved at the base; petals blue 1–1.5 cm. long; capsule 6–8 mm. long. Waste places and old fields; occasionally escaped from cultivation, native of Eu. My-S.

2. *L. Lewisii* Pursh. Stem 2–7 dm. high, often branched at the base, obscurely striate; leaves erect, linear or nearly so, 1–2 cm. long; sepals 5.5–7 mm. long, the outer ovate, short-acuminate, the inner broader, mucronate; petals blue or rarely white, 1.5–2 cm. long. Plains and hills: Man.—Neb.—Tex.—Calif.—Alaska; n Mex. *Plain—Mont.* My-Au.

3. *L. pratense* (Norton) Small. Stem 1–6 dm. high, striate in age, commonly branched at the base; leaves commonly numerous and crowded towards the base, narrowly linear or subulate, 0.5–1 cm. long, rather succulent; bracts subulate; sepals mostly 4–5 mm. long, ovate to oblong-ovate, the outer acute or short-acuminate, the inner broader, mucronulate; petals blue, 1–1.5 cm. long. Dry plains: Sask.—Tex.—Ariz.—Nev.—Wyo. *Plain—Submont.* My-S.

2. CATHARTOLINUM Reichenb. YELLOW FLAX.

Annual or perennial herbs. Leaves alternate or occasionally opposite, without stipules, but often with stipular glands, mostly narrow, entire or serrulate. Sepals 5, persistent or deciduous, at least the inner ones with gland-tipped teeth. Petals 5, yellow or white. Stamens 5; filaments united at the base, monadelphous, the free portion more or less dilated at the base, sometimes with short staminodia in the sinuses. Gynoecium 5-carpellary, rarely 2-carpellary. Styles filiform, distinct or united; stigmas terminal, capitate. Capsule ovoid or depressed, 5-celled, rarely 2-celled, or completely or incompletely 10-celled by false septa. Seeds flattened, often lunate.

Styles distinct; capsules without cartilaginous thickenings at the bases of the sepals; sepals ovate, scarcely as long as the capsule; leaves oblong or oblong-linear; flowers in fastigate cymes.

Outer sepals obtuse or merely acutish at maturity; capsule 3 mm. long.

1. *C. sedoides*.

Outer sepals acuminate at maturity; capsule 4 mm. long.

2. *C. Kingii*.

Styles more or less united; capsule with cartilaginous thickenings at the base of the sepals; sepals lanceolate, much exceeding the capsule; leaves linear-lanceolate to subulate.

Outer sepals copiously gland-toothed; staminodia none or entire.

Stem, branches, and pedicels densely puberulent.

3. *C. puberulum*.

Stem, branches, and pedicels not densely puberulent, usually glabrous.

Sepals not more than half longer than the capsule, the inner ones with relatively coarse and conspicuously gland-tipped teeth.

Petals 5-9 mm. long.

Outer sepals with lateral ribs faint near the base; branches blunt-angled.

4. *C. australe*.

Outer sepals with lateral ribs prominent throughout; branches wing-angled.

5. *C. compactum*.

Petals 10-20 mm. long.

False septa of the capsule slightly thickened; sepals becoming 6-8 mm. long; petals 11-15 mm. long.

6. *C. rigidum*.

False septa thickened half their width; sepals becoming 9-11 mm. long; petals 17-20 mm. long.

7. *C. Berlandieri*.

Sepals twice as long as the capsule, long-acuminate, aristate, the inner ones with very numerous, fine, inconspicuously gland-tipped teeth.

8. *C. aristatum*.

Outer sepals entire or with few scattered teeth; staminodia 2-lobed.

9. *C. subteres*.

1. *C. sedoides* (Porter) Small. Perennial, with a woody base; stems or branches mostly less than 1 dm. long; leaves very numerous, approximate, near the base of the stem, more or less imbricate, erect or ascending, clavate, the upper short-linear, 3-9 mm. long; outer sepals ovate, about 4 mm. long, with few gland-tipped teeth; petals bright yellow; capsule ovoid, 3 mm. long. *L. Kingii sedoides* Porter. *L. Kingii pinetorum* M. E. Jones. High mountains: Utah. *Subalp.* Jl.

2. *C. Kingii* (S. Wats.) Small. Perennial, with a woody base; stem and branches more or less tufted, 0.5-3 dm. high; leaves numerous, spreading, thick, the lower linear-spatulate, the upper linear, 1-2 cm. long; outer sepals ovate, about 4 mm. long, sparingly gland-toothed, the inner ones broader, abruptly short-pointed; petals bright yellow; capsule ovoid, 4 mm. long. *Linum Kingii* S. Wats. High mountains: Utah—Wyo. *Submont.*—*Mont.* Jl—Au.

3. *C. puberulum* (Engelm.) Small. Pale green, often glaucous, perennial; stem 0.5-3 dm. high, usually branched throughout; leaves numerous and crowded at the base, erect or ascending, thick, the lower linear or linear-spatulate, entire, the upper linear or subulate, often gland-toothed below the middle; sepals narrowly lanceolate, becoming 7-9 mm. long, acuminate, the inner ones shorter than the outer, and more coarsely toothed towards the apex; petals light yellow, 12-17 mm. long. *L. rigidum puberulum* Engelm. Dry plains and hills: Colo.—Tex. —Ariz.—Nev. *Plain*—*Submont.* Ap—Au.

4. *C. australe* (Heller) Small. Pale green perennial, glabrous or nearly so; stem 1.5-5 dm. high, simple below, the branches erect or ascending; leaves scattered, early deciduous, thick, serrulate; sepals lanceolate or oblong-lanceolate, becoming 6-8 mm. long, evenly glandular-toothed, long-acuminate; inner slightly broader than the outer; petals pale yellow, 6-9 mm. long. *L. australe* Heller.

Dry plains and hills: Colo.—N.M.—Ariz.—Utah; n Mex. · *Son.*—*Submont.* Ap—Au.

5. *C. compactum* (A. Nels.) Small. Dull-green perennial; stem 1-2 dm. high, branched at the base; leaves numerous towards the base, but early deciduous, the upper more persistent, erect or ascending, entire; sepals lanceolate, becoming 6-8 mm. long, acuminate, evenly glandular-toothed, the inner much shorter than the outer; petals yellow, 7-9 mm. long; capsule ovoid, 4 mm. long. *L. compactum* A. Nels. Dry plains: N.D.—Mo.—Wyo.—Mont. *Plain*—*Submont.* Je—Au.

6. *C. rigidum* (Pursh) Small. Glabrous, bright green perennial; stem 1-5 dm. high, simple at the base, corymbosely branched above, prominently striate-angled; leaves relatively few, erect, early deciduous, linear to linear-lanceolate, 0.6-3 cm. long, acute or acuminate, the upper ones glandular-ciliate or glandular-serrulate; sepals lanceolate, becoming 6-8 mm. long, acuminate, evenly glandular-toothed, the inner ones shorter and broader than the outer ones; petals yellow; capsule ovoid, 4-5 mm. long. *L. rigidum* Pursh. Plains and hills: Man.—Tex.—Colo.—Alta. *Plain*—*Submont.* Je—O.

7. *C. Berlandieri* (Hook.) Small. Bright green glaucescent perennial; stem 0.5-3.5 dm. high, simple at the base, branched and angled above; leaves rather few, spreading or ascending, linear to linear-lanceolate, mostly 1.5-4 cm. long, acuminate, entire, the lateral veins marginal; sepals lanceolate, becoming 9-11 mm. long, evenly glandular-toothed, acuminate and minutely spinulose-tipped, the inner ones shorter; petals light yellow, 17-20 mm. long; capsule ovoid, 4-4.5 mm. long. *L. Berlandieri* Hook. *L. arkansanum* Osterhout. Sandy soil: Neb.—Tex.—Colo. *Plain*—*Son.* Ap—Jl.

8. *C. aristatum* (Engelm.) Small. Glaucescent perennial; stem 2-4 dm. high, corymbosely branched above, striate or somewhat angled, glabrous; cymes few-flowered; leaves few, erect, thickish, the lower linear or narrowly linear-spatulate, about 1 cm. long, the upper subulate, slender, with involute margins, entire; sepals linear-lanceolate, becoming 9-10 mm. long, aristately tipped, the inner shorter than the outer, more finely toothed; petals yellow, 13-15 mm. long; capsule about 3 mm. long, ovoid. *L. aristatum* Engelm. Sandy soil: w Tex.—se Utah—n Mex. *Son.* Jl—Au.

9. *C. subteres* (Trelease) Small. Glaucous perennial; stem 2-3 dm. high, branched at the base, terete or nearly so; leaves crowded at the base and on the main branches, erect, thick, succulent, the lower linear-spatulate, the upper linear or subulate, 1-1.5 cm. long; sepals lanceolate, becoming 6-7 mm. long, abruptly pointed, the inner shorter, with several teeth; petals yellow, 10-13 mm. long; capsule ovoid, 4 mm. long. *L. aristatum subteres* Trellease. Sandy places: Nev.—Utah. *Son.*—*Submont.* My—Au.

FAMILY 69. **BALSAMINACEAE.** JEWEL-WEED FAMILY.

Herbs, with more or less succulent leaves and swollen nodes. Flowers perfect, irregular, zygomorphic. Sepals 3, rarely 5, the posterior one petaloid, strongly saccate or spurred at the base. Petals 5, or by union of two and two only 3. Stamens 5, alternate with the petals; anthers more or less united around the stigma. Gynoecium of 5 united carpels; styles obsolete. Pod a 5-celled capsule, elastically dehiscent.

1. **IMPATIENS** L. TOUCH-ME-NOT, JEWEL-WEED.

All our species annual. Sepals in ours 3. Lateral petals each united with the adjacent posterior one. Capsule elastically dehiscent. Seeds usually many, pendulous above each other in a single row.

Spur present.

Spur porrect, *i. e.*, bent at a right angle to the sack, one-fourth as long as the same or less; sack as broad as long, pale yellow, unspotted or minutely so.

1. *I. pallida*.

Spur strongly incurved, one-third as long as the sack or more; sack longer than broad.

Sack at least two-thirds as broad as long, abruptly contracted into the spur; flowers orange or pinkish, with large spots or rarely unspotted. 2. *I. biflora*.

Sack one-half as broad as long or less, gradually tapering into the spur; flowers unspotted.

Sack about 2 cm. long; flowers light yellow.

3. *I. occidentalis*.

Sack about 12 mm. long; flowers golden-yellow.

4. *I. aurella*.

Spur wanting.

5. *I. ecalcarata*.

1. *I. pallida* Nutt. Stem usually light green, 1–2 m. high; leaf-blades thin, bright green, oval or ovate, 3–15 cm. long, crenate-dentate; lateral sepals broadly ovate, acuminate, light green, 5–7 mm. long; posterior sepal light sulphur-yellow, usually unspotted, broadly conic, about 15 mm. long; spur 3–8 mm. long; petals of the same color as the spur or lighter, usually dotted, the anterior one broadly obovate, emarginate, 7–8 mm. long. River banks: N.S.—Ga.—Kans.—Sask. *Plain*.

2. *I. biflora* Walt. Stem 1–1.5 m. high, often tinged with red; leaf-blades oval or ovate, 2–10 cm. long, green or purplish; lateral sepals light green or purplish, obovate, short-acuminate, 5–6 mm. long; posterior sepal orange, or rarely pink, usually copiously spotted with red or purple, sometimes wholly unspotted, elongate-helmet-shaped, 15–18 mm. long; spur about 1 cm. long; petals of the same color as the posterior sepal, the anterior one nearly orbicularly obcordate, 6–7 mm. long. *I. maculata* Muhl. *I. fulva* Nutt. River banks: Newf.—Fla.—Ala.—Ida.—Mack. *Plain—Submont.*

3. *I. occidentalis* Rydb. Stem light green or straw-colored, about a meter high; leaf-blades oval, thin, light green, 2–10 cm. long, acute at the apex, acute to subcordate at the base, crenate-dentate; lateral sepals obovate, abruptly acuminate, about 6 mm. long; posterior sepal conic-trumpet-shaped, somewhat curved, about 2 cm. long, pale yellow; spur 8–10 mm. long, cylindric; anterior petals broadly obovate, emarginate, 7 mm. long, fully 10 mm. wide. Wet places: Wash.—Alaska—(? Ida).

4. *I. aurella* Rydb. Stem slender, light green, 5–6 dm. high; leaf-blades ovate or oval, thin, bright green, a little paler beneath, 2–8 cm. long, coarsely dentate; lateral sepals ovate, 4–5 mm. long; posterior sepal orange, unspotted, conic, 10–15 mm. long; spur about 8 mm. long; anterior petal triangular-obovate, emarginate, 5 mm. long, 8 mm. wide. Wet places: Mont.—Ida.—Wash.—BC.

5. *I. ecalcarata* Blankinship. Stem glabrous, light green, 9–12 dm. high; leaf-blades ovate or ovate-elliptic, 2–10 cm. long, dentate, light green above, paler beneath; lateral sepals obliquely oval, 6 mm. long; posterior sepal orange or sometimes paler yellow, unspotted, helmet-shaped, unspurred, 8–10 mm. deep, 10–13 mm. wide; petals of the same color as the sack; anterior sepals orbicular or reniform, notched; petals oblanceolate or oblong, 6 mm. long. Wet places: Mont.—Wash.—B.C.

FAMILY 70. LIMNANTHACEAE. FALSE MERMAID FAMILY.

Herbs of wet places, with pinnately dissected leaves. Flowers perfect, regular. Hypanthium present, but small, saucer-shaped. Sepals 3–5, persistent, valvate or nearly so. Petals 3–5, marcescent. Stamens 6–10. Gynoecium of 2–5 carpels; ovaries distinct, but the styles united to near the top, arising between the ovaries. Fruit of semi-drupaceous nutlets.

1. FLOËRKEA Willd. FALSE MERMAID.

Low slender annuals. Leaves simply pinnately dissected. Flowers inconspicuous on axillary peduncles. Sepals 3, slightly imbricate, spreading in fruit. Petals 3, white, about half as long as the sepals. Stamens 6; filaments subulate, distinct, those opposite the petals shorter; anthers didymous, introrse, opening longitudinally. Ovaries 2 or 3; style 2- or 3-cleft at the apex; stigmas capitate.

1. *F. occidentalis* Rydb. Very slender glabrous annual; stem slightly branched, less than 1 dm. high, ascending or decumbent; leaves 1–3 cm. long,

pinnate, glabrous; divisions 3-5, oblong or oblanceolate to nearly linear, 5-15 mm. long; sepals ovate, 2 mm. or in fruit 3 mm. long; petals oblanceolate or oblong, usually less than 1 mm. long; carpels usually 2. Wet places: Colo.—Wyo.—Calif.—Wash.

FAMILY 71. ZYGOPHYLLACEAE. CALTROP FAMILY.

Perennial herbs, shrubs, or trees, with articulate stems. Leaves alternate or opposite, digitate or evenly pinnate, with inequilateral punctate leaflets. Flowers perfect, regular or nearly so. Sepals 5, rarely 4 or 6, usually imbricate. Petals as many, hypogynous. Stamens twice as many. Gynoeceum of 2-5 united carpels; ovary 2-5-celled, rarely 10-12-celled, angled or winged; styles wholly united. Fruit a capsule or splitting into as many or twice as many nutlets as there are carpels.

Leaves digitately 1-7-foliolate; stipules spiny; stamens with scale-like appendages.

1. FAGONIA.

Leaves abruptly pinnate; stipules in ours not spiny.

Shrubs with endosperm; fruit woolly; stamens with scale-like appendages.

2. COVILLEA.

Herbs without endosperm; corolla mostly yellow; stamens without scale-like appendages.

Fruit dividing into 5 (by abortion sometimes fewer) carpels, each with 3-5 one-seeded compartments, spiny.

3. TRIBULUS.

Fruit dividing into 8-12 (twice as many as the original carpels) one-seeded nutlets, merely tubercled.

4. KALLSTROEMIA.

1. FAGONIA L.

Branching, diffuse, spreading, or prostrate undershrubs. Stems spinulose on the upper angles. Leaves opposite, digitately 1-7-foliolate; leaflets entire, callous-mucronate or spinulose-tipped; stipules often spinescent. Flowers solitary, pedunculate. Sepals 5, imbricate, caducous. Petals 5, imbricate, unguiculate, caducous. Stamens 10; filaments filiform, naked. Style subulate; stigma simple; ovary 5-celled. Fruit pyramidal-ovoid, deeply 5-angled, the 1-seeded carpels at length separating from the axis and dehiscing on the inner edge.

1. *F. californica* Benth. A low dichotomously branched undershrub; stems 2-5 dm. long, diffuse, much branched, glabrous; stipules 2-5 mm. long, arcuate-spreading; leaflets 3, lanceolate or ovate-lanceolate, glabrous or nearly so, 3-10 mm. long; petals spatulate, 5-8 mm. long; fruit ovate or spindle-shaped in outline, 4-5 mm. long, 7-8 mm. broad, finely pubescent. Sandy soil: Calif.—s Utah.—Sonora—L. Calif. *L. Son.*

2. COVILLEA Vail. CREOSOTE BUSH, HEDIONDILLA.

Low, evergreen, strong-scented, balsamiferous shrubs. Leaves opposite, consisting of a single pair, rarely of several pairs of small inequilateral leaflets; stipules persisting. Peduncles 1-flowered. Sepals 5, imbricate, unequal, caducous. Petals 5, yellow, obovate or lanceolate-spatulate, more or less unguiculate. Stamens 10, inserted on the base of the small disc. Anthers oblong. Pistil of 5 united carpels. Ovary short-stipitate, globose, pilose, 5-celled, the cells alternate with the petals; styles united, sometimes separable. Fruit villose or tomentose, globose, 5-angled. [*Larrea* Cav., not Ort.]

1. *C. glutinosa* (Engelm.) Rydb. A diffusely branched resinous shrub, 1-3.5 m. high; stems densely leafy, angled, silky-pubescent; leaves nearly sessile; leaflets obliquely lanceolate or lunate, falcate, 5-10 mm. long, coriaceous, resinous, yellowish, silky-pubescent, becoming glabrate, 3-ribbed; petals slightly unguiculate, spatulate-oblong, bright yellow; fruit subglobose or elliptic, 4-5 mm. broad, densely rusty-villous. *L. glutinosa* Engelm. *L. mexicana* Torr., not Moric. *C. tridentata* Vail, in part. Dry plains and hills: Tex.—s Utah—Calif.; n Mex. *L. Son.*

3. TRÍBULUS L. BUR-NUT.

Diffuse herbs, with weak, often prostrate, stems and branches. Leaves abruptly pinnate, opposite. Stipules lanceolate or subulate, membranaceous. Flowers solitary on axillary peduncles. Sepals 5, lanceolate, herbaceous, soon caducous. Petals 5, obovate, yellow, orange, or rarely white, spreading, deciduous. Stamens 10, hypogynous; filaments filiform, naked, the 5 inner alternate with the petals, shorter than the outer, subtended by a small gland. Ovary sessile, 5-celled, surrounded at the base by an urceolate 10-lobed disk. Styles united into a short stout column; stigmas 5, more or less connate. Fruit depressed, 5-angled, tuberculate or spinose, separating at maturity into 5 bony carpels. Seeds oblong-obovate. Endosperm wanting.

1. T. terrestris L. A diffuse trailing annual herb; stems hirsute and slightly swollen at the nodes; leaflets about 5-7 pairs, somewhat oblique, oblong or elliptic, 3-13 mm. long; petals obovate, about 4 mm. long, light yellow; carpels 5, bony, each with 2 divergent stout spines and 2 or more smaller ones, sparingly hispid. Waste places and sandy soil: S.C.—Ill.—Neb.—Ariz.; Mex. and W. Ind.; nat. from Eu. *Plain—Son.*

4. KALLSTROËMIA Scop. CALTROP.

Diffuse and branching herbs. Stems procumbent. Leaves opposite, abruptly pinnate, the terminal pair larger. Flowers solitary, orange or yellow. Peduncles axillary. Sepals 5 or 6, mostly persisting. Petals 4-6, obovate or obcordate, spreading, caducous. Stamens 10 or 12, hypogynous; filaments filiform, those opposite the petals adnate to the petals, the alternate ones smaller and subtended externally by a small gland. Ovary sessile, 8-12-celled, without transverse septa; styles united, columnar, or subulate from a conic base; stigma capitate; fruit roughened or tuberculate, separating at maturity into 8-12 bony, indehiscent, 1- rarely 2-seeded tuberculate nutlets, leaving a more or less persistent thick styliiferous central axis.

Plant sparingly pubescent or glabrate; petals 3-5 mm. long; beak much shorter than the body of the fruit.

Plant densely hirsute; petals 5-6 mm. long; beak slightly shorter than the body.

1. *K. brachystylis.*

2. *K. hirsutissima.*

1. K. brachystylis Vail. A profusely branched annual; stems 2-3 dm. long or more, very brittle; leaflets 3-4 pairs, obliquely elliptic or oval, 6-15 mm. long, slightly falcate, ciliate on the margins; sepals lanceolate, caducous; petals 4-5 mm. long, orange to pale yellow, sometimes shorter than the sepals; fruit minutely pubescent; beak persistent, glabrous, 1-2 mm. long; nutlets with rounded tubercles on the back, strongly reticulate on the faces. Sandy soil: N.M.—s Colo.—L. Calif.; Mex. *Son.*

2. K. hirsutissima Vail. A much branched annual; branches stout, trailing, 4-7 dm. long, appressed cinereous-pubescent and hirsute with longer spreading hairs; leaflets 3-4 pairs, elliptic, 8-20 mm. long, shaggy-hirsute, at least beneath; sepals linear-lanceolate, 4-6 mm. long; petals obovate-oblong, 5-6 mm. long, yellow or orange, fading whitish, retuse; fruit canescent-strigose; beak pubescent, conic at the base, 3-4 mm. long; carpels 10. Sandy soil: Tex.—Kans.—Colo.—Mex. *Son.*

FAMILY 72. RUTACEAE. RUE FAMILY.

Aromatic trees or shrubs, with secreting glands in the foliage. Leaves mostly digitately or pinnately compound; leaflets usually inequilateral. Flowers perfect, polygamous or dioecious. Calyx with 3-5 lobes or sepals, rarely wanting. Petals 3-5, imbricate. Stamens as many as the petals or twice as many, sometimes more, inserted on a hypogynous disk. Gynoecium of 1-5, or more, free or united carpels. Fruit various, of follicles, a capsule, samara, or drupe.

Fruit a samara; cells of ovary 2-ovuled; trees or shrubs with digitately compound leaves.

Fruit a capsule; cells of ovary 5- or 6-ovuled; undershrubs or low shrubs with simple leaves.

1. PTELEA.

2. THAMNOSMA.

1. PTELEA L. HOP-TREE, SHRUBBY TREFOIL.

Unarmed shrubs or trees. Leaves alternate, rarely opposite, 3-foliate, rarely 4- or 5-foliate; leaflets entire or toothed, pellucid-punctate. Flowers polygamous, in corymbose or paniculate cymes. Sepals 4 or 5, rarely 6. Petals as many, greenish or yellowish white. Stamens 4 or 5, rarely 6, hypogynous, abortive in the pistillate flowers. Gynoecium of 2 or 3 united carpels; ovules 2 in each cavity. Fruit a 2-celled or rarely 3-celled samara with reticulate wings, surrounding the body.

1. *P. Baldwinii* T. & G. A shrub or small tree, 3-8 m. high; leaflets usually 3, narrowly lanceolate to oval or obovate, 1.5-6 cm. long, crenulate or entire, somewhat pubescent beneath; fruit 1-2 cm. long, with thin oblong to nearly orbicular wings. *P. angustifolia* Benth. *P. crenulata* Greene. Woods and cañons: Fla.—Tex.—Colo.—Calif.; Mex. *Son.*—*Submont.*

2. THAMNOSMA Torr. & Frem.

Strong-scented glandular shrubs or undershrubs. Leaves simple, alternate, entire. Flowers perfect, racemose. Sepals 4. Petals 4, imbricate. Disk present, cup-like, entire or crenate. Stamens 8, inserted on the disk; filaments subulate or filiform. Gynoecium of 2, rarely 3, united carpels; ovary 2- or 3-lobed; style filiform; ovules 5-6 in each cavity. Capsule leathery, 2- or 3-celled, opening at the apex.

Shrubby; corolla 8-10 mm. long; capsule distinctly stipitate.

1. *T. montana*.

Herbaceous from a woody base; corolla about 4 mm. long; capsule sessile or subsessile.

2. *T. texana*.

1. *T. montana* Torr. & Frem. A glandular shrub, 3-6 dm. high, often spinose; leaves few, early deciduous, linear to spatulate or oval; petals purple, oblong or oval; filaments filiform; seeds 3 or by abortion solitary. Arid regions: N.M.—s Utah—Nev.—se Calif.; Mex. *Son.*

2. *T. texana* (A. Gray) Torr. A low undershrub, 1-5 dm. high; leaves linear-oblong to narrowly linear, 5-15 mm. long, entire, sessile; sepals ovate or oval, obtuse or retuse; petals oval or elliptic, greenish yellow or whitish, tinged with purple; capsule lobed to the middle, 3-7 mm. high. *Rutosma purpurea* Woot. & Standl. Arid regions: Tex.—Colo.—Ariz.; Mex. *Son.*

FAMILY 73. POLYGALACEAE. MILKWORT FAMILY.

Herbs, or rarely shrubs or trees, with alternate, opposite, or whorled leaves; stipules wanting. Flowers irregular. Sepals 5, free, imbricate, the two inner petaloid, called wings. Petals 5 or 3, the lower one concave, often beaked or crested, called keel, the others more or less united. Stamens usually 8; filaments usually united into a tube, cleft on the back; anthers becoming 1-celled, opening by terminal pores or cracks. Gynoecium usually of 2, rarely 5, united carpels. Fruit usually a 2-celled capsule.

1. POLYGALE (Tourn.) L. MILKWORT.

Filaments united. Capsule compressed laterally, 2-celled. Seeds caruncled.

Plants herbaceous, unarmed; keel with a fimbriate crest.

Annuals; leaves verticillate, narrowly linear.

Perennials; leaves alternate.

Leaves linear or linear-oblancoate.

Leaves lanceolate to ovate.

More or less spiny undershrubs; keel not crested, but with a beak.

Plant 5-15 cm. high; flowers 7-10 mm. long.

Plant 3-10 dm. high; flowers 3-4 mm. long.

1. *P. verticillata*.

2. *P. alba*.

3. *P. Senega*.

4. *P. subspinoza*.

5. *P. acanthoclada*.

1. *P. verticillata* L. Stem 0.5–3 dm. high, angled, with numerous spreading branches; leaves in 4's or 5's, 1–3 cm. long; racemes spike-like, narrowly conic; flowers greenish or greenish white; wings ovate, about 1 mm. long; keel crested with several thick processes; capsule about 2 mm. long. Dry soil: Que.—Fla.—Mex.—Wyo.—Sask. *Plain—Submont.* Je—S.

2. *P. alba* Nutt Stems several from the base, erect or ascending, 1–5 dm. high, angled, simple; leaves 1–2.5 cm. long; racemes spike-like, 4–6 mm. thick; wings oval or obovate, 2–3 mm. long; corolla white; keel with a fimbriate crest; capsule ovoid, 2–3 mm. long. Dry plains: Minn.—Kans.—Tex.—Ariz.—Colo.—Mont.; Mex. *Plain.* Ap—O.

3. *P. Senega* L. Stems several from a thick root, erect, 1–5 dm. high, simple; leaves numerous, lanceolate to lance-elliptic or (in var. *latifolia*) ovate-lanceolate or ovate, scabrous on the margin; racemes spike-like, 2–6 cm. long; wings orbicular-ovate, 2–3 mm. long; corolla greenish white, 3–4 mm. long; keel crested with thick processes; capsule flat, broader than long. Dry soil: N.B.—N.C.—Ark.—(Black Hills) S.D.—Alta. *Submont.* My—Jl.

4. *P. subspinosa* S. Wats. Spinescent undershrub, intricately branched, puberulent; leaves lance-oblong to elliptic or spatulate, 1–2 cm. long, firm; inflorescence a few-flowered raceme; wings elliptic-oblong, acutish, as well as tips of the lateral petals rose-colored; keel yellow, with a blunt beak; capsule obovate, retuse, veiny, glabrous. Foot-hills: Colo.—Ariz.—Nev. *Son.—Submont.* My—Jl.

5. *P. acanthoclada* A. Gray. Spinescent shrub, with white or yellowish bark, intricately branched; leaves 6–12 mm. long; oblanceolate or spatulate; racemes few-flowered, with a stout peduncle produced into a spine; flowers yellowish white, or the petals tipped with purplish; wings obovate; keel with a very short blunt, often obsolete, beak; fruit oblong-ovate, 5 mm. long, deeply notched. Arid regions: Colo.—Ariz.—Nev. *Son.* Je.

FAMILY 74. **EUPHORBIACEAE.** SPURGE FAMILY.

Monoecious or dioecious herbs (all ours), or shrubs or trees, often with milky sap, and alternate, opposite, or verticillate simple leaves. Flowers with or without petals, sometimes much reduced and subtended by a calyx-like involucre. Stamens few or many; filaments united or distinct. Ovary usually 3-celled. Styles as many as the cells of the ovary, simple, divided, or many-cleft. Capsule separating at maturity into three 2-valved carpels.

Flowers not in involucre; calyx of several sepals.

Corolla present in either the staminate or pistillate flowers, or in both.

Stamens 5 or 6; filaments distinct.

Stamens 10; filaments monadelphous.

Corolla wanting.

Flowers in involucre; calyx represented by a minute scale on the filament-like pedicels. Glands of the involucre with petal-like appendages, these however sometimes much reduced.

Leaves all opposite.

Leaf-blades oblique at the base, inequilateral; glands 4. **4. CHAMAESYCE.**

Leaf-blades equilateral, not oblique at the base; glands 5.

Leaves alternate or scattered, at least below the inflorescence; annuals or biennials; bracts petal-like. **5. ZYGOPHYLLIDIUM.**

Glands of the involucre without petal-like appendages, entirely naked, sometimes with crescent-shaped horns. **6. LEPADENIA.**

Stem topped by an umbel; stipules none; involucre in open cymes, each with 4 glands and entire or toothed lobes. **7. TITHYMALUS.**

Stem not topped by an umbel; stipules gland-like; involucre in conglomerate cymes, each with a single gland, or rarely 4 glands and fimbriate lobes. **8. POINSETTIA.**

1. CRÔTON L. CROTON.

Herbs (ours) or shrubs, monoecious or rarely dioecious, heavy-scented, stellate-pubescent or scaly, sometimes more or less glandular. Leaves mostly alternate, entire, toothed or lobed. Flowers in axillary or terminal clusters. Stam-

inate flowers uppermost. Sepals 4-6, usually 5. Petals usually present, but often small, alternating with the glands. Stamens 5 or more, inflexed in bud. Pistillate flowers below the staminate ones. Sepals 5-10. Petals usually wanting. Ovary 3-celled; ovules solitary in each cell; stigmas once, twice, or thrice 2-cleft. Capsule mostly splitting into three 2-valved carpels. Seeds smooth or minutely pitted.

Annual; leaf-blades linear, lanceolate, or oblong, 3-5 times as long as the petioles.

Perennial; leaf-blades elliptic or oval, only a little longer than the petioles.

1. *C. texensis*.

2. *C. longipes*.

1. ***C. texensis*** (Klotzsch) Muell. Arg. Lepidote, dioecious annual; stem 4-16 dm. high, di- or tri-chotomously branched; the staminate plant usually more slender than the pistillate one and with narrower leaves; leaf-blades linear, lanceolate, or oblong, 4-12 cm. long, entire; staminate racemes 1-3 cm. long; sepals oblong to ovate-oblong; stamens 8-12; pistillate flowers 2-4 together or solitary; sepals triangular; capsule globose or oval, 4-6 mm. long, warty. Plains and prairies: Ill.—Ala.—Tex.—Ariz.—Wyo.; Mex. *Plain*. My—Au.

2. ***C. longipes*** M. E. Jones. Perennial, woody at the base, 3-6 dm. high, white, lepidote-stellate; leaf-blades 2-3 cm. long, densely stellate beneath, sparingly so or glabrate above; staminate flowers 2 mm. wide; pistillate ones 6 mm. wide; sepals in both triangular; capsule globose, densely stellate. Sand: Utah—Nev. *Son.*—*Submont.* Ap—My.

2. DITÁXIS Vahl.

Monoecious or rarely dioecious herbs or shrubs, often with rootstocks. Leaves alternate, silky or pilose, entire or rarely toothed, often strongly veined. Flowers in axillary and terminal clusters, usually bracted. Staminate flowers usually crowded at the ends of the racemes. Sepals 4 or 5, valvate. Petals 4 or 5. Stamens of the same number, or twice or thrice as many; filaments united into a column. Pistillate flowers with imbricate sepals and rudimentary petals. Ovary 3-celled, each cell with a solitary ovule. Styles 3, 2-cleft. Capsule 3-lobed, depressed, separating into three 2-valved carpels. Seeds subglobose, wrinkled or crested.

1. ***D. humilis*** (Engelm. & Gray) Pax. Perennial, with a woody root and caudex; stems much branched, pubescent, spreading, 1-3 dm. long; leaf-blades ovate, oblong, or oblanceolate, 1-3 cm. long, entire; capsule short-pedicelled, depressed, 4-6 mm. in diameter; seeds oval-globose, 2 mm. long, muricate. Prairies: Kans.—La.—Tex.—N.M. *Son.* My—O.

3. TRÀGIA (Plum.) L.

Perennial monoecious herbs, or shrubs, usually armed with stiff, stinging hairs. Leaves alternate, entire, toothed, or lobed, mostly cordate, petioled. Flowers in racemes or spicate racemes, bracteolate, apetalous. Staminate flowers with 3-5 sepals, and mostly 1-3 stamens. Pistillate flowers with 3-8 sepals. Ovary 3-celled; ovules solitary. Styles 3, often united to above the middle. Capsule 3-lobed, separating into three 2-valved carpels. Seeds subglobose.

1. ***T. ramosa*** Torr. Light green perennial, with a woody caudex, hispid; stem 0.5-3 dm. high, usually much branched; leaf-blades lanceolate to triangular-lanceolate, 1-5 cm. long, coarsely and sharply serrate; staminate flowers with 4-5 sepals and 5-6 stamens; pistillate flowers solitary, with 5 sepals subtended by a 3-lobed bract; capsule depressed, 6-8 mm. thick, orange, more or less variegated. Dry soil: Mo.—Tex.—Ariz.—Colo. *Son.*—*Submont.* Ap—Au.

4. CHAMAESÏCE S. F. Gray. SPURGE, CARPET-WEED.

Annual or perennial herbs, or in the tropics shrubs. Stems often radially branched at the base, ascending or prostrate, forking. Leaves opposite, entire or toothed, more or less oblique at the base; stipules delicate, entire or fringed. Involucres solitary in the axils or in axillary cymes. Glands 4, sessile or stalked,

naked or usually with an appendage; one sinus of each involucre usually glandless. Capsule 3-lobed, smooth, with sharp or rounded angles. Seeds angled, the faces smooth or transversely wrinkled.

Leaf-blades entire.

Annuals or biennials.

Plants prostrate; leaves oblong to orbicular.

Leaf-blades manifestly longer than broad, usually more than twice as long.

1. *C. Geyeri*.

2. *C. serpens*.

Leaf-blades as broad as long or nearly so.

Plants more or less ascending or erect; leaf-blades linear or linear-lanceolate.

Capsule less than 1.5 mm. long.

3. *C. revoluta*.

Capsule about 2 mm. long or more.

Appendages of the glands conspicuous, white.

4. *C. petaloidea*.

Appendages inconspicuous, greenish white, or obsolete.

Stems low and erect; stipules subulate-setaceous; seeds finely granulate, obscurely angled.

5. *C. Parryi*.

Stems long and ascending; stipules triangular; seeds smooth, 3-angled.

6. *C. flagelliformis*.

Perennials.

Leaves glabrous.

Appendages fan-shaped, white, petaloid; stipules triangular, fimbriate.

7. *C. albomarginata*.

Appendages crescent-shaped or semi-orbicular, greenish, pinkish, or yellowish; stipules subulate-setaceous.

Appendages crescent-shaped, much narrower than the gland; leaves broadly deltoid-ovate; seeds transversely ridged; plant prostrate.

8. *C. Greenei*.

Appendages conspicuous, semi-orbicular, fully as broad as the glands; leaves ovate or ovate-lanceolate; seeds irregularly pitted; plant erect.

9. *C. Fendleri*.

10. *C. lata*.

Leaves pubescent.

Leaves toothed, but sometimes only at the apex; stems and branches prostrate; annuals.

Capsules glabrous.

Seeds strongly transversely wrinkled.

11. *C. glyptosperma*.

Seeds pitted or irregularly and faintly wrinkled.

12. *C. rugulosa*.

Seeds deeply and irregularly pitted.

Seeds faintly pitted or wrinkled.

Leaves oblong; seeds usually with a white bloom.

13. *C. serpyllifolia*.

Leaves linear; seeds brownish, usually without a bloom.

14. *C. albicaulis*.

Capsule pubescent.

Leaf-blades and involucre glabrous or sparingly pubescent.

15. *C. maculata*.

Leaf-blades and involucre copiously hirsute.

16. *C. stictospora*.

1. *C. Geyeri* (Engelm.) Small. Plant green; stem branched at the base; branches 0.5–4 dm. long; leaf-blades oblong to ovate, 4–12 mm. long, obtuse, usually mucronulate, truncate or subcordate at the base; involucre turbinate, 1.5 mm. high; glands 0.3 mm. broad; appendages inconspicuous, white or red; seeds narrowly ovoid, 1.5 mm. long, nearly terete, ash-colored. *Euphorbia Geyeri* Engelm. On plains and prairies: Ill.—Mo.—Tex.—Neb.—Minn. *Plain*. Je–S.

2. *C. serpens* (H.B.K.) Small. Plant pale green; stems branched at the base, 5–30 cm. long; leaf-blades orbicular to oval, 2–6 mm. long, obtuse or emarginate, rounded or subcordate at the base; involucre nearly 1 mm. high; appendages minute, irregular, crenate; capsules nodding, depressed-globose, 2 mm. broad; seeds 1 mm. long, smooth, obtusely 4-angled, light gray. *E. serpens* H.B.K. On prairies and plains: Ont.—Fla.—Ariz.—S.D.; Mex. *Plain*—*Son.* Je–O.

3. *C. revoluta* (Engelm.) Small. Plant delicate; stem very slender, 8–20 cm. high; leaves few; blades narrowly linear, 1–3 cm. long, usually about 1 mm. broad, acute; involucre 1 mm. long; glands minute, broader than long, purple; appendages white or reddish, oblong or ovate, obtuse, entire; capsules about 1 mm. long, rather sharply 3-angled; seeds oblong, less than 1 mm. long, sharply 4-angled, the faces irregularly wrinkled. *E. revoluta* Engelm. Hillsides: Tex.—Colo.—N.M.; n Mex. *Son.* Ji–Au.

4. *C. petaloidea* (Engelm.) Small. Plant pale green; stem 1–6 dm. high; leaf-blades linear, oblong or linear-lanceolate, 1–2.5 cm. long, obtuse; involucre oblong-campanulate, 2 mm. long; glands about as long as the lobes; appendage white, reniform, ovate or suborbicular, entire or undulate; capsules globose-reniform, fully 2 mm. long; seeds oblong-ovoid, nearly 2 mm. long, ash-colored,

minutely pitted, nearly terete. *E. petaloidea* Engelm. Plains, in sandy soil: la.—Mont.—Tex. *Plain*. JI-S.

5. *C. Parryi* (Engelm.) Rydb. Plant pale; stems slender, about 1 dm. high; leaf-blades linear, acute or acutish at both ends, 1-2 cm. long, 1-2 mm. wide, rolled inward when drying; involucre 1.5-2 mm. long; appendages unequal, small, greenish, truncate; capsules sharp-angled; seeds 1.5 mm. long, ovate. *E. Parryi* Engelm. Loose sand: se Utah—Nev. *L. Son*.

6. *C. flagelliformis* (Engelm.) Rydb. Plant glabrous, pale; stems prostrate or ascending, branched, 1-4 dm. long; leaf-blades linear or oblong-linear, entire, acutish at both ends, 8-15 mm. long, 2 mm. wide; involucre broadly campanulate; glands 2-4, concave; appendages obsolete or a mere margin; capsule broadly triangular; seeds gray, acute. Sandy valleys: N.M.—Colo.—Utah—Ariz. *Son*.

7. *C. albomarginata* (T. & G.) Small. Plant glabrous; stems diffusely branched from the base, 2-15 cm. long; leaf-blades suborbicular or ovate-orbicular, 4-8 mm. long, truncate or subcordate at the base; involucre fully 1 mm. high; glands transversely oval; appendages irregular, entire or lobed; capsule globose-ovoid, 2 mm. long, sharply 3-angled; seeds oblong-ovoid, 1-1.3 mm. long. *E. albomarginata* T. & G. Dry soil: Tex.—Colo.—Utah—Calif.; Mex. *Son*. Mr-N.

8. *C. Greenei* (Millsp.) Rydb. Perennial from a woody root; stems numerous, prostrate, diffuse, branched, 1-2 cm. long; leaves 4-7 mm. long and nearly as broad, glabrous, very oblique; involucre 1.5-2.5 mm. long; glands thick, purple; appendages thick, minutely 2-lobed; capsules 2.5-3 mm. thick; seeds ovoid, white, angled. *E. Greenei* Millsp. Confused with *C. Fendleri*. Dry or sandy plains: Neb.—Wyo.—Colo.—Ida. *Plain—Submont*. Je-Au.

9. *C. Fendleri* (T. & G.) Small. Plant caespitose, usually pale green; stems erect or ascending, about 1 dm. high; leaf-blades ovate to lance-ovate, 4-6 mm. long, 2-5 mm. wide; involucre 1.5-2.5 mm. high; appendages yellowish or purplish, often crenate-toothed; capsule 3 mm. in diameter; seeds ovoid, 1.5 mm. long. *E. Fendleri* T. & G. Plains: Tex.—Ariz.—Utah. *Son*. Ap-O.

10. *C. lata* (Engelm.) Small. Stems branched from a woody root, spreading or ascending, 5-15 cm. long, pubescent; leaf-blades ovate to lanceolate, 5-10 mm. long, canescent-pubescent, revolute-margined; involucre 1 mm. long; appendages narrowly crescent-shaped, undulate; capsule rounded 3-angled, 2 mm. thick; seeds oblong, 1.5 mm. long, 4-angled and transversely wrinkled. *E. lata* Engelm. Plains: Kans.—Tex.—N.M.—Colo. *Son*.

11. *C. glyptosperma* (Engelm.) Small. Plant pale green, glabrous; stem 0.5-4 dm. long; leaf-blades oblong, linear-oblong, or rarely ovate, 2-12 mm. long, obtuse or subcordate at the base, serrulate towards the apex; involucre 1 mm. long, with 4 dark ribs; appendages narrow, crescent-shaped, often crenulate; capsule less than 2 mm. thick; seeds oblong, 1 mm. long, ash-colored, strongly 4-angled. *E. glyptosperma* Engelm. Sandy soil: Ont.—Mo.—Tex.—Mex.—B.C. *Plain—Submont*. My-S.

12. *C. rugulosa* (Engelm.) Rydb. Plant light green; leaf-blades oblong, elliptic, or oval, 5-8 mm. long, semi-cordate at base, serrulate above the middle; involucre turbinate-campanulate, 1 mm. long; appendages whitish, broadly crescent-shaped or semi-orbicular, usually lobed; capsule 1.5-2 mm. thick; seeds oblong-ovoid, obtusely angled, ashy, with purplish pits, nearly 1 mm. long. *E. serpyllifolia rugulosa* Engelm. Sandy soil: s Calif.—Wyo.—Colo. Je-O.

13. *C. serpyllifolia* (Pers.) Small. Plant dark green or reddish; stems 1-4 dm. long; leaf-blades oblong or spatulate, 3-12 mm. long, obtuse or retuse, serrulate above the middle or nearly entire; involucre more than 1 mm. long; appendages narrow, crescent-shaped, lobed; capsules 2 mm. broad; seeds ovoid, hardly 1 mm. long, obtusely 4-angled. *E. serpyllifolia* Pers. Plains and in dry soil: Mich.—Tex.—Calif.—B.C.—Alta.; Mex. *Plain—Submont*. Ap-O.

14. *C. albicaulis* Rydb. Plant pale green; stems straw-colored or light greenish yellow, shining; leaf-blades linear, minutely callous-toothed towards the apex, 1-1.5 cm. long, 2-3 mm. wide; involucre about 1 mm. long, turbinate

appendages white, crescent-shaped, crenulate; pod 2 mm. thick; seeds light olive-brown, oblong, acutely 4-angled, 1.3-1.5 mm. long, less than 0.5 mm. broad. *E. albicaulis* Rydb. Cultivated or sandy soil: Ncb.—Mont.—N.M. Plain. Jl—Au.

15. *C. maculata* (L.) Small. Plant dark green; stems 5-40 cm. long, often dark red, villous; leaf-blades oblong or ovate-oblong, 4-16 mm. long, more or less serrate, usually blotched, oblique, semi-cordate at base; involucre 1 mm. long; appendages semiorbicular, white, crenulate; capsules about 2 mm. thick, pubescent; seeds ovoid-oblong, less than 1 mm. long, obtusely angled, ash-colored, minutely pitted and inconspicuously transversely wrinkled. *E. maculata* L. Dry ground and waste places: Ont.—Fla.—Tex.—Wyo.; introduced in Calif. Plain. Mr—O.

16. *C. stictospora* (Engelm.) Small. Plant yellowish green; stems 5-30 cm. long, villous; leaf-blades oblong to suborbicular, densely villous, 4-6 mm. long, obtuse, dentate-serrate above the middle; involucre campanulate, 1 mm. high; appendages narrow, crescent-shaped; capsules 1.5-2 mm. in diameter; seeds narrowly ovoid, 1.2-1.5 mm. long, pointed, pitted, ash-colored, sharply angled. *E. stictospora* Engelm. Dry soil: Kans.—Colo.—Ariz.—Tex.—Mex. Son. Ap—N.

5. ZYGOPHYLLIDIUM Small. SPURGE.

Annual herbs, with erect, forking stems. Leaves mostly opposite, narrow, equilateral, not oblique at the base. Stipules gland-like, often obsolete. Involucres short-peduncled in the upper forks. Glands 5, broader than long, with petal-like appendages. Capsule long-pedicelled, 3-lobed. Seeds terete, narrowed upwards, more or less papillose.

Leaves entire; appendages of the glands triangular-ovate.

Leaves serrate; appendages of the glands semi-orbicular.

1. *Z. hexagonum*.

2. *Z. exstipulatum*.

1. *Z. hexagonum* (Nutt.) Small. Plant yellowish green; stem slender, 1-5 dm. high, with ascending almost filiform branches; leaves linear, oblong, or lanceolate, short-petioled; involucre 2-3 mm. long, ciliate; appendages green or whitish; capsule 4 mm. thick; seeds ovoid or oblong, 3 mm. long, terete, papillose. *Euphorbia hexagona* Nutt. On sandy prairies and river valleys: Ia.—Tex.—N.M.—Mont. Plain. Jl—S.

2. *Z. exstipulatum* (Engelm.) Woot. & Standl. Plant light green; stem erect, branched, glabrous, 1-3 dm. high; leaf-blades linear to lanceolate or on the branches ovate, sharply serrate, 1-3 cm. long, glabrous; involucre fully 1 mm. high; appendages white, 2-4-lobed; capsule rounded, 3 mm. thick; seeds ash-colored, tubercled and with 2-3 cross ridges, round-angled, 2 mm. long. *E. exstipulata* Engelm. *E. Aliceae* A. Nels. Dry regions: Wyo.—Tex.—Ariz. Son.—Submont. Au—S.

6. LEPADENIA Raf. SNOW-ON-THE-MOUNTAIN.

Annual herbs, with erect stems. Leaves scattered below the umbel-like inflorescence, often very showy and petal-like in the inflorescence. Stipules fugaceous. Involucres campanulate; lobes fimbriate. Glands 5, peltate, with pink or white petal-like appendages. Capsule 3-lobed, pubescent, round-lobed. Seeds narrowed upwards, reticulate. [*Dichrophyllum* Kl. & Garke.]

1. *L. marginata* (Pursh) Niewl. Stout annual; stem 3-9 dm. tall, usually pilose; leaves ovate or obovate, 2-9 cm. long, sessile; bracts large, white-margined; involucre campanulate, 4 mm. long, usually pubescent; appendages reniform, white; capsule depressed-globose, 6 mm. in diameter, usually pubescent; seeds ovoid-globose, terete, 4 mm. long, dark ash-colored, reticulate-tuberculate. *E. marginata* Pursh. *Dicrophyllum marginatum* (Pursh) Kl. & Garke. Prairies, plains, and river valleys: Minn.—Tex.—Colo.—Mont.; introduced eastward. Plain—Submont. Jl—S.

7. TITHYMALUS (Tourn.) Adans. SPURGE.

Annual or perennial herbs, rarely shrubby, with simple or branched stems. Leaves below the inflorescence scattered, without stipules, entire or toothed,

often broadened upwards. Bracts of the umbel-like inflorescence different from the stem-leaves. Involucres sessile or peduncled; lobes often toothed. Glands 4, transversely oblong, reniform, or crescent-shaped, with the horn-like appendages pointing upwards. Capsule 3-lobed; lobes rounded, acute or keeled. Seeds pitted.

Leaves entire; glands of the involucres with processes, except in the first species.

Perennials with a woody base; processes short and blunt, or none.

Stem-leaves linear; capsule rough; seeds smooth.

1. *T. Cyparissias*.

Stem-leaves from oblong or oblanceolate to orbicular; capsule smooth or slightly wrinkled; seeds pitted.

Glands crenulate, obscurely horned; leaves small, ascending.

2. *T. luridus*.

Glands distinctly horned; horns larger than the teeth (if any) between them; leaves large, spreading.

Bracts rhombic-ovate, cuspidate; stem rather slender.

3. *T. philorus*.

Bracts rhombic-reniform, mucronate; stem stout.

4. *T. robustus*.

Annuals or perennials by means of sobols (suckers); processes of the glands long and horn-like.

Seeds with small deep pits; leaves very thin.

5. *T. commutatus*.

Seeds with broad shallow pits; leaves firm.

6. *T. mancus*.

Leaves distinctly serrulate; plants annual or biennial; glands without processes.

Upper stem-leaves merely sessile; bracts manifestly longer than broad.

7. *T. arkansanus*.

Upper stem-leaves with small auricles at the base; bracts mostly broader than long.

8. *T. missouriensis*.

1. ***T. Cyparissias*** (L.) Lam. Bright green, caespitose perennial; stems erect, usually simple, 2-3 dm. high, very leafy; leaves 1.5-3 cm. long, 0.5-3 mm. broad; bracts reniform or nearly orbicular; involucres 2 mm. long; glands crescent-shaped; appendages none; capsule subglobose, 3 mm. thick; seeds oblong, 2 mm. long. *E. Cyparissias* L. Waste places and around dwellings: Mass.—Va.—Colo.—Mont.; escaped and nat. from Eu. My—O.

2. ***T. luridus*** (Engelm.) Woot. & Standl. Stems several from the woody caudex, 1.5-3 dm. high, strict, very leafy; leaves oblanceolate or obovate, obtuse or mucronate, 8-15 mm. long; bracts oblanceolate to rounded; involucres 2 mm. long, hirsute within; glands transversely oblong; capsule 3 mm. thick; seeds cylindric-ovoid, 2.4 mm. long. *E. lurida* Engelm. Arid regions: N.M.—s Utah—Ariz. Son. Je—Jl.

3. ***T. philorus*** Cockerell. Glabrous, caespitose perennial; stems branched, erect, 1-3 dm. high; leaves ovate, lanceolate, or broadly oval, 0.5-2 cm. long; involucres 2 mm. high; glands 0.5 mm. long, 1 mm. wide; capsule depressed-ovoid, 3 mm. high, 3.5 mm. wide; seeds ovoid-oblong, 2 mm. long, ash-colored. *E. montana* Engelm., not Raf. Mountains: Colo.—Utah—Mex.—Tex. Son.—Submont. Mr—Jl.

4. ***T. robustus*** (Engelm.) Small. Robust, caespitose perennial; stems 1-3 dm. high; usually glabrous; stem-leaves oblong to broadly ovate, 1-2 cm. long, often nearly as broad; involucres 2.5 mm. high, 1.5 mm. wide, hirsute inside; glands often dentate between the short horns, 1-2 mm. wide; capsule depressed-ovoid, 4-4.5 mm. wide; seeds ovoid, 2.3 mm. long, with shallow pits. *E. montana robusta* Engelm. Mountains: S.D.—Mont.—Ariz.—N.M.—Neb. Plain—Submont. My—Jl.

5. ***T. commutatus*** (Engelm.) Kl. & Garke. Annual or perennial by means of shoots from the decumbent stems, 1.5-3 dm. high, branched at the base; stem-leaves obovate, obtuse or retuse, 0.5-3 cm. long; those of the sterile branches oblanceolate; bracts triangular-reniform; glands 1-1.5 mm. wide, yellow or brown when old; horns white, twice as long; capsule 3 mm. thick; seeds subglobose. *E. commutata* Engelm. River valleys and sandy soil: Pa.—N.C.—Tex.—Wis.—Mont. Plain. My—Jl.

6. ***T. mancus*** (A. Nels.) Heller. Annual; stems 1-3 dm. high, branched at the base, erect, or decumbent below; leaves spatulate or obovate, obtuse, 1-2 cm. long; bracts ovate-reniform, connate especially on the outside, 1-2 cm. wide and more than half as long; glands 2 mm. wide, with divergent horns; capsule 4 mm. long, somewhat broader; seeds oblong-ovoid. *E. manca* A. Nels. Valleys: Colo.—Ariz.

7. *T. arkansanus* (Engelm. & Gray) Kl. & Garke. Annual or biennial; stem slender, 2-5 dm. high, branched; leaves few, cuneate or spatulate, acute, serrulate, 1-3 cm. long, 5-10 mm. wide; bracts broadly triangular-ovate to oblong, mucronate, serrulate, the larger 1 cm. wide, 1-2 cm. long; involucre 1 mm. high; glands transversely elliptic, yellow, less than 1 mm. wide; capsule depressed globose, verrucose, 2.5-3 mm. wide; seeds ovoid-lenticular, brown or purplish, wrinkled, reticulate, nearly 1.5 mm. long. *E. arkansana* Engelm. & Gray. Plains and sandy places: N.D.—Mo.—Ala.—Tex.—Ariz.—Wyo.; Mex. *Plain.* Ap-Je.

8. *T. missouriensis* (Norton) Small. Annual or biennial, olive-green; stem 3-6 dm. high, stout; stem-leaves spatulate, 2-3.5 cm. long, obtuse, serrate to below the middle; bracts ovate, inequilateral, acute, serrate; involucre less than 2 mm. high; glands transversely oblong; capsules 3-3.5 mm. wide, bearing elongated warts; seeds ovoid, distinctly and regularly reticulate, purplish-brown. *E. arkansana missouriensis* Norton. Dry plains: Minn.—Kans.—N.M.—Wash. *Plain.* My-Jl.

8. **POINSETTIA** Graham. SPURGE.

Annual or perennial herbs, or shrubby plants, with green or partially colored foliage. Leaves alternate below, opposite above. Stipules gland-like. Involucres in axillary or terminal cymes, or solitary; lobes finbriate. Glands fleshy, solitary, or rarely 3 or 4, without appendages. Capsule 3-lobed, lobes rounded. Seeds narrowed upwards, tuberculate.

Gland or glands of the involucre stalked; bracts and upper leaves slightly if at all discolored.

Seeds not prominently tubercled; glands of the involucre 3-4; leaf-blades linear or linear-lanceolate.

Seeds prominently tubercled; gland of the involucre solitary; leaf-blades ovate to lanceolate (linear-lanceolate only in one variety).

Gland of the involucre sessile or nearly so; bracts and upper leaves discolored at the base; leaf-blades very variable, the upper usually fiddle-shaped.

1. *P. cuphusperma*.
2. *P. dentata*.
3. *P. heterophylla*.

1. *P. cuphusperma* (Boiss.) Small. Simple annual; stem 2-4 dm. high, more or less pubescent, especially upwards, erect; leaf-blades 2-8.5 cm. long, entire or denticulate; involucre crowded at the ends of the branches, almost 4 mm. long; capsule 5 mm. in diameter; seeds narrowly ovoid, 3 mm. long, irregularly 4-angled, ridged and slightly tuberculate. *E. cuphusperma* Boiss. Plains and prairies: S.D.—Colo.—Ariz.—Tex.—Mex. *Son.—Submont.* Au-S.

2. *P. dentata* (Michx.) Small. Pubescent annual; stem erect or ascending, 2-4 dm. high, somewhat woody at the base, branched; leaf-blades from ovate to nearly linear or orbicular-oblong, 1-9 cm. long, coarsely dentate; involucre about 3 mm. long; capsule glabrous, 4-5 mm. in diameter; seeds ovoid-globose, ash-colored, inconspicuously 4-angled. *E. dentata* Michx. Dry soil: S.D.—Pa.—La.—Mex. *Plain—Submont.* Je-S.

3. *P. heterophylla* (L.) Small. Bright green annual or biennial, pubescent or nearly glabrous; stem erect, 3-10 dm. high, woody below; leaf-blades linear to orbicular, the lower ones often entire, the upper undulate, sinuate, or dentate, the uppermost often fiddle-shaped and like the bracts blotched with red; involucre 3 mm. long, with 5 ovate or oblong lacinate lobes, one sinus bearing a sessile gland; capsule glabrous or minutely pubescent, 6 mm. broad; seeds oblong-ovoid, 3-4 mm. long, transversely wrinkled and tuberculate. *E. heterophylla* L. Sandy soil: Ill.—Fla.—Tex.—Mont.; Mex. and trop. Am. *Plain.* Ja-D.

FAMILY 75. **CALLITRICHACEAE.** WATER STARWORT FAMILY.

Small aquatic caulescent annuals or perennials, with opposite, entire leaves, often crowded towards the end of the branches. Flowers inconspicuous, solitary in the axils of the leaves, polygamous. Calyx wanting. Corolla none. Stamens solitary; anthers 2-celled; cells sometimes con-

fluent. Pistils solitary; ovary 4-celled; styles united in pairs. Fruit leathery, indehiscent, 4-lobed, 4-seeded. Endosperm fleshy, embryo straight, axile, terete.

1. *CALLITRICHE* L. WATER STARWORT.

Characters of the family.

Upper floating leaves obovate or spatulate, 3-nerved; flowers subtended by a pair of bracts.

All leaves linear, 1-nerved; flowers bractless.

1. *C. palustris*.
2. *C. autumnalis*.

1. *C. palustris* L. Aquatic annual; stems usually floating, 2-30 cm. long; submerged leaves sessile, linear, 1-nerved, 1-1.5 cm. long; floating leaves petioled; blades 5-10 mm. long; fruit obovoid, 1.5 mm. long, slightly notched, grooved and winged, especially above. *C. verna* L. Shallow water: Newf.—Fla.—Calif.—Alaska; Mex., S. Am., and Eurasia. Plain—Mont. Je—Au.

2. *C. autumnalis* L. Submerged aquatic annual; stem slender, 1-4 dm. long; leaves all linear, retuse or bifid at the apex, 0.5-2 cm. long; fruit orbicular or rounded ellipsoid, 1-2 mm. in diameter, grooved and winged. *C. bifida* (L.) Morong. In water: Que.—N.Y.—Colo.—Utah—Ore.; Eu. Plain—Mont. Jl—S.

FAMILY 76. CELASTRACEAE. STAFF-TREE FAMILY.

Shrubs, trees, or twining vines, sometimes spiny, with opposite, whorled, or alternate, simple leaves, with or without stipules. Inflorescence normally cymose. Flowers perfect, polygamous, or dioecious. Sepals 4 or 5, imbricate. Petals 4 or 5, usually inserted under the fleshy disk, imbricate. Stamens 4 or 5 under the disk, on the margin thereof, or on top of it. Gynoecium of a compound pistil. Ovary 2-5-celled; style short or wanting; stigma 2-5-lobed. Fruit a capsule, drupe, or berry. Seeds often surrounded by a brightly colored aril.

Stamens as many as the petals and sepals.

Fruit a loculicidal capsule; seeds with an aril.

Shrubby vines, with alternate leaves; ovary free from the disk; aril crimson.

Shrubs, with opposite leaves; ovary immersed in the disk.

Capsule 3-5-celled, 3-5-lobed; aril orange or scarlet.

Capsule 2-celled, unlobed; aril white or nearly so.

Fruit indehiscent, by abortion 1-seeded; aril wanting.

Stamens more numerous than the sepals or petals; ovary 1-celled.

1. CELASTRUS.
2. EUONYMUS.
3. PACHYSTIMA.
4. MORTONIA.
5. FORSELLESIA.

1. *CELÁSTRUS* L. WAXWORK, SHRUBBY BITTERSWEET, STAFF-TREE.

Usually twining vines or shrubs. Leaves alternate, entire or toothed; stipules minute. Flowers in axillary or terminal racemes, or panicles. Sepals 5. Hypanthium urn-shaped. Petals 5, inserted under the disk, which is cup-shaped, 5-lobed. Stamens 5, inserted in the sinuses of the disk. Gynoecium of a compound pistil; ovary 2-4-celled, sometimes incompletely so; style short and stout; stigma 2-4-lobed. Ovules 2 in each cavity, erect. Capsule globose or ellipsoid, leathery, 2-4-celled, loculicidal. Seeds 1 or 2 in each cavity, surrounded by a scarlet aril.

1. *C. scandens* L. A climbing shrub, usually with twining branches; leaf-blades elliptic, oval, oblong, or ovate, 6-10 cm. long, acuminate, crenate, glabrous or nearly so; petals oblong or obovate, greenish, erose; capsule subglobose, 1 cm. in diameter, finely wrinkled, orange, opening by 3 valves. Along streams and in thickets: Que.—Fla.—N.M.—Mont. Plain. My—Je.

2. *EUÓNYMUS* (Tourn.) L. BURNING BUSH, WAHOO.

Shrubs or trees, commonly with 4-angled branches. Leaves opposite, entire or toothed, deciduous; stipules caducous. Flowers solitary or cymose. Sepals 4 or 5. Petals as many, inserted under the disk. Stamens 4 or 5, inserted on the disk; filaments very short; anthers 2-celled. Disk flat, 4- or 5-lobed. Gynoe-

cium of a compound pistil; ovary 3-5-celled; stigma with as many inconspicuous lobes; ovules 2 in each cavity, ascending. Capsule 3-5-lobed, angled or winged, loculicidal. Seeds 2 in each cavity, surrounded by an orange or scarlet aril.

1. **E. atropurpureus** Jacq. A shrub or small tree, 1-8 m. high; leaf-blades elliptic to ovate or obovate, 5-16 cm. long, acuminate, puberulent, crenate-serrate; flowers trichotomously cymose; corolla dark purple; petals 4, suborbicular, 2-3 mm. long; capsule 4-lobed, pendulous, not warty, depressed, the lobes wing-like; seeds 8-10 mm. long, with a scarlet aril. River banks: N.Y.—Fla.—Okla.—Mont. *Plain.* Je.

3. **PACHYSTIMA** Raf. MOUNTAIN LOVER.

Low, depressed evergreen shrubs. Leaves opposite, leathery, toothed or entire. Flowers solitary or clustered in the axils of the leaves. Sepals 4. Petals 4, greenish. Stamens 4, inserted under the flat, 4-angled disk; filaments short. Ovary 2-celled; style very short; stigma obscurely 2-lobed. Ovules 2 in each cavity, erect. Capsule 2-celled, somewhat flattened, not lobed, 2-valved. Seeds surrounded by a white aril.

Leaves decussately spreading; petioles abruptly contracted into the midrib; petals nearly as broad as long; stigma rounded. 1. *P. Myrsinites*.

Leaves arranged in one plane; petioles thickened, the thickening continued into the midrib; stigma 2-lobed.

Stigma slightly 2-lobed; anthers equalling the filaments. 2. *P. macrophylla*.

Stigmas deeply 2-cleft; anthers much shorter than the filaments. 3. *P. Schaefferi*.

1. **P. Myrsinites** (Pursh) Raf. Shrub 2-5 dm. high; branches usually ascending, brown, with 4 dark ridges; leaf-blade oval or elliptic, with dentate, thickened, and revolute margins, yellowish green, 1-3 cm. long; lateral veins 3-4 pairs; flowers numerous, odorless; sepals broadly oval, with faint midribs, obtuse; petals oval or ovate; filaments twice as long as the anthers. Wooded hills and mountains: Alta.—N.M.—Calif.—B.C. *Submont.*—Mont. My—Au.

2. **P. macrophyllum** Farr. Shrub 4-6 dm. tall; branches cinnamon-brown, with 4 dark brown ridges, loosely spreading; leaf-blades oval-elliptic or oblanceolate, 2-4 cm. long, with 6 pairs of lateral veins, bluish green above, bright green beneath; margins serrate and revolute; flowers few; sepals ovate, with prominent midrib, pointed; petals ovate; filaments equalling the anthers. Mountains: B.C. *Mont.* My—Je.

3. **P. Schaefferi** Farr. Shrub about 5 dm. high; branches spreading, dark brown; leaf-blades lanceolate to linear-lanceolate, the veins 6-7 pairs, blunt-toothed above, not revolute, bright green; flowers fragrant, numerous; sepals and petals as in the preceding; filaments 1.5-2 times as long as the anthers. Mountains: B.C. My—Je.

4. **MORTONIA** A. Gray.

Intricately branched low shrubs, with often hispid twigs. Leaves alternate, thick, entire, 1-nerved, with abortive stipules. Flowers cymose or paniculate-cymose, perfect. Sepals and petals 5. Stamens 5. Pistil compound; ovary 5-celled; style short, terminal; stigma 5-lobed; ovules 2 in each cell. Fruit dry, oblong, 1-celled and 1-seeded by abortion; seed filling the cavity, without an aril.

1. **M. utahensis** (Coville) Rydb. A shrub about 1 m. high, with spreading branches and yellow bark; twigs scabrous-hispidulous; leaf-blades thick, scabrous-hispidulous, oval, 8-13 mm. long, entire; panicles narrow, raceme-like, 3-5 cm. long; sepals lanceolate-triangular, 2 mm. long; petals 3 mm. long, broadly obovate, crenulate on the margins, white. Arid regions: Utah—Nev.—Ariz. *Son.*

5. **FORSELLÈSIA** Greene.

Small shrubs, with green, glabrous, spinescent branches. Leaves alternate, small, entire, with adnate setaceous stipules. Flowers axillary, subsolitary, perfect. Sepals and petals 4-6. Stamens more numerous, usually twice as

many as the sepals and petals. Gynoecium of a compound pistil; stigma sessile, slightly notched; ovary 1-celled, with 2 basal anatropous ovules. Fruit follicular, 1- or 2-seeded; seeds with a minute aril or caruncle at the base. [*Glossopetalon* A. Gray.]

Stamens 5-7.
Stamens 10.

1. *F. meionandra*.
2. *F. spinescens*.

1. ***F. meionandra*** (Koehne) Heller. A low intricately branched spinescent shrub; leaves grayish green, blades up to 15 mm. long, cuneate oblong or oblanceolate; sepals ovate; petals 5-6 mm. long, 2 mm. wide, spatulate. *Glossopetalon meionandrum* Koehne. Hills: w Colo. Submont. My.

2. ***F. spinescens*** (A. Gray) Greene. An intricately branched, spinescent shrub 3-12 dm. high; leaves glaucous, glabrous, oblanceolate or linear-oblanceolate, 5-10 mm. long, acute; sepals oblong-ovate, 2 mm. long; petals narrowly linear, 4-5 mm. long; capsule ovoid, somewhat flattened, strongly striate. *G. spinescens* A. Gray. Mountain ravines and cliffs: Ore.—Calif.—Tex.—Colo.; Mex. Son. F—My.

FAMILY 77. ANACHARDIACEAE. SUMACH FAMILY.

Polygamous, monoecious, or dioecious, or rarely hermaphrodite shrubs or trees, with alternate, simple or pinnate leaves, without stipules. Inflorescence paniculate, or spicate, or racemose. Flowers regular. Sepals 3-5, distinct. Petals 3-5, usually inserted on a hypogynous disk, imbricate or rarely valvate. Stamens 3-5, rarely more, alternate with the petals. Gynoecium of 1, or 4 or 5 united or nearly distinct carpels; styles united, sometimes distinct; stigmas entire. Fruit a drupe or a berry; seeds solitary.

Drupe with pubescent exocarp; stone smooth.
Drupe with glabrous, smooth exocarp; stone ribbed.

1. RHUS.
2. TOXICODENDRON.

1. RHŪS (Tourn.) L. SUMACH, SKUNK-BUSH.

Shrubs or trees, not poisonous. Leaves alternate, odd-pinnate, rarely unifoliate; leaflets more or less toothed. Flowers in terminal panicles, polygamous or dioecious. Sepals commonly 5. Petals as many, imbricate. Ovary 1-celled; ovules pendulous. Drupe red, covered with acid-secreting hairs. Stone smooth. Stamens 5, inserted under the edge or between the lobes of the flattened disk. Flowers greenish white or yellowish.

Leaflets 11-21; inflorescence terminating leafy shoots.

Leaflets light green or yellowish green, rather dull, subsessile.

Leaflets dark green above, shining, strictly sessile.

Leaflets 1-3, rarely 5; inflorescence axillary.

Leaves densely villous.

Leaves puberulent or glabrous.

Leaves 3-foliate, rarely 5-foliate.

Branchlets and leaves puberulent, at least when young.

Branchlets and leaves glabrous, except a few scattered cilia on the petioles and veins.

Leaves 1-foliate, or rarely some of them 3-foliate with small lateral leaflets and a broad terminal one.

1. *R. cismontana*.
2. *R. occidentalis*.
3. *R. Osterhoutii*.

4. *R. trilobata*.
5. *R. oxyacanthoides*.
6. *R. utahensis*.

1. ***R. cismontana*** Greene. Shrub 1-2 m. high; branches glabrous, often reddish, somewhat glaucous; leaves 1.5-2 dm. long; leaflets 11-15, usually pallid green, often lighter along the veins, glaucescent beneath, 5-10 cm. long, lanceolate, abruptly acuminate, sharply serrate, thin; panicle about 1 dm. long; branches usually spreading, finely pubescent; calyx-lobes 1 mm. long; petals greenish yellow, 2-2.5 mm. long. *R. sambucina*, *R. tessellata*, *R. albida*, and *R. asplenifolia* Greene. Along streams: S.D.—Mo.—N.M.—Ariz.—Wyo. Plain—Submont. My—Jl.

2. ***R. occidentalis*** (Torr.) Blankinship. Shrub 1-3 m. high; branches glabrous and glaucous; leaves ascending, often 3 dm. long; leaflets 11-21, oblong-lanceolate, 6-8 cm. long, sharply serrate up to the long acumination, very glau-

cous beneath; panicles 1-2 dm. long, branches usually strongly ascending, rather densely pilose; calyx-lobes 1.5 mm. long; petals yellowish, 3 mm. long; fruits 4 mm. wide. *R. glabra occidentalis* Torr. *R. arguta* Greene. *R. nitens* Greene. Along streams: Ore.—B.C.—Mont.—Utah. *Son.* My-Jl.

3. *R. Osterhoutii* Rydb. Shrub about 1 m. high; leaves trifoliate; leaflets sessile, 1-2.5 cm. long, cuneate, 3-5-lobed and some of the lobes with rounded teeth, dark green above, pale beneath. *Schmaltzia pubescens* Osterh. Hills: Colo. *Submont.* Je.

4. *R. trilobata* Nutt. Shrub 1-2 m. high, blooming before the leaves; leaves trifoliate, with unpleasant odor; leaflets 1-3 cm. long, dark green above, paler and minutely pubescent beneath, the lateral ones elliptic or cuneate-obovate, the terminal one cuneate-spatulate, usually more or less 3-lobed and crenate; petals obovate, 2 mm. long; fruit globose, 5-6 mm. thick, more or less densely short-pubescent. *Schmaltzia trilobata*, *S. Bakeri*, *S. cognata*, *S. glomerata*, *S. subpinnata*, and *S. glabrata* Greene. Hills and plains: Sask.—Mo.—Tex.—Calif.—Wash. *Plain—Submont.* Ap-Je.

5. *R. oxyacanthoides* (Greene) Rydb. Low shrub, about 1 m. high; leaves 3-foliate; leaflets obovate-cuneate, or the terminal one rhombic-obovate, rather thin, rounded-crenate, the terminal one 2-4 cm. long, and often 3-lobed, the lateral ones 1.5-3 cm. long; fruit bright red, puberulent. *Schmaltzia oxyacanthoides* Greene. Hills and cañons: w Colo.—Utah—(? Mont.) *Submont.* Ap-My.

6. *R. utahensis* Goodding. A shrub 1-1.5 m. high, diffusely branched; leaves simple, the blades usually suborbicular or reniform, truncate at the base, crenate, or rarely 3-lobed, 1.5-3 cm. long, finely pubescent beneath; inflorescence few-flowered; fruit rather large, 5-8 mm. thick, short-pubescent. *R. canadensis simplicifolia* Greene. *Schmaltzia simplicifolia* and *S. affinis* Greene. Desert regions: Utah—Ariz.—L. Calif. *Son.* Ap.

2. **TOXICODENDRON** (Tourn.) Mill. POISON IVY, POISON OAK, POISON SUMACH.

Shrubs, trees, or vines, with a resinous sap, poisonous to touch. Leaves alternate, pinnately 3-several-foliate, with coarsely toothed or entire leaflets. Flowers polygamous, paniculate. Sepals 4-6, persistent. Petals 4-6, imbricate, yellowish or greenish. Disk annular. Stamens 4-6 or 10. Ovary 1-celled; ovules pendulous. Drupe whitish, smooth, shining, glabrous. Stone striately ribbed.

Leaflets thick, the terminal one decidedly longer than broad, its petiolule usually 1-2 cm. long; petals 3 mm. long.

Leaflets thin, the terminal one nearly as broad as long, its petiolule 3-4 cm. long; petals 2.5 mm. long.

1. *T. Rydbergii*.

2. *T. longipes*.

1. *T. Rydbergii* (Small) Greene. A single-stemmed shrub, usually less than 1 m. high; leaves pinnately 3-foliate; leaflets 3-10 cm. long, rhombic-ovate, thick, bright green, strongly veined beneath, glabrous, usually coarsely and broadly toothed; flowers in dense axillary panicles; petals whitish yellow, with greenish veins; fruit depressed-globose, 5-6 mm. in diameter. *T. hesperinum* Greene, a large form. Hillsides and open woods: S.D.—Kans.—N.M.—Ariz.—Ore.—B.C. *Plain—Submont.* Je-Jl.

2. *T. longipes* Greene. Erect single-stemmed shrub; leaves pinnately 3-foliate; leaflets thin, light green, the lateral ones broadly obliquely ovate, 7-10 cm. long, the terminal one almost orbicular, abruptly short-acuminate, coarsely toothed; inflorescence racemose, lax, rarely with 1 or 2 branches below; petals reflexed, greenish white, with dark veins. Cañons: Utah. *Submont.* Je.

FAMILY 78. **ACERACEAE.** MAPLE FAMILY.

Shrubs or trees, with opposite, simple or compound leaves, without stipules. Flowers perfect or polygamous, rarely dioecious or monoecious, regular. Sepals 4 or 5, rarely 6-9, imbricate, often colored. Petals of the

same number, inserted on the margins of an indistinct disk, or very often wanting. Stamens 4-9, often 8. Gynoecium of two united carpels; styles united. Fruit of 2 winged carpels, united below (samaras).

Leaves palmately lobed or rarely palmately compound; flowers polygamous or perfect.

Leaves pinnately compound; flowers dioecious.

1. ACER.
2. NEGUNDO.

1. **ACER** (Tourn.) L. MAPLE.

Trees or rarely shrubs. Leaves opposite, petioled, more or less palmately lobed or cleft, rarely palmately compound. Flowers polygamous or rarely perfect, regular, in axillary or terminal racemes or corymbs. Sepals 4 or 5, rarely 6-9. Disk cup-shaped, lobed, or more commonly obsolete or wanting. Stamens 4-9. Petals as many as the sepals or wanting. Samaras 2, with reticulate wings.

Flowers in racemes or corymbs; petals and sepals both present; disk well developed; lobes of the leaves toothed.

Flowers in long racemes, appearing after the leaves; leaves long-acuminate, with small lateral lobes; petals longer than the sepals. 1. *A. spicatum*.

Flowers corymbose, appearing with the leaves; leaves not long-acuminate, deeply 3-5-cleft; terminal lobe only slightly larger; petals and sepals greenish, sub-equal.

Bark of the one-year-old branches grayish; leaves and their lobes acuminate, not dotted beneath.

Sinuses between the leaf-lobes shallow, open; terminal lobe broadly triangular-ovate. 2. *A. Douglasii*.

Sinuses between the leaf-lobes deep and narrow; terminal lobe rhombic.

3. *A. glabrum*.

Bark of the one-year-old branches white; leaves and their lobes acute, not acuminate, with more or less numerous glandular red dots beneath.

4. *A. tripartitum*.

Flowers in umbels, appearing with the leaves; petals lacking; lobes of the leaves sinuate.

5. *A. grandidentatum*.

1. ***A. spicatum*** Lam. Shrub or small tree, sometimes 10 m. high, with thin smooth bark; twigs somewhat velutinous-puberulent or glabrate in age; leaf-blades longer than broad, cordate, 3-lobed, glabrate above, paler and pubescent beneath; petals linear or spatulate; samaras about 2 cm. long; wings ascending-spreading at about 90°; backs nearly straight. Rocky woods and mountain slopes: Newf.—Ga.—Minn.—Sask. *Boreal*. My—Je.

2. ***A. Douglasii*** Hook. Shrub or small tree, sometimes 10 m. high; twigs glabrous, purplish or red; older branches grayish; leaf-blades broadly cordate in outline, 3-10 cm. long and about as broad, 3-5-lobed, or on young shoots and vigorous twigs sometimes 3-divided to the base, glabrous on both sides; samaras 3-4 cm. long, ascending, usually incurved on the back; sinus usually rounded. *A. subserratum* Greene. Hills and mountain sides: Alta.—Wyo.—Ore.—B.C. *Submont.*—Mont. Ap—Je.

3. ***A. glabrum*** Torrey. Usually a small tree, 5-15 m. high; twigs glabrous, reddish; older branches gray; leaf-blades broadly cordate or rounded-reniform in outline, 4-8 cm. long, 4-10 cm. wide, glabrous, 5-7 lobed, or usually on young shoots and vigorous branches or sometimes on the whole tree 3-divided to the base; samaras 2.5-3 cm. long, usually straight on the back; sinus usually acute. *A. neomexicanum* Greene. Mountains, usually along streams: S.D.—N.M.—Utah—Wyo. *Submont.*—Mont. My—Je.

4. ***A. tripartitum*** Nutt. Shrub 1-5 m. high; twigs reddish, glabrous; leaf-blades rounded-reniform in outline, glabrous above, more or less puberulent beneath, shining, 3-5-lobed or -cleft or sometimes [as in the type specimens] 3-parted to the base, the terminal lobe more or less rhombic, coarsely toothed, 2-4 cm. long, 2-5 cm. wide; samaras 2-2.5 cm. long, ascending, incurved on the back, forming with each other a narrow angle. Dry hills: Wyo.—Utah—s Calif. *Son.*—*Submont.* My—Je.

5. ***A. grandidentatum*** Nutt. Shrub or rarely a small tree, 5 m. high, with light brown twigs and gray branches; leaves reniform or orbicular in outline, deeply 3-5 lobed, with rounded sinuses, glabrous, pale and velutinous

beneath, 4-8 cm. long, 5-10 cm. wide; lobes rhombic-lanceolate; hypanthium long-hairy; samaras divergent, about 3 cm. long, forming with each other an angle of about 120°. Cañons: w Tex.—Wyo.—Ida.—Ariz. *Son.*—*Submont.* Ap—My.

2. NEGÚNDO (Ray) Ludwig. BOX-ELDER, ASH-LEAVED MAPLE.

Trees, with light green twigs, widely branching. Leaves opposite, odd-pinnate, usually with toothed leaflets. Flowers dioecious, appearing before the leaves, the staminate in drooping small clusters, the pistillate racemose. Sepals 4 or 5, very small. Petals wanting. Stamens 4 or 5. Disk obsolete. Samaras 2, with reticulate wings. [*Rulac* Adans.]

Branchlets glabrous, usually with a bloom; anthers acute, tapering into a tip one-half to one-fourth mm. long. 1. *N. Nuttallii*.

Branchlets pubescent; anthers obtuse, merely mucronate.

Wings of the carpels terminal, scarcely at all decurrent on the body; racemes seldom over 1 dm. long in fruit. 2. *N. interius*.

Wings of the carpels extending down on the inner side almost to the bottom of the sinus; racemes in fruit 1.5-2 dm. long. 3. *N. Kingii*.

1. *N. Nuttallii* (Nieuwl.) Rydb. Tree up to 15 m. high, with spreading branches; bark of the twigs and younger branches light green; leaflets usually 3, lanceolate or ovate, long-acuminate, usually rounded at the base, coarsely toothed or often more or less lobed, sparingly hairy or in age glabrate above, more densely so beneath, and often with tufts of hairs in the axils of the veins; fruit glabrous, gradually tapering below; wing scarcely decurrent. River valleys: Mich.—Ia.—Kans.—Colo.—Mont.; often cultivated. *Plain.* Ap—My.

2. *N. interius* (Britton) Rydb. Tree up to 12 m. high; leaflets lanceolate or ovate, or the terminal rhombic, 5-12 cm. long, long-acuminate, usually lobed, coarsely toothed, otherwise as in the preceding; fruit as in the preceding. *A. interior* Britton. Along streams and in cañons, mostly in the foot-hills and mountains: Sask.—Man.—Neb.—N.M.—Ariz.—Mont. *Plain*—*Submont.* My—Je.

3. *N. Kingii* (Britton) Rydb. Tree perhaps 10 m. high; twigs grayish green; leaflets lanceolate, long-acuminate, 5-10 cm. long; pubescence as in the preceding; fruit glabrous; wings less spreading than in the two preceding. *A. Kingii* Britton. Cañons: Utah—(? Ariz.). *Submont.*—*Mont.* My—Je.

FAMILY 79. RHAMNACEAE. BUCKTHORN FAMILY.

Shrubs or trees, with alternate, rarely opposite, simple, usually several-ribbed leaves and small stipules. Flowers greenish, perfect or polygamous, rarely dioecious. Sepals 4 or 5, valvate. Hypanthium somewhat developed, lined or filled with a thickened disk. Petals 4 or 5. Stamens of the same number, inserted on the disk, opposite the petals. Gynoecium of 2 or 3 united carpels; ovary 2- or 3-celled, partly immersed in the disk. Styles and stigmas more or less united. Fruit a capsule, a drupe, or rarely a samara.

Fruit pulpy; petals small, clawless, or wanting; stigmas usually 2.

1. RHAMNUS.

Fruit dry; petals hooded and long-clawed; stigmas 3.

2. CEANOTHUS.

1. RHÁMNUS (Tourn.) L. BUCKTHORN.

Shrubs or trees, unarmed, or with spinose branchlets. Leaves alternate, entire or toothed, several-ribbed; stipules deciduous. Flowers perfect or polygamo-dioecious, axillary, often clustered, in racemes, cymes or umbels. Sepals 4 or 5, keeled within. Disk cup-shaped, lining the hypanthium. Petals 4 or 5, or wanting, clawless, inserted on the margin of the disk. Stamens of the same number, on the edge of the disk; filaments very short. Ovary 2-4-celled; styles 2-4, united at the base. Drupe berry-like, with 3-4 nutlets. Endosperm fleshy.

Flowers solitary or in sessile umbels, usually polygamo-dioecious or dioecious; winter-buds scaly.

Shrub spinose; introduced species.

1. *R. carthartica*.

Shrub not spinose; native species.

Flowers 4-merous; petals present; seeds 2, grooved; leaves not strongly veiny.

Leaves broadly lanceolate, acuminate with a blunt apex. 2. *R. lanceolata*.

Leaves narrowly lanceolate, not acuminate. 3. *R. Smithii*.

Flowers 5-merous, apetalous; seeds 3, scarcely grooved; leaves strongly veiny.

4. *R. alnifolia*.

Flowers in peduncled umbels or corymbs, perfect; winter-buds not scaly, pubescent.

Peduncles longer than the pedicels; leaves merely callous-denticulate. 5. *R. Purshiana*.

Peduncles shorter than the pedicels, sometimes almost none; leaves finely but distinctly serrate. 6. *R. betulaeifolia*.

1. *R. carthartica* L. Shrub or low tree, 2-7 m. high, with rough bark; leaves petioled; blades glabrous or nearly so, broadly ovate or oval, 3-6 cm. long, crenate; flowers dioecious, greenish, 4-merous; petals lanceolate; drupe globose, about 8 mm. in diameter; seeds 3-4, grooved. Around dwellings: Ont.—Va.—Colo.; cult. and occasionally escaped; native of Eu. Je.

2. *R. lanceolata* Pursh. Unarmed shrub or small tree; leaves short-petioled; blades lanceolate or ovate-lanceolate, acuminate, with a blunt apex, minutely crenate, glabrous above, puberulent beneath, 3-8 cm. long; flowers 2-3 in the axils of the leaves, greenish, dioecious; petals lanceolate, shorter than the sepals; drupe black, 6 mm. in diameter. Wet ground: Pa.—Ala.—Tex.—Neb. Plain. My-Je.

3. *R. Smithii* Greene. Unarmed shrub, with densely leafy branches and yellowish or grayish bark; leaves short-petioled; blades yellowish green, lanceolate, obtuse or acutish, finely crenate, 2-4 cm. long; flowers greenish, dioecious; drupe subglobose, 6-7 mm. in diameter, black. Mountain valleys: Colo.—N.M.—Ariz.—Utah. Submont. Je.

4. *R. alnifolia* L'Her. Unarmed shrub, 1-2 m. high; branches gray, finely pubescent; leaves short-petioled; blades oval or elliptic, from obtuse to somewhat acuminate, coarsely crenate-serrate, finely pubescent when young, soon glabrate, 3-10 cm. long, strongly veined; flowers solitary or 2 or 3 umbellate; sepals spreading; drupe black, 7-8 mm. in diameter. Swamps: Me.—N.J.—Wyo.—n Calif.—B.C. Submont. My-Je.

5. *R. Purshiana* DC. Unarmed shrub or small tree, 3-10 m. high; leaves short-petioled; blades broadly oval, rounded or subcordate at the base, obtuse or abruptly short-acuminate, 3-12 cm. long, short-villous beneath and on the veins above; flowers 5-merous, perfect; petals minute; drupe depressed-globose, purple or black, 3-seeded; seeds plano-convex, without a groove. Woods: Mont.—Calif.—B.C. Submont. My-Je.

6. *R. betulaeifolia* Greene. Unarmed low shrub, 1-3 m. high; branches pubescent; leaves short-petioled; blades oval or elliptic or obovate-lanceolate, acute or obtuse at the apex, 5-10 cm. long, puberulent and in age glabrate above, pubescent beneath, especially on the strong veins; flowers corymbose, few; drupe purplish black, 8 mm. broad, 3-seeded. Under cliffs and along streams: N.M.—Ariz.—s Utah. Son.—Submont. My-Jl.

2. CEANOTHUS L. NEW JERSEY TEA, MOUNTAIN LAUREL.

SNOW BRUSH, DEER BRUSH.

Shrubs or small trees, often with spinulose branches. Leaves alternate, commonly 3-ribbed; stipules caducous. Flowers perfect, crowded in terminal panicles, cymes, or umbels. Hypanthium urn-shaped, filled by the disk. Sepals 5, deciduous, white. Petals 5, inserted under the disk, long-clawed and strongly hooded. Stamens 5; filaments filiform, exserted. Ovary immersed in the disk, 3-celled. Styles short, united below; stigmas 3. Fruit dry, 3-lobed, separating into 3 nutlets. Seeds flattened; endosperm fleshy.

Leaves alternate, thin, triple-nerved.

Leaf-blades rounded-oval, often cordate at the base, closely glandular-dentate or crenate.

Peduncles often naked from lateral buds; leaves sparingly pubescent beneath, soon glabrate.

Leaves 3-6 cm. long; young branches long-hairy, soon glabrate.

Leaves 1-2.5 cm. long; young branches finely puberulent. 1. *C. sanguineus*.
2. *C. Martini*.

Peduncles on leafy branches of the present season; leaves velutinous beneath.

3. *C. velutinus*.

Leaf-blades oblong to elliptic or ovate, glandular-serrate to subentire.

Umbels paniced, mostly terminal; leaves dull beneath, glabrate or villous.

Leaves thin, glossy above, sparingly hairy when young, glabrate in age; peduncles finely viscid-puberulent.

4. *C. oatus*.

Leaves thick, veiny, dull, as well as the peduncles more or less permanently villous.

5. *C. pubescens*.

Umbels mostly axillary; leaves silky beneath.

Leaf-blades distinctly glandular-serrate; plant not spiny.

6. *C. subsericeus*.

Leaf-blades obsoletely denticulate or entire; branches often ending in spines.

7. *C. Fendleri*.

Leaves opposite, very small and thick, not triple-nerved.

Leaves entire or nearly so; petals white.

8. *C. Greggii*.

Leaves spinulose-toothed; petals bluish.

9. *C. prostratus*.

1. ***C. sanguineus*** Pursh. Tall shrub, 1-3 m. high; young twigs greenish, those of preceding season red or purple; leaf-blades oval, rounded at the apex, rounded or cordate at the base, glabrate; petals white, spatulate; fruit obovoid, 3-lobed above, not crested, 4 mm. thick. Hillsides and copses: Mont.—n Calif.—B.C. *Submont.* Ap-Jl.

2. ***C. Martini*** M. E. Jones. Branched unarmed shrub, 1-2 m. high; twigs and branches grayish, the former finely and closely pubescent; leaf-blades broadly oval or subrotund, glabrous, except the veins beneath, minutely glandular-dentate; inflorescence small, 1-3 cm. long; petals white, broadly spatulate. Mountain sides: Utah—Nev. *Son.*—*Submont.* Je-Jl.

3. ***C. velutinus*** Dougl. Shrub 1-3 m. high, with olive twigs and brown branches; leaf-blades thick, broadly oval, often subcordate at base, glabrous and shining above, pale and velutinous beneath, 4-8 cm. long; inflorescence paniculate, ample; petals white, broadly spatulate; fruit obovoid, 5 mm. in diameter, deeply 3-lobed on the top. Hillsides: Mont.—S.D.—Colo.—Utah—B.C. *Submont.*—Mont. My-Jl.

4. ***C. ovatus*** Desf. Shrub 2-10 dm. high; branches brownish; leaf-blades narrowly oblong to oval or ovate, 1.5-4 cm. long, serrate with gland-tipped teeth; petals spatulate-dippershaped, 1.5-2 mm. long; fruit 4-4.5 mm. in diameter, depressed globose, 3-lobed. *C. ovalis* Bigel. Sandy soil: Vt.—Ga.—Tex.—Colo.—(Black Hills) S.D.—Man. *Plain*—*Submont.* Ap-Je.

5. ***C. pubescens*** (T. & G.) Rydb. Shrub 5-10 dm. high; leaf-blades from oblong to lanceolate or oval, 2-5 cm. long, glabrate except the veins above, villous beneath, glandular-serrate; petals white, 1.5 mm. long, spatulate; fruit subglobose, 5-6 mm. in diameter, slightly 3-lobed. *C. ovatus pubescens* T. & G. Sandy soil: Mich.—Mo.—Tex.—Colo.—S.D. *Plain*—*Submont.* My-Jl.

6. ***C. subsericeus*** Rydb. Small shrub; leaves short-petioled; leaf-blades elliptic or elliptic-lanceolate, acute at both ends, 2-3 cm. long, 3-ribbed, sparingly strigose above, grayish-silky beneath; petals white, broadly spatulate, clawed, 1.5 mm. long; fruit dark brown, about 4 mm. in diameter, slightly 3-lobed above. Foot-hills: Colo. *Submont.* Jl.

7. ***C. Fendleri*** A. Gray. Low spinescent shrub, 1-5 dm. high, with canescent twigs; leaf-blades elliptic, 3-ribbed, entire-margined, 7-30 mm. long, green and strigose or glabrate above, pale and silky-canescens beneath; petals white, 1.5 mm. long, spatulate; fruit 4 mm. wide, subglobose, somewhat 3-lobed. Woods and hillsides: S.D.—N.M.—Ariz.—Utah—Wyo. *Submont.*—Mont. Je-Au.

8. ***C. Greggii*** A. Gray. Intricately branched spinescent shrub, 1-2 m. high; branches gray or olive-green, at first finely tomentose; leaves short-petioled; blades 5-15 mm. long, 1-ribbed, elliptic or oval, entire or nearly so, coriaceous, glabrate above, tomentulose beneath; petals white, obovate-spatulate, 1.5 mm. long; capsule slightly elongate, 4 mm. in diameter. Arid mountain sides: Tex.—Nev.—Mex. *Son.* F-Je.

9. ***C. prostratus*** Benth. Intricately branched prostrate shrub; leaves 5-25 mm. long, coriaceous, obovate or oblong-cuneate, spinulose dentate, glabrous or puberulent, pale beneath; petals bright blue, broadly obovate; capsule subglobose, about 5 mm. thick. Mountains: Ore.—Ida.—Nev.—Calif. *Submont.*—Mont. Ap-Je.

FAMILY 80. **VITACEAE.** GRAPE FAMILY.

Woody vines, climbing by means of tendrils. Flowers perfect, polygamous, or dioecious, in axillary clusters. Sepals and petals 4 or 5, the latter valvate. Stamens as many as the petals and opposite them. Gynoecium of 2, or rarely 3-6, united carpels; styles united; stigmas capitate or peltate. Fruit a berry; seeds 1 or 2 in each cavity.

Hypogynous disk present; leaves in our species simple, palmately veined and usually lobed.

Hypogynous disk wanting; leaves palmately 5-7-foliolate.

1. *VITIS*.
2. *PARTHENOCISSUS*.

1. **VITIS** (Tourn.) L. GRAPE.

Climbing or trailing vines, with shreddy bark and simple tendrils. Leaves alternate, simple, palmately lobed, petioled; stipules small and caducous. Flowers dioecious, polygamo-dioecious, or rarely perfect. Disk hypogynous. Calyx minute. Petals caducous, coherent at the apex as a cap. Stamens exserted. Ovary 2-celled, rarely 5- or 4-celled. Berry pulpy. Seeds few, pear-shaped.

Twigs and leaves somewhat puberulent when young, glabrate in age, except the veins and their axils beneath; vine high-climbing.

Twigs and leaves white-floccose when young; plant scarcely climbing.

1. *V. vulpina*.
2. *V. arizonica*.

1. **V. vulpina** L. High climbing vine; leaf-blades thin, broadly cordate, with a broad sinus, often somewhat 3-lobed, deeply and irregularly serrate, 5-12 cm. long, 6-15 cm. wide; panicles 5-12 cm. long; berries 1 cm. or less in diameter, bluish or purplish black, with a bloom, very sour. Woods and river banks: N.B.—W.Va.—Tex.—N.M.—Wyo. *Plain—Mont.* Ap-Je.

2. **V. arizonica** Engelm. Weak, branched vine, scarcely climbing; leaf-blades cordate-ovate, with a broad sinus, usually indistinctly lobed, dentate, with numerous small teeth, white-floccose when young, becoming more glabrate in age; panicles 5-8 cm. long; berries black, about 1 cm. in diameter, pleasant-tasting. (?) *V. boulderensis* Daniels. River banks and cañons: N.M.—Colo.—Utah—s Calif.; Mex. *Son.—Submont.* Ap-Je.

2. **PARTHENOCISSUS** Planch. VIRGINIA CREEPER, AMERICAN IVY, WOODBINE.

Climbing or trailing vines, with forking tendrils, their branches often with adhesive disks. Leaves alternate, palmately 5-7-foliolate. Flowers perfect or polygamo-dioecious, in compound cymes. Sepals and petals 5. Disk obsolete or wanting. Stamens 5. Ovary 2-celled, sessile. Berries with scant pulp, inedible. Seeds more or less 3-angled. [*Psedera* Neck.]

Aerial rootlets present; tendrils with disks.

Aerial rootlets lacking; tendrils without disks.

1. *P. quinquefolia*.
2. *P. vitacea*.

1. **P. quinquefolia** (L.) Planch. Tall vine, climbing; branches warty; leaves usually 5-foliolate; leaflets ovate or obovate to oblong-lanceolate, acute or short-acuminate, serrate above the middle, teeth directed forward; corymbs 8-12 cm. broad; berries subglobose, 8-9 mm. in diameter, blue, with a scant bloom. Woods and banks: Que.—Fla.—Tex.—S.D.—Man. *Plain—Submont.* Je-Jl.

2. **P. vitacea** (Knerr) Hitchcock. Straggling vine, with long tendrils, and smoother bark; leaflets 5-6, thin, 4-10 cm. long, lanceolate or oval, acuminate, serrate, with large, often flaring, lanceolate teeth; corymb about 5 cm. broad; berries 5-7 mm. in diameter, bluish black. *P. quinquefolia laciniata* Planch. Woods and banks: Mich.—Ohio—N.M.—Ariz.—Wyo. *Plain—Submont.* Je-Jl.

FAMILY 81. **MALVACEAE.** MALLOW FAMILY.

Herbs (all ours), or rarely shrubs or trees, with alternate, palmately ribbed and usually lobed leaves, often with stellate or branched pubescence. Flowers perfect, regular. Calyx of 5, more or less united valvate sepals. Petals

5, convolute. Stamens many, monadelphous. Gynoecium of several, usually united carpels. Fruit a several-celled capsule, or the carpels separating at maturity.

Style-branches filiform, stigmatose longitudinally on the exterior side.

Stamens simply monadelphous; flowers involuclled.

Petals notched at the apex; carpels beakless, without internal processes.

Petals not emarginate at the apex; carpels beaked, with an internal process above the seed.

Stamens more or less united in falanges in a double series; flowers without involuclles.

Style-branches terminated by capitate stigmas.

Lower seed at least from an ascending ovule; calyx more or less bracteolate.

Carpels strongly reticulate on the lower part of the sides facing the adjacent carpels, this portion enclosing the seeds, the upper part of the carpels smooth and empty.

Carpels not differentiated in an upper and lower portion.

Carpels thin-walled, loosely investing the 2 or 3 seeds, hirsute; tall perennials with maple-like leaves.

Carpels reticulate, the rather thick walls closely surrounding the single seed; annuals with round-lobed leaves.

Lower seed at least resupinate-pendulous; calyx without involuclles or these represented by 1-3 setaceous bractlets.

Carpels 1-ovuled, the cell filled with the seed; bractlets present.

Carpels 3-9-ovuled, several-seeded, dehiscent apically and dorsally; bractlets absent.

1. *MÁLVA* (Tourn.) L. MALLOW, CHEESES (fruit).

Annual or perennial herbs. Leaves alternate, with pubescent, lobed or dissected, reniform or suborbicular blades. Flowers solitary or clustered in the axils of the leaves, or rarely in terminal racemes or spikes, subtended by 2 or 3 bractlets, perfect and regular. Calyx of 5 partly united sepals. Petals 5, emarginate. Carpels many, 1-celled, reniform, indehiscent, beakless, arranged around a central axis. Seeds ascending; embryo circular.

Corolla scarcely exceeding the calyx; carpels rugose-reticulate on the back, and with acute or winged margins.

Calyx becoming much enlarged, and spreading under the fruit, nervose-reticulate; angles of the carpels margined and denticulate.

Calyx not much enlarged in fruit, mostly erect, not reticulate; carpels merely acute on the margins.

Corolla about twice as long as the calyx; carpels not rugose on the backs, round-margined.

Plant decumbent; leaves scarcely crisp; carpels smooth.

Plant erect; leaves very crisp; carpels veiny-reticulate.

3. *M. rotundifolia*.

4. *M. crispa*.

1. *M. parviflora* L. Annual; stem erect or ascending, branched, glabrous or sparingly hairy; leaf-blades reniform in outline, with about 7 rounded crenate lobes, 2-10 cm. in diameter; calyx-lobes rounded, mucronate; corolla lilac, about 5 mm. long; carpels glabrous or pubescent. Waste places: N.D.—Tex.—Calif.; also on the Atlantic Coast; Mex.; adv. or nat. from Eu. F-O.

2. *M. pusilla* Smith. Annual; stem erect, branched, 1-3 dm. high; leaf-blades reniform, 2-5 cm. broad, obscurely round-lobed and crenate; calyx-lobes ovate, in fruit mostly erect; corolla white; carpels pubescent or glabrate. *M. borealis* Wallm. Waste places: Mont.—Calif.; adv. from Eu. JI-Au.

3. *M. rotundifolia* L. Annual; stems procumbent; leaf-blades rounded-reniform, more or less distinctly round-lobed and crenate, usually more or less pubescent; calyx not much accrescent, its lobes ovate; corolla pale lilac or whitish, about 1 cm. long; carpels puberulent. Waste places: Mass.—N.C.—Calif.—Wash.; nat. from Eu. My-S.

4. *M. crispa* L. Annual; stem erect, 5-20 dm. high; leaf-blades reniform in outline, 5-20 cm. in diameter, distinctly lobed and double-crenate; flowers nearly sessile; calyx accrescent, in fruit becoming membranous and veiny, but not spreading; corolla purplish or white, about 1 cm. long; carpels not at all rugose. Waste places and around dwellings: N.S.—N.J.—Colo.—Minn.; escaped from cultivation. JI-S.

2. CALLIRHOË Nutt. POPPY MALLOW.

Perennial herbs, with thick, farinaceous roots. Leaves alternate, with lobed or cleft blades or the upper stem-leaves palmately or pedately dissected. Flowers solitary, axillary, or sometimes in terminal racemes, subtended by 1-3 bractlets. Sepals 5, united below. Petals 5, crimson to white, cuneate at the base, or fan-shaped. Carpels 10-20, 1-celled, 1-seeded, beaked. Seeds ascending; embryo curved.

1. **C. involucrata** (T. & G.) A. Gray. Cespitose perennial, with a napiform thick root; stems procumbent, more or less hirsute; leaf-blades rounded in outline, palmately or pedately 5-7-parted, the cuneate divisions deeply cleft into lanceolate or oblong lobes; peduncles surpassing the leaves; calyx subtended by 3 linear or oblong bractlets half as long as the lanceolate calyx-lobes; petals crimson or purple, 2-3 cm. long. Plains: Minn.—Mo.—Tex.—Utah—Wyo. *Plain.* Je—Au.

3. SIDÁLCEA A. Gray. WILD HOLLYHOCK, FALSE MALLOW, ROSE MALLOW.

Erect perennial (ours) or annual herbs, with palmately or digitately lobed or cleft leaf-blades. Flowers in terminal spikes or racemes, purple, or pink, or yellowish white, occasionally polygamous by the abortion of the stamens in some flowers, without bractlets. Sepals 5, united below. Petals 5, emarginate or truncate. Stamens in two more or less distinct series, the outer of 5 phalanges, each of 4-10 stamens, the inner of 10 phalanges of 2 stamens. Carpels 5-9, at maturity separating from the axis, beakless or apiculate.

Corolla yellowish white; plant with a creeping rootstock; leaves glabrous.

Corolla pink, rose-colored, or lilac, rarely white; plants with a woody base; leaves pubescent.

Pubescence, especially that of the calyx and stem, stellate, without any longer hairs. Petals about 10 mm. long; carpels smooth.

Petals 15-20 mm. long; carpels reticulate on the back.

Pubescence of the calyx and the stem at least with some scattered long hairs.

Calyx-lobes lanceolate; stem mostly single, erect.

Calyx stellate, with longer hairs on the margins; carpels puberulent, reticulate on the back.

Calyx hirsute, with branched hairs; carpels smooth and glabrous.

Calyx-lobes ovate, glandular-puberulent and with a few scattered long hairs; stems usually several, decumbent at the base.

1. **S. candida** A. Gray. Stem glabrous and shining, 5-10 dm. high; blades of the basal leaves rounded, 5-9-lobed, and crenate, 4-10 cm. broad, those of the upper stem-leaves still larger, sometimes almost 2 dm. in diameter, cleft into lanceolate divisions; calyx minutely stellate, about 7 mm. long; lobes ovate, acute; petals 15-20 mm. long; carpels smooth, nearly glabrous. Along streams and in wet meadows: Wyo.—N.M.—Utah. *Submont.*—*Subalp.* Jl—S.

2. **S. oregana** (Nutt.) A. Gray. Stem 6-15 dm. high; basal leaf-blades rounded-reniform, 7-9-cleft, with crenate or lobed divisions, 4-10 cm. wide; uppermost stem-leaves divided into linear divisions; inflorescence spiciform; calyx about 6 mm. long; lobes triangular-ovate, abruptly short-acuminate; petals lilac or rose. *S. digitata* A. Nels. Open places: Wash.—Ida.—n Calif. My—Au.

3. **S. nervata** A. Nels. Stems usually single; leaf-blades sparingly pubescent, with short branched hairs above, minutely stellate beneath, those of the basal leaves orbicular-reniform, 4-8 cm. broad, usually 5-9-lobed, sometimes obscurely so, each lobe with 2-3 broad teeth, those of the upper stem-leaves deeply cleft into cuneate, lobed divisions; calyx 6-7 mm. long; lobes triangular-lanceolate, acute; petals rose-colored. Hills and mountain valleys: Wyo.—Utah—Ida. *Submont.* Je—Jl.

4. **S. campestris** Greene. Stem 3-10 dm. high; leaf-blades rather coarsely pubescent, with branched or stellate hairs; those of the basal leaves orbicular-reniform, about 9-lobed, the lobes 3-5-toothed, those of the upper stem-leaves

with lanceolate or linear lobes; calyx 8-9 mm. long, its lobes lanceolate, long-acuminate; petals rose or lilac, 15-20 mm. long. Hills and plains: B.C.—Mont.—Ida.—n Calif. My—Je.

5. *S. neomexicana* A. Gray. Stem 6-20 dm. high; blades of the basal leaves rounded-reniform, 3-10 cm. wide, hirsute, crenate and more or less distinctly 5-9-lobed, those of the upper stem-leaves divided into linear or oblong divisions; petals lilac, rarely rose or white, 12-18 mm. long. Mountain valleys: Wyo.—N.M.—Ariz.—Ida.; Mex. *Submont.*—*Mont.* Je—S.

6. *S. crenulata* A. Nels. Stems 2-5 dm. high, green, nearly glabrous, with a few scattered hairs; leaf-blades sparsely appressed-pubescent, with forked hairs, those of the basal leaves orbicular-reniform, 2-5 cm. broad, crenate, those of the stem-leaves 5-9-lobed or cleft, the uppermost with linear divisions; inflorescence racemose; calyx about 6 mm. long; lobes lanceolate, acute, or short-acuminate; petals 12-15 mm. long; carpels smooth or slightly reticulate on the back. Meadows and draws: Utah—Nev. *Son.* Je—Jl.

4. **SPHAERÁLCEA** St. Hil. GLOBE MALLOW, SCARLET MALLOW.

Mostly perennial herbs, often cinereous, with stellate or branched hairs. Leaves alternate, with palmately lobed or dissected blades. Flowers mostly in terminal spike-like racemes, subtended by 1-3 bractlets. Sepals 5, partially united. Petals 5, golden, pink, or scarlet, usually notched. Stamens monadelphous in a single series. Stigmas truncate or capitate. Carpels 5 or more; the lower portion of each enclosing 1 or 2 seeds, reticulate on the sides facing the adjacent carpels, the upper portion of the carpels smooth and empty. [*Malvas-trum* A. Gray.]

Leaves lanceolate; fruit ellipsoid to ovate.

Carpels with a cusp.

Carpels rounded at the apex.

Leaves rounded or rhomboid to reniform in outline; fruit depressed-globose to broadly ellipsoid.

Leaves merely toothed or round-lobed, or at most cleft half-way down.

Plant low and depressed, 1 or rarely 2 dm. high; leaf-blades rounded-rhombic, coarsely toothed.

Plant tall, 3-6 dm. high; leaf-blades round-lobed.

Calyx-lobes 5-7 mm. long, acuminate, longer than the fruit; inflorescence more racemiform.

Calyx-lobes 3-4 mm. long, merely acute, not longer than the fruit; inflorescence thyrsoid.

Leaves lobed less than half-way down.

Capsule separating from the axis by means of a thread; leaves coarsely few-toothed; terminal lobe mostly acute.

Carpels without a thread; leaves densely crenate; terminal lobe rounded.

Calyx sparingly stellate, except at the base and on the margins of the lobes.

Calyx densely stellate throughout.

Leaves 3-cleft half-way down, the terminal lobe acute.

Leaf-blades divided to near the base.

Upper seedless portion of the carpels at least as large as the lower reticulate and seed-enclosing portion.

Plant green, only slightly stellate; bractlets about two-thirds as long as the calyx; fruit ellipsoid.

Plant grayish or whitish, densely stellate; bractlets scarcely half as long as the calyx; fruit depressed-globose.

Primary divisions of the leaves cuneate, with rounded-ovate lobes; corolla about 12 mm. long.

Primary divisions of at least the upper leaves with linear divisions; corolla 9-10 mm. long.

Upper smooth seedless portion of the carpels very small, much smaller than the lower reticulate portion.

Primary divisions of the leaves rather broad, cleft or lobed.

Leaves 3-parted; lateral segments deeply 2-cleft; lobes broadly oblong, oblanceolate, or obovate.

Plant low, 1-2 dm. high; middle segment of the leaves slightly longer than the others; raceme crowded.

Plant tall, 3-4 dm. high; middle segment of the leaves usually half longer than the others; raceme elongate.

Leaves 5-parted to the base; segments all cleft into linear or linear-oblong lobes.

Primary divisions of the leaves linear, not lobed.

10. *S. grossulariaefolia*.

11. *S. digitata*.

12. *S. coccinea*.

13. *S. elata*.

14. *S. dissecta*.

15. *S. leptophylla*.

1. **S. cuspidata** Torr. Perennial, with a woody base; stem 3–10 dm. high, stellate-pubescent; leaf-blades lanceolate or linear-lanceolate, crenulate, 5–10 cm. long, sometimes hastately lobed at the base; flowers axillary; sepals ovate, acute; petals pink, 6–8 mm. long; carpels 5–6 mm. long, strongly rugose at the base. Plains: Tex.—Kans.—Colo.—Ariz.; n Mex. *Son.* Ap—Au.

2. **S. angustifolia** (Cav.) Don. Perennial, with a somewhat woody base; stem 5–15 dm. high, leafy, subcanescent; leaf-blades 5–12 cm. long, lanceolate or linear-oblong, crenate, the lower sometimes hastately lobed; flowers clustered in the axils; sepals lanceolate or ovate-lanceolate, acute or short-acuminate; petals pink, 8–10 mm. long; carpels 5–6 mm. long, only the lower fourth or less rugose. Plains and dry places: Tex.—Colo.—Utah—Ariz.; Mex. *Son.*—*Submont.* Ap—Au.

3. **S. caespitosa** M. E. Jones. Caespitose, with a thick woody root and caudex; stem 5–15 cm. high, rarely higher, densely stellate; leaves rhombic-ovate or -obovate, 2–3.5 cm. long, coarsely serrate, thick, densely white-stellate; calyx sharply angled; lobes triangular; corolla red, fully 2 cm. long; fruit depressed-globose; carpels 2-seeded. Volcanic soil: w Utah. *Son.* Je.

4. **S. ambigua** A. Gray. Perennial, woody at the base; stem 3–10 dm. high, tomentulose-canescens; leaf-blades rounded-cordate or orbicular, often obscurely 3–5-lobed, irregularly crenate; inflorescence racemiform; calyx densely stellate, its lobes lanceolate, 8–10 mm. long; petals rose-colored or white, 1–2 cm. long; carpels about 6 mm. long, cuspidate-acuminate. Desert regions: Ariz.—s Utah—Calif.—L. Calif. *L. Son.* Mr—Je.

5. **S. Munroana** (Dougl.) Spach. Perennial, with a woody root; stem leafy, 3–6 dm. high, minutely canescent; leaf-blades rounded-cordate, more or less distinctly 3–5-lobed, coarsely toothed; inflorescence thyrsoid-glomerate; calyx densely stellate, its lobes ovate, acute; petals scarlet to rose-red, about 1 cm. long; carpels about 3 mm. long, merely acutish above. *Malvastrum Munroanum* A. Gray. Dry plains: B.C.—Ida.—Utah—Ore. My—Je.

6. **S. marginata** York. Perennial; stem usually branching from the base, 2–6 dm. tall, densely stellate-canescens; leaf-blades subrotund, rounded-ovate or subcordate, 1.5–4 cm. long, crenate, slightly 3–5-lobed, densely stellate; flowers borne in narrow panicles; calyx-lobes ovate, acute, or acuminate, in fruit 4–5 mm. long; petals pink, obovate, 10–12 mm. long; carpels 3–4 mm. long, cuspidate, the lower half reticulate. Dry places: Colo.—Utah—N.M. *Son.*—*Submont.* My—Je.

7. **S. arizonica** Heller. Perennial, with a woody caudex; stem branching from the base; leaf-blades reniform to cordate, 3–5 cm. long, densely stellate on both sides, obscurely lobed and crenate; inflorescence paniculate, dense, with short branches; calyx-lobes ovate, acute, about 3 mm. long; petals pink, about 1 cm. long; carpels about 4 mm. long and 1.5 mm. wide, mucronate or short-cuspidate, oblong, with only about the lowest fourth reticulate. Desert regions: Ariz.—s Utah. *L. Son.* Ap—Je.

8. **S. subrhomboides** Rydb. Perennial, with a woody caudex; stems branched at the base, stellate, 2–4 dm. high; leaf-blades rhombic in outline, 2–5 cm. long, grayish green, cuneate at the base, 5-ribbed, the divisions 2–4-lobed; inflorescence a dense virgate panicle; calyx densely stellate, 4–5 mm. long; lobes broadly ovate, obtusish; corolla scarlet, 8–9 mm. long; carpels nearly round, obtuse, the lower half reticulate on the faces; seeds solitary. Valleys: Utah. *Mont.* Jl—Au.

9. **S. Rusbyi** A. Gray. Perennial, with a woody caudex; stems 4–6 dm. high, glabrous or sparingly stellate, often tinged with purple; leaf-blades reniform in outline, 2–3.5 cm. broad, 5-divided to the base; divisions obovate, cleft into oblong or linear lobes; flowers in a narrow, virgate panicle; calyx 7–8 mm. long, stellate; lobes lanceolate, acute; corolla scarlet, 15–18 mm. long; carpels mucronate, only the basal one-third reticulate on the faces. Dry places: Ariz.—Utah. *Son.* My.

10. **S. grossulariaefolia** (H. & A.) Rydb. Perennial, with a woody caudex; stem 2–6 dm. high; leaf-blades cordate in outline, stellate-canescens, deeply 3–5-

cleft, 2-4 cm. long; divisions rhombic-cuneate, lobed or coarsely toothed; inflorescence paniculate; calyx-lobes ovate, acute, 3-4 mm. long; petals brick-red to pink, 10-15 mm. long; carpels reniform, 3 mm. long, rounded at the apex. *S. pedata* Torr. *Sida grossulariaefolia* Hook. & Arn. Plains, open hillsides, and valleys: Wyo.—Ariz.—Nev.—Ida. *Son.*—*Submont.* My—Au.

11. *S. digitata* (Greene) Rydb. Perennial, with woody caudex; stems 2-6 dm. high; leaves digitately or pedately 5-divided, or the uppermost 3-divided; divisions of the lower leaves oblanceolate or cuneate, usually 3-cleft, with oblong lobes, those of the upper leaves narrow, linear or with linear lobes; inflorescence a narrow virgate panicle; calyx-lobes lanceolate-acute; corolla scarlet, 9-10 mm. long; carpels obliquely reniform, lower half reticulate on the faces. *S. pedata angustiloba* A. Gray. *Malvastrum digitatum* Greene. Dry mesas and sandy soil: w Tex.—N.M.—Utah—Ariz. *Son.* My—Au.

12. *S. coccinea* (Nutt.) Rydb. Perennial, with a woody base; stems several, 1-3 dm. high; leaf-blades 3-cleft to the base and the lateral divisions again deeply 2-parted; divisions rhombic-cuneate to spatulate, usually 3-cleft at the apex, with oval or oblong lobes; inflorescence dense, short, raceme-like; sepals ovate, about 3 mm. long, villous-stellate; petals usually brick-red, 8-12 mm. long; carpels reniform, 3 mm. high. *Malvastrum coccineum* (Nutt.) A. Gray. Dry plains and sandy valleys: Man.—Ia.—Tex.—Utah—Ore. *Plain*—*Mont.* My—Au.

13. *S. elata* (E. G. Baker) Rydb. Perennial, with a woody caudex; stems 2-4 dm. high; leaf-blades cordate in outline, 3-cleft to the base and the lateral divisions again 2-cleft; middle division oblanceolate, 3-5-lobed above the middle, the lateral divisions 2-3-lobed or entire; calyx-lobes lanceolate, 3-4 mm. long; petals about 12 mm. long, brick-red; carpels 3-4 mm. long. *Malvastrum coccineum elatum* E. G. Baker. Dry plains: N.M.—Colo. *Son.* My—Jl.

14. *S. dissecta* (Nutt.) Rydb. Perennial, with a caespitose woody base; stems 1-3 dm. high, densely cinereous-stellate; leaf-blades 1-3 cm. broad, dissected to the base into 5 divisions; these rhombic in outline and twice cleft; inflorescence racemiform; petals scarlet, 10-12 mm. long; carpels reniform, strongly reticulate, 3 mm. long. *Malvastrum coccineum dissectum* Nutt. *M. Cockerellii* A. Nels. Dry rocky hills: Wyo.—Ariz.—Utah. *Son.* My—Je.

15. *S. leptophylla* (A. Gray) Rydb. Perennial, with a thick woody taproot and caudex; stems 1-4 dm. high, numerous, silvery-lepidote; leaf-blades divided into 3 narrowly linear divisions, or the upper entire, linear-filiform, silvery-lepidote; inflorescence racemiform; calyx-lobes ovate, acute; petals copper-red, 1 cm. or less long; carpels tomentulose, 3 mm. long. *Malvastrum leptophyllum* A. Gray. Dry places: w Tex.—s Colo.—s Utah—Ariz. *Son.* My—Au.

5. PHYMOSIA Desv. WILD HOLLYHOCK, MAPLE-LEAVED MALLOW.

Tall leafy perennials, with rootstocks. Leaves alternate, palmately ribbed and lobed, with acute lobes, and maple-like in appearance. Flowers large, clustered in the upper axils or interruptedly spicate or corymbose at the summit, subtended by bractlets. Sepals united at the base. Petals rose-colored, purplish, or white, obcordate. Stamens monadelphous in single series. Carpels oblong, hirsute, thin, not reticulate, 2- or 3-seeded. [*Iliamna* Greene.]

Sepals lanceolate or ovate-lanceolate, long-attenuate; bractlets subulate, three-fourths as long as the sepals.

Sepals broadly triangular-ovate, acute; bractlets scarcely more than half as long as the sepals.

Calyx and pedicels stellate; bractlets subulate; petals 2-2.5 cm. long.

Plant sparingly stellate, green.

Plant densely stellate-canescens.

Calyx and pedicels hirsute with branched hairs; bractlets lanceolate; petals 3 cm. or more long.

2. *P. rivularis*.

3. *P. acerifolia*.

4. *P. grandiflora*.

1. *P. Crandallii* Rydb. Stem simple, about 6 dm. high; sparingly stellate; leaf-blades cordate in outline, 5-lobed, about 5 cm. in diameter; lobes lanceolate, coarsely toothed; pedicels and calyx sparingly and finely stellate; petals white or

nearly so, about 2.5 cm. long, cuneate and slightly emarginate. *Sphaeralcea Crandallii* Rydb. Mountains: Colo. *Submont.*

2. *P. rivularis* (Dougl.) Rydb. Stem 6–20 dm. high, sparingly stellate; leaf-blades cordate or reniform in outline, 5–7-lobed, 5–15 cm. long and about as wide; lobes triangular or broadly lanceolate, usually coarsely toothed; pedicels and calyx stellate; petals pink or white, 2–2.5 cm. long. *S. rivularis* Torr. *I. rivularis* and *I. angulata* Greene. Along streams: Alta.—S.D.—Colo.—Nev.—B.C. *Submont.*—Mont. J1-S.

3. *P. acerifolia* (Nutt.) Rydb. Stem 5–10 dm. high; leaf-blades cordate or reniform in outline, 5–7-lobed, 5–10 cm. broad; lobes triangular, coarsely serrate; petals rose-colored, 2–2.5 cm. long. *Sphaeralcea acerifolia* Nutt. Along streams: Mont.—Ida.—Ore. *Submont.* Je.

4. *P. grandiflora* Rydb. Stem glabrous below, stellate above, 1–2 m. high; blades cordate or reniform in outline, 9–15 cm. wide, deeply 5–7-lobed; lobes lanceolate or triangular, coarsely toothed, with triangular teeth; pedicels and calyx densely hirsute-pubescent, with long stellate hairs; petals pinkish, 3 cm. or more long. *Sphaeralcea grandiflora* Rydb., not Phil. Mountains: Colo.—Utah. *Submont.*—Mont. Je.

6. EREMÁLCHÉ Greene.

More or less hispid or hirsute annuals, not stellate. Leaves alternate, reniform, palmately ribbed, crenate or lobed. Flowers solitary, axillary, long-peduncled, subtended by 3 slender bractlets. Sepals 5, partially united. Petals 5, purplish. Stamens monadelphous, in a single series. Carpels orbicular, rugose, pointless, closely investing the single seed.

1. *E. exilis* (A. Gray) Greene. Annual; stem branched, spreading or decumbent, more or less pubescent, with branched hairs; leaves long-petioled; blades reniform, 5–7-lobed, 1–2 cm. wide; lobes cuneate, with 3–5 rounded teeth; sepals triangular-lanceolate, acuminate; petals white or pink, 6–10 mm. long; carpels 2 mm. long, reniform, with thick rugose backs. *Malvastrum exile* A. Gray. Sandy places: Ariz.—s Utah—Calif.; n Mex. *L. Son.* Ap-Je.

7. DISÉLLA Greene.

Canescent, stellate perennials. Leaves alternate, pubescent, reniform, or hastate. Flowers perfect, solitary or clustered in the axils of the leaves. Bractlets 1–3. Sepals 5, united into a usually angular base. Petals 5; carpels five to many, 1-celled. Styles filiform; stigmas capitate. Carpels 1-seeded, indehiscent or partially 2-valved, obtuse or short-acuminate. Seeds pendulous, 3-angled.

Leaves reniform or orbicular.
Leaves lanceolate, hastate.

1. *D. hederacea*.
2. *D. sagittaeifolia*.

1. *D. hederacea* (Dougl.) Greene. Perennial, with a caespitose caudex or rootstock; stems decumbent or spreading, branched, 1–4 dm. long, scurfy-canescens; leaf-blades reniform or suborbicular, dentate, scurfy-canescens, 1–5 cm. wide; petals pale yellow or white, about 1 cm. long; fruit short-conic, tomentulose. *Sida hederacea* (Dougl.) Torr. Low banks and salt-flats: Wash.—Utah—Ariz.—w Tex.—Mex. *Son.*—*Submont.* Je-S.

2. *S. sagittaeifolia* (A. Gray) Greene. Caespitose perennial; stems spreading or decumbent 1–4 dm. long, scurfy-lepidote; leaf-blades sinuate-dentate, 2–5 cm. long, scurfy-lepidote, silvery when young; petals yellowish white, tinged with rose or purple, about 12 mm. long; fruit depressed. *Sida lepidota sagittaeifolia* A. Gray. Plains: w Tex.—s Colo.—s Calif.; n Mex. *Son.* My-N.

8. ABÛTILON (Tourn.) Mill. INDIAN MALLOW, VELVET LEAF.

Herbs (ours), shrubs, or trees. Leaves alternate, softly pubescent, entire, toothed, or lobed, usually cordate at the base. Flowers perfect, mostly axillary. Involute wanting. Sepals 5, united below. Petals 5, distinct, usually yellow. Styles filiform or club-shaped, with terminal stigmas. Carpels 1-celled, leathery

or parchment-like, more or less prominently beaked, 2-valved at the apex and on the back, with 1-6 reniform seeds.

1. **A. parvulum** A. Gray. Cespitose perennial, with woody base; stems 2-4 dm. high, cinereous-stellate, spreading; leaf-blades rounded to ovate-cordate, dentate, sometimes obscurely 3-lobed, 1-3 cm. long, stellate-canescens; flowers axillary; calyx-lobes 3-4 mm. long, lanceolate, in fruit reflexed; petals 3-5 mm. long, brick-red or pinkish; fruit 7-8 mm. long and about as wide, minutely stellate. Dry soil: Tex.—Colo.—Ariz. Ap-S.

FAMILY 82. **HYPERICACEAE.** ST. JOHN'S-WORT FAMILY.

Herbs or shrubby plants, with opposite, rarely whorled, entire or nearly so, pellucid-punctate leaves, without stipules. Flowers cymose, perfect, regular or nearly so. Sepals 4 or 5, herbaceous, equal or unequal. Petals 4 or 5, yellow or flesh-colored. Stamens few or many, usually 3- or 5-delphous. Gynoecium of several united carpels. Ovary 1-celled, with parietal placentae, or 3-7-celled, with central placentae. Styles distinct or united; stigmas often capitate. Fruit a septicidal capsule.

1. **HYPÉRICUM** (Tourn.) L. ST. JOHN'S-WORT.

Herbs (all ours), or shrubs. Leaves opposite, rather thick, usually sessile, entire or nearly so, more or less punctate. Flowers cymose. Sepals 5, slightly unequal. Petals 5, yellow, convolute. Stamens numerous, more or less distinctly 3- or 5-delphous. Ovary 1-celled, with 3 (all ours) or 5 parietal placentae, or 3- or 5-celled. Styles 3-5, sometimes coherent. Seeds numerous.

Petals more than twice as long as the sepals, both usually margined with black glands; stamens numerous; erect perennials.

Sepals acuminate or at least decidedly acute.

Sepals obtuse or acutish.

Stem 3-5 dm. high; petals 8-10 mm. long.

Stem about 1 dm. high; petals 10-15 mm. long.

Petals slightly exceeding the sepals; black glands none; stamens 5-20; annuals or no. 4 often perennial, rooting at the nodes.

Procumbent, often forming mats; leaves broadly oval.

Erect and simple; leaves oblong to lanceolate.

1. *H. formosum*.

2. *H. Scouleri*.

3. *H. Nortonae*.

4. *H. anagalloides*.

5. *H. majus*.

1. **H. formosum** H.B.K. Perennial, with a horizontal rootstock; stem simple, 3-6 dm. high; leaves oval or elliptic, 2-3 cm. long, sessile; sepals 4-5 mm. long, black-dotted on the margin and usually also on the back, acuminate or acute; petals 10-12 mm. long, oval; capsule 3-lobed, 8 mm. long; stamens numerous. Mountains and hillsides: N.M.—Wyo.—s Calif.—Mex. *Submont.*—*Mont.* Jl-Au.

2. **H. Scouleri** Hook. Perennial, with a horizontal rootstock; stem 4-gonous above, 2-5 dm. high; leaves oblong or elliptic to ovate, somewhat clasping, 1-2 cm. long; sepals ovate, obtuse, with a few black dots along the margin; petals 8-10 mm. long, oval; capsule 3-lobed; stamens numerous. Copses and hillsides: Mont.—Wyo.—Calif.—B.C. *Submont.*—*Mont.*

3. **H. Nortonae** M. E. Jones. Perennial, with a slender rootstock; stem barely angled; leaves oval or rounded-oval, obtuse, 1.5-2.5 cm. long, cordate at the base; flowers 1-3; sepals ovate-obtuse, about 2.5 mm. long; petals narrow, strongly many-nerved; pod 3-lobed at the apex. Moist alpine places: Mont. *Alp.*

4. **H. anagalloides** Cham. & Schlecht. Diffusely branched annual or perennial, rooting at the nodes; branches 5-30 cm. long, procumbent or ascending; leaves elliptic to broadly oval, 5-7-ribbed, 5-15 mm. long, not dotted; sepals elliptic, unequal; petals 3-4 mm. long, oval; stamens 15-21, in 3 clusters; capsule 1-celled, ovate. *H. tapetoides* A. Nels. Wet ground: B.C.—Mont.—Ida.—L. Calif. Je-Jl.

5. **H. majus** (A. Gray) Britton. Erect annual, simple below; stem 2-9 dm. high; leaves lanceolate or oblong-lanceolate, 2-6 cm. long, 5-7-ribbed; sepals

lanceolate, acuminate; petals oval or obovate, 2-3 mm. long; stamens 5-10; capsule narrowly conic. *H. canadense majus* A. Gray. Wet places: Me.—N.J.—Colo.—Wash.—B.C. *Plain—Submont.* Jl—Au.

FAMILY 83. **ELATINACEAE.** WATER-WORT FAMILY.

Herbs or shrubby plants, ours low water herbs, with opposite or whorled leaves, with stipules. Flowers inconspicuous, perfect, regular, solitary or clustered in the axils of the leaves. Sepals 2-5, imbricate. Petals as many, hypogynous. Stamens 2-5, or sometimes 10. Gynoecium of 2-5 united carpels. Ovary 2-5-celled, with central placentae; stigmas 2-5, distinct. Fruit a septicidal capsule.

1. **ELATINE** L. WATER-WORT, MUD-PURLANE.

Low water plants. Leaves opposite or whorled, entire. Flowers usually solitary, axillary. Sepals 2-4, membranous, obtuse, nerveless. Petals and stamens as many as the sepals or the latter twice as many. Ovary and fruit 2-4-celled. Styles 2-4. Capsule membranous, 2-4-valved.

Flowers sessile; stamens 2-3, as many as the petals.

Leaves oblanceolate; flowers usually 3-merous.

Leaves obovate.

Flowers 3-merous; plant red; leaves 2 mm. long.

Flowers 2-merous; plant green; leaves 4-6 mm. long.

Flowers pedicelled; stamens 6-8, twice as many as the sepals and petals.

1. *E. triandra*.

2. *E. rubella*.

3. *E. americana*.

4. *E. Williamsii*.

1. ***E. triandra*** Schkur. Immersed water plant, flaccid; stems 5-10 cm. long; leaves opposite, oblong or oblanceolate; flowers sessile; sepals usually 2; seeds slightly curved, little sculptured. Shallow water: Ill.—Colo.—Wash.; Eu. *Plain—Submont.*

2. ***E. rubella*** Rydb. Low and depressed annual, whole plant reddish; stems scarcely more than 5 mm. long; leaves opposite, broadly obovate-spatulate, fleshy; flowers sessile; pod depressed-globose, 1.5 mm. in diameter; seeds curved, sculptured as in the next. Wet volcanic sand: Yellowstone National Park. *Mont.*

3. ***E. americana*** (Pursh) Arn. Diffuse rooting annual; stems 1-4 cm. long; leaves obovate, very obtuse, 2-6 mm. long; petals in the terrestrial form rose-colored; pod globose, 1 mm. in diameter; seeds slightly curved, sculptured with 9-10 longitudinal and 20-30 cross-bars. Mud and shallow water: Que.—Va.—Tex.—Calif.—B.C. *Plain—Submont.* Jl—S.

4. ***E. Williamsii*** Rydb. Slender diffuse annual; stems 3-5 cm. long; leaves broadly spatulate, distinctly petioled, 5-8 mm. long, thin, indistinctly 3-nerved; flowers on pedicels 1-2 mm. long; capsule 1.5 mm. in diameter; seeds curved into a hook, less than 0.5 mm. long, with numerous cross-lines. Shallow water: Mont. Au—S.

FAMILY 84. **FRANKENIACEAE.** FRANKENIA FAMILY.

Low herbs or undershrubs, with opposite or whorled, entire, thick leaves, with a stipular membrane connecting their bases. Flowers small, perfect, regular. Sepals 4 or 5, united into a tube. Petals as many, clawed. Gynoecium of 3 or 4 united carpels; ovary 1-celled, with as many parietal placentae. Fruit a capsule, septicidal, enclosed in the calyx.

1. **FRANKËNIA** L.

Characters of the family.

1. ***F. Jamesii*** Torr. Erect shrub, 3-6 dm. high, thickly branched; branches scabrous-puberulent; leaves nearly glabrous, linear, 5-10 mm. long, with revolute margins, fascicled; petals white; blades 4 mm. long, cuneate, erose-truncate;

stamens usually 6; anther-cells elongate, oblong. Bluffs and plains: w Tex.—Colo.—Sonora. Son. Je-Jl.

FAMILY 85. **CISTACEAE.** ROCK-ROSE FAMILY.

Shrubs or undershrubs. Leaves alternate or opposite. Flowers nearly regular, usually perfect, solitary, racemose, clustered, or paniculate. Sepals 3-5, persistent. Petals 5 or 3, sometimes wanting, fugaceous. Stamens 8, hypogynous. Gynoecium of several united carpels; ovary sessile, 1-several-celled; ovules orthotropous; styles united; stigma entire or 3-lobed. Fruit a capsule. Seeds several or numerous. Embryo slender; endosperm starchy or fleshy.

1. **CROCANTHEMUM** Spach. FROST-WEED.

Undershrubs. Leaves more or less coriaceous, entire, flat or revolute-margined. Flowers of two kind, viz., some with large fugaceous petals and many stamens, the others cleistogamous, apetalous or with small petals, and 3-10 stamens. Styles obsolete or short; stigmas capitate or 3-lobed. Fruit a capsule. Embryo curved.

1. **C. majus** (L.) Britton. Hoary canescent herbs, slightly woody at the base, 3-6 dm. high; leaves oblanceolate or oblong-lanceolate, 1.5-3.5 cm. long, stellate on both sides, canescent beneath, greener above; petaliferous flowers 5-12, in terminal cymes; sepals densely canescent, the outer nearly as long as the inner, petals yellow, 7-9 mm. long, oval; apetalous flowers clustered in the axils of the leaves, nearly sessile. *Helianthemum majus* (L.) B.S.P. *H. canadense* Walkerae W. H. Evans. Dry soil: Me.—Va.—Tex.—Colo.—S.D. Plain—Submont. Jl—Au.

FAMILY 86. **VIOLACEAE.** VIOLET FAMILY.

Low herbs, or in the tropics woody. Leaves simple, alternate or basal, with stipules. Flowers perfect, irregular. Sepals and petals 5; the latter imbricate in bud, the lowermost spurred or saccate at the base. Stamens 5; anthers united or connivent. Gynoecium of 3 united carpels. Ovary 1-celled, with 3 parietal placentae. Capsule loculicidal; seeds anatropous.

Sepals auricled at the base; corolla spurred.

1. **VIOLA.**

Sepals not auricled at the base; lowest petal merely saccate at the base.

2. **CALCEOLARIA.**

1. **VIOLA** (Tourn.) L. VIOLET, HEARTS-EASE, PANSY.*

Usually perennial herbs, either bearing leaves and 1-flowered scapes from the crown of the rootstock, or stemmed, with manifest internodes between the leaves, and with axillary 1-flowered peduncles. Flowers usually of two kinds, those of spring with showy petals and those of summer with petals rudimentary or lacking, the latter never opening, but self-fertilized within the closed calyx; petaliferous flowers nodding, pentamerous and irregular as to calyx, corolla and stamens. Sepals 5, persistent in fruit, auricled at the base. Petals 5, the lowest one spurred. Stamens distinct, but more or less coherent, the two lower furnished with nectar-bearing appendages projecting into the spur. Capsule ovoid to cylindric, 3-valved, bearing 20-60 obovate seeds 1-3 mm. long.

Plants acaulescent, or without manifest stems.

Plants without stolons.

Flowers violet-purple.

Rootstock thick.

Leaves not lobed nor parted.

Leaves and scapes glabrous.

Spurred petal glabrous, rounded at the apex.

Peduncles of cleistogamous flowers usually 1-3 cm. long, prostrate under the soil or dead leaves.

1. **V. papilionacea.**

* Contributed by Prof. Ezra Brainerd.

- Peduncles of cleistogamous flowers usually 4-6 cm. long, erect or ascending.
- Spurred petal more or less bearded, retuse or emarginate.
- Spurred petal somewhat bearded, mostly retuse.
- Spurred petal thickly bearded, emarginate.
- Leaves and scapes hirsutulous.
- Leaves 2-3-ternately parted.
- Rootstock slender.
- Flowers white.
- Plants stoloniferous.
- Flowers not yellow.
- Flowers white or lilac; petioles glabrous.
- Flowers white; petioles after flowering pilose.
- Flowers yellow.
- Stolons several, long, prostrate, leafy.
- Stolons few, short, ascending, with 1-3 leafy bracts.
- Plants caulescent, or with manifest stems.
- Leaves compound or much dissected.
- Upper petals deep violet, the lower pale violet, with yellow base.
- All the petals pale yellow.
- Leaves simple, not dissected.
- Flowers yellow.
- First peduncles from the base of the stems.
- Basal leaves round, 5-7-lobed or -toothed.
- Basal leaves ovate to lanceolate, denticulate.
- Basal leaves 5-9 cm. long, ovate to elliptic.
- Basal leaves 2-5 cm. long.
- Basal leaves narrowly ovate, obtuse.
- Basal leaves lanceolate, acute or subacute.
- First peduncles from the upper half of the stem.
- Style and lateral petals beardless.
- Style and lateral petals bearded.
- Upper part of stem and its leaves nearly glabrous.
- Upper part of stem and its leaves densely short-pubescent.
- Flowers not yellow.
- Petals white on the inner face, with a yellow base, on the outer face usually purplish.
- Underground stolons present.
- Stolons lacking.
- Stems usually 15-35 cm. high.
- Stems usually 10-15 cm. high.
- Petals violet or purple.
- Stipules sharply or bristly toothed; perennials.
- Plant dwarf; leaves cuneate, glabrous.
- Plant over 1 dm. high, usually puberulent.
- Leaves 2-3 cm. long, seeds 1.5 mm. long.
- Leaves 3-5 cm. long, seeds 2 mm. long.
- Stipules leaf-like, pectinate at base; annuals.

1. *V. papilionacea* Pursh. Plants robust and hardy from a stout branching rootstock, usually glabrous, but petioles sometimes sparsely pubescent; blades when fully grown often 12 cm. wide, reniform or broadly ovate-cordate, acute or abruptly pointed; outer sepals ovate-lanceolate; upper and lateral petals broadly obovate, 8-10 mm. wide. Fields and groves: Mass.—Ga.—Okla.—Minn.; apparently introduced in gardens and along irrigation ditches in Denver, Colo., and vicinity.

2. *V. pratincola* Greene. Plant every way smaller than the preceding; leaves deeply cordate-ovate, tapering gradually to a subacute apex, 2-3 cm. wide at petaliferous flowering, 5-8 cm. wide at maturity; petals spatulate, 4-6 mm. wide; peduncles taller than the leaves. Hills and prairies: Colo.—Wyo.—N.D. *Plain*—*Submont.*

3. *V. retusa* Greene. Glabrous throughout; leaves at flowering time broadly cordate-deltoid, finely serrate; later leaves much dilated, with a shallow sinus, more or less decurrent on the petiole, often abruptly acuminate; cleistogamous flowers on erect peduncles; capsules ellipsoid, green; seeds brown, 2 mm. long. Borders of streams: Kans.—Colo. *Plain*. My-Je.

4. *V. nephrophylla* Greene. Leaves broadly cordate-ovate to reniform, obtuse or bluntly short-pointed; petals large, the upper pair often sparsely pubescent; sepals ovate to lanceolate, obtuse; cleistogamous flowers on erect

peduncles; capsules green, short-ellipsoid; seeds olive-brown, 2 mm. long. *V. cognata* Greene. Bogs and borders of cold streams: Que.—Conn.—Wis.—N.M.—Utah—Wash.—B.C. *Plain—Mont.* My—Jl.

5. *V. septentrionalis* Greene. Basal stipules often 1 cm. long, bristly ciliate and more or less glandular; leaves cordate-ovate, somewhat acuminate, the apex obtuse; flowers large; sepals obtuse, finely ciliate; cleistogamous flowers sagittate, on ascending peduncles; their capsules subglobose, usually purple. Woodlands: P.E.I.—Conn.—Pa.—Wash.—B.C. *Boreal.*

6. *V. pedatifida* G. Don. Leaves 3-parted, the divisions variously cleft and incised into linear lobes, usually truncate or cuneate at the base, the margins and midrib hirsutulous; peduncles of the petaliferous flowers taller than the leaves, those of the apetalous flowers shorter, but erect. *V. delphinifolia* Nutt. Prairies and valleys: Sask.—Ohio—N.M.—S.D. *Plain—Mont.* Ap—Je.

7. *V. Selkirkii* Pursh. Leaves broadly cordate-ovate, the basal lobes converging or overlapping, the margins crenate-serrate, the upper surface hirtellous; petals pale violet, all beardless; spur 3–5 mm. long, with an enlarged rounded end; capsule subglobose; seeds small, buff. Woods: N.B.—Pa.—Minn.—B.C.—Colo. *Mont.*

8. *V. renifolia* Gray. Pubescent throughout, or often subglabrous, especially on the upper surface of the leaf; blades reniform, those of summer often ending in a short blunt tip; petals white, all beardless; capsule ellipsoid; cleistogamous flowers on horizontal pedicels, their capsules purple. Cold forests: Newf.—Pa.—Minn.—Colo.—Mack. *Mont.* Ap—My.

9. *V. palustris* L. Scapes and leaves glabrous throughout, arising from the ends of scaly creeping rootstocks; blades cordate-ovate to orbicular, remotely and lightly crenate-serrate; petals pale lilac to white, the lateral slightly bearded, the spur short and thick; seeds dark brown, 1.5 mm. long. *V. cyclophylla* and *V. eucycla* Greene. Cold bogs and wet borders of rivulets: Lab.—N.H.—S.D.—Colo.—Utah—Alaska. *Mont.—Subalp.* My—Au.

10. *V. Macloskeyi* Lloyd. Stolons slender, leafy, bearing at the end the following spring a tuft of leaves and scapes; blades ovate-orbicular, slightly cordate, rounded at the apex, obscurely and remotely crenulate, bearing at maturity on the lower surface and petioles white crinkled hairs; seeds olive-brown, 1 mm. long. Wet places in the mountains: Alta.—B.C.—Calif. *Submont.—Mont.* Je—Jl.

11. *V. sempervirens* Greene. Stolons often 30 cm. long, bearing cleistogamous flowers in summer; leaves usually remaining green through the dry season, the blades round-cordate, with open sinus, those of the stolons nearly as large as those of the rootstock; petals 1 cm. long; spur very short; capsule globose, 7 mm. long, brown or sometimes green. *V. sarmentosa* Dougl., not Bieb. Woods: B.C.—w Mont.—Calif. *Submont.*

12. *V. orbiculata* Geyer. Rootstock stout and jagged with stumps of former leaves; blades orbicular, crenate-serrate, somewhat hirtellous above, the sinus usually closed by the overlapping basal lobes; stolons 5–10 cm. long, ascending, bearing petaliferous and cleistogamous flowers, and 1–3 small leaves with brown scarious stipules. Alta.—Ida.—Wash.—B.C. *Submont.—Mont.*

13. *V. Beckwithii* T. & G. Stems several, mostly underground from a deep-seated rootstock; leaves 2–3-ternately parted into linear entire obtuse lobes, glabrous or sometimes hirsutulous; lateral petals bearded; spur short and thick. Valleys: Utah—Calif.—Ore. *Son.—Submont.* Ap—Je.

14. *V. Sheltonii* Torr. Stems as in the preceding; leaves hirsutulous or nearly glabrous, palmately 3-divided, the middle division palmately, the lateral divisions pedately, 3-parted, and often again variously cleft into obtuse linear lobes; lateral petals bearded; capsule globose, 8 mm. long, brown, glabrous; seeds buff, 2.5 mm. long. *V. biternata* Greene. Rocky hillsides: Colo.—Ore.—Calif. *Mont.* Ap—Je.

15. *V. venosa* (S. Wats.) Rydb. Minutely puberulent; crown of vertical rootstock usually 3–12 cm., underground; stems sometimes elongating 12 cm.

above the ground; its leaves ovate to lanceolate, gradually smaller upward, the margins nearly entire; petaliferous flowers from the lower axils, cleistogamous from the upper; outer petals madder-brown. *V. atriplicifolia* Greene. *V. Thori* A. Nels. Cliffs and hillsides: Mont.—Colo.—Calif.—Ore. *Submont.*—*Mont.* Ap-Jl.

16. *V. linguaefolia* Nutt. Pubescence variable, from villous to subglabrous; stems tardily developed, 1-3 dm. long; first flowers petaliferous, the upper petals reddish brown; later apetalous flowers from the upper axils; capsule globose, usually glabrous; seeds 3 mm. long. *V. flavovirens* Pollard. *V. erectifolia* A. Nels. *V. gomphopetala* Greene. Valleys: Mont.—Colo.—Calif.—Wash. *Submont.*—*Subalp.*

17. *V. vallicola* A. Nels. Glabrous or pubescent; leaves nearly entire, ovate to lanceolate, obtuse, the base often obliquely rounded; petals yellow, the two upper often tinged with purple; cleistogamous flowers borne on the upper part of the stem; capsule short-ellipsoid; seeds 2 mm. long. *V. physalodes* Greene. Moist valleys in the mountains: Colo.—Sask.—Wash.—B.C. *Plain*—*Mont.* My-Je.

18. *V. Nuttallii* Pursh. More or less pubescent; stems commonly numerous, in moist situations elongating 15-25 cm.; leaves except the few earliest lanceolate to linear-lanceolate, tapering at the base into margined petioles, the apex acute or subacute, obscurely and remotely denticulate; seeds brown, 3 mm. long. On the foot-hills and plains: Man.—Mo.—Ariz.—Mont. *Plain*—*Submont.* Ap-Je.

19. *V. biflora* L. Stems several, slender, 2-3-leaved and 2-3-flowered; leaves somewhat hirtellous, reniform, narrowly cordate at base, rounded at apex, 2-4 cm. wide; cauline stipules ovate; flowers small, citrous-yellow; spur short-conical; stigma margined on two sides. In wet moss and in fine gravel along rivulets: Colo.; Alaska, and n Eurasia. *Mont.*—*Subalp.* Ap-Jl.

20. *V. glabella* Nutt. Rootstock stout, jagged, usually horizontal; stems 1-4, leafy only toward the top; root-leaves 1-2, the blades reniform, crenate-serrate, short-pointed, nearly glabrous, 6-8 cm. wide; cauline leaves 2-4, the upper much smaller and ovate; capsules ellipsoid, 1 cm. long; seeds nearly black, 2 mm. long. Woods: Alaska—Mont.—Ida.—Calif. *Submont.*—*Mont.*

21. *V. pubescens* Ait. Stem often solitary; root-leaves few or none; stem-leaves short-petioled; blades reniform to ovate, cordate or truncate-decurrent, the apex slightly blunt-pointed; stipules large, obliquely ovate; capsules often white-woolly; seeds 3 mm. long. Rich woodlands: N.S.—Va.—Neb.—(Black Hills) S.D. *Plain*—*Submont.*

22. *V. rugulosa* Greene. Stems 2-6 dm. high; root-leaves cordate-reniform, abruptly short-pointed, often 10 cm. wide, densely hirsutulous beneath; lower stem-leaves similar, the upper successively smaller and shorter-petioled, becoming ovate-acuminate; capsules ovoid to subglobose, often puberulent, 6-10 mm. long; seeds brown, 2 mm. long. *V. Rydbergii* Greene. Woods: Man.—Ida.—Colo.—Alaska. *Plain*—*Mont.* My-Jl.

23. *V. canadensis* L. Stems several, 15-35 cm. high; leaves broadly cordate-ovate, abruptly acuminate, serrate with incurved teeth, nearly glabrous, or the smaller upper leaves muriculate to hirtellous, especially on the veins underneath; petals often purplish with age; spur short and rounded; capsule ovoid, usually glabrous; seeds brown, 2 mm. long. *V. neomexicana* and *V. geminiflora* Greene. Moist, wooded, and steep mountain slopes: N.B.—S.C.—N.M.—Ariz.—B.C. *Submont.*—*Mont.* My-Jl.

24. *V. scopulorum* (A. Gray) Greene. Stems numerous, more or less spreading, 10-20 cm. high; leaves cordate-deltoid, about 2 cm. wide, gradually tapering into an acute apex; upper surface often minutely scabrous; flowers about 1 cm. broad, on long axillary peduncles, and often later numerous cleistogamous flowers on axillary branches; seeds 1.5 mm. long. Moist groves and shady river banks: Colo. *Submont.*—*Mont.*

25. *V. bellidifolia* Greene. Plants caespitose, with short obscure stems; leaves glabrous, round-ovate, truncate or cuneate at base, obtuse at apex, 8–15 mm. wide; stipules linear-lanceolate, with 2–6 bristly teeth on either margin; capsule 5 mm. long; seeds 1.5 mm. long. *V. demissa* Greene. Mountain sides: Mont.—Colo.—Ida. *Mont.*—*Subalp.* Je—Au.

26. *V. adunca* J. E. Smith. Stems numerous, often short at first flowering; leaves subcordate-ovate, obtuse, crenulate, glabrous to puberulent or scabrous, 2–3 cm. wide; stipules linear-subulate, with setulose teeth near the base; spur 5–7 mm. long, often hooked or straight on the same plant. *V. monticola* Rydb. *V. retroscabra*, *V. albertina*, *V. cordulata*, *V. mamillata*, *V. oxypetala*, *V. subvestita*, *V. stenantha*, *V. Tidestromii*, and *V. unguiculata* Greene. *V. inamoena* Greene, a glabrate form. (?) *V. Clarkae* A. Nels. Hills and valleys: Que.—N.H.—Alta.—Colo.—Calif.—Alaska. *Submont.*—*Subalp.*

27. *V. montanensis* Rydb. Stems slender, 1–2 dm. high, scabrous; leaves broadly ovate, subcordate, obtuse at the apex, 3–4 cm. wide; stipules linear-lanceolate; petals light violet; capsule ellipsoid, 1 cm. long; seeds 2 mm. long. *V. retroscabra* Greene, in part. *V. odontophora* Rydb., a form with toothed spur. Colo.—Utah—Mont. *Submont.*—*Mont.* Je—Jl.

28. *V. Rafinesquii* Greene. A subglabrous annual, 10–25 cm. high, often branching from the base; lower leaves round, upper ovate to spatulate, attenuate at the base; stipules foliaceous, pectinate, the terminal segment elongate, entire; petals cream-colored, about twice the length of the sepals. Fields and waste places: N.Y.—Ga.—Tex.—Colo.—Mich. *Plain.* Ap—My.

2. CALCEOLARIA Loebl. GREEN VIOLET.

Perennial herbs or rarely shrubs, with alternate or opposite leaves. Flowers axillary and solitary or racemose, perfect. Sepals equal, not auricled. Petals unequal, the lowest largest and gibbous at the base; stamens 5; anthers connivent but distinct; the two lower filaments glandular at the base. Capsule 3-valved, opening elastically. [*Hybanthus* Jacq. *Ionidium* Vent.]

1. *C. verticillata* (Ortega) Kuntze. Low perennial herb; stems clustered, 1–4 dm. high, slightly pubescent; leaves alternate, but often fascicled; stipules subulate or wanting; blades linear, 2–4 cm. long; flowers solitary, nodding; petals white, 4–6 mm. long. Dry ground: Kans.—Tex.—Ariz.—Colo.; Mex. *Son.*

FAMILY 87. LOASACEAE. LOASA FAMILY.

Usually scabrous-pubescent herbs, rarely shrubs, with opposite or alternate leaves, without stipules. Flowers perfect, regular, cymose. Hypanthium well developed, turbinate to cylindric, enclosing the ovary. Sepals 4 or 5, imbricate or convolute. Petals as many, yellow or red. Stamens numerous; filaments filiform or dilated, sometimes passing into staminodia closely resembling the petals. Gynoeceium of 2–5 united carpels, enclosed in the hypanthium. Ovary 1-celled, with parietal placentae.

Stamens numerous; styles several, more or less distinct; seeds several or many.

Styles and placentae 3; flowers subsessile.

Placentae with horizontal lamellae between the seeds; these in two rows.

Filaments 3-cleft at the apex, the middle tooth bearing the anther, the lateral ones cuspidate; seeds angled or with folds, not winged; annuals.

1. BICUSPIDARIA.

Filaments not cleft; seeds very flat, more or less winged; perennials or biennials.

2. NUTTALLIA.

Placentae without lamellae; seeds usually prismatic.

Placentae filiform; ovules in one row, 10–40; seeds minutely muricate, not striate; filaments free or nearly so.

3. ACROLASIA.

Placentae broad, band-like; ovules in 1–2 rows, few; seeds distinctly striate, often rugose; filaments at the base united with the petals into a ring.

4. MENTZELIA.

5. EUCNIDE.

6. PETALONYX.

Styles and placentae 5; flowers distinctly pedicelled.

Stamens 5; styles simple; seed solitary.

1. **BICUSPIDÀRIA** (S. Wats.) Rydb.

Annuals, scabrous, with rather large flowers. Sepals 5, persistent. Petals 5, free, light yellow. Stamens 80–130; filaments dilated, 3-cleft at the apex, the middle tooth bearing the anther, the lateral teeth cuspidate. Hypanthium cylindric; placentae with horizontal lamellae between the ovules and vertical wings; ovules in 2 rows, 15–40 on each placenta. Capsule thin-walled, inflated, sessile. Seeds angled or with folds, not winged.

1. **B. tricuspis** (A. Gray) Rydb. Annual; stem 1–2 dm. high, branched near the base, hispid and pilose; leaves petioled, lanceolate, acute or acuminate, sinuately dentate; bracts 2, pinnatifid or toothed; petals light yellow, obovate, 3 cm. long; fruit ellipsoid, about 18 mm. long and half as thick. *Mentzelia tricuspis* A. Gray. Dry regions: s Utah—s Calif. *L. Son.* My.

2. **NUTTÀLLIA** Raf. SAND LILY, BLAZING STAR.

Scabrous pubescent, biennial or perennial herbs, with barbed or hooked hairs, mostly stout. Leaves alternate, toothed or pinnatifid, rarely entire. Sepals 5, persistent. Petals 5, or apparently 10, on account of the petaloid staminodia, yellow to straw-colored, usually conspicuous. Stamens numerous; filaments filiform, or the outer ones dilated. Hypanthium oblong-cylindric; ovules in two rows on each of the three parietal placentae. Capsule stout; seeds numerous, horizontal, flattened, winged or margined, separated by horizontal lamellae. [*Touleria* Eat. & Wright, *Hesperaster* Cockerell.]

Petal-like staminodia present; petals therefore apparently 10 or nearly that number.

Petals golden or greenish yellow, rarely more than 2 cm. long.

Seeds irregularly angled on the faces; petals greenish yellow. 1. *N. lutea*.

Seeds not angled on the faces; petals golden yellow.

Upper leaves entire, narrowly linear.

2. *N. multicaulis*.

All leaves pinnatifid or lobed.

Petals obtuse; seeds broadly winged.

Lower leaves at least deeply pinnatifid, with linear-oblong or lanceolate lobes.

3. *N. multiflora*.

Leaves sinuately lobed or toothed, with triangular-ovate lobes or teeth.

Stem glabrous; all leaves oblanceolate; capsule somewhat turbinate at the base.

4. *N. lobata*.

Stem pubescent; upper leaves lanceolate, with broad clasping bases; capsule rounded at the base.

5. *N. pterosperma*.

Petals acute.

Capsule 7–10 mm. long; lobes of the leaves narrowly linear.

6. *N. humilis*.

Capsule over 12 mm. long; lobes of the leaves not narrowly linear.

Plants low, less than 4 dm. high; leaves less than 6 cm. long; petals less than 15 mm. long; seeds broadly winged.

Leaves sinuately dentate or crenate, the lower ones oblanceolate or spatulate, the upper ovate-lanceolate.

7. *N. integra*.

Leaves mostly pinnatifid.

Plant simple below; lobes of the leaves short, broadly oblong.

8. *N. pumila*.

Plant much branched and suffruticose at the base; lobes of the leaves narrow, linear or lanceolate.

9. *N. densa*.

Plants tall, usually 4 dm. high, or more; leaves often 1 dm. long; petals 15–20 mm. long; seed less broadly winged.

Leaves divided to near the midrib into linear-oblong or narrowly lanceolate lobes.

10. *N. laciniata*.

Leaves sinuate or lobed halfway to the midrib; lobes triangular or ovate.

Stem erect; leaves tapering at the base, lobed.

11. *N. speciosa*.

Stem decumbent at the base; leaves, at least the upper ones, rounded at the base, sinuate.

12. *N. crysantha*.

Petals straw-colored, usually more than 2 cm. long.

Outer filaments dilated; petals 2–3 cm. long.

Petals about 2 cm. long; upper leaves with broad bases, long-acuminate.

13. *N. Rusbyi*.

Petals nearly 3 cm. long; none of the leaves broad at the base.

Plant branched below; flowers subtended by solitary entire bracts.

14. *N. nuda*.

Plant simple below; flowers subtended by several toothed bracts.

15. *N. stricta*.

Filaments all filiform; petals 4–5 cm. long.

16. *N. decapetala*.

Petal-like staminodia none; petals 5, yellow; a few of the outer filaments slightly dilated. Stem glabrous or nearly so, white and shining; upper stem-leaves neither with a broad base, nor long-acuminate. 17. *N. laevicaulis*.

Stem pubescent throughout, straw-colored, rather dull; upper stem-leaves long-acuminate and with a broad base.

Petals 5-7 cm. long; leaves coarsely hirsute-scabrous.

18. *N. acuminata*.

Petals 2.5-3 cm. long; leaves finely scabrous-puberulent.

19. *N. parviflora*.

1. ***N. lutea*** Greene. Stout biennial, 6-9 dm. high, with a fusiform fleshy root; lower leaves sinuate-pinnatifid, the upper sinuate-dentate; petals elliptic, short-clawed, acute; petaloid staminodia about three-fourths as long; capsule thick-walled. *Mentzelia lutea* Greene. Alkaline soil: Colo. *Submont.* S.

2. ***N. multicaulis*** Osterhout. Much branched perennial; stems many, white, shining, 2-4 dm. high; lower leaves pinnatifid, with oblong divisions; flowers opening at sundown; sepals lanceolate, acuminate, 1 cm. long; petals spatulate, 17-20 mm. long; petaloid staminodia about half as large; capsule fully 1 cm. long; seeds smooth, margined. *T. multicaulis* Osterhout. Dry soil: Colo. *Submont.* Je-Jl.

3. ***N. multiflora*** (Nutt.) Greene. Corymbosely branched perennial or biennial; stems bright white and shining, scabrous-puberulent, 3-6 dm. high; petals spatulate, 12-20 mm. long; petaloid staminodia slightly smaller; capsule 15-20 mm. long, acute at the base. *Bartonia multiflora* Nutt. Dry plains: w Tex.—Colo.—Ariz.—Utah—Mex. *Submont.*—*Mont.* Ap-S.

4. ***N. lobata*** Rydb. Perennial, with a thick root; stems strict, white and shining, 3-4 dm. high; leaves 5-8 cm. long; sepals lanceolate, acuminate, 8-10 mm. long; flowers diurnal; petals spatulate, 12-18 mm. long; petaloid staminodia similar and almost as large; capsule 15 mm. long. Sandy soil: s Utah. *L. Son.* Jl.

5. ***N. pterosperma*** (Eastwood) Greene. Biennial; stem white, 1-3 dm. high, divaricately branched; lower leaves spatulate, 2.5-3 cm. long, sinuately dentate, with broad, usually obtuse teeth; petals oblanceolate, 1-1.5 cm. long; petaloid staminodia similar; capsule about 1 cm. long. Sandy valleys: Colo.—Utah. *Son.* Je-Jl.

6. ***N. humilis*** (A. Gray) Rydb. Low branched perennial or biennial; stem 2-4 dm. high, scabrous-puberulent; leaves pinnatifid; petals oblanceolate, 8-10 mm. long, bright yellow; petaloid staminodia almost as large; capsule 7-10 mm. long, rounded at the base. *M. multiflora humilis* A. Gray. Dry soil: w Tex.—Colo.—N.M. *Son.*

7. ***N. integra*** (M. E. Jones) Rydb. Rather simple biennial; stem puberulent, 2-3 dm. high; lower leaves 4-5 cm. long; sepals lanceolate, 7-8 mm. long; petals oblanceolate, 15-18 mm. long; staminodia similar, slightly smaller; capsule 12-15 mm. long, acute at the base. *M. multiflora integra* M. E. Jones. Sandy or clayey soil: Utah. *Son.* My-S.

8. ***N. pumila*** (Nutt.) Greene. Low biennial; stem scabrous-puberulent, 2-3 dm. high; leaves oblanceolate, 4-8 cm. long, sinuately pinnatifid; petals oblanceolate, acute, 10-12 mm. long; staminodia similar, but somewhat smaller; capsule fully 1 cm. long, acute at the base. *M. pumila* Nutt. Barren hills and sandy flats: Wyo.—Colo.—Utah. *Submont.* Je.

9. ***N. densa*** Greene. Low perennial, with thick root and several stems; stems white, puberulent, 2-4 dm. high, branched; leaves oblanceolate, 3-6 cm. long, deeply pinnatifid; sepals lanceolate, acuminate, nearly 1 cm. long; petals about 15 mm. long; staminodia similar, scarcely smaller; capsule about 15 mm. long. Hillsides, cañons, and dry table-lands: Colo.—Utah—N.M. *Son.*—*Mont.* Je—Au.

10. ***N. laciniata*** (Rydb.) Woot. & Standl. Biennial or short-lived perennial; stems 3-4 dm. high, white, puberulent; leaves 5-10 cm. long; petals 15-20 mm. long, short-clawed, oblanceolate; staminodia similar; capsule 15-18 mm. long. *Touleria laciniata* Rydb. Hillsides: Colo. *Submont.* Je-Jl.

11. ***N. speciosa*** (Osterhout) Greene. Stout perennial; stem whitish, puberulent, corymbosely branched, 3-8 dm. high; leaves linear or oblong-lanceolate, 10-

15 cm. long; flowers vespertine; petals 2 cm. long, oblanceolate, sometimes whitish without, golden yellow within; staminodia about half their size; capsule fully 2 cm. long. *M. aurea* and *M. speciosa* Osterhout. Hills and dry valleys: Colo.—Wyo. *Submont.*—Mont. JI—Au.

12. *N. chrysantha* (Engelm.) Greene. Decumbent biennial 3–4 dm. high; stems stout, white-pubescent, much branched; lower leaves 10–15 cm. long, lanceolate or oblanceolate; upper leaves broadly lanceolate, or even ovate; petals 15–20 mm. long, oblanceolate; staminodia similar; capsule 2.5–3 cm. long. *T. sinuata* Rydb. *N. sinuata* Daniels. Cañons: Colo. *Submont.* S.

13. *N. Rusbyi* (Wooton) Rydb. Erect biennial; stem stout, scabrous, 1–1.5 m. high; lower leaves long-lanceolate, 1–2 dm. long, sinuate-dentate, with triangular teeth; flowers with two pinnatifid bracts; petals light yellow, oblanceolate, acute, 16–20 mm. long; petaloid staminodia narrower and shorter; capsule 3 cm. long, acute at the base; seeds winged. *M. Rusbyi* Wooton. Plains and valleys: N.M.—Wyo.—Ariz. *Son.*—*Submont.* Je—S.

14. *N. nuda* (Pursh) Greene. Stout perennial or biennial; leaves oblanceolate, 5–15 cm. long, sinuately lobed, with oblong or ovate lobes, less hispid above; petals spatulate, acute, about 2 cm. long; staminodia nearly as large, similar; capsule about 3 cm. long; seeds winged. *Bartonia nuda* Pursh. *M. nuda* T. & G. Plains and hillsides: w Neb.—Colo.—Wyo. *Plain*—*Submont.* JI—Au.

15. *N. stricta* (Osterhout) Greene. Strict, rather simple perennial; stem 5–10 dm. high, branched above; leaves linear-lanceolate, 5–10 cm. long, sinuately toothed, with triangular teeth; petals oblanceolate, acute, 2.5–3.5 mm. long; petaloid staminodia similar; capsule 2–3 cm. long; seeds wing-margined. *Hesperaster strictus* Osterhout. Plains and foot-hills: w Neb.—Tex.—Colo.—Wyo. *Plain*—*Submont.* Je—O.

16. *N. decapetala* (Pursh) Greene. Stout biennial; stem 5–10 dm. high, leafy, very scabrous; lower leaves oblanceolate, 1–3 dm. long, the upper lanceolate, pinnately lobed, with lanceolate lobes; flowers subtended by several pinnatifid bracts; petals 4–5 cm. long, oblanceolate, acute; petaloid staminodia almost as large; capsule about 4 cm. long; seeds with a narrow wing. *Bartonia decapetala* Pursh. *M. ornata* T. & G. Cañons: S.D.—Tex.—Nev.—Alta. *Plain*—*Submont.* JI—S.

17. *N. laevicaulis* (Dougl.) Greene. Stout biennial; stem 3–10 dm. high; lower leaves oblanceolate, sinuately dentate, with triangular teeth, 1–1.5 cm. long; upper stem-leaves ovate-lanceolate, densely scabrous; flowers diurnal, subtended by toothed bracts; petals narrowly oblanceolate, 5–6 cm. long; seeds wing-margined. *Bartonia laevicaulis* Dougl. *M. laevicaulis* T. & G. Cañons and river valleys: Wash.—Ida.—Utah—Calif. *Son.*—*Submont.* Je—Au.

18. *N. acuminata* Rydb. Stout biennial; stem 3–10 dm. high, straw-colored; lower leaves oblanceolate, 1–2 dm. long, sinuately dentate, densely scabrous, with triangular teeth; upper stem-leaves lanceolate, pinnatifid, with lanceolate or rarely triangular lobes; flowers diurnal, their bracts narrowly linear, entire or with a few narrow lobes; capsule 4 cm. long; seeds winged. River valleys: Wash.—Mont.—Wyo.—Utah. *Son.*—*Submont.* Je—S.

19. *N. parviflora* (Dougl.) Greene. Divaricately branched biennial; stem white; lower leaves oblanceolate, coarsely sinuately toothed, with triangular teeth; the upper lanceolate; flowers diurnal; bracts narrowly linear, mostly entire; petals oblanceolate, 2.5–3 cm. long; capsule about 2 cm. long; seeds winged. *Bartonia parviflora* Dougl. (?) *M. Brandegei* S. Wats. Along rivers: B.C.—Wash.—Ore. *Son.*—*Submont.* Je—Jl.

3. ACROLÀSIA Presl.

Scabrous pubescent annuals. Leaves alternate, rarely some opposite, narrow, from entire to pinnatifid. Sepals 5, persistent. Petals 5, yellow, rather inconspicuous. Stamens many, free, or nearly so; filaments filiform. Hypan-

thium cylindric; placentae 3, filiform; ovules 10-40, in a single row on each placenta. Capsule slender, linear-cylindric or linear-clavate. Seeds rather few, pendulous, more or less prismatic, muricate, not striate, not separated from each other by horizontal lamellae.

Inflorescence congested; bracts broad, 3-lobed, membranous at the base.

1. *A. congesta*.

Inflorescence open; bracts neither 3-lobed nor membranous.

Seeds rather strongly muricate; upper leaves narrow; sepals lanceolate-subulate, half as long as the petals or longer.

Petals 3-6 mm. long.

Leaves pinnatifid with many lobes; petals 5-6 mm. long.

Leaves divided to near the midrib, with ascending lobes; plant erect.

Leaves divided one-half or one-third to the midrib, with divergent lobes; plant ascending or diffuse.

Only the middle leaves pinnatifid with few lobes, or seldom all entire; petals 3-4 mm. long.

Petals 2-3 mm. long; plant very slender.

Leaves deeply pinnatifid, with narrow lobes.

Leaves narrowly linear, entire.

Seeds minutely muricate (tubercles seen only under strong magnification); at least the upper leaves broadly ovate.

Petals 5 mm. long; sepals about half as long, lanceolate, acute; plant tall and stout.

Petals 3-4 mm. long; sepals linear, obtuse, only one-third as long as the petals. Plant tall, 3-5 dm. high; capsules 2-3 cm. long; lower leaves lanceolate or linear, some of them usually toothed.

Plant low, less than 2 dm. high; capsule 12-15 mm. long; leaves all ovate, entire.

1. *A. congesta* (Nutt.) Rydb. Stems white, 1-4 dm. high, somewhat pilose; lower leaves linear, entire, 4-6 cm. long; the upper ones lanceolate, sometimes sinuately toothed; sepals 2-3 mm. long; petals rounded-ovate; capsule 8 mm. long, clavate-oblong, about 20-seeded. Hills: Ida.—Nev.—Calif. *Son.*

2. *A. gracilis* Rydb. Stem 3-5 dm. high; leaves 5-10 cm. long, deeply pinnatifid to near the midrib; floral leaves lanceolate, sessile, pinnatifid or toothed, rarely entire; sepals 4-5 mm. long; petals obovate, 6-7 mm. long, strongly striate; capsule linear-cylindric, 2.5-3 cm. long. Foot-hills and plains: Colo.—Wyo.—Nev.—Wash. *Son.*—*Submont.* My—Jl.

3. *A. ctenophora* Rydb. Stems 3-6 dm. long; lower leaves linear or linear-lanceolate in outline, often 2 dm. long, the upper lanceolate, with a broad base, all pectinately lacinate; sepals ovate-lanceolate, acute, 4-5 mm. long; petals obovate, light yellow, about 8 mm. long. *M. ctenophora* Rydb. Sandy soil: Mont.—Neb.—N.M.—Ariz.—B.C. *Plain*—*Submont.* Mr—Au.

4. *A. albicaulis* (Dougl.) Rydb. Stem white, glabrous, erect, or decumbent at the base, 1-4 dm. high; lower leaves linear-ob lanceolate, usually dentate or entire; middle leaves with 1-5 pairs of linear lobes, the upper linear, usually entire; sepals lanceolate-subulate, 2-2.5 mm. long; petals obovate, 3-4 mm. long, golden yellow, rather prominently veined; capsule linear-cylindric, 10-15 mm. long, 2 mm. thick. *M. albicaulis* Dougl. Sandy soil: Mont.—Neb.—N.M.—Ariz.—B.C. *Plain*—*Submont.* Mr—Au.

5. *A. Tweedyi* Rydb. Stem very slender, erect, 1-3 dm. high, pilose when young; leaves lanceolate or linear in outline, those of the inflorescence almost entire; sepals 1 mm. long; petals oblanceolate, light yellow, 2-3 mm. long; capsule linear-clavate, 15 mm. long. *M. Tweedyi* Rydb. Pine woods: Mont.—B.C. *Plain*—*Submont.* My—Je.

6. *A. tenerrima* Rydb. Stem very slender, ascending, branched, straw-colored, 3-5 dm. high; leaves 2-3 cm. long, pilose; sepals linear-lanceolate, 1 mm. long; petals oblanceolate, lemon-yellow, 2-3 mm. long; capsule 15 mm. long. *M. tenerrima* Rydb. Mountain sides and dry valleys: Mont.—Utah—Ida. *Submont.*—*Mont.* My—Au.

7. *A. latifolia* Rydb. Stem 3-5 dm. high, branched; leaves sessile, ovate or ovate-lanceolate, coarsely toothed or entire, 5-10 cm. long; sepals 2.5-3 mm. long; petals obovate-spatulate, about 5 mm. long; capsule linear-cylindric, 2.5-3 cm. long. Foot-hills and mountains: Colo. *Submont.* Je—Au.

8. *A. dispersa* (S. Wats.) Rydb. Stem erect; lower leaves entire, the middle ones lanceolate, entire or dentate, the uppermost ovate, entire; petals 3-4 mm. long, obovate, bright yellow; capsule 2-3 cm. long. *M. albicaulis integrifolia* S. Wats. *M. dispersa* S. Wats. Sandy soil: Mont.—Colo.—Calif.—B.C.; Mex. *Son.*—*Submont.* My—Au.

9. *A. compacta* (A. Nels.) Rydb. Stem whitish, pilose; leaves numerous, 2-3 cm. long, rough-hirsute; petals obovate, 3-4 mm. long; capsule linear-clavate, 10-13 mm. long, 10-12-seeded. *M. compacta* A. Nels. Plains and foot-hills: Wyo.—Colo.—Ida.—Wash. *Son.*—*Submont.* Je—Au.

4. MENTZELIA (Plum.) L. STICK-LEAF.

Annual or biennial, or in the tropics even perennial herbs, scabrous, with barbed hairs. Leaves alternate, relatively broad, sinuate or lobed. Flowers perfect, cymose. Sepals 5, persistent. Petals also 5, deciduous. Stamens numerous; filaments filiform, united at the base with each other and with the petals into a ring. Hypanthium short, tapering at the base. Placentae 3, broad and band-like, bearing the ovules in 1 or 2 rows. Capsule 3-valved at the top. Seeds rather few, ellipsoid, angled, striate, neither winged, nor separated by horizontal lamellae.

1. *M. oligosperma* Nutt. Perennial, with a fusiform root; stem straw-colored, rough-hirsute; leaves ovate or ovate-lanceolate, or sometimes rhombic, coarsely dentate and often somewhat lobed, 1-6 cm. long; sepals 5-8 mm. long, linear-subulate; petals 10-15 mm. long, obovate-cuneate, cuspidate, golden yellow; stamens about 20; capsule about 8 mm. long, 2 mm. thick, about 3-seeded. *M. Nelsonii* Greene, a small-flowered form. Rocky places and hill-sides: Ill.—La.—Tex.—N.M.—N.D.; Mex. *Plain*—*Submont.* Je—Au.

5. EUCNIDE Zucc.

Annual or biennial herbs. Leaves alternate, broad, toothed or lobed, long-petioled, armed with stinging barbed hairs. Flowers solitary or in cymes. Sepals 5, persistent. Petals 5, deciduous, united at the base. Stamens numerous; filaments united below and adnate to the petals. Styles 5, distinct above. Placentae 5, parietal; ovules numerous. Capsule broadened upwards, 5-valved at the top; seeds numerous, longitudinally striate.

1. *E. urens* Parry. Stem very hispid, with stinging bristles, straw-colored; leaf-blades suborbicular or broadly ovate, 4-5 cm. long, the lower petioled, the upper sessile; sepals lanceolate, 15-20 mm. long; petals obovate, 3-4 cm. long, light yellow, short-acuminate. Sandstone cliffs: s Utah—Nev. *L. Son.* My.

6. PETALONYX A. Gray.

Erect perennial herbs, shrubby at the base, or low shrubs, scabrous with short barbed hairs. Leaves alternate, entire or toothed. Flowers small, in terminal heads or short spikes. Hypanthium small, cylindric. Sepals 5, linear, deciduous. Petals 5, yellowish, long-clawed, spatulate. Stamens 5; filaments free, filiform. Ovary 1-celled. Style simple. Stigma entire. Ovule solitary, pendulous. Capsule oblong, bursting irregularly. Seed smooth.

Leaves of the branches reduced, less than 1 cm. long.

Leaves of the branches not reduced, about 2 cm. long.

1. *P. Thurberi*.

2. *P. Parryi*.

1. *P. Thurberi* A. Gray. Perennial, more or less shrubby at the base; stems 3-6 dm. high, finely scabrous-pubescent; leaves 6-20 mm. long, ovate or triangular-ovate, thick, finely scabrous, sessile, entire or few-toothed; spikes short, 1-4 cm. long; bracts 2, small, linear; sepals linear, 1 mm. long; petals white, 4-5 mm. long, slender-clawed; blades ovate; fruit ovate, 2.5 mm. long. Dry sandy soil: Ariz.—s Utah—s Calif.; Mex. *L. Son.* My—Jl.

2. *P. Parryi* A. Gray. A low shrub; bark of the stems gray and fissured, that of the twigs straw-colored and scabrous-puberulent; leaves subsessile, ovate or rhombic, or the lower spatulate, crenate, 1-3 cm. long, very scabrous;

bracts lanceolate, crenate; sepals linear, 3 mm. long, twice as long as the hypanthium; petals yellowish, about 1 cm. long, long-clawed; blades spatulate. Desert region: s Utah. *L. Son.*

FAMILY 88. **CACTACEAE.** CACTUS FAMILY.

Succulent shrubby plants, usually spiny, the spines arising from small hairy or bristly cushions (areolae); leaves usually wanting, if present, in ours small and deciduous. Flowers perfect, in ours regular, solitary. Hypanthium well developed, enclosing the ovary. Sepals usually many, imbricate, the inner often petal-like. Petals many, in two or more series. Stamens numerous, in several series. Gynoecium of several united carpels; ovary inferior, 1-celled, with several parietal placentae. Fruit a fleshy or rather dry berry.

Leaves evident, but small and deciduous; flowers without definite tube; seeds with a bony aril; stems jointed. 1. OPUNTIA.

Leaves wanting; flowers with a more or less definite tube; seeds without aril; stems not conspicuously jointed.

Flowers borne near the spine-bearing areolae.

Plant-body more or less cylindric; spines arranged on definite ribs; flowers arising from near fully developed areolae, hence lateral on the stem. 2. ECHINOCEREUS.

Plant-body usually globular or ellipsoid or short cylindric; fruit not spiny; stem tubercled or ribbed, if ribbed the flowers arising near young areolae, hence nearly terminal on the stem.

Flowers large; fruit covered with bracts; seeds smooth. 3. ECHINOCACTUS.

Flowers small; fruit naked or nearly so; seeds roughened; stems tubercled. 4. PEDIOCACTUS.

Flowers borne remote from the spines, at the base of the tubercles of the stem. 5. CORYPHANTHA.

1. **OPUNTIA** Hill.* PRICKLY PEAR, CHOLLA, INDIAN FIG, TREE CACTUS.

Fleshy plants with conspicuously jointed stems, the joints flat or terete. Leaves scale-like, caducous, spirally arranged. Areolae axillary, usually spine-bearing. Flowers lateral, arising from the upper part of some spine-bearing areolae. Hypanthium bearing areolae, not produced beyond the ovary. Sepals spreading, in several rows. Style cylindric; stigma 5-8-lobed. Berry more or less pear-shaped, fleshy or rather dry. Seeds disk-like and flattened. Embryo curved around the endosperm.

Internodes cylindrical; spines covered with a delicate sheath.

Internodes very fleshy, turgid, easily detached.

Internodes less fleshy, not easily detached.

Fruit dry; seeds angular.

Fruit fleshy; seeds not angular.

Plants tall (1 to 3 meters high); flowers red.

Plants low and spreading (less than 1 meter high).

Spines yellow; flowers olive-green.

Spines white; flowers yellow.

Internodes flat and broad; spines not covered by a sheath.

Pulvini not densely woolly.

Fruit dry when mature, usually very spiny.

Internodes very fleshy, often terete in section, the terminal one easily breaking loose. 6. *O. fragilis*.

Internodes never terete in section, but always much broader than thick.

Internodes somewhat turgid; spines very long. 7. *O. rutila*.

Internodes flat; spines medium length.

Petals normally yellow.

Spines stout, dark brownish.

Spines weak, white.

Petals red.

Filaments red.

Filaments yellow.

Fruit juicy, usually naked or nearly so.

Internodes pubescent, always spineless.

Internodes glabrous.

Internodes often naked or sometimes bearing long, stout spines.

Internodes pale, somewhat glaucous.

Internodes deep green.

1. *O. echinocarpa*.

2. *O. acanthocarpa*.

3. *O. arborescens*.

4. *O. Davisii*.

5. *O. Whipplei*.

12. *O. basilaris*.

13. *O. humifusa*.

14. *O. Greenei*.

* Key prepared by Dr. J. N. Rose.

Internodes generally bearing several spines from each areole.

Spines twisted.

Spines not evidently twisted.

Low and procumbent; internodes 5 to 10 cm. broad.

Stout and somewhat ascending; internodes 12

15. *O. tortispina*.

16. *O. camanchica*.

cm. or more broad.

17. *O. utahensis*.

Pulvini densely long-woolly.

Plant erect; one spine deflexed.

Plant prostrate; all spines deflexed.

18. *O. Palmeri*.

19. *O. rubrifolia*.

1. ***O. echinocarpa*** Engelm. A low shrub, 1.5–4.5 dm. high, with numerous spreading branches; internodes ovate, 2.5–6 cm. long, less than 2.5 cm. thick, with ovate crowded areolae, 8–10 mm. long; pulvini with few straw-colored bristles; larger spines about 4, whitish, 18–25 mm. long; smaller ones 8–16, spreading; flowers greenish yellow, 3.5–4 cm. broad; fruit dry, depressed-globose, very spiny. Desert regions: Ariz.—s Utah—Calif. *L. Son.*

2. ***O. acanthocarpa*** Engelm. Erect and arborescent, 1.5–2 m. high, with few alternate branches; internodes cylindric, 1–2 dm. long, 2.5 cm. thick; areolae oblong, 18–20 mm. long; pulvini with short wool and scanty bristles; spines 8–25, spreading in all directions, the inner 2.5–3 cm. long; flowers copper-colored; fruit depressed-globose, with few stout spines. Desert regions: Ariz.—s Utah—se Calif.—Sonora. *s. Son.*

3. ***O. arborescens*** Engelm. Erect, arborescent, 1.5–8 m. high, with verticillate branches; internodes cylindric, 0.5–1.5 dm. long, 2 cm. thick; areolae oblong, 15–30 mm. long; pulvini short-woolly, but scarcely bristly; spines 8–30, terete, spreading, the inner often 2.5 cm. long; flowers purple, 6–7.5 cm. broad; fruit subglobose, prominently tuberculate, unarmed. TREE CACTUS. Foot-hills and plains: Tex.—Colo.—Utah—Sonora. *Son.—Submont.*

4. ***O. Davisii*** Engelm. Spreading or procumbent, with divaricate branches; internodes slender, narrowed towards the base, 10–15 cm. long, with linear-oblong areolae, 14–16 mm. long; inner spines 4–7, subtriangular, reddish brown, 2.5–3.5 cm. long, the lower 5 or 6 slender, 6–12 mm. long; flowers yellowish; fruit ovoid, 2.5 cm. long, spiny. Arid regions: Tex.—s Colo.—s Calif. *Son.*

5. ***O. Whipplei*** Engelm. Stem erect, rarely spreading, 2–20 dm. high, with divaricate branches; internodes cylindric, 5–30 cm. long, 1–2 cm. thick, with ovate areolae, 10 mm. long; pulvini sparingly woolly, scarcely bristly; spines short, the longer 1–4 divaricate, 6–18 mm. long, and 2–8 smaller ones deflexed; flowers red; fruit subglobose, lightly tuberculate, unarmed. Desert regions: N.M.—s Utah—Calif.—L. Calif. *L. Son.*

6. ***O. fragilis*** (Nutt.) Haw. Decumbent; internodes 3.5–5 cm. long, ovate, only slightly compressed or subterete; pulvini large, white woolly and with few bristles; spines 1–4, divaricate, the uppermost stout, angular, 12–20 mm. long; flowers pale yellow, about 5 cm. broad; fruit ovate, almost naked, about 2.5 cm. long. Plains and hills: B.C.—Minn.—Wis.—Kans.—Utah. *Plain—Submont.*

7. ***O. rutila*** Nutt. Stems ascending or diffuse; internodes thick, ovate, 5–10 cm. long, 2.5–7.5 cm. broad; pulvini crowded, white-woolly and bristly; spines 3–5, reddish gray, 1–4 cm. long, the central one longer, spreading or declined, the upper erect, the rest reflexed; flowers rose-red or pink; fruit ovate, dry, spinulose, 2.5–3 cm. long. Plains: w Wyo.—Calif.—Ariz. *Son.—Submont.*

8. ***O. polyacantha*** Haw. Stem prostrate; internodes broadly obovate or orbicular, pale green, 5–15 cm. long, about 12 mm. thick; pulvini densely bristly; spines 5–15, rather stout, 1–5 cm. long, variegated, the 3–5 inner stout, reddish brown, 3–5 cm. long, some deflexed, some spreading; flowers yellow; fruit ovoid, spiny, 2.5 cm. long. *O. missouriensis* DC. Plains and prairies: Sask.—Wis.—Mo.—N.M.—Utah—B.C. *Plain.* My-Je.

9. ***O. Schweriniana*** K. Schum. Diffuse; internodes oblong, small, only 5 cm. long and 3.5 cm. wide; pulvini with brown bristles; spines 7–10, only on the lower side of the pulvini, the larger only about 1 cm. long, at last all reflexed; flowers 4 cm. broad, yellow or greenish yellow; filaments green or yellow; fruit ovoid. Hillsides: Colo. *Submont.*

10. *O. rhodantha* K. Schum. Stem erect; internodes obovate or more oblong, 7-12 cm. long, 5-10 cm. wide; pulvini with reddish brown bristles; spines 2-4, soon becoming gray, up to 3 cm. long, the larger flattened, porrect or erect, the lower deflexed; flowers carmine; style rose-red; stigma green; fruit obovate, bristly, soon unarmed. Table-lands: Colo.—w Neb.—Wyo. *Submont.* Je.

11. *O. xanthostemma* K. Schum. Stem erect, 3 dm. high; internodes obovate, bright green; pulvini woolly at first, with reddish brown bristles; lower ones spineless, the upper with 2-4 large spines, which are terete, 4 cm. long, the upper dark brown, porrect, the lower reflexed, and 2-4 dark smaller ones; flowers 5 cm. broad, carmine-red; style white at the base; stigma green; fruit obovoid, prickly. Table-lands: Colo. *Submont.* Je.

12. *O. basilaris* Engelm. Ascending; internodes obovate, glaucescent, minutely pubescent, 1-2 dm. long; pulvini depressed, with yellow wool and numerous reddish brown bristles, without proper spines; flowers purple, 6 cm. broad; fruit short-obovate, pubescent. Desert regions: Ariz.—Utah—Nev.—se Calif.—Sonora. *Son.*

13. *O. humifusa* Raf. Stem diffuse; internodes obovate or suborbicular, 7.5-12 cm. long; pulvini with slender reddish brown bristles, mostly unarmed; spines when present few, only marginal, stout, straight, white, usually reddish at the base and apex, the longest 1.5-2.5 cm. long; flowers sulphur-yellow, 6-8.5 cm. broad; fruit clavate, naked, 3.5-5 cm. long, with purplish pulp. *O. Rafinesquii* Engelm. Sandy soil: Tex.—Colo.—Minn. *Plain.*

14. *O. Greenei* Engelm. Stem diffuse; internodes orbicular-obovate; pulvini with numerous reddish brown bristles, unarmed, or armed with 1-3 spines, the upper one stout, terete, 2.5-3.5 cm. long, brownish red, at least at the base; fruit ovate, 3 cm. long, unarmed. Dry plains: Colo.—Ariz. *Son.—Submont.*

15. *O. tortispina* Engelm. Stem prostrate; internodes orbicular-obovate, 1.5-2 dm. long; pulvini with yellowish bristles, armed with 3-5 yellowish, angled, usually twisted spines, the longer ones 3-6 cm. long, with 2-4 slender ones below; flowers sulphur-yellow, 6-7.5 cm. broad; fruit ovate, 4.5-5 cm. long. Plains: Miss.—Neb.—Tex.—Colo. *Plain—Son.*

16. *O. camanchica* Engelm. Stem prostrate; internodes obovate-orbicular; pulvini with few greenish or yellowish brown bristles, armed with 1-3 (or the marginal ones 3-6) spines, which are reddish brown or blackish brown, with paler tips, 3.5-7.5 cm. long, the upper erect, the rest deflexed; fruit oval, 3.5-5 cm. long, deep red, sweet. Plains and hillsides: Tex.—Colo.—Ariz. *Plain—Submont.*

17. *O. utahensis* Purpus. Stem prostrate; internodes elliptic or obovate, dark green; pulvini with yellowish white wool and yellowish bristles; spines 1-4, the longest 4 cm. long; flowers up to 9 cm. broad, carmine; fruit cylindric, 4 cm. long and 2 cm. thick. Mountains: Utah. *Submont.*

18. *O. Palmeri* Engelm. Stem erect; internodes oval, not tuberculate, pale, glaucous, 20-25 cm. long, 15-20 cm. broad; pulvini with pale brownish or gray persistent wool, and few straw-colored bristles; spines 5-7 larger ones and a few smaller ones on the upper pulvini, 1-3 on the lower ones, 2.5-3 cm. long, erect or spreading or the upper ones deflexed. Arid regions: s Utah. *L. Son.* Je.

19. *O. rubrifolia* Engelm. Prostrate; internodes ovate, 12-15 cm. long and 10 cm. broad; pulvini with brownish gray persistent wool and numerous yellowish bristles; spines mostly 2 or 3, slender, angular and often twisted, 2.5-6 cm. long, all deflexed. Arid regions: s Utah. *L. Son.*

2. *ECHINOCEREUS* Engelm. HEDGEHOG CEREUS.

Plants with cylindric or rarely oblong stems, ribbed, or if tubercled, the tubercles more or less connected in vertical rows. Leaves none. Spine-bearing

areolae on the ribs or the tubercles. Flowers arising close above the spine-bearing, fully developed areolae, hence appearing lateral on the stem. Hypanthium prolonged beyond the ovary, scaly. Style filiform. Fruit fleshy. Seeds tubercled, endosperm scanty; embryo straight.

Corolla greenish; ribs of the stem about 13.

Corolla red or purple; ribs usually less than 13.

Ribs of the stem 8-12.

Flowers scarlet; central spines 2-7.

Central spines all terete; flowers 4-6 cm. long, yellowish inside.

Lower central spine quadrangular; flowers 8-10 cm. long.

Flowers purple or violet.

Central spines 4-5, straight.

Central spines solitary, bulbous at the base.

Central spine terete; radials 12-25 mm. long, the lower stouter.

Central spine angular; radials 2-5 cm. long, the lateral ones strongest.

Ribs of the stem 5-7.

Central spine present, 8 cm. long, angled and grooved; radials 6-8, strongly angled.

Central spine wanting; radials 3-59, almost terete.

8. *E. paucispinus*.

1. ***E. viridiflorus*** Engelm. Stem globose or sometimes oblong-cylindric, 2.5-7.5 cm. high; ribs 13, acute; central spines solitary, stout, straight or curved, 12-14 mm. long, variegated with purple and white; radial spines 12-18, strict and radiating, 2-6 mm. long; flowers 2.5 cm. wide, greenish brown without, yellowish green within; fruit elliptic, 10-12 mm. long. Plains and hills: Tex.—Wyo.—N.M. *Son.*—*Submont.*

2. ***E. aggregatus*** (Engelm.) Rydb. Ovate or subglobose, obtuse, 3.5-7.5 cm. high, 3-5 cm. thick, cespitose in hemispheric tufts; ribs 8-11, tubercled; spine slender, straight, terete; radials 8-12, white, 6-12 mm. long, the upper shorter; central spines 1-3, stouter, 1-2 cm. long; flowers deep scarlet, 3.5-6 cm. long, 2.5-3.5 cm. broad. *Cereus coccineus* and *C. phoeniceus* Engelm. Hillsides and plains: Tex.—Colo.—Ariz.; n Mex. *Son.*—*Submont.*

3. ***E. Roemerii*** (Muhlenph.) Engelm. Stem ovoid, 7.5-10 cm. high, sparingly branched; ribs 9-11, obtuse, tubercled; spines whitish or straw-colored, with bulbous bases; radials 8-12, slender, straight, the upper 4-10 mm. long, the lateral 12-30 mm. long; central spines 3-5, very bulbous, the lowest quadrangular, dusky when young, 2.5-7.5 cm. long, porrect or reflexed; flowers scarlet, 8-10 cm. long, 3.5-5 cm. broad. *Cereus Roemerii* Muhlenph. *C. conioides* Engelm. Plains: N.M.—Colo.—Calif.; n Mex. *Son.*

4. ***E. Engelmanni*** (Parry) Lem. Stem elliptic-cylindric, 12-30 cm. high, 5-7 cm. thick, simple or sparingly branched; ribs 10-12, rarely 13, tuberculate; radial spines 12-14, slender, 6-12 mm. long, white, with dark tips, the upper setaceous and the lower stoutest; central spines 4 (or 5), straight and angled, 2.5-5 cm. long, the 3 upper yellow, straight, the lowest white, porrect or reflexed; flower purple, 5-7 cm. long; fruit ovate, 4×2.5 cm. *Cereus Engelmanni* Parry. Deserts: Utah—Calif.—L. Calif.—Sonora. *L. Son.*

5. ***E. Fendleri*** (Engelm.) Ruml. Stem ovoid or ovoid-cylindric, 7.5-20 cm. high, 5-7.5 cm. in diameter, cespitose; ribs 9-12, tuberculate; radial spines 5-10, straight or curved, the lowest stoutest, white and angular, 12-25 mm. long; central spine 1, stout and bulbous at the base, curved upwards, reddish black, 2.5-5 cm. long; flowers violet-purple, 6-8.5 cm. broad; fruit ovate-globose, 2.5-3 cm. long, purple-green, edible. *Cereus Fendleri* Engelm. Dry plains: Tex.—Utah—Ariz.; n Mex. *Son.*

6. ***E. mojavensis*** (Bigel. & Engelm.) Ruml. Stem ovate, glaucous, 5-8 cm. high, densely tufted, forming masses 1 m. wide; ribs 8-12, slightly tubercled; central spine angular, dusky, curved upwards, 3.5-6 cm. long; radials 5-8, stout, curved, and interlocked, white or with tawny tips, the upper and lower 2-3 cm. long, the lateral ones 3-5 cm. long; flowers deep crimson, 5-7 cm. long; fruit oblong, 2.5-3 cm. long. Deserts: Calif.—Utah—Ariz. *Son.*

7. *E. goniacanthus* (Engelm.) Lem. Stems ovoid, 7.5–12.5 cm. high, simple or sparingly branched at the base; ribs 7, rarely 8 or 9, tuberculate; spines stout, angular, straight, or curved; radials 8, the lower 16–24 mm. long, the rest 2–3 cm. long, yellow at the base and dark-tipped, the upper one and the solitary central one stout, 6–7-angled, 3–6 cm. long, 2 mm. broad; flowers scarlet, about 6 mm. long. *Cereus goniacanthus* Engelm. Sandy hills: Colo.—N.M. *Submont.*

8. *E. paucispinus* (Engelm.) Ruml. Stem ovoid or ovoid-cylindric, 12–25 cm. high, 5–10 cm. thick, simple or somewhat branched, deep green; ribs 5–7, tubercled; spines stout, with a bulbous base, straight or somewhat curved; radials 3–7, reddish or dark, at last blackish, 18–32 mm. long; central one wanting or rarely a stout subangular one, 3–4 cm. long, porrect; flowers purplish red, 2.5–3 cm. broad. *Cereus paucispinus* Engelm. Rocks and limestone hills: Tex.—Colo.—N.M. *Submont.*

3. **ECHINOCACTUS** Link & Otto. HEDGEHOG CACTUS, BARREL CACTUS.

Fleshy plants, with globular, or oblong, or sometimes cylindric stems, with spine-bearing ribs, or these divided into spiral or vertical rows of tubercles. Leaves none. Flowers borne just above young spine-bearing areolae, hence appearing almost terminal on the stem. Hypanthium produced beyond the ovary, more or less scaly, not spiny. Style columnar; stigmas slender. Fruit a fleshy or dry berry, scaly. Seeds smooth, or nearly so, with an endosperm; embryo curved.

Stem with definite ridges, not tuberculate.

Scales of the hypanthium subulate, copiously woolly in their axils; fruit dry and clothed with wool.

Uppermost central spine the broadest; ribs of the stem 15–20.

Lowermost central spine the broadest; ribs of the stem 13. 1. *E. polycephalus*.

Scales of the hypanthium ovate, orbicular, or cordate, not woolly in their axils; fruit not woolly. 2. *E. xeranthemoides*.

One or more of the central spines strongly hooked, neither annulate nor strongly compressed.

Central spines except the hooked one, flattened, glabrous.

Central spines all terete, pubescent. 3. *E. Whipplei*.

One or more of the central spines distinctly annular, strongly broadened, flattened above, slightly if at all hooked. 4. *E. pubispinus*.

Radial spines 9–13; upper central spine angled.

Radial spines over 20; upper three spines terete. 5. *E. cylindraceus*.

Stem with the ribs more or less divided into tubercles. 6. *E. Wislizeni*.

Tubercles terete.

Radial spines 8–9; central ones 1–3; tubercles 1 cm. high. 7. *E. subglaucus*.

Radial spines 10–14; central spines 4; tubercles low. 8. *E. Johnsoni*.

Tubercles rhombic in cross-section; radial spines 13–15. 9. *E. Sileri*.

1. *E. polycephalus* Engelm. & Bigel. Globose to ovate or cylindric, 15–70 cm. high, 12.5–25 cm. in diameter, branched at the base; ribs 15–21; spines 8–15, very stout, compressed, more or less recurved, reddish; radials 4–11, comparatively slender, 2.5–5 cm. long; centrals 4, very unequal, 2–9 cm. long, the uppermost broadest, curved upward, the lower longest and decurved; flowers yellow; fruit globose, 15–20 mm. in diameter. Stony or gravelly ground: Ariz.—Utah—s Calif. *L. Son.*

2. *E. xeranthemoides* Engelm. Stem globose, 2.5–12.5 cm. high; ribs 13, sharp and interrupted; spines 10–15, straight or slightly curved; radials small, about 3 cm. long; centrals 4, slender, 3–5 cm. long, the lowest broadest and porrect, otherwise as the preceding. Desert regions: s Utah—Ariz. *L. Son.*

3. *E. Whipplei* Engelm. Stem globose-ellipsoid, 7–13 cm. high, 5–10 cm. thick; ribs 13–15, compressed and somewhat interrupted; radial spines 7–11, white or the lower dusky, 12–36 mm. long; central spines 4, the uppermost flattened, straight, 2.5–4 cm. long, 1–2.5 mm. broad at base, turned upwards, the others 2.5–3 cm. long, 4-angled, dark brown, the lateral straight, the lowest sharply hooked downward; flowers greenish red, 2–3 cm. long. Sandy soil: Utah—Colo.—Ariz. *Son.*

4. *E. pubispinus* Engelm. Small, turbinate or ellipsoid, 5 cm. high, 2.5–3 cm. in diameter; ribs 13, compressed, tuberculate; spines velvety pubescent, in age glabrate; radial spines 5–6 below, 9–12 above, 2–8 mm. long, straight to hooked; central spines wanting or solitary, longer, 10–12 mm. long, strongly hooked. Valleys: Utah. *Son.*

5. *E. cylindraceus* Engelm. Globose to ovoid or ovate-cylindric, simple or branching at the base, up to 9 dm. high and 3 dm. thick; ribs 13–27, obtuse and tuberculate; spines stout, compressed, more or less curved, reddish; radials about 12, 2.5–5 cm. long, the lowest stouter and hooked; centrals 4, very stout, 4-angled, about 5 cm. long, the uppermost broadest, straight and erect, the lowest decurved; flowers yellow; fruit subglobose, pale green, 2.5 cm. thick. Desert regions: Tex.—s Utah—Calif.—L. Calif. *L. Son.*

6. *E. Wislizeni* Engelm. At first globose, at last cylindric, 5–12 dm. high; ribs 21–25, or sometimes less, acute and oblique, more or less tubercled; radial spines 1.5–5 cm. long, the 3 upper and 3–5 lower stouter, the lateral ones bristle-like; centrals 4, stout, angled, red, 3.5–7.5 cm. long, the 3 upper straight, the lowest and strongest up to 12 cm. long, flat and hooked downwards; flowers yellow or sometimes red, 5–6.5 cm. long; fruit ovate, yellow. Desert regions: w Tex.—s Utah—Calif.; n Mex. *L. Son.*

7. *E. subglaucus* Rydb. Simple, depressed-globose or ellipsoid; ribs 8–13, with conical tubercles; radial spines 8–9, white or with darker tips, straight, up to 15 mm. long; central spines 1–3, curved, dark brown; flowers 3 cm. broad, rose-red; fruit pear-shaped, 1 cm. high. *E. glaucus* K. Schum., not Karw. High table-land: Colo. *Submont.*

8. *E. Johnsoni* Parry. Stem oval, 1–1.5 dm. high; ribs 17–21, rounded, interrupted into low rounded tubercles; radial spines 10–14, 1.5–3 cm. long, the upper strongest; central spines 4, stout, recurved, reddish gray, 3.5–4 cm. long; flowers 5–6.5 cm. long, deep red to pink; seeds pitted. Arid regions: Utah. *Son.*

9. *E. Sileri* Engelm. Globose; ribs 13, prominent, densely crowded with short rhombic-angled tubercles; radial spines 11–13, white; centrals 3, black with pale base, 18 mm. long, the uppermost slightly longer; flowers scarcely 2.5 cm. long, straw-colored. Desert regions: s Utah. *L. Son.*

4. **PEDIOCÁCTUS** Britton & Rose.

Stem globose, leafless, tubercled; the tubercles arranged in spiral rows, nipple-shaped. Flowers borne on the tubercles, near the areolae. Hypanthium funnelform, bearing a few scales. Petals numerous, pink. Stamens numerous. Fruit globose, irregularly bursting, nearly or quite scaleless. Seed tubercled, with a basal hilum.

1. *P. Simpsoni* (Engelm.) Britton & Rose. Subglobose or turbinate at the base, sometimes clustered, 7.5–12.5 cm. in diameter; ribs 8–13, with prominent nipple-shaped tubercles, which are 12–16 mm. long; radial spines 20–30, slender, straight, 8–12 mm. long; central spines 8–10, stouter, yellowish to black, 10–14 mm. long; flowers 16–20 mm. long, and nearly as broad, yellowish green or purple; fruit green, 6–7 mm. long, suborbicular. *Echinocactus Simpsoni* Engelm. Table-lands and plains: Nev.—Utah—Colo. *Submont.—Subalp.*

5. **CORYPHÁNTHA** (Engelm.) Lem.

Fleshy plants, with globular or oval, solitary or clustered stems, covered by spirally arranged tubercles with spine-bearing areolae at the end. Leaves none. Flowers borne near woolly areolae in the axils or near the base of the tubercles. Hypanthium produced beyond the ovary, campanulate or funnelform, naked. Style filiform. Berry fleshy. [*Mamillaria* Haw.]

Larger spines curved upwards; tubercles not grooved; flowers borne at the base of older tubercles, hence lateral on the stem. 1. *C. Grahamei*.
Spines all straight; tubercles grooved; flowers borne at the base of young tubercles, hence nearly terminal.

Flowers yellowish or greenish, merely tinged with red; central spines 1; berry scarlet, globose.

Stem usually simple or nearly so; central spines stout, porrect; flowers about 2.5 cm. long.

Stems tufted; central spine often wanting or small; flowers 3-4 cm. long.

Flowers purple; central spines several; berry green, ellipsoid.

Stems tufted, depressed-globose; central spines 3-4.

Stems usually simple, ellipsoid or oblong; central spines 4-12, rarely 3.

4. *C. vivipara*.

5. *C. radiosa*.

1. **C. Grahamei** (Engelm.) Rydb. Stem simple or clustered, globose, becoming ellipsoid, 3-8 cm. high; tubercles ovate, 6 mm. long; radial spines 15-30, white, often dusky-tipped, 6-12 mm. long; central spines 1-3, blackish, with a paler base, the lower one stouter and longer, 6-18 mm. long, hooked upwards; flowers 2-2.5 cm. long, rose-colored; fruit 2-2.5 cm. long; seeds 1 mm. long, black. *M. Grahamei* Engelm. Rocky places: Tex.—s Utah—s Calif.; Sonora. *L. Son.*

2. **C. missouriensis** (Sweet) Britton & Rose. Stem mostly simple, globose, 3-5 cm.; tubercles 12-15 mm. long, in about 8 spiral rows; spines gray, 10-20 together; central spine 10-12 mm. long; corolla greenish yellow or tinged with reddish; berry globose, 6-8 mm. in diameter, ripening the next spring; seeds black, 1 mm. long. *M. missouriensis* Sweet. *M. Notesteinii* Britton. *Cactus missouriensis* Kuntze. Plains and hills: S.D.—Mont.—Colo.—Kans. *Plain.* My.

3. **C. similis** (Engelm.) Britton & Rose. Stems clustered, forming masses 3 dm. broad; tubercles 1.5-2 cm. long, in 8 spiral rows; radial spines gray, 12-15, puberulent, the central one often lacking, not larger than the rest; corolla yellowish, 3-5 cm. long; berry globose, 8-10 mm.; seeds 1.5-2 mm. long. *M. similis* Engelm. *Cactus missouriensis similis* Coulter. Plains: Kans.—Colo.—Tex. *Son.*

4. **C. vivipara** (Nutt.) Britton & Rose. Stems usually tufted, 3-5 cm. high; tubercles terete, ellipsoid, slightly grooved; central spines 3-4, slender, reddish brown, 8-12 mm. long, one of them deflexed, the others ascending; radial spines 12-20, white, often dark-tipped, 6-8 mm. long; flowers about 3.5 cm. long, bright purple; fruit pale green, 12-18 mm. long; seeds yellowish brown, obliquely pear-shaped, 1.5 mm. long. *Cactus viviparus* Nutt. *M. vivipara* Haw. Plains: Man.—Alta.—Colo.—Kans. *Plain.*

5. **C. radiosa** (Engelm.) Rydb. Stems mostly simple, ellipsoid or cylindric, 5-12 cm. high and 5 cm. thick; tubercles 8-12 mm. long; central spines 4-12, tawny or purplish, 8-12 mm. long, the upper the longer, the lowest small and porrect; radial spines 20-30, white, 6-8 mm. long; flowers 3.5-5 cm. long, dark purple; seeds 2 mm. long. *M. radiosa* Engelm. *Cactus radiosus* Coulter. Plains: Kans.—s Utah—Sonora—Tex. *Son.*

FAMILY 89. ELAEAGNACEAE. OLEASTER FAMILY.

Shrubs or trees, with silvery, scaly, or stellate pubescence. Leaves entire, alternate or opposite. Flowers in axillary clusters, perfect, polygamous or dioecious. Hypanthium in the pistillate flowers tubular or urn-shaped, adnate to and enclosing the ovary. Sepals 4, deciduous. Corolla none. Stamens 4 or 8. Disk present, annular or lobed. Ovary 1-celled, 1-ovuled. Fruit drupe-like.

Stamens 4; flowers perfect or polygamous; leaves alternate.

Stamens 8; flowers dioecious; leaves opposite.

1. ELAEAGNUS.

2. LEPARGYRAEA.

1. ELAEÁGNUS (Tourn.) L. SILVER-BERRY, SILVER-BUSH.

Silvery-scaly shrubs or trees. Leaves alternate, petioled. Flowers solitary or 2-4 together, axillary, perfect or polygamous. Hypanthium tubular, constricted over the ovary. Sepals 4, deciduous, valvate. Stamens 4. Fruit drupe-like.

1. **E. commutata** Bernh. Shrub or small tree, 2-5 m. high, with brown-scurfy twigs; leaf-blades oblong or elliptic, densely silvery, scurfy on both sides, 2-10 cm. long; flowers 1-3 in the axils, fragrant, 12-16 mm. long; perianth silvery without, yellowish within; sepals ovate, 2 mm. long; fruit ellipsoid, silvery, 8-12 mm. long; stone 8-striate. *E. argentea* Pursh. Banks and hillsides: Que.—Minn.—S.D.—Utah—Yukon. *Plain—Submont.* Je—Jl.

2. **LEPARGYRÆA** Raf. BUFFALO-BERRY, BULL-BERRY.

Shrubs, with silvery or brown, scaly or stellate pubescent. Leaves opposite, petioled. Flowers small, dioecious, in small clusters at the nodes of preceding season. Hypanthium of the pistillate flowers urn-shaped or ovoid, bearing an 8-lobed disk at its mouth. Stamens 8, alternate with the lobes of the disk. Fruit drupe-like. [*Shepherdia* Nutt.]

Leaves green above; shrub not thorny.

Leaves silvery white on both sides; plant usually thorny.

Leaves oblong; fruit ellipsoid; tall shrub or small tree.

Leaves rounded-oval or ovate; fruit globular; low shrub.

1. *L. canadensis*.

2. *L. argentea*.

3. *L. rotundifolia*.

1. **L. canadensis** (L.) Greene. A thornless shrub, 1-3 m. high, with brown scurfy branches; leaves ovate or oval, silvery stellate and brown-scurfy spotted beneath; flowers brown without, greenish yellow within; fruit rounded-ellipsoid, red or yellowish, 4-6 mm. long, insipid. *Shepherdia canadensis* (L.) Nutt. Woods and banks: Newf.—N.Y.—Mich.—Colo.—Utah—Ore.—Alaska. *Submont.—Subalp.* Ap—Je.

2. **L. argentea** (Nutt.) Greene. A shrub or small tree, 2-7 m. high, with whitish, more or less thorny branches; leaves oblong, 2-5 cm. long, rounded at the apex, acute at the base; flowers brown; fruit rounded-ellipsoid, sour, scarlet, red, or golden yellow, 4-6 mm. long. *S. argentea* Nutt. River banks: Sask.—Man.—Kans.—N.M.—Nev.—Alta. *Plain—Submont.* Ap—My.

3. **L. rotundifolia** (Parry) Greene. Low densely branched shrub, with silvery tomentose branches; leaves persistent, rounded-oval or ovate, 1-3 cm. long; staminate flowers in 3's, the pistillate solitary, silvery without; fruit globular, scurfy. *S. rotundifolia* Parry. Bare clayey soil: s Utah. *Son.* Mr.

FAMILY 90. **LYTHRACEAE.** LOOSESTRIFE FAMILY.

Herbs, rarely shrubs or trees, with opposite or alternate, mostly entire leaves. Flowers perfect, solitary or in axillary clusters or cymes. Hypanthium from globose or campanulate to cylindric, enclosing but free from the ovary. Sepals 4 or 5, often accompanied by as many accessory teeth. Petals 4 or 5, or wanting. Stamens few or many, in one or several series. Gynoecium of several united carpels; ovary 2-6-celled, rarely 1-celled; styles united. Fruit a capsule, rarely indehiscent.

Hypanthium campanulate or turbinate, in fruit becoming globose or hemispheric.

Capsule bursting irregularly.

Capsule septicidal.

Hypanthium cylindric.

1. **AMMÁNIA**.

2. **ROTALA**.

3. **LYTHRUM**.

1. **AMMÁNIA** (Houston) L.

Annual herbs, with 4-angled stems. Leaves opposite, entire, usually auricled at the base. Flowers solitary or cymosely clustered in the axils. Hypanthium campanulate, 4-angled, becoming subglobular. Sepals 4, usually with as many small teeth in the sinuses between them. Petals 4, early deciduous. Stamens 4-8. Ovary subglobose, usually 2-4-celled; styles filiform; stigmas capitate. Capsule membranous, bursting irregularly. Seeds angular, with coriaceous coat.

1. **A. coccinea** Rottb. Annual; stem erect, glabrous, branched below, 1.5-5 dm. high, glabrous; leaves linear or linear-lanceolate, acutish at the apex, auriculate at the base, entire, 3-7 cm. long; flowers 1-5 in each axil, sessile or nearly so; petals purple, early deciduous; style elongate, very slender, usually more

than half as long as the capsule. *A. latifolia* T. & G., not L. (?) *A. alcalina* Blankinship. Swamps and wet places: Ind.—Fla.—Tex.—Wyo.—Mont.; Mex.; Brazil. *Plain.* Jl-S.

2. ROTĀLA L.

Annual or biennial swamp herbs, with 4-angled stems. Leaves opposite, narrow, entire. Flowers perfect, usually solitary in the axils. Hypanthium campanulate, becoming subglobose in fruit. Sepals 4, very small. Petals usually 4. Stamens 4; filaments short. Ovary subglobose, 4-celled; styles very short; stigma entire or nearly so. Capsule 4-celled, subglobose, septicidally 4-valved.

1. *R. ramosior* (L.) Koehne. A glabrous annual, 5-25 cm. high; leaves oblong or linear-oblong, 1-3 cm. long, obtuse, acute at the base; flowers usually solitary in the axils; calyx 3-4 mm. long; lobes acuminate; petals minute; capsule ellipsoid. Wet places: Mass.—Fla.—Tex.—Neb.—Calif.—Ida.—Wash.; W. Ind. and Mex. Jl-S.

3. LÝTHRUM L. LOOSESTRIFE.

Herbs or shrubs, with angled stem; ours perennial herbs. Flowers solitary in the axils, or in spikes or racemes. Hypanthium cylindric, ribbed or grooved. Sepals 4-6, accompanied with as many accessory teeth. Petals 4-6, obovate or oblanceolate. Stamens 8-12, in one series; filament filiform. Ovary 2-celled; stigma capitate. Capsule membranous, 2-celled, or becoming 1-celled, septicidally 2-valved or bursting irregularly.

1. *L. alatum* Pursh. Perennial; stem glabrous, 3-12 dm. high, 4-angled or -winged; leaves sessile, alternate or the lowest opposite, lanceolate or oblong, rounded at the base, acute at the apex, 2-3 cm. long; flowers solitary in the upper axils; petals deep purple, ascending; disk fleshy; calyx 5-6 mm. long in fruit, ribbed. Low ground: Ont.—Mass.—D.C.—Tex.—Wyo.—B.C. *Plain.* Je-Au.

FAMILY 91. ONAGRACEAE. EVENING-PRIMROSE FAMILY.

Herbs, or rarely shrubs, with simple alternate or opposite leaves. Flowers perfect, axillary or in terminal racemes. Hypanthium often elongate, enclosing and adnate to the ovary. Sepals 2-6, usually 4. Petals 2-9, usually 4, convolute in the bud, rarely wanting. Stamens as many or twice as many as the sepals. Gynoecium of 1-6, usually 4, united carpels. Ovary 1-6-celled, inferior; styles united. Fruit capsular or nut-like.

Flowers 4-merous.

Fruit a many-seeded capsule, opening by valves.

Seeds with a tuft of silky hairs.

Hypanthium not prolonged beyond the ovary; flowers large.

1. CHAMAENERION.

Hypanthium somewhat prolonged beyond the ovary.

Hypanthium-tube cylindric, not inflated above the ovary, without scales within; flowers neither showy nor scarlet.

Flowers regular; stamens and style not declined; petals purplish, pink or white, in ours yellow only in one species.

2. EPILOBIUM.

Flowers irregular; stamens and style somewhat declined; petals yellowish.

3. CORDYLOPHORUM.

Hypanthium-tube inflated above the ovary, bearing 8 scales within; flowers irregular, showy scarlet.

4. ZAUSCHNERIA.

Seeds without a tuft of silky hairs, naked or tuberculate.

Hypanthium not produced beyond the ovary; flowers minute.

Stamens 8; sepals deciduous; capsule linear.

5. GAYOPHYTUM.

Stamens 4; sepals persistent; capsule obovoid or turbinate.

6. ISNARDIA.

Hypanthium prolonged beyond the ovary into a cylindric or funnelform tube.

Anthers attached near the base, erect; petals never yellow.

Calyx-lobes erect; petals minute, clawless; capsule membranous.

7. BOISDUVALLIA.

Calyx-lobes reflexed; petals showy, clawed; capsule coriaceous.

Fertile stamens 4, the alternate ones rudimentary; petals 3-lobed.

8. CLARKIA.

- Fertile stamens 8; petals entire, rhombic. 9. *PHAEOSTOMA*.
 Anthers attached near the middle and versatile.
 Stigma divided into 4 linear lobes.
 Stamens equal in length; capsule terete or round-angled.
 Ovules and seeds horizontal, inserted in 2 or rarely more rows,
 prismatic-angled; petals yellow. 10. *OENOTHERA*.
 Ovules and seeds ascending, in one row, not angled; buds droop-
 ing; petals white or pink. 11. *ANOGRA*.
 Stamens unequal in length, the alternate longer; capsule crested or
 winged; plant acaulescent or low-stemmed.
 Capsules with more or less distinct double crests on the angles;
 seed furrowed along the raphe. 12. *PACHYLOPHUS*.
 Capsules winged or at least sharply angled on the angles.
 Plants acaulescent, cesvotose. 13. *LAVAUXIA*.
 Plants caulescent, with wiry diffuse stems. 14. *GAURELLA*.
 Stigma discoid or capitate.
 Stigma discoid; hypanthium-tube funnellform above.
 Hypanthium-tube longer than the ovary; stigma entire. 15. *GALPINSIA*.
 Hypanthium-tube shorter than the ovary; stigma 4-toothed. 16. *MERIOLEX*.
 Stigma capitate.
 Plant acaulescent; capsules 4-winged; hypanthium-tube tubular-
 cylindric. 17. *TARAXIA*.
 Plant caulescent; capsules not winged; hypanthium-tube ob-
 conic or funnellform.
 Capsule linear, sessile, narrowed above. 18. *SPHAEROSTIGMA*.
 Capsule more or less clavate, pedicelled and obtuse. 19. *CHYLISMIA*.
 Fruit indehiscent, nut-like.
 Hypanthium-tube filiform; filaments unappendaged; ovary 1-celled. 20. *STENOSIPHON*.
 Hypanthium-tube obconic; filaments with scales at the base; ovary 4-celled. 21. *GAURA*.
 Flowers 2-merous; fruit indehiscent, obovoid and bristly with hooked hairs. 22. *CIRCAEA*.

1. *CHAMAENERION* (Gesn.) Boehmer-Ludwig. FIRE-WEED.

Perennial herbs, somewhat woody at the base. Leaves alternate, narrow, entire. Flowers perfect, somewhat irregular, showy, in terminal racemes. Hypanthium not prolonged beyond the ovary. Sepals 4, deciduous. Petals 4, purple, forming an oblique cross, entire. Stamens 8, with declined filaments. Stigma 4-lobed. Capsule elongate, nearly linear, obtusely 4-angled, locu-
 loidal. Seeds with a tuft of hairs (coma) at the upper end.

Style pubescent at the base; leaves lanceolate or linear-lanceolate, with the lateral veins confluent in marginal loops.

Petals 15–20 mm. long; stem-leaves usually obtuse at the base. 1. *C. exaltatum*.

Petals 8–12 mm. (rarely 15 mm.) long; leaves all acute at the base. 2. *C. spicatum*.

Style glabrous; lateral veins of the leaves obsolete, not looped.

Leaves lanceolate to ovate, entire or nearly so; pod about 3 mm. thick. 3. *C. latifolium*.

Leaves narrowly linear-lanceolate, denticulate; pod about 2 mm. thick. 4. *C. subdentatum*.

1. *C. exaltatum* Rydb. Stem 1–3 m. high, glabrous or nearly so; leaves linear-lanceolate, 1–2 dm. long, 2–3 cm. wide, short-petioled, minutely denticulate or entire, slightly paler beneath; lateral veins numerous, at almost right angles to the midrib; petals purple, broadly obovate; styles exceeding the stamens, bearded some distance above the base; capsule 5–8 cm. long, spreading. Hillsides: Alaska—Mont.—Ida.—Wash. *Submont.* Je—Jl.

2. *C. spicatum* (Lam.) S. F. Gray. Stem 0.5–2.5 m. high, glabrate below, puberulent above; leaves lanceolate or linear-lanceolate, 5–15 cm. long, paler beneath; petals purple, rose-colored or rarely white; style exceeding the stamens, hairy at the base; capsule 5–7.5 cm. long. *Epilobium angustifolium* β L. *C. angustifolium* Scop. Edges of woods and copses, burnt-over ground, etc.: Greenl.—N.C.—Ill.—N.M.—Calif.—Alaska. *Submont.*—*Mont.* Je—S.

3. *C. latifolium* (L.) Sweet. Perennial, with a caespitose rootstock; stem 1–4 dm. high, glabrous below; leaves 2–5 cm. long, ovate or ovate-lanceolate, pale; inflorescence usually short; petals 1.5–3 cm. long, rose-colored, pale purple,

or white, purple-veined; style shorter than the stamens, glabrous; capsule 5–8 cm. long. *Epilobium latifolium* L. Wet places, especially along mountain streams: Greenl.—Que.—S.D.—Colo.—Wash.—Alaska. *Subalp.*—*Alp.* Je—Au.

4. C. subdentatum Rydb. Stem 2–3 dm. high, finely puberulent; leaves narrowly lance-linear, more or less distinctly denticulate, 2–4 cm. long, 3–8 mm. wide, finely puberulent, the midvein strong, but the lateral ones obscure; sepals lance-linear, 12 mm. long, purplish; petals oblanceolate, about 15 mm. long, rose or white; style shorter than the stamens, glabrous; capsule 3–6 cm. long, 2 mm. thick. Banks: Alta.—B.C. *Subalp.*

2. *EPILOBIUM* (Gesn.) L. WILLOW-HERB, COTTON-WEED.

Caulescent herbs, rarely shrubby. Leaves alternate or opposite, with often toothed blades. Flowers perfect, racemose or spicate, or rarely solitary. Hypanthium prolonged beyond the ovary into an obconic short tube. Sepals and petals 4, the latter often notched, purplish, pink or white, rarely yellow. Stamens 8, not declined. Stigma club-shaped, subentire, slightly notched, or rarely 4-lobed. Capsule elongate, subcylindric, slightly fusiform or clavate, 4-celled, 4-sided, loculicidal. Seeds with a tuft of hairs (coma) at the upper end.

Petals purple, pink or white.

Perennials; stigma entire or merely notched.

Leaves oblong, oval, ovate, or lanceolate, usually dentate or denticulate.

Plants with rosettes or turions; leaves ovate or lanceolate, usually broadest below the middle, and distinctly denticulate or dentate (except sometimes in nos. 8, 9, and 16).

Stem pubescent throughout; leaves also pubescent, at least when young.

Pubescence consisting of long silky hairs.

Pubescence short and dense, crisp or glandular.

Petals 7–8 mm. long.

Petals 4–5 mm. long.

Leaves ovate, permanently glandular, dark green.

Leaves lanceolate, glabrous in age, pale green.

Stem glabrous below; leaves glabrous or nearly so.

Flowers 7–8 mm. long; petals purple or dark pink; leaves ovate-lanceolate.

Leaves sessile or nearly so; innovations by turions.

Seeds without apiculations; coma sessile.

Plant tall, 5–10 dm. high; leaves dark green, sharply dentate.

Plant low, 2–4 dm. high; leaves light green, more indistinctly denticulate.

Seeds with a pale hyaline beak at the apex.

Leaves short-petioled; innovations by rosettes.

Flowers 3–5 mm. long.

Leaves all except the uppermost, short-petioled.

Seeds pellucid-apiculate; leaves not very thin; pods strongly ascending or nearly erect.

Innovations by rosettes.

Leaves narrowly lanceolate, pale green; corolla white.

Leaves broadly lanceolate, not pale; corolla usually pink.

Innovations by turions.

Seeds not apiculate; leaves very thin; pods ascending-spreading.

Leaves all sessile or only the very earliest sometimes short-petioled.

Leaf-blades rounded at the base, broadly lanceolate to ovate.

Petals purple, 5–8 mm. long, leaf-blades usually ovate.

Petals white, 4 mm. long; leaf-blades lanceolate.

Leaf-blades acute at the base.

Petals white or rarely pale pink.

Leaf-blades ample, ovate or broadly lanceolate.

Plant tall, 3–6 dm. high; pod and inflorescence more or less glandular.

Plant 1–2 dm. high; whole plant perfectly glabrous, except the slightly crisp-hairy decurrent lines.

Leaf-blades narrowly lanceolate, almost erect; plant slender.

1–3 dm. high.

15. *E. Drummondii*.

- Petals pink-purple. 16. *E. delicatum*.
 Plants with stolons or soboles, low, 1-2 (seldom 3) dm. high; leaf-blades oval or oblong, indistinctly denticulate.
 Leaves more or less distinctly petioled.
 Petals white; plant 1-3 dm. high, stoloniferous. 17. *E. alpinum*.
 Petals purple or pink.
 Plant 1-3 dm. high, soboliferous; flowers 5-7 mm. long.
 Plant usually less than 1 dm. high, stoloniferous; flowers less than 5 mm. long.
 Flowers nodding in the bud; pods cylindric; seeds smooth. 18. *E. Hornemannii*.
 Flowers ascending in the bud; pods somewhat clavate; seeds papillose. 19. *E. anagallidifolium*.
 Leaves sessile; plant glabrous up to the hypanthium. 20. *E. clavatum*.
 Stem somewhat angled by the decurrent lines; plant stoloniferous; leaves oblong or linear, less than 1.5 cm. long.
 Stem terete, without decurrent lines; plant more or less glaucous, soboliferous. 21. *E. oregonense*.
 Stem-leaves linear-lanceolate. 22. *E. glaberrimum*.
 Stem-leaves ovate or ovate-lanceolate. 23. *E. platyphyllum*.
 Leaves narrow, linear or linear-oblong, entire or minutely denticulate; capsule cinereous.
 Innovations of long subterranean shoots, bearing at their ends ovoid turions; petals white.
 Leaves and lower part of the stem glabrous. 24. *E. wyomingense*.
 Leaves and stem crisp-pubescent. 25. *E. lineare*.
 Innovations leafy rosettes; petals pale; leaves 5-15 mm. long.
 26. *E. davuricum*.
 Annuals with more or less shreddy, straw-colored bark; stigma 4-cleft.
 Seeds smooth; stem more or less strigose or crisp-hairy, not viscid; leaves lance-elliptic; calyx (with the tube of the hypanthium) about 2 mm. long.
 27. *E. Lindleyi*.
 Seeds muriculate; stem glabrous throughout or glandular above; leaves linear or narrowly linear-lanceolate; calyx usually over 2 mm. long.
 Tube of the hypanthium funnelform, 1-3 mm. (rarely 4 mm.) long.
 Petals white, only slightly exceeding the calyx, 2-3 mm. long; capsule glabrous; tube of hypanthium 1-1.5 mm. long.
 28. *E. Tracyi*.
 Petals pink or purple, 3.5-7 mm. long, about twice as long as the calyx.
 Capsule and pedicels glabrous or sparingly puberulent.
 Leaves and bracts very thick, horny at the apex, the latter very short; capsule glabrous; pedicels short. 29. *E. subulatum*.
 Leaves and bracts not very thick, not horny at the apex; capsule usually puberulent, at least when young; pedicels slender.
 30. *E. paniculatum*.
 Capsule and pedicels glandular-pubescent; pedicels very short.
 31. *E. adenocladon*.
 Tube of the hypanthium 4-8 mm. long, cylindric or nearly so, abruptly widening into the calyx.
 Tube of the hypanthium about 4 mm. long; petals 6-7 mm. long.
 32. *E. laevicaule*.
 Tube of the hypanthium 7-8 mm. long; petals 10-12 mm. long.
 33. *E. Hammondii*.
 34. *E. luteum*.
 Petals yellow; perennials; stigma 4-cleft.

1. *E. ursinum* Parish. Perennial, with turions (subterranean bulb-like winter-buds); stem 1-3 dm. high, pilose with long silky hairs; inflorescence minutely glandular; leaves 2-3 cm. long, ovate or broadly lanceolate, serrate or serrulate, rounded at the base, sessile, pilose throughout; petals white or lavender, about 5 mm. long; capsule 3 cm. long, soon glabrous; seeds 1.5 mm. long, short-beaked, with a white scant coma. Wet meadows: Wash.—Ida.—s Calif. *Son.* Je-Jl.

2. *E. Sandbergii* Rydb. Perennial by means of turions; stem obtusely angled, 6-10 dm. high, finely puberulent throughout; leaves sessile, ovate, acute, dentate, 3-7 cm. long, pubescent on both sides, or glabrate below, except the veins; inflorescence crisp-hairy; calyx-lobes linear-lanceolate, about 5 mm. long; petals rose, 7-8 mm. long; pod 4-6 cm. long, glandular-pilose; seeds 1.5 mm. long, almost beakless; coma twyny. Moist places? Ida.—Mont. *Submont.* Jl.

3. *E. Palmeri* Rydb. Perennials propagating by turions or occasionally by rosettes; stem 4-6 dm. high, glandular-pilose, usually reddish or brownish; leaves sessile or nearly so, ovate or ovate-lanceolate, denticulate, 3-4 cm. long,

more or less pubescent; petals pink or light purple, rarely white, about 5 mm. long; pod 4-6 cm. long; seeds papillose, without a beak; coma white or in age somewhat tawny. Wet meadows: Utah—Colo.—Mont.—Ida. *Submont.* JI-S.

4. ***E. glandulosum*** Lehm. Stem 3-9 dm. high, somewhat angled, glabrous below, crisp-pubescent and glandular above; leaves ovate, 5-12 cm. long, acute or acuminate, sessile, darkening in drying; petals 5-7 mm. long, purple; capsule about 6 cm. long, more or less pubescent; coma dingy. *E. Treleaseanum* Lev., a large-flowered form. Wet places, usually in edges of woods: Sask.—Wyo.—Alaska. *Submont.*—Mont. JI-Au.

5. ***E. ovatifolium*** Rydb. Stem 2-6 dm. high, glabrous except the crisp-hairy decurrent lines; leaves sessile or nearly so, ovate or ovate-lanceolate and acute, or the lowest oval and obtuse, 3-4 cm. long, glabrous; petals purple or rarely rose, 5-7 mm. long; capsule 5-6 cm. long, crisp-hairy; coma white. Wet places in the mountains: Colo.—Utah—N.M. *Mont.*—Alp. Je-Au.

6. ***E. brevistylum*** Barbey. Stem 2-6 dm. high, glabrous below, crisp-pubescent above; leaves 3-6 cm. long, ovate or elliptic-lanceolate, drying pale, sessile; petals pink or purple, about 5 mm. long; capsules 4-6 cm. long, short-pedicelled, almost glabrous; coma dingy. Springs and along brooks: Mont.—Colo.—Calif.—Wash. *Submont.*—Mont. Je-Au.

7. ***E. occidentale*** (Trelease) Rydb. Stem 3-10 dm. high, somewhat angled, glabrous below, crisp and glandular-pubescent above; lower leaves short-petioled, the upper subsessile; blades ovate to triangular-lanceolate, 3-7 cm. long; petals purple or rose, 5-6 mm. long; capsule 4-6 cm. long, more or less pubescent; seeds beakless; coma white. *E. adenocaulon occidentale* Trelease. Wet places: Alta.—S.D.—Colo.—Calif.—B.C. *Submont.*—Mont. JI-Au.

8. ***E. americanum*** Haussk. Stem 3-6 dm. high, slightly angled, glabrous below, slightly crisp-hairy above; leaves short-petioled, 2-4 cm. long, glabrous and pale, denticulate or subentire; petals about 4 mm. long, white; capsules glabrous or sparingly pilose when young, 3-5 cm. long; coma white. *E. adenocaulon perplexans* Rydb., scarcely Trelease. Wet places: Sask.—N.D.—Wyo.—Ida.—B.C. Je-Au.

9. ***E. adenocaulon*** Haussk. Stem erect, 3-10 dm. long, somewhat angled, glabrous below, crisp and glandular in the inflorescence; leaves glabrous or the upper puberulent, ovate-lanceolate or elliptic-lanceolate, 3-6 cm. long; petals about 4 mm. long; capsules 4-5 cm. long, glabrate in age; coma white or nearly so. Wet places: N.B.—Pa.—Colo.—Nev.—Yukon. *Plain*—Mont. Je-Au.

10. ***E. latiusculum*** Rydb. Stem 2-4 dm. high, more or less tinged with purple, glabrous or with pubescent lines below, more or less crisp-hairy above; leaves ovate-lanceolate, 2-4 cm. long, acute at the apex, rounded at the base, glabrous; petals pink or rose-colored, about 4 mm. long; capsules 4-5 cm. long, minutely glandular-puberulent, soon glabrate; seeds obtuse at each end, with a very short apiculation; coma sparse, tawny. *E. Drummondii latiusculum* Rydb. Wet places: B.C.—Ida.—Wyo. *Submont.*—Subalp. JI-Au.

11. ***E. MacDougalii*** Rydb. Perennial, with fleshy rosettes; stem 3-5 dm. high, glabrous, with pubescent lines; leaves with very short petioles; blades lanceolate or ovate-lanceolate, glabrous, very thin, 5-7 cm. long, acutish at both ends, denticulate; corolla white, about 4 mm. long; capsule 6-7 cm. long, on pedicels about 1 cm. long; seeds acute at the base, obtuse at the apex; coma scant, white, about 6 mm. long. Lake shores: w Mont. JI.

12. ***E. rubescens*** Rydb. Perennial, with turions; stem 3-4 dm. high, strict and simple, often more or less reddish, glabrous below, crisp-hairy above and more or less on the decurrent lines; leaves 3-4 cm. long, lanceolate, very acute, slightly crisp-hairy beneath when young; petals about 4 mm. long; pods 4-5 cm. long, more or less crisp-pubescent; seeds without neck; coma white. Springs: Colo.—Utah. *Submont.*—Mont. JI-Au.

13. ***E. stramineum*** Rydb. Stem 5-6 dm. high, simple, straw-colored, glabrous or somewhat puberulent below, pubescent and glandular in the inflorescence; leaves sessile, light green, lanceolate, tapering at both ends, 4-5 cm. long;

petals 4-5 mm. long; pod 4-5 cm. long, more or less crisp and glandular; seeds without a neck; coma white. Wet places: Colo.—Wyo.—Utah. *Submont.*—*Subalp.* JI-Au.

14. *E. saximontanum* Haussk. Perennial, with turions; stem simple, ascending or suberect, 1-2 dm. (rarely 3 dm.) high; leaves pale green, glabrous, 1-3 cm. long, the lower ovate, entire, the upper ovate-lanceolate, denticulate; petals 3-5 mm. long; capsules glabrous, about 4 cm. long, short-pedicelled; seeds acute at each end. Near springs: Alta.—Wyo.—B.C. *Submont.*—*Subalp.* JI-Au.

15. *E. Drummondii* Haussk. Perennial, with turions; stem strict, erect, 2-4 dm. high, pale, glabrous; leaves pale, 2-4 cm. long, repand-dentate; petals 4 mm. long; capsule 3-5 cm. long, slender-pedicelled; seeds acute at each end, minutely apiculate; coma dingy. Wet places: Sask.—S.D.—Colo.—Utah—B.C. *Submont.*—*Mont.* Je-Au.

16. *E. delicatum* Trelease. Perennial, with turions; stem slender, 1-3 dm. high, glabrous, with crisp-hairy lines above; leaves 2-7 cm. long, mostly spreading, lanceolate, obtuse, undulate-denticulate, thin and pale; petals about 5 mm. long; capsule 4-6 cm. long, slender-pedicelled; seeds papillose, apiculate; coma dingy. Wet places: Wash.—Mont.—Wyo.—Ore. JI-Au.

17. *E. alpinum* L. Stem ascending or decumbent at the base, 1-3 dm. high, glabrous; leaves elliptic, rather obtuse, 2-5 cm. long, glabrous, the upper often alternate; petals about 3 mm. long; capsules slender, about 5 cm. long, with long pedicels; seeds smooth, beaked. *E. lactiflorum* Haussk. *E. canadense* Lev., a somewhat puberulent form. Wet places in the mountains and in arctic regions: Greenl.—N.H.—S.D.—Colo.—Calif.—Alaska; n Eu. and ne Asia. *Mont.*—*Alp.*

18. *E. Hornemannii* Reichenb. Stem 1-3 dm. high, ascending, somewhat crisp-hairy on the decurrent lines and in the inflorescence; leaves 2-4 cm. long, elliptic or oval, mostly obtuse; flowers few, erect; petals 5-7 mm. long; capsule 5 cm. long, on slender peduncles; seeds usually rough, short-apiculate; coma dingy. Wet places on the mountain sides and in arctic regions: Greenl.—N.H. S.D.—Colo.—Calif.—Alaska; n Eurasia. *Mont.*—*Subalp.* Je-Au.

19. *E. anagallidifolium* Lam. Stem about 1 dm. high, usually S-bent, somewhat crisp-hairy, at least on the decurrent lines; leaves 1-2 cm. long, oval or oblong, obtuse; petals lilac or rose, 4-5 mm. long; capsules 2-4 cm. long, slender-pedicelled, cylindric; seeds short-apiculate; coma dingy. In wet places in alpine-arctic situations: Greenl.—Lab.—Alta.—Colo.—(? Calif.)—Alaska; Eurasia. *Subalp.*—*Alp.* Je-Au.

20. *E. clavatum* Trelease. Stems ascending or decumbent, 1 dm. high or less, glabrate or sparingly glandular; leaves 1-2 cm. long, divergent, broadly oval, obtuse; petals rose-colored, about 5 mm. long; capsule about 2.5 cm. long, more or less arcuate; seeds fusiform, papillose; coma dingy. Alpine peaks: Alta.—Colo.—Utah—B.C. *Mont.*—*Alp.* JI-Au.

21. *E. oregonense* Haussk. Stem 1-2 dm. high, simple, erect, glabrous, often purplish above, 1-few-flowered; leaves obtuse, glabrous, entire or remotely and minutely denticulate, 1-1.5 cm. long; petals violet or rose, 3-5 mm. long; capsules 2-4 cm. long, on pedicels of about the same length; seeds apiculate. Bogs: B.C.—Ida.—Nev.—Calif. *Mont.*—*Subalp.* Je-Au.

22. *E. glaberrimum* Barbey. Stems erect, simple, 3-6 dm. high, glabrous, terete; leaves ascending, 2-5 cm. long, the lowest oblanceolate, entire or repand, narrowed at each end; petals purplish, rose, or rarely white, 5-8 mm. long; capsule 7.5 cm. long, linear-falcate, distinctly pedicelled; seeds very rough; coma dingy. Wet places: Wash.—Ida.—Calif. *Mont.* JI-Au.

23. *E. platyphyllum* Rydb. Stems ascending or erect, glabrous, without decurrent lines, terete; leaves rounded or subcordate at the base, acute, or the lower obtuse, entire or minutely denticulate, 1.5-2.5 cm. long; petals pale, about 4 mm. long; capsules glabrous, about 5 cm. long, on short pedicels; seeds not

apiculate; coma white or dingy. *E. glaberrimum latifolium* Barbey. Wet places: B.C.—Utah—Calif. *Submont.*—*Mont.* JI—Au.

24. *E. wyomingense* A. Nels. Stem slender, erect, branched, glabrous below, minutely puberulent above; leaves thin, 3–5 cm. long; midrib evident, but lateral veins obscure; petals 3–4 mm. long; capsules 4–7 cm. long, minutely cinereous; seeds fusiform, scarcely beaked; coma white. *E. palustre albiflorum* Lehm. In bogs and along streams: Sask.—S.D.—Colo.—Utah—Yukon. *Plain*—*Submont.* JI—Au.

25. *E. lineare* Muhl. Stem erect, branched, 2–4 dm. high; leaves linear, short-pubescent, with crisp hairs, revolute on the margins, 2–5 cm. long; flowers numerous; petals about 4 mm. long; capsule 4–5 cm. long, canescent, often slender-pedicelled; seeds fusiform, short-apiculate; coma dingy. Swamps: N.B.—Del.—Colo.—Ida.—B.C. *Plain*—*Submont.* JI—S.

26. *E. davuricum* Fischer. Stem 1–2 dm. high, sparingly crisp-hairy; leaves 5–15 mm. long, crowded at the base, distant above, linear or narrowly oblong, obtuse, remotely denticulate, sessile; flowers at first nodding; capsule erect, 4 cm. long, on slender pedicels; coma white. Bogs: Alaska—B.C.; e Siberia. *Subalp.*

27. *E. minutum* Lindl. Stem 1–3 dm. high, without decurrent lines, branched; leaves mostly opposite, short-petioled, rather fleshy, more or less strigose; flowers numerous, 3–4 mm. long; petals white or rose-colored; capsules clavate, tortuose, 1–2 cm. long; seeds rounded at the apex. *Crossostigma Lindleyi* Spach. *E. adscendens* Suksdorf. Hills and rocky places: Athabasca—Nev.—Calif.—B.C. *Submont.* Ap—JI.

28. *E. Tracyi* Rydb. Stem 3–8 dm. high, perfectly glabrous, straw-colored; leaves 2–4 cm. long, linear, entire, glabrous; tube of the hypanthium 1–1.5 mm. long; calyx-lobes about 2 mm. long, very acute; capsule more or less clavate, about 1.5 cm. long; seeds obovoid, 1.5 mm. long. Sandy soil: B.C.—Ore.—Utah—Mont. *Son.*

29. *E. subulatum* (Haussk.) Rydb. Stem slender, 3–6 dm. high, much-branched, brownish, glabrous; leaves linear or linear-subulate, 2–3 cm. long; tube of hypanthium about 2 mm. long; calyx-lobes 2–2.5 mm. long; petals 3.5–5 mm. long, rose; capsule about 2 cm. long; seeds brown, 1.5 mm. long, obovate; coma tawny. *E. paniculatum subulatum* Haussk. Sandy soil: B.C.—Ida.—Utah—Calif. *Son.*—*Plain.* JI—Au.

30. *E. paniculatum* Nutt. Stem branched, 4–8 dm. high, glabrous, straw-colored; leaves linear or linear-lanceolate, 3–5 cm. long; pedicels longer than the bracts; tube of hypanthium 2–3 mm. long; calyx-lobes about as long; petals lilac or rose-colored, 5–7 mm. long; pods clavate, about 2 cm. long; seeds brown, 2 mm. long; coma tawny. Sandy soil: Alta.—Colo.—Calif.—B.C. *Plain*—*Mont.* JI—Au.

31. *E. adenocladon* (Haussk.) Rydb. Stem rigid, 4–8 dm. high, glabrous and straw-colored below, the smaller branches and pedicels densely glandular; leaves linear or linear-lanceolate, mostly entire, 2–4 cm. long; tube of the hypanthium about 3 mm. (rarely 4 mm.) long; calyx-lobes 2–3 mm. long; petals purple or rose, 5–7 mm. long; capsule clavate, 1.5–2.5 cm. long; seeds blackish brown, obovoid, 2 mm. long; coma tawny. *E. paniculatum adenocladon* Haussk. Sandy soil: S.D.—Colo.—Utah—Mont. *Plain*—*Submont.*

32. *E. laevicaule* Rydb. Stem glabrous, 6–10 dm. high, glabrous and shining; leaves linear or linear-lanceolate, 3–6 cm. long, the upper mostly involute; calyx-lobes 3–4 mm. long; petals rose-colored; pods clavate, about 3 cm. long, glabrous or almost so; seeds obovoid, dark; coma dingy. Sandy valleys: Ida.—Mont.—Wash. *Plain.* JI—Au.

33. *E. Hammondii* Howell. Stem 6–10 dm. high, glabrous, with shreddy bark, paniculate-branched; leaves linear, 2–5 cm. long, the upper involute, pale green, entire; calyx-lobes about 5 mm. long; petals rose or purplish; capsule somewhat clavate, 3–4 cm. long. Rocky places: Ore.—Ida. Au—S.

34. *E. luteum* Pursh. Perennial, with a rootstock and turions; stem 2-8 dm. high, terete and glabrous below, pubescent on the decurrent lines above; leaves sessile, glabrous or nearly so, 4-8 cm. long, dentate, ovate or lance-ovate; tube of the hypanthium very short, campanulate; sepals 1 cm. long or more; petals yellow, slightly exceeding the sepals; style exserted; capsule glabrescent, 4-6 cm. long; seeds obovoid; coma reddish. Wet places: Alaska—Alta.—Wash. Mont.—Subalp. Jl—Au.

3. *CORDYLÓPHORUM* (Nutt.) Rydb.

Suffruticose perennial herbs, branched at the base. Leaves mostly opposite, narrow, entire. Flowers perfect, axillary, irregular. Hypanthium prolonged beyond the ovary into a broadly funnelliform tube. Sepals 4. Petals 4, unequal, pale yellow, notched at the apex. Stamens 8, declined. Style slightly declined, long-exserted; stigma deeply 4-lobed. Capsule fusiform, elongate, 4-valved. Seeds with a deciduous coma.

1. *C. suffruticosum* (Nutt.) Rydb. Suffruticose perennial; stems many, decumbent or ascending, more or less strigose, terete; leaves sessile, lanceolate, acute, entire, 1-3 cm. long, cinereous-strigose; tube of hypanthium about 3 mm. long; calyx-lobes about 5 mm. long; petals slightly exceeding the calyx, pale yellow; capsule 1.5-2.5 cm. long; seeds obovoid-oblong, 2.5-3 mm. long; coma tawny. *Epilobium suffruticosum* Nutt. Stony places: Mont.—Wy.—Wash. Jl—Au.

4. *ZAUSCHNERIA* Presl.

Perennial caespitose herbs, sometimes shrubby at the base. Leaves, except those of the inflorescence, opposite, toothed. Flowers perfect, somewhat irregular, racemose, showy. Hypanthium inflated above the ovary, then funnelliform, with 4 erect and 4 reflexed scales in the throat. Sepals and petals 4, the latter scarlet, retuse, obcordate, or deeply cleft. Stamens 8, the alternate ones inserted with the petals lower down. Styles elongate and exserted; stigma pelate or capitate, 4-lobed. Capsule elongate-fusiform, obtusely angled, loculicidal, 4-valved. Seeds with a coma.

Leaves ovate; lateral veins strong.
Leaves oblanceolate; lateral veins faint.

1. *Z. Garrettii*.
2. *Z. crassifolia*.

1. *Z. Garrettii* A. Nels. Stems erect from a decumbent base, 1.5-3 dm. high, with pale shreddy bark below, softly hirsute above; leaves sessile; elliptic, oval, or ovate, 2-3 cm. long, remotely dentate, sparsely soft-hirsute; tube of hypanthium red, 12-16 mm. long; petals deep-red, obovate-obcordate; capsule minutely glandular-puberulent on the angles. Dry hills: Utah. Submont.—Mont. Au.

2. *Z. crassifolia* Rydb. Stems 2-4 dm. high, pilose; bark in age exfoliating; leaves sessile, oblanceolate or elliptic-oblanceolate, 1.5-3 cm. long, acute at each end, denticulate, pilose or in age glabrate; flowers crimson; hypanthium trumpet-shaped, 2 cm. long; sepals narrowly lanceolate, 8 mm. long; petals about 1 cm. long, oblanceolate; capsule about 2 cm. long, cylindric. Cañons and sandy soil: Ariz.—s Utah. Son. S-N.

5. *GAYÓPHYTUM* A. JUSS. BABY'S BREATH.

Caulescent annuals. Leaves very narrow, linear, entire. Flowers axillary, minute, perfect. Hypanthium not produced above the ovary. Sepals 4, reflexed, deciduous. Petals 4, small, obovate or spatulate, white or rose-colored. Stamens 8, those opposite the petals shorter and with sterile anthers. Stigmas capitate or clavate. Capsule clavate or linear, 2-celled, 4-valved. Seeds without a coma.

Seeds canescent.

Petals 3-6 mm. long.

Petals about 1 mm. long.

Plant diffusely branched, glabrous throughout, or upper part of the stem and capsules strigillose; capsule distinctly pedicelled.

Plant with strict branches, hirsutulous; pedicel of capsule very short or almost none.

1. *G. eriospermum*.

2. *G. lasiospermum*.

3. *G. Helleri*.

Seeds glabrous.

Capsules torulose, less than three times as long as the pedicels, usually more or less clavate.

Petals 3-6 mm. long; capsules scarcely longer than the pedicels.

Petals 1-3 mm. long.

Plant pubescent with spreading hairs.

Plant glabrous throughout or the young capsules strigillose.

Petals 1.5-2.5 mm. long, rose with yellow base; capsules 8-12 mm. long, nearly twice as long as the pedicels.

Petals about 1 mm. long, rose or white.

Capsules decidedly clavate, rounded at the apex, seldom longer than the pedicels, spreading or reflexed.

Capsules only slightly if at all clavate, narrow, usually longer than the pedicels, and erect.

Capsules neither torulose nor clavate; pedicel very short.

Capsules narrow, scarcely flattened, with suberect seeds.

Capsules broader, flattened contrary to the septum, with oblique seeds.

4. *G. diffusum*.

5. *G. caesium*.

6. *G. intermedium*.

7. *G. ramosissimum*.

8. *G. Nuttallii*.

9. *G. racemosum*.

10. *G. pumilum*.

1. ***G. eriospermum*** Coville. Stem 3-5 dm. high, widely branched, glabrous; leaves narrowly linear, 3-5 cm. long; pedicels 5-10 mm. long, erect; sepals 3-4 mm. long, strigose; petals rose-colored in age; capsule strigose, erect, about 1 cm. long, torulose, 8-10-seeded. Sandy soil: Ore.—Ida.—Calif. *Son.* Jl-S.

2. ***G. lasiospermum*** Greene. Stem 3-6 dm. high; leaves narrowly linear, 1-3 cm. long; pedicels erect, 2-4 mm. long; petals white, often turning rose-colored; capsules erect, slightly clavate, scarcely torulose, glabrous or strigillose, 6-10 mm. long. Sandy soil: Wash.—Mont.—Utah—Calif. *Plain*—*Submont.* Je-Au.

3. ***G. Helleri*** Rydb. Stem 1-3 dm. high; leaves linear, 0.5-2 cm. long, softly hirsutulous; pedicels very short, even in fruit scarcely more than 1 mm. long; petals scarcely 1 mm. long; capsules linear, erect, 8-10 mm. long, almost sessile, hirsutulous, not torulose. Sandy places: Ida.—Wyo.—Calif. *Submont.* Je-Jl.

4. ***G. diffusum*** T. & G. Stem dichotomously branched, 3-6 dm. high, glabrous or nearly so; leaves linear, 2-6 cm. long, glabrous, or strigillose when young; sepals about 2 mm. long; capsule clavate, torulose, 5-10 mm. long, usually erect. Sandy places: Mont.—Wyo.—Utah—Calif.—Wash. *Submont.*—*Mont.* Je-Au.

5. ***G. caesium*** T. & G. Stem 1-5 dm. high; branched; leaves linear or narrowly linear-oblancoate, 2-5 cm. long, sepals and petals 1-2 mm. long; capsule clavate, torulose, 8-10 mm. long; erect, short-pedicelled. Sandy places: Mont.—Wyo.—Utah—Calif.—Wash. *Son.*—*Submont.* Je-Au.

6. ***G. intermedium*** Rydb. Stem white and shining, with more or less peeling bark, profusely branched, 3-7 dm. high, erect; leaves linear or nearly so, light green; sepals about 1.5 mm. long, yellowish; capsule somewhat clavate and torulose, somewhat strigose when young. Sandy soil: Mont.—Colo.—Calif.—Wash. *Submont.*—*Mont.* Jl-Au.

7. ***G. ramosissimum*** T. & G. Stem diffusely branched, 3-6 dm. high; leaves linear, 2-4 cm. long; petals white or rose-colored; capsule 3-8 mm. long, decidedly torulose, spreading or usually reflexed. Sandy places and on hillsides: Mont.—S.D.—Colo.—Ariz.—Calif.—B.C. *Submont.*—*Mont.* My-Au.

8. ***G. Nuttallii*** T. & G. Stem 2-5 dm. high, glabrous, branched; leaves 1-3 cm. long, acute; capsule linear, 7-15 mm. long, somewhat torulose; pedicels 2-4 mm. long. Sandy or dry soil, hillsides, etc.: S.D.—Colo.—Ariz.—Calif.—Wash. *Submont.* Jl-S.

9. ***G. racemosum*** T. & G. Stem 1-3 dm. high, more or less branched, glabrous or slightly strigose above; leaves linear, 2-4 cm. long, usually glabrous; sepals and petals mostly less than 1 mm. long; capsule narrowly linear, 1-1.5 cm. long, glabrous, erect, almost sessile. Sandy soil: S.D.—Colo.—Calif.—Wash. *Submont.*—*Subalp.* Je-Au.

10. ***G. pumilum*** S. Wats. Stem 1-2 dm. high, glabrous or nearly so, simple or branched at the base; leaves narrowly linear-oblancoate, acute, 2-4

cm. long; sepals and petals about 1 mm. long; capsules erect, flat, glabrous or nearly so, 6–12 mm. long. Low sandy soil: Wash.—Ida.—Utah—Calif. *Mont.* Je—Au.

6. *ISNÁRDIA* L. MARSH PURSLANE.

Succulent caulescent herbs, with creeping or floating stems. Leaves few, petioled, opposite. Flowers perfect, axillary, sessile. Hypanthium not produced beyond the ovary. Sepals 4, erect and persistent. Petals 4, small, reddish, or wanting. Stamens 4, with short filaments. Capsule short, truncate at the apex, mostly obpyramidal or obovoid. Seeds without a coma.

1. *I. palustris* L. Stem branching, 1–5 dm. long; leaf-blades oval, ovate, or spatulate, 1–2.5 cm. long, slender-petioled; flowers solitary; bractlets none; sepals triangular, acute; capsule 4-sided, slightly longer than broad, 3–4 mm. long. Muddy places and shallow water: N.S.—Fla.—Calif.—Ore.; Mex. and the Old World.

7. *BOISDUVÁLLIA* Spach.

Erect caulescent annuals. Leaves alternate, simple, sessile. Flowers in leafy spikes. Hypanthium produced above the ovary into a funnelform deciduous tube. Sepals 4, erect. Petals 4, sessile, 2-lobed, purple or white. Stamens 8, those opposite the petals shorter; anthers all perfect, oblong, attached near the base. Styles filiform; stigma with 4 cuneate lobes. Capsule oblong, membranous, 4-celled, 4-valved to the base. Seeds without a coma, smooth.

Capsule loculicidal, a considerable portion of the septa remaining attached to the valves at dehiscence; leaves mostly alike.

Leaves ovate or ovate-lanceolate, dentate, glabrous or nearly so. 1. *B. glabella*.

Leaves narrowly lanceolate, entire or remotely denticulate, softly pubescent.

Capsule septicidal; septa adherent to the placenta, rendering the latter 4-winged; upper floral leaves broader. 2. *B. parviflora*.

3. *B. salicina*.

1. *B. glabella* (Nutt.) Walp. Stem 1–3 dm. high, simple, or branched near the base, glabrous or nearly so; leaves and bracts 1–2 cm. long, acute, serrulate; corolla about 2 mm. long, violet; capsule slender, nearly straight, about 7 mm. long, 4-ribbed, seeds sub-fusiform, about 1 mm. long. Damp ground: Sask.—Nev.—Calif.—B.C. *Plain—Submont.* Je—Jl.

2. *B. parviflora* Heller. Stem 1–3 dm. high, branched below, pubescent with spreading white hairs; leaves 1–2.5 cm. long; petals red, about 3 mm. long; capsule about 7 mm. long, slightly curved; seeds somewhat flattened. Sandy soil: Wash.—Ida.—Ore. *Submont.* My—Au.

3. *B. salicina* (Nutt.) Rydb. Stem simple, 2–5 dm. high, grayish strigose; leaves linear or linear-lanceolate, 2–3 cm. long, canescent, entire-margined or nearly so; bracts ovate-lanceolate or ovate, 1–2 cm. long; corolla 4–5 mm. long, purple or rarely white; capsule about 1 cm. long, slightly 4-angled; seeds concave on the inner face. *Oenothera densiflora* β T. & G. *O. salicina* Nutt. Low ground: B.C.—Ida.—Ore. *Plain—Submont.* Jl—S.

8. *CLÁRKIA* Pursh. CLARKIA, PINK FAIRIES.

Annual caulescent, brittle herbs. Leaves alternate, narrow. Flowers showy, in terminal racemes, perfect. Hypanthium produced beyond the ovary into an obconic tube, which is deciduous. Sepals 4, reflexed. Petals 4, clawed, 3-cleft, purple. Perfect stamens 4, with a linear scale at the base on each side; the alternate ones rudimentary, filiform; perfect anthers oblong. Stigmas with 4 broad lobes. Capsule elongate, 4-angled, 4-celled, and 4-valved to the middle. Seeds angled or margined, without a coma.

1. *C. pulchella* Pursh. Stem 2–6 dm. high, puberulent; leaves linear-lanceolate to linear, 3–7 cm. long, entire, glabrous or nearly so; calyx 1–1.5 cm. long; petals purple, 12–25 mm. long, with long slender claws and 3-cleft limb; capsule linear, 16–24 mm. long, 8-angled. Dry plains and hillsides: B.C.—Alta.—Mont.—Ore. *Son.—Submont.* Je—Jl.

9. PHAEOSTOMA Spach.

Annual caulescent herbs. Leaves alternate, narrow. Flowers in terminal racemes. Hypanthium-tube above the ovary obconic. Sepals 4, reflexed. Petals 4, rhomboidal, with a broad short blade, entire, purple. Stamens 8, all perfect, with hairy scales at the bases. Stigma with broad lobes. Capsule elongate, somewhat fusiform, 4-angled, 4-celled, 4-valved to the middle. Seeds without a coma, obliquely prismatic.

1. *P. rhomboidea* (Dougl.) A. Nels. Stem puberulent or glabrous, 3-6 dm. high; leaves petioled; blades oblong-lanceolate or oblong-ovate, 3-5 cm. long; petals purple, 5-7 mm. long, short-clawed, the claw often with a tooth on each side; blades rhombic, entire; capsule 15-25 mm. long, 4-angled, nearly glabrous. *Clarkia rhomboidea* Dougl. *Ospianthes gauroides* (Don.) Lilja. Sandy soil and hillsides: B.C.—Mont.—Utah—Calif. *Submont.* Ap-Jl.

10. OENOTHERA L. EVENING-PRIMROSE.

Biennial or annual stout herbs, with taproots. Leaves alternate, undulate or toothed. Flowers in terminal spikes, nocturnal, from erect buds. Hypanthium-tube above the ovary funnelform. Sepals 4, reflexed. Petals 4, usually obcordate, yellow, or in age turning purplish. Stigmas with 4 linear lobes. Stamens 8. Capsule usually tapering upwards, 4-celled, loculicidal, 4-valved. Seeds in two or more rows, horizontal. [*Onagra* Adans.]

Free tube of the hypanthium 1.5-4 cm. long.

Petals turning pink or purplish in age, 3-4 cm. long.

Free tips of the sepals about 4 mm. long; pubescence of the leaves short, that of the calyx not very copious.

Free tips of the sepals 2-2.5 mm. long; pubescence of the leaves long and loose, that of the calyx copious.

Petals not turning pink or purplish in age, less than 3 cm. long.

Free tips of the sepals 3 mm. long or longer.

Spike not conspicuously leafy-bracted; bracts lance-linear, none except the very lowest ones exceeding the hypanthium-tube or the fruit in length.

Spike conspicuously leafy-bracted; bracts, even the upper ones, exceeding the hypanthium-tube or the fruit in length.

Bracts caudate-acuminate, with twisted tips; plant canescent; corolla about 15 mm. long.

Bracts not caudate-acuminate.

Petals 10-12 mm. long; plant green.

Petals 20-30 mm. long; plant canescent.

Free tips of the sepals about 2 mm. long.

Stem erect; petals 12-20 mm. long.

Stem decumbent; petals about 10 mm. long.

Free tube of the hypanthium 8-15 cm. long.

Leaves linear, entire.

Leaves ovate or lanceolate, sinuate-dentate.

1. *O. Hookeri*.

2. *O. hirsutissima*.

3. *O. subulifera*.

4. *O. Cockerellii*.

5. *O. muricata*.

6. *O. ornata*.

7. *O. strigosa*.

8. *O. depressa*.

9. *O. longissima*.

10. *O. Jamesii*.

1. *O. Hookeri* T. & G. Biennial, with a taproot; stem 5-10 dm. high, erect, angled, more or less hirsute and canescent; leaves lanceolate, repand-dentate, hirsute and canescent, 5-20 cm. long; free tube of the hypanthium 3.5-4 cm. long; sepals about 3 cm. long, more or less hirsute; petals 3-4 cm. long; capsules 4-5 cm. long, hirsute and more or less canescent. *Onagra Macbridei* A. Nels. Valleys: Mont.—N.M.—Calif.—B.C.; n Mex. *Submont.*—Mont. Je-S.

2. *O. hirsutissima* (A. Gray) Rydb. Biennial, with a taproot; stem 3-6 dm. high, grayish pubescent, as well as coarsely hirsute, sometimes almost hispid; leaves lanceolate or linear-lanceolate, entire, or merely denticulate, 5-10 cm. long, densely hirsute; bracts linear-lanceolate, shorter than the hypanthium-tube; free part of the hypanthium about 3 cm. long; sepals about 3 cm. long; petals 3-4 cm. long; capsule 2.5-3 cm. long. *Oenothera biennis hirsutissima* A. Gray. Valleys: N.M.—Colo.—Ariz.—Chihuahua. Jl-S.

3. *O. subulifera* Rydb. Biennial; stem 3-6 dm. high, sparingly hirsute; leaves lanceolate or the lower oblanceolate, densely pubescent, somewhat cinereous, 5-15 cm. long, minutely denticulate; free tube of the hypanthium 1.5-2.5 cm. long; calyx-lobes about 2 cm. long, sparingly hirsute, somewhat glandular; free tips 3-4 mm. long, slender; petals 1.5-2 cm. long; capsule 2.5-3.5 cm.

long, sparingly hirsute. *Onagra strigosa subulata* Rydb. *O. Oakesiana* Rydb. (Fl. Colo.). Valleys: Mont.—Colo. Submont. Jl—Au.

4. *O. Cockerellii* De Vries. Biennial, with a taproot; stem erect, strigose-canescens; leaves lanceolate, caudate-attenuate, strigose-canescens, entire, 5–8 cm. long; bracts similar, with involute, curved and twisted tips; calyx-lobes about 2 cm. long, strigose-canescens; free tips about 3 mm. long; petals yellow; capsule about 3 cm. long. Valleys: Colo. Submont.

5. *O. muricata* L. Biennial, with a taproot; stem erect, 2–8 dm. high, very leafy, puberulent and usually hirsute, the hairs with reddish pustulate bases; leaves lanceolate, ascending, entire or sinuately denticulate, more or less pubescent; inflorescence dense; calyx-lobes 15–18 mm. long; petals light yellow, 12–15 mm., rarely 2 cm. long; capsule 2.5–3 cm. long, more or less hirsute. Sandy places: Newf.—N.Y.—Colo.—Mont. Plain—Submont. Jl—S.

6. *O. ornata* (A. Nels.) Rydb. Stout biennial; stems adscurgent, 4–6 dm. high, very leafy, densely and finely pubescent as well as hirsute; leaves lanceolate or linear-lanceolate, 5–15 cm. long, densely canescens, sinuate-dentate; bracts lanceolate, acute; hypanthium and calyx densely canescens; sepals 2–2.5 cm. long; petals deep yellow or orange, 2–2.5 cm. long; capsule 2–3 cm. long, slightly tapering upwards. *Onagra ornata* A. Nels. Sandy soil: B.C.—Wyo.—Ida. Submont. Je—Jl.

7. *O. strigosa* (Rydb.) Mack. & Bush. Biennial or annual; stem erect, 3–10 dm., grayish strigose and hirsute; lower leaves spatulate, the other lanceolate, 5–10 cm. long, more or less repand-dentate; inflorescence leafy; calyx-lobes 1.5–2 cm. long, grayish-hirsute; capsule 2.5–3 cm. long, grayish hirsute. *O. biennis canescens* T. & G. *Onagra strigosa* Rydb. Valleys and sandy places: Minn.—Kans.—Utah—Wash.—B.C. Plain—Submont. Je—Au.

8. *O. depressa* Greene. Annual or biennial; stems decumbent, 3–8 dm. long, densely canescens; leaves lanceolate, repand-denticulate, densely white-canescens; inflorescence leafy-bracted; calyx and hypanthium densely canescens; sepals about 12 mm. long; capsule about 3 cm. long, densely canescens. This may be a form of the preceding, produced by cultivation. Dry sandy soil: Mont. Jl—Au.

9. *O. longissima* Rydb. A tall biennial; stem strict, 5–10 dm. high, densely canescens, with short crinkled hairs as well as sparingly hirsute; leaves linear or narrowly linear-lanceolate, 1–1.5 dm. long, densely canescens, entire, acute at both ends; spike rather lax; hypanthium-tube 10–12 cm. long, densely canescens, only slightly widening upwards; sepals linear-lanceolate, about 4 cm. long; free tips about 4 mm. long; petals golden yellow, 4 cm. long; capsule about 4 cm. long, densely canescens, slightly tapering upwards. Cañons: Utah.—Ariz. Son. Au—S.

10. *O. Jamesii* T. & G. Biennial; stem decumbent or erect, canescens; leaves ovate, or lanceolate-acuminate, sinuate-dentate, cinereous-canescens; inflorescence leafy, few-flowered; free tube of the hypanthium 8–15 cm. long, more or less pubescent; calyx-lobes 4–6 cm. long; free tips 5–7 mm. long; petals 4–5 cm. long, yellow, turning rose-colored; capsule 2.5–3 cm. long. River valleys: Tex.—Colo.—Ariz. Son. Jl—Au.

11. ANÒGRA Spach. WHITE EVENING-PRIMROSE.

Annual or perennial caulescent herbs, often with white flaky bark. Leaves alternate, usually pinnatifid or toothed. Flowers axillary, usually diurnal, from drooping buds. Hypanthium produced beyond the ovary into a cylindric tube. Sepals 4, narrow, reflexed. Petals white, turning pink, obcordate, showy. Stigma with 4 linear lobes. Capsule cylindric, slightly angled, loculicidal, 4-valved, many-seeded. Seeds terete in one row in each cavity of the ovary.

Calyx in bud merely acutish; tips not free or slightly so in no. 4.

Pubescence at least in part consisting of long silky hairs.

Capsule divergent or reflexed.

Blades of the upper leaves rhombic-lanceolate to ovate in outline.

- Blades of all the leaves deltoid-lanceolate, sinuate-dentate, acuminate or acute; capsule reflexed. 1. *A. deltoidea*.
- Blades of the lower leaves spatulate, sinuate or round-lobed, obtuse; capsules divergent. 2. *A. Engelmannii*.
- Blades of all leaves linear, oblanceolate or oblong in outline.
- Leaf-blades linear or the lower linear-oblanceolate, sinuately dentate; calyx with a few long hairs. 3. *A. Buffumi*.
- Leaf-blades oblanceolate or oblong in outline, sinuately pinnatifid, with oblong lobes; calyx densely silky villous. 4. *A. violacea*.
- Capsule erect or ascending.
- Seeds narrow, smooth, very acute at the apex; petals 1–1.75 cm. long. 5. *A. trichocalyx*.
- Seeds ovoid, ridged and tubercled, rather blunt at the apex.
- Branches erect; petals 1.5–2 cm. long. 6. *A. perplexa*.
- Branches decumbent or merely ascending; petals 2.5–4 cm. long. 7. *A. albicaulis*.
- Pubescence wholly cinereous-strigose. 8. *A. Bradburiana*.
- Calyx in bud acuminate or acute; tips free.
- Capsule linear-cylindric; throat of the corolla glabrous.
- Leaves all long-petioled, oblanceolate, subentire; plant dwarf. 9. *A. simplex*.
- Stem-leaves short-petioled or sessile; plant not dwarf.
- Calyx sparingly long-hairy, glandular-puberulent, or glabrous, not strigose.
- Stem-leaves deeply pinnatifid.
- Plant perennial with a rhizome. 10. *A. rhizomata*.
- Plant biennial, with a taproot. 11. *A. violacea*.
- Stem-leaves subentire, dentate or short-lobed.
- Capsules strongly ascending, straight; leaves linear or lance-linear, entire or nearly so, strigose beneath. 12. *A. pallida*.
- Capsules divergent, usually curved upwards; leaves usually denticulate or sometimes lobed. 13. *A. leptophylla*.
- Leaves glabrous, except the margins. 14. *A. Vreelandii*.
- Calyx glabrous or nearly so; tips slender. 15. *A. cinerea*.
- Leaves lanceolate to linear-lanceolate. 16. *A. runcinata*.
- Leaves linear or very narrowly linear-oblanceolate. 17. *A. latifolia*.
- Calyx pilose; tips very short. 18. *A. coronopifolia*.
- Leaves pubescent on both sides.
- Calyx and hypanthium densely grayish strigose; leaves cinereous.
- Leaves linear-lanceolate, deeply pinnatifid; petals rhombic.
- Leaves ovate or oblong, rarely lanceolate, dentate; petals obcordate.
- Capsules oblong; throat of the corolla hairy; leaves deeply pinnatifid.

1. *A. deltoidea* (Torr. & Frem.) Small. Annual or biennial; stems often branched at the base, 1–3 dm. high, decumbent below; leaves petioled; blades 3–10 cm. long, densely canescent above, hirsute beneath; tube of the hypanthium 3–4 cm. long, densely hirsutulous; calyx-lobes 1.5–2.5 cm. long, hirsutulous; petals 2–3 cm. long; capsule 3–4 cm. long, 2 mm. thick. Dry regions: Ariz.—s Utah—s Calif. *L. Son.* Ap–Je.

2. *A. Engelmannii* (Small) Woot. & Standl. Biennial; stem erect, 3–6 dm. high; basal leaves petioled, 7–10 cm. long; stem-leaves sessile, lanceolate or ovate, sinuately toothed, 2–4 cm. long, canescent on both sides, and hirsute on the veins; tube of the hypanthium 1.5–2 cm. long, canescent and hirsutulous; calyx-lobes about 1.5 cm. long, hirsute; petals about 2 cm. long; pod 3–5 cm. long, 2.5–3 mm. thick. Dry places: w Tex.—Utah. *Son.* Je–Jl.

3. *A. Buffumi* A. Nels. Annual; stem erect, 2–3 dm. high, usually simple, sparingly puberulent and with scattered long hairs, or nearly glabrate; basal leaves petioled, 6–12 cm. long; petals about 2.5 cm. long; capsule spreading and curved, 2–3 cm. long. River valleys: Wyo. *Submont.* Au.

4. *A. violacea* A. Nels. Biennial, with a taproot; stems several, erect, 2–3 dm. high, violet or purple, finely puberulent or glabrous; basal leaves linear-oblanceolate, entire or dentate; stem-leaves puberulent, 4–8 cm. long; tube of hypanthium 2–2.5 cm. long, sparingly hairy; calyx-lobes 1.5–2 cm. long; capsule divergent, about 3 cm. long, 2 mm. thick, usually strongly curved. Sandy soil: Wyo.—Colo. *Plain—Submont.* My–Je.

5. *A. trichocalyx* (Nutt.) Small. Biennial or perennial; stems erect, 1–2 dm. high, somewhat puberulent; leaves more or less deeply sinuate-pinnatifid, cinereous and with scattered long hairs; tube of hypanthium 2–2.5 mm. long,

cinereous; sepals 1.5 cm. long, cinereous and silky-villous; capsule erect, 2-3 cm. long, 2 mm. thick, nearly straight. *O. trichocalyx* Nutt. Dry places: Wyo.—Colo.—Nev. *Plain—Submont.* My-Jl.

6. *A. perplexa* Rydb. Biennial; stem 1-2 dm. high, more or less cinereous and with scattered hairs, branched at the base, with erect branches; leaves 2-6 dm. long, oblanceolate in outline, hirsute and somewhat canescent, the basal ones dentate, the cauline ones strongly ascending, deeply pinnatifid, with narrowly linear, more or less ascending lobes; tube of the hypanthium 1.5-2 cm. long, hirsute; calyx-lobes 1.5-1.75 cm. long, hirsute; capsule about 3 cm. long, and fully 3 mm. thick, erect. Plains: Neb.—Kans.—Colo.—Wyo. *Plain—Submont.* Je-Jl.

7. *A. albicaulis* (Pursh) Britton. Annual or biennial; stem 1-3 dm. long, branched at the base; basal leaves spatulate, obtuse, merely toothed; stem-leaves 5-12 cm. long, deeply pinnatifid, with lanceolate or linear, rather divergent divisions; tube of hypanthium about 3 cm. long, sparingly pubescent; calyx-lobes about 3 cm. long, sparingly silky-hirsute or sometimes glabrous; pod 3.5-5 cm. long, about 3 mm. thick. *Oenothera pinnatifida* Nutt. *O. albicaulis* Pursh. Hillsides and in sandy soil: S.D.—Tex.—Ariz.—Mont.; n Mex. *Plain—Submont.* My-Jl.

8. *A. Bradburiana* (Nutt.) Rydb. Annual or biennial; stem erect, 1-2 dm. high, finely cinereous-strigose; leaves 3-5 cm. long, oblanceolate in outline; the basal ones subentire or dentate, the cauline ones deeply pinnatifid, cinereous-strigose; tube of hypanthium and calyx-lobes cinereous, each nearly 2 cm. long; petals fully 2 cm. long. *O. Bradburiana* Nutt. Sandy places: Wyo.—S.D.

9. *A. simplex* Small. Annual; stem simple, 1-1.5 dm. high; leaves petioled, oblanceolate, sinuately toothed or entire, 5-10 cm. long, grayish strigose; tube of hypanthium 2-2.5 cm. long, canescent; calyx-lobes about 2 cm. long, strigose, their free tips fully 1 mm. long; petals 2.5-3 cm. long, white, turning rose, with yellow bases. Dry places: s Utah—L. Calif. *L. Son.*

10. *A. rhizomata* A. Nels. Perennial, with a rootstock; stems 1-2 dm. long, often pinkish or violet, strigose and sparingly hirsute; leaves oblanceolate in outline, 3-5 cm. long, strigose and hirsute, the lowermost entire or dentate; tube of hypanthium 1.5-2 cm. long; calyx-lobes silky-hirsute, 1.5-2 cm. long; free tips scarcely 1 mm. long; capsules spreading, about 3 cm. long. Dry sandy places: Wyo.—Colo. *Plain—Submont.* My-Jl.

11. *A. Nuttallii* (Sweet) A. Nels. Perennial; stem 3-10 dm. high; leaves 5-10 cm. long; tube of hypanthium glabrous or sparingly glandular-puberulent, 3-4 cm. long; calyx-lobes 1.5-2 cm. long, glabrous or sparingly hirsute; free tips 3 mm. long; capsule 3 cm. long; petals 2-2.5 cm. long. *Oenothera albicaulis* Nutt. In sandy soil: Sask.—Minn.—Colo.—Ida.—B.C. *Plain—Mont.* Je—Au.

12. *A. pallida* (Dougl.) Britton. Perennial, with a horizontal rootstock; stem 3-5 dm. high, glabrous; leaves perfectly glabrous, entire, dentate, or the upper somewhat sinuate-pinnatifid, 3-10 cm. long; tube of the hypanthium 2-3 cm. long; calyx-lobes 1.5-2 cm. long; free tips 1.5-2 mm. long; petals obcordate, 1.5-2 cm. long; pod 2.5-3 cm. long, 3 mm. thick. Sandy places: Mont.—Utah—Calif.—B.C. *Plain—Submont.* Je-Jl.

13. *A. leptophylla* (Nutt.) Rydb. Perennial; stem 2-4 dm. high, glabrous, shining; leaves 2-5 cm. long, pubescent on the margins, otherwise glabrous; tube of hypanthium 1.5-2 cm. long; calyx-lobes about 1.5 cm. long, glabrous or with scattered hairs; free tips 1.5 mm. long; petals scarcely 1.5 cm. long; capsule less than 2 cm. long and scarcely 2 mm. wide. Sandy places: Wyo.—Utah—Ida. *Son.—Submont.* Je-Jl.

14. *A. Vreelandii* Rydb. Perennial; stem erect, strict, 3-5 dm. high; leaves narrowly lanceolate, about 5 cm. long, glabrous, sinuate-dentate; petals about 2 cm. long, white, turning pink; pod cylindric, usually somewhat curved upwards, 3 cm. long, 2 mm. thick. Hills and cañons: Colo.—Utah. *Son.* Je.

15. *A. cinerea* Rydb. Branched perennial; stem 3-4 dm. high, cinereous-strigose when young; leaves lanceolate to ovate-lanceolate, mostly subsessile, 3-5 cm. long, sinuate-dentate or denticulate, cinereous; tips of the calyx free and rather long; petals 15-18 mm. long; pods 3-3.5 cm. long, 3 mm. thick, almost straight. Dry soil: S.D.—w Neb.—Ida.—Colo. *Plain—Submont.* Je-Jl.

16. *A. runcinata* (Engelm.) Woot. & Standl. Perennial; stem much branched, 2-4 dm. high, cinereous; leaves lanceolate to linear, canescent-strigose, 2-6 cm. long, pinnatifid, with triangular-lanceolate, divergent lobes; tube of hypanthium and calyx-lobes each 1.5-2 cm. long; free tips about 1 mm. long; petals 1.5-2 cm. long; pod divergent, 3-4 cm. long, 2-3 mm. thick, often twisted. *O. albicaulis runcinata* Engelm. Dry places: Tex.—Utah—Ariz. *Son.* Ap-S.

17. *A. latifolia* Rydb. Perennial, whole plant strigose-canescant; stem divaricately branched, 2-6 dm. high; leaves ovate, oblong or lanceolate, sinuate-dentate, 2-6 cm. long; tube of hypanthium and calyx-lobes about 2 cm. long; free tips 1.2-2 mm. long; petals nearly 2 cm. long; capsule divaricate, usually curved, 3 cm. long, 3 mm. thick. Sandy soil: Neb.—Kans.—Utah—Ida. *Plain—Mont.*

18. *A. coronopifolia* (T. & G.) Britton. Perennial, with a rootstock; stem 1-3 dm. high, strigose; leaves 1-6 cm. long, pinnatifid, with linear divisions, or the basal ones spatulate and merely dentate; tube of hypanthium 1-2 cm. long, strigose; calyx-lobes 1.5-2 cm. long; free tips less than 1 mm. long; petals 1-1.5 cm. long; capsule oblong, 1-1.5 cm. long, 4 mm. thick. *O. coronopifolia* T. & G. Prairies and plains: S.D.—Kans.—N.M.—Ariz.—Ida. *Plain—Mont.* Je-Au.

12. *PACHYLOPHUS* Spach. ROCK ROSE, MOUNTAIN PRIMROSE.

Acaulescent or short-stemmed perennials. Leaves mostly crowded, toothed, lobed, or pinnatifid. Flowers axillary, perfect, night-blooming. Hypanthium much elongated beyond the ovary into a narrowly funnellform tube. Sepals 4, elongate, reflexed. Petals white, turning pink, showy. Stamens 8. Stigma with 4 linear lobes. Capsule lance-ovoid or ovoid-oblong, large, 4-angled, with more or less wavy-crested angles, woody, tardily loculicidal. Seeds many, in 1 or 2 rows in each cell.

Plant glabrous, or nearly so.

1. *P. caespitosus*.

Plant hairy.

Plant not canescent-strigose.

Leaves lyrate-pinnatifid; apex and lobes rounded or obtuse; hairs with pustulate bases.

2. *P. Johnsoni*.

Leaves sinuately lobed or toothed, acute; hairs not pustulate at the bases.

Hypanthium, calyx, and fruit glabrous, slightly strigose or with a few scattered long hairs.

Tube of the hypanthium 3-6 cm. long; pubescence short and usually appressed.

3. *P. montanus*.

Tube of hypanthium 6-12 cm. long.

Plant acaulescent, caespitose; pod short, conic-ovoid, with very thick ridges.

4. *P. macroglottis*.

Plant more or less caulescent; pod elongate, conic-ovoid, with low ridges.

5. *P. caulescens*.

Hypanthium, calyx, and fruit densely hirsute.

Fruit subsessile, conic-ovoid, obtuse at the base.

Plant acaulescent; ridges of the fruit slightly tuberculate.

Hypanthium 8-12 cm. long; petals 3-4 cm. long.

6. *P. hirsutus*.

Hypanthium about 5 cm. long; petals about 2 cm. long.

7. *P. crinitus*.

Plant more or less caulescent; ridges of the fruit with lobed, more or less foliaceous crests.

8. *P. eximius*.

Fruit more or less stipitate, fusiform, tapering at both ends, with slightly tuberculate ridges; plant often more or less caulescent.

9. *P. marginatus*.

Plant densely canescent-strigose throughout.

10. *P. canescens*.

1. *P. caespitosus* (Nutt.) Raim. Caespitose acaulescent perennial; leaves with winged petioles, 1-2 dm. long; blades oblanceolate, glabrous, sinuate-dentate, with triangular teeth; tube of the hypanthium 5-10 cm. long, glabrous; petals 3-4 cm. long; fruit lance-ovoid, 3 cm. long, with low rounded tubercles on the angles. *Oenothera caespitosa* Nutt. *P. glabra* A. Nels., a depauperate form. Dry hills: Sask.—Neb.—N.M.—Utah—Mont. *Plain—Mont.* Je-Au.

2. *P. Johnsoni* (Parry) Rydb. Cespitose perennial, acaulescent; leaves lyrate-pinnatifid, 4-7 cm. long, short-pubescent; terminal lobe oval or ovate, dentate-crenate, about 2 cm. long; larger lateral lobes 6-8 mm. long, oblong, the smaller ones deltoid; hypanthium about 3 cm. long, sparingly pilose; petals 1.5-2 cm. long; capsule sessile, lance-oblong, about 2 cm. long, with a double row of strongly tuberculate ridges on each angle. *O. Johnsoni* Parry. Dry regions: s Utah—s Calif. *Son.*

3. *P. montanus* (Nutt.) A. Nels. Cespitose, acaulescent perennial; leaves short-petioled, 5-10 cm. long; leaf-blades oblanceolate, coarsely sinuate-toothed, canescent-pubescent on the margins, otherwise glabrous or sparingly strigose; petals 2-3 cm. long; capsule sessile, ovoid, obtusely tubercled on the blunt angles, 2 cm. long. *O. montana* Nutt. Dry hills: Sask.—Neb.—Colo.—Nev.—Ida. *Plain—Submont.* My—Au.

4. *P. macroglottis* Rydb. Acaulescent or nearly so; leaves 8-15 cm. long, tapering into a margined petiole, puberulent, and villous ciliate on the margins and the veins, very thin; tube of hypanthium gradually widening into a funnel-form throat, 1 cm. in diameter; sepals lanceolate, gradually long-acuminate, 3-5 cm. long; petals about 3.5 cm. long, and fully as wide; capsule with rather strong sinuate ridges, 3-4 cm. long, lance-ovoid. Hillsides: Colo.—Wyo. *Submont.—Mont.* Je—Au.

5. *P. caulescens* Rydb. More or less caulescent perennial; stem 1-2 dm. high, angled; leaves with the long petioles about 2 dm. long, about 3 cm. wide, pubescent on the margins and veins, sinuately dentate; hypanthium-tube about 9 cm. long, glabrous, at the throat nearly 1.5 cm. wide; petals about 2.5 cm. long, obovate; pod sessile, about 3 cm. long, lance-ovoid, with rounded low ridges. Hillsides and river banks: Colo. *Submont.* My—Je.

6. *P. hirsutus* Rydb. Cespitose, almost acaulescent perennial; leaves oblanceolate, 1-2 dm. long, more or less petioled, runcinately lobed or divided, hirsute-villous, especially on the margins and the veins; hypanthium at the throat 1-1.5 cm. wide; sepals 3-4 cm. long; capsule 4-5 cm. long, lance-ovoid, about 1 cm. in diameter, sessile; ridges low and rounded, slightly if at all tubercled. Hillsides: Wyo.—N.M.—Utah. *Submont.—Mont.*

7. *P. crinitus* Rydb. Strongly cespitose, acaulescent perennial, the caudex branching below ground; leaves oblanceolate in outline, 2-4 cm. long, densely hirsute, sinuately toothed, acute; sepals linear-lanceolate, about 18 mm. long, densely pilose; petals obovate, 2 cm. long, or a little more; pod (not fully developed), sessile, ovoid, scarcely tubercled on the ridges, densely hairy. Dry places: Utah. *Submont.* Je—Au.

8. *P. eximius* (A. Gray) Woot. & Standl. Caulescent perennial; stem stout, 1-3 dm. high, leafy; leaves oblanceolate or spatulate in outline, 1-2 dm. long, more or less hirsute, especially on the margins and veins, sinuate-dentate or lobed; tube of hypanthium 1-1.5 dm. long, hirsute; petals 2.5-4 cm. long; capsule 3-4 cm. long, lance-ovoid. *O. eximia* A. Gray. *P. exiguus* Rydb. (Fl. Colo., misprint). Hills and banks: S.D.—N.M. *Plain—Submont.* Je—Au.

9. *P. marginatus* (Nutt.) Rydb. Cespitose acaulescent or short-stemmed perennial; leaves oblanceolate, sinuate-dentate, or runcinate, 1-1.5 dm. long, villous-hirsute, especially on the margins and veins; tube of the hypanthium 7-10 cm. long; petals 3-4 cm. long; pod 3-4 cm. long, with rather prominent tubercles on the angles. *O. marginata* Nutt. *O. idahoensis* Mulford. On hills: Ida.—Colo.—Utah—Ore. *Son.—Submont.* My—Jl.

10. *P. canescens* Piper. Acaulescent cespitose perennial, canescent with fine appressed pubescence; leaves pale green, oblanceolate, sinuate-dentate or subentire; tube of hypanthium 5-8 cm. long, canescent; petals 2-4 cm. long; capsule 2-3 cm. long, lance-ovoid, canescent, strongly tubercled. Dry hills and bench-lands: Mont.—w Neb.—Calif.—Wash. *Son.—Submont.* Je—Jl.

13. *LAVAUXIA* Spach.

Perennial or annual, mostly acaulescent herbs. Leaves mostly basal, numerous, pinnatifid or lobed. Flowers few, axillary. Sepals narrow, reflexed. Petals

white, pink, or yellow. Stamens 8. Hypanthium produced beyond the ovary into a slightly funnellform tube. Stigmas with 4 linear lobes. Capsule short, sharply 4-angled or 4-winged above, few-seeded.

Leaves strigose-canescens.

Leaves green, glabrous or puberulent, with ciliate margins.

1. *L. brachycarpa*.

2. *L. flava*.

1. ***L. brachycarpa*** (A. Gray) Britton. Cespitose acaulescent perennial, canescens-strigose throughout; leaves oblanceolate or spatulate, sinuate-pinnatifid to entire, 5-15 cm. long; tube of the hypanthium 1-1.5 dm. long, petals yellow, turning rose-colored, 4-5 cm. long; capsule 15-30 mm. long, canescens. *Oenothera brachycarpa* A. Gray. *O. Howardii* M. E. Jones. Plains and hills: Kans.—Tex.—N.M.—Utah. *Plain*—*Submont.* My—Jl.

2. ***L. flava*** A. Nels. Acaulescent perennial; leaves oblong-lanceolate in outline, deeply runcinate-pinnatifid, 15-25 cm. long, glabrous or a little pubescent on the margins; tube of hypanthium 4-7 cm. long; petals yellow, turning pink, 12-18 mm. long; capsule 2-3 cm. long, narrowly winged. *Oenothera triloba ecristata* M. E. Jones. Valleys: Sask.—Neb.—Colo.—Calif.—Wash. *Submont.*—*Mont.* Je—Au.

14. GAURÉLLA Small. SPOTTED PRIMROSE.

Low caulescent perennials, with branching stems. Leaves alternate, entire or distantly toothed. Flowers perfect, axillary, sessile. Hypanthium produced beyond the ovary into a slightly funnellform tube. Sepals elongate, reflexed. Petals 4, obovate, white or pink, spotted or striped with red. Style short, slightly clavate; stigma with 4 linear lobes. Capsule short, 4-angled, with a short curved beak. Seeds few, angled, striate.

1. ***G. canescens*** (Torr. & Frem.) A. Nels. Cespitose perennial; stems 1-5 dm. long, strongly branched, decumbent or ascending, strigose; leaves lanceolate or oblong, 8-16 mm. long, repand-denticulate or entire; petals white, turning pink, spotted, about 1 cm. long; capsule 8-10 mm. long, angled. *Oenothera canescens* Torr. & Frem. *O. guttulata* Geyer. Prairies: Neb.—Tex.—N.M.—Colo. *Plain*.

15. GALPÍNSIA Britton.

Suffruticose perennials, with branched stems. Leaves alternate, narrow. Flowers perfect, axillary to foliaceous bracts. Hypanthium produced beyond the ovary into a more or less funnellform tube. Sepals 4, reflexed. Petals 4, yellow. Stamens 8. Stigma disk-like, entire. Capsule cylindric or somewhat fusiform, narrowed at the base, more or less curved. Seeds often tuberculate.

Whole plant strigose-cinereous.

Stem and hypanthium more or less hirsute.

1. *G. lavandulaefolia*.

2. *G. interior*.

1. ***G. lavandulaefolia*** (T. & G.) Small. Cespitose perennial, with a woody base; stems 1-2 dm. high, decumbent or ascending, canescens; leaves numerous, crowded, linear or linear-spatulate, entire or nearly so, finely pubescent; hypanthium gradually dilated; tube 3-4 cm. long; petals 13-19 mm. long; capsule 2-2.5 cm. long. *Oenothera lavandulaefolia* T. & G. Plains and prairies: Neb.—Kans.—Tex.—Ariz.—Wyo. *Plain*—*Son.* My—Jl.

2. ***G. interior*** Small. Cespitose perennial, with a woody base; stems 2-3 dm. high, hirsute as well as puberulent; leaves oblong, 1-2.5 cm. long, entire, partly clasping; hypanthium elongate, gradually dilated, 2-3.5 cm. long; petals 1.5-2.5 cm. long; capsule 1.5-2 cm. long. Plains and prairies: Neb.—Kans.—Tex. *Plain.* My—Au.

16. MERIOLIX Raf.

Biennial or perennial herbs, with branched stems, sometimes suffruticose at the base. Leaves alternate, narrow or sharply serrate. Flowers perfect, regular, axillary. Hypanthium produced beyond the ovary, funnellform, the free portion rather short. Sepals 4, keeled on the back. Petals yellow, often spotted at the base. Stamens 8. Stigma disk-like, 4-toothed. Capsule linear, 4-angled, sessile. Seeds numerous, longitudinally grooved.

Throat of the hypanthium dark purple within, 5-6 mm. broad at the mouth.

Throat of the hypanthium orange within, sometimes with a darker ring at the base of the stamens, 3-4 mm. broad at the mouth.

1. *M. melanoglottis*
2. *M. serrulata*.

1. **M. melanoglottis** Rydb. Perennial, shrubby and branched at the base; stems 2.5-4 dm. high, the upper portion as well as the leaves grayish strigose; leaf-blades spatulate to almost linear, 2.5-6 cm. long, shallowly serrate; petals 10-12 mm. long; capsule straight, 2 cm. long, copiously pubescent. Dry soil: Tex.—Colo. *Plain*.

2. **M. serrulata** (Nutt.) Walp. Perennial, woody at the base; stem 1-5 dm. high, branched and leafy, more or less canescent; leaf-blades spatulate to linear-oblong or linear, 2-5 cm. long, serrate, canescent-strigose; petals obovate, 8-12 mm. long, crenulate; capsule 1.5-2 cm. long. *Oenothera serrulata* Nutt. Dry soil, plains and hills: Man.—Mo.—Tex.—Ariz.—Alta. *Plain—Submont.* Je-Au.

17. TARAXIA Nutt.

Acaulescent perennial herbs, with a short caudex. Leaves crowded at the base, pinnatifid or entire. Flowers perfect, regular, axillary. Hypanthium prolonged beyond the ovary into a slender cylindric tube, marcescent. Petals 4, yellow or white. Stamens 8. Stigma capitate, entire or 4-toothed. Capsule sessile, oblong, 4-winged. Seeds in a double row in each cell of the ovary.

Leaves entire or merely toothed.

1. *T. subacaulis*.

Leaves pinnatifid.

Hypanthium 2-5 cm. long; petals about 5 mm. long.

2. *T. breviflora*.

Hypanthium 6-10 cm. long; petals 10-14 mm. long.

3. *T. longiflora*.

1. **T. subacaulis** (Pursh) Rydb. Acaulescent perennial; leaves oblanceolate or lanceolate, 7-15 cm. long, entire or repand, glabrous; tube of hypanthium 3-4.5 cm. long, slender; petals pale yellow, 8-12 mm. long; capsule ovate-ellipsoid, 1.5-2 cm. long. *Oenothera heterantha* Nutt. Plains and valleys: Mont.—Colo.—Calif. *Submont.* Je-Au.

2. **T. breviflora** Nutt. Acaulescent perennial; leaves deeply pinnatifid, 5-12 cm. long, minutely pubescent; sepals and yellow petals about 5 mm. long; capsule about 1.5 cm. long, lance-ovoid, tuberculate. *O. breviflora* T. & G. Plains and valleys: Alta.—Wyo.—Utah—B.C. *Plain—Submont.* Je-Au.

3. **T. longiflora** Nutt. Acaulescent perennial; leaves narrowly oblanceolate in outline, sinuately pinnatifid to near the midrib, 8-15 cm. long, sparsely strigose; sepals narrowly lance-oblong, 8 mm. long; petals emarginate or rounded, yellow; capsule lance-ovoid, round-ridged. *O. Nuttallii* T. & G. *T. tikurana* A. Nels. Meadows: Calif.—Ida.—Wash. *Submont.* Je-Au.

18. SPHAEROSTIGMA F. & M.

Annual or perennial caulescent herbs. Leaves alternate, entire or pinnatifid. Flowers small or minute, in bracted or leafy spikes. Hypanthium produced beyond the ovary into an obconic short tube. Sepals 4. Petals 4, yellow, white, or pink, entire or emarginate. Stamens 8, slightly unequal. Stigma capitate, entire. Capsule sessile, linear, terete or 4-angled, often more or less twisted and curved, 4-celled. Seeds linear-oblong, smooth.

Corolla yellow, turning reddish or greenish.

Capsule fusiform.

1. *S. andinum*.

Capsule linear.

Leaves narrowly linear.

Plant glabrous, or nearly so.

Pods straight, erect.

Pods curved, often reflexed.

4. *S. parvulum*.

5. *S. flexuosum*.

Plant more or less pubescent, at least when young.

Plant strigillose; leaves usually dentate.

Plant hirsutulous below, often glandular above;

linear.

6. *S. strigulosum*.

8. *S. pubens*.

Leaves oval, lanceolate, or oblong.

Petals 1-2 mm. long.

Plant dwarf, only a few centimeters high, strigillose; capsule about 2 cm. long.

9. *S. minus*.

Plant taller, 1-4 dm. high, often viscid above; capsule about 5 cm. long.

11. *S. chamaenerioides*.

12. *S. alyssoides*.

Petals 5-6 mm. long.

Corolla white to ochroleucous or rose-colored.

Capsule enlarged at the base, tapering upwards; bark shreddy.

Plant glabrous; leaf-blades oblanceolate.

2. *S. decorticans*.

Plant more or less glandular; leaf-blades ovate.

3. *S. Boothii*.

Capsule scarcely enlarged at the base, cylindric; plant pubescent; bark not shreddy.

Plant strigose or puberulent.

7. *S. refractum*.

Leaves linear.

Leaves elliptic, spatulate or lanceolate.

10. *S. tortum*.

Petals 1-2 mm. long.

12. *S. alyssoides*.

Petals 5-6 mm. long.

Plant villous.

Leaf-blades 3-5 cm. long, obovate, sparsely villous; petals 7-8 mm. long.

13. *S. macrophyllum*.

Leaf-blades 1-2.5 cm. long, densely villous; petals 3-5 mm. long.

14. *S. ulahense*.

1. ***S. andinum*** (Nutt.) Walp. Small annual; stem 3-10 cm. high, branched, canescent-puberulent; leaves linear or linear-ob lanceolate, 1-3 cm. long, entire, more or less strigose; flowers minute, numerous; tube of the hypanthium less than 1 mm. long; petals about 1 mm. long; capsule 6-7 mm. long, canescent. *Oenothera andina* Nutt. Hills: Sask.—Wyo.—Utah—Calif.—Wash. *Son.*—*Submont.* My-Jl.

2. ***S. decorticans*** (H. & A.) Small. Originally described as perennial, but apparently only biennial or annual; stem 2-4 dm. high, sparingly branched, glabrous, somewhat glandular-puberulent in the inflorescence; leaves lanceolate or oblanceolate, 2-6 cm. long, entire or denticulate; tube of the hypanthium about 4 mm. long; petals white or cream-colored, turning pink, 3-4 mm. long; capsule about 2 cm. long, 2 mm. thick, more or less curved and twisted. *Gaura decorticans* H. & A. *O. gauriflora* T. & G. Sandy places: s Utah—Ariz.—Calif. *Son.*—*Submont.* Ap-Je.

3. ***S. Boothii*** (Dougl.) Walp. Annual; stem in age glabrate, shining, with white shreddy bark; leaves petioled; blades ovate, dentate, acute or acuminate, glabrous above or nearly so, hirsute beneath, 2-3 cm. long; tube of hypanthium 5 mm. long, glandular-pubescent; petals 4-5 mm. long; capsule 1-1.5 cm. long, 1.5-2 mm. thick at the base. *O. Boothii* Dougl. Gravelly hills: Wash.—Ida.—Nev.—Calif. *Son.* Je.

4. ***S. parvulum*** (Nutt.) Walp. Slender annual; stem 5-10 cm. long, branched; leaves narrowly linear, almost filiform, entire, 1-3 cm. long, less than 1 mm. wide; tube of hypanthium 1.5 mm. long; petals 2-3 mm. long; capsule linear-cylindric, 2-2.5 mm. long, 1 mm. thick, erect, straight, glabrous. *O. parvula* Nutt. Sandy plains and rocky hills: Wyo.—Utah—Ida. *Son.*—*Submont.* My-Je.

5. ***S. flexuosum*** A. Nels. Small annual; stem 1 dm. high or less, with few branches; leaves narrowly linear, entire, 2-3 cm. long, about 1 mm. wide; tube of hypanthium 1.5 mm. long; capsules linear-cylindric, 2-3 cm. long, S-curved. *S. contortum flexuosum* A. Nels. Dry soil: Wyo.—Utah. *Son.* Je.

6. ***S. strigulosum*** Fisch. & Mey. Annual; stem 1-3 dm. high, branched near the base, with spreading or ascending branches; leaves linear or oblong, 1-3 cm. long, 1-3 mm. wide, in depauperate specimens narrow and subentire; tube of hypanthium 2 mm. long; petals 3-4 mm. long; capsule linear-cylindric, 1 mm. thick, 2-3 cm. long, ascending, only slightly curved. *O. strigulosa* T. & G. Sandy places: B.C.—Ida.—Calif. *Son.* My-Jl.

7. ***S. refractum*** (S. Wats.) Small. Annual; stem erect, diffusely branched, 2-4 dm. high, somewhat glandular-puberulent; leaves linear or narrowly linear-lanceolate, 2-5 cm. long; tube of the hypanthium about 4 mm. long; petals cream-colored, 5-6 mm. long; capsule slender, 2-3 cm. long, more or less twisted, abruptly reflexed. *O. refracta* S. Wats. Arid regions: s Utah—Ariz. *Son.*

8. ***S. pubens*** (S. Wats.) Rydb. Annual; stem 1-3 dm. high; leaves linear, entire or rarely minutely denticulate, 1-3 cm. long, 1-2 mm. wide; tube of hypanthium 1-1.5 mm. long; corolla 3-4 mm. long; capsule linear-cylindric, 2-3 cm. long, 1 mm. thick, spreading at the base, arching upwards. (?) *S. filiforme* A. Nels. Dry places: Ida.—w Colo.—Ariz.—Calif.—B.C. *Son.* My-Jl.

9. *S. minus* A. Nels. A small annual; stems simple or with a few branches at the base, 3–10 cm. high, puberulent; leaves 1–2.5 cm. long, mostly short-petioled; tube of the hypanthium 1.5–2 mm. long; petals 1–1.5 mm. long; capsule nearly straight or somewhat contorted, 2 cm. long, 1 mm. thick. *S. Nelsonii* Heller. Dry hills: Wyo. My.

10. *S. tortum* (Lev.) A. Nels. Annual; stems branched near the base, 1–3 dm. high, more or less strigose; leaves petioled; blades oblanceolate or linear-oblong, strigose or nearly glabrous, 2–4 cm. long; tube of hypanthium 1–2 mm. long; petals ochroleucous, 1–2 mm. long; capsule 2 cm. long, variously twisted. *S. minutiflora* (S. Wats.) Rydb. Sandy soil and dry hills: Wyo.—Colo.—Utah Ore. My—Je.

11. *S. chamaenerioides* (A. Gray) Small. Annual; stem slender, 1–4 dm. high, somewhat viscid-puberulent above; lower leaves petioled, the uppermost sessile; blades lanceolate or oblanceolate, repand-denticulate or entire, 3–6 cm. long; tube of the hypanthium 2 mm. long; petals yellow, 1.5–2 mm. long; capsule linear-cylindric, 3–5 cm. long, 1 mm. thick, straight or slightly curved. Dry places: Tex.—s Utah—Ariz. *Son.* Mr—My.

12. *S. alyssoides* (H. & A.) Walp. Annual; stem branched, 1–3 dm. high, more or less strigose; leaves petioled; blades oblanceolate or elliptic, 2–6 cm. long, more or less strigose; tube of hypanthium 5–7 mm. long, strigose; petals white or ochroleucous, 5–6 mm. long; capsule linear-cylindric, 2–2.5 cm. long, 1 mm. thick, more or less twisted. *S. implexa* A. Nels. Sandy places and hills: Ida.—Utah—Calif.—Ore. *Son.* My—Je.

13. *S. macrophylla* (Small) Rydb. Annual; stem 1–3 dm. high, sparingly villous, branched; leaves petioled; blades obovate or broadly spatulate, 3–5 cm. long, more or less villous; tube of the hypanthium 5–6 mm. long, villous; petals white, 7–8 mm. long, broadly obovate. Saline or alkaline soil: Utah—Nev. *Son.*

14. *S. utahense* Small. Annual; stem erect, 2–10 cm. high, simple or with ascending branches, sparingly villous; leaves short-petioled; blades spatulate or obovate or oval, 1–2.5 cm. long, densely villous, entire or nearly so; calyx-tube 7–9 mm. long; petals obovate, 3–5 mm. long; capsule filiform, 1.5 cm. long, spirally twisted at the base. Sandy soil: Utah. *Son.* My—Je.

19. CHYLÍSMIA Nutt.

Caulescent annual herbs. Leaves pinnatifid, but sometimes reduced to the terminal segment. Flowers in terminal racemes, except in one species. Hypanthium produced beyond the ovary into an obconic or funnelform tube. Sepals 4, reflexed. Petals 4, entire, yellow or ochroleucous, sometimes turning purplish. Stamens 8; anthers oblong, attached to the middle. Stigma capitate, entire. Capsule linear or clavate, membranous, peduncled. Seeds in a single row in each cell.

Flowers axillary; delicate plant 1 dm. high or less.

Flowers in terminal racemes or panicles.

Leaf-blades simple, sinuate or entire, or pinnate with the lower leaflets much reduced.

Plant glabrous, puberulent, minutely strigose, or glandular.

Petals 3–5 mm. long; leaves glabrous.

Petals 7–10 mm. long; leaves grayish-strigose when young.

Plant more or less hirsute or villous, with long white hairs.

Leaves simple or with a few (1 or 2 pairs, rarely more) small lobes on the

petioles; leaves and stem sparingly hairy.

Petals 10–12 mm. long; pod linear, 5–6 cm. long.

Petals 2–7 mm. long; pod clavate, less than 1.5 cm. long.

Petals 6–7 mm. long.

Petals 2–5 mm. long.

Petals 4–5 mm. long; stem tall, 3 dm. high or more, branched.

Petals 2–3 mm. long; stem low, about 1 dm. high, simple.

Leaves interruptedly pinnate, with several leaflets.

Petals 8–10 mm. long; leaves and lower part of the stem densely hairy.

8. *C. venosa*.

1. *C. pterosperma*.

2. *C. scapoidea*.

3. *C. cruciformis*.

4. *C. brevipes*.

5. *C. Parryi*.

6. *C. tenuissima*.

7. *C. Walkeri*.

Petals 4-6 mm. long; leaves and stem sparingly hairy or glabrate.

9. *C. parviflora*.

Leaves interruptedly pinnate, the larger alternate pairs 12 or more, not reduced.

10. *C. multijuga*.

1. ***C. pterosperma*** (S. Wats.) Small. Stem slender, 5-10 cm. high, branched, hirsute; leaves oblong-lanceolate, 1-2 cm. long, entire, hispidulous; tube of hypanthium 1 mm. long; petals obcordate, rose-colored, 1.5-2 mm. long; capsule cylindric-clavate, 12-18 mm. long; seeds 2 mm. long, the margins thin, incurved, cellularly tuberculate. *Oenothera pterosperma* S. Wats. Foot-hills: Utah—Calif. Son. My-Je.

2. ***C. scapoidea*** Nutt. Stem glabrous, 1-3 dm. high, simple or branched at the base; leaves petioled, simple or pinnate, with small lateral leaflets; blade or terminal leaflet ovate or elliptic, 1-4 cm. long, dentate or entire, glabrous, veiny; tube of the hypanthium 2-3 mm. long; petals bright yellow, 3-5 mm. long; capsule 1.5-2 cm. long, 2 mm. thick. *O. scapoidea* Nutt. Hills and river banks: Wyo.—Colo.—Ariz.—Calif.—Ore. Son.—Submont.

3. ***C. cruciformis*** (Kellogg) Howell. Stem 2-4 dm. high, finely puberulent or glabrate; leaves interruptedly pinnate; leaflets 5-15, lanceolate or ovate, 0.5-4 cm. long, veiny; tube of hypanthium 4-5 mm. long; petals 7-10 mm. long; capsule about 2 cm. long, 2 mm. thick. *O. cruciformis* Kellogg. Dry regions: Ore.—Colo.—Ariz.—Calif. Son. Mr-Je.

4. ***C. brevipes*** (A. Gray) Small. Stem branched at the base, 2-3 dm. high, usually densely white-hirsute; leaves simple, or pinnate with small lateral leaflets; blade or terminal leaflet ovate, 3-5 cm. long, dentate, veined, hirsute; tube of the hypanthium 5 mm. long; petals yellow; capsule spreading on short pedicels. *O. brevipes* A. Gray. Arid regions: s Utah—Ariz.—Calif.—Nev. Son. Ap-Je.

5. ***C. Parryi*** (S. Wats.) Small. Stem branched, 2-3 dm. high, sparingly ciliate; leaves simple, petioled; blades ovate or oblong-lanceolate, 2-5 cm. long, entire or sinuate, pubescent with scattered long spreading hairs, especially on the veins; free tube of hypanthium 1 mm. long; petals yellow or orange, 6-7 mm. long; capsule 8-12 mm. long, ascending. Clayey hills: s Utah. L. Son.

6. ***C. tenuissima*** (M. E. Jones) Rydb. Stem much branched, 3-10 dm. high; leaves mostly simple; blade lanceolate, sparingly dentate, acute at each end, veiny beneath, sparingly pilose, about 1 cm. long; inflorescence racemes or panicles, axillary, with ascending-spreading branches; tube of the hypanthium about 1 mm. long; petals 2-5 mm. long, yellow; capsule clavate, 4-6 mm. long, on divergent pedicels. *O. tenuissima* M. E. Jones. Barren clay soil: Utah. Son. S.

7. ***C. Walkeri*** A. Nels. Stem slender, 1-2 dm. high, minutely glandular-pubescent and with some long white hairs; leaves simple, entire, ovate to oblong-lanceolate, white-hirsute; tube of hypanthium 0.5 mm. long; petals yellow, oval; capsule clavate, 10-14 mm. long, on a filiform spreading pedicel of the same length. Gypsum hills: w Colo. Son. Jl.

8. ***C. venosa*** Nels. & Kenn. Stem 3-5 dm. high, villous, becoming glabrate in the inflorescence; leaves 1-2 dm. long, interruptedly pinnate; terminal leaflet orbicular or ovate, 2-4 cm. long, finely canescent above, hirsute beneath, veiny, irregularly serrate; the lateral ones smaller and lanceolate; tube of hypanthium 2.5 mm. long; petals yellow, turning purple, 8 mm. long; capsule 2 cm. long, almost glabrous. Cañons and river valleys: Nev.—Utah. Son. My-Je.

9. ***C. parviflora*** (S. Wats.) Rydb. Annual; stem 2-3 dm. high, glabrous or sparingly pubescent; leaves interruptedly pinnate, glabrous or nearly so; terminal leaflet ovate, 2-4 cm. long, sharply serrate, strongly-veined, the lateral ones lanceolate, smaller; tube of hypanthium 2 mm. long or less; petals light yellow, 4-6 mm. long; capsule about 3 cm. long, 2 mm. thick. *O. brevipes parviflora* S. Wats. Arid regions: s Utah—Ariz. L. Son.

9. ***C. multijuga*** (S. Wats.) Small. Stem branched, glabrous, 2-3 dm. high; leaves interruptedly pinnate; larger leaflets 12 pairs or more, of nearly

the same size, ovate, 2-3 cm. long, glabrous, veiny, sharply serrate; free tube of hypanthium 3 mm. long; petals yellow, about 1 cm. long; pod linear, spreading. *O. multijuga* S. Wats. Dry places: s Utah. Mr.

20. STENOSIPHON Spach.

Perennial herbs, with erect leafy stem. Leaves alternate, sessile, narrow. Flowers perfect, in elongate terminal spikes. Hypanthium much produced beyond the ovary into a filiform tube. Sepals 4, reflexed. Petals white, clawed. Stamens 8, declined, without scales at the base. Ovary 1-celled; stigma 4-lobed, surrounded by a cup-like border. Fruit 8-ribbed, indehiscent, 1-celled, 1-seeded.

1. *S. linifolium* (Nutt.) Britton. Stem slender, glabrous, 6-15 dm. high; leaves lanceolate to linear, 2.5-5 cm. long, entire, acuminate; spikes elongate, sometimes 3 dm. long; tube of the hypanthium about 1 cm. long; petals white, long-clawed, about 5 mm. long; fruit ovoid, hirsutulous, rugose, 3-4 mm. long. Dry plains and prairies: Neb.—Ark.—Tex.—Colo.; Mex. Jl-S.

21. GAÛRA L. BUTTERFLY WEED.

Annual, biennial, or perennial caulescent herbs, with branching stems. Leaves alternate, usually narrow. Flowers perfect, in terminal racemes or panicles, or spikes. Hypanthium prolonged beyond the ovary into a slender but short tube. Sepals 4, rarely 3. Petals clawed, unequal. Stamens usually 8, declined, with a small scale at the base of the filament. Ovary 4-celled; style declined; stigma 4-lobed, with a cup-like border below. Fruit nut-like, indehiscent, ribbed or angled, 4-celled, but some of the cells usually empty. Seeds 1-4.

Anthers oval, attached near the middle; fruit fusiform, sessile, almost equally 8-ribbed.

1. *G. parviflora*.
Anthers linear or nearly so, attached near the base; fruit strongly 4-angled, at least above.

Fruit sessile, broadly fusiform; tall biennials.

2. *G. neomexicana*.

Fruit prolonged below into a stipe-like base.

Stipe-like base slender; fruit fusiform; tall herbaceous plant. 3. *G. coloradensis*.
Stipe-like base thick; body of the fruit pyramidal-ovoid; low plants, with sublig-
neous base.

Plants more or less pubescent.

Leaves canescent, the lower usually oblong and sinuately toothed.

4. *G. coccinea*.

Leaves sparingly strigose, all linear or nearly so and entire.

5. *G. parvifolia*.

Plant glabrous or nearly so, except the strigose hypanthium.

6. *G. glabra*.

1. *G. parviflora* Dougl. Biennial; stem 6-15 dm. high, silky-pilose, with long spreading hairs; leaves lanceolate, ovate-lanceolate, or elliptic, 3.5-10 cm. long, acute or acuminate, repand-dentate, softly pilose; spike very long; petals 2.5-4 mm. long; fruit 6-8 mm. long, glabrous or nearly so. Plains, valleys, and prairies: S.D.—Mo.—La.—Ariz.—Wash.; Mex. Plain—Submont. My-O.

2. *G. neomexicana* Wooton. Perennial; stems usually more than one from the woody root, 4-7 dm. high, villous, somewhat glandular in the inflorescence; leaves lanceolate, 5-10 cm. long, entire or sinuately toothed; flowers sessile; tube of hypanthium 1 cm. long; petals 1 cm. long, rose-pink; fruit obovoid-pyramidal, 7-8 mm. long, 3-4 mm. broad, sessile. Valleys: N.M.—Colo. Submont. Je.

3. *G. coloradensis* Rydb. Herbaceous biennial or perennial, with fusiform root; stem 5-7 dm. high, strict, but somewhat branched, finely strigose, more or less red; leaf-blades narrowly oblanceolate, 5-10 cm. long, gradually tapering below into a short petiole, or the upper sessile, callous-denticulate, finely strigose; hypanthium about 2 cm. long, finely strigose; petals about 8 mm. long, spatulate, pink; fruit 8-10 mm. long. Meadows: Colo. Submont. Jl.

4. *G. coccinea* Nutt. Stems several, branched, strigose or puberulent and more or less hirsute, 1-5 dm. high; leaves numerous, sessile, oblong or lanceolate, the upper linear-lanceolate, repand-dentate or entire, 1-3.5 cm. long, canescent; tube of hypanthium 6-8 mm. long; petals from pink or white to scarlet,

4-6 mm. long; capsule 5-7 mm. long, canescent. *G. marginata* Lehm. Plains and prairies: S.D.—Tex.—Ariz.—Mont.; Mex. *Plain—Submont.* Ap-Jl.

5. *G. parvifolia* Torr. Stem 3-4 dm. high, with erect branches, sparingly strigose or in age glabrate; leaves 1-2.5 cm. long; tube of hypanthium 5 mm. long; petals 4-5 mm. long, scarlet; capsule 6-7 mm. long. Dry hills and plains: Tex.—Colo.—N.M. *Son.—Submont.* Jl-Au.

6. *G. glabra* Lehm. Stem 2-4 dm. high, in age straw-colored and shreddy; leaves oblong or lanceolate, or those of the branches linear-lanceolate; tube of hypanthium 6-7 mm. long; petals pink or brick-red, rarely white; fruit 5-6 mm. long. Dry plains and prairies: S.D.—Colo.—Ariz.—Mont. *Plain—Submont.* Je-Au.

22. CIRCAEA L. ENCHANTER'S NIGHTSHADE.

Low perennial herbs, with succulent but slender stems. Leaves opposite, petioled. Flowers small, in racemes. Hypanthium slightly produced beyond the ovary into a slender short tube. Sepals 2. Petals 2, notched, white. Stamens 2, alternate with the petals. Fruit 1-2-celled, 1-2-seeded, obovoid, indehiscent, usually covered with hooked hairs.

Plant 1-2 dm. high; leaves sharply dentate, usually cordate at the base. 1. *C. alpina*.
Plant 3-6 dm. high; leaf-blades sinuately denticulate, usually truncate or rounded at the base. 2. *C. pacifica*.

1. *C. alpina* L. Stem 0.5-2 dm. high, glabrous or pubescent above; leaf-blades cordate, 2.5-5 cm. long; pedicels 3-4 mm. long, reflexed in fruit; fruit narrowly obovoid, about 2 mm. long. Cold woods: Lab.—Ga.—S.D.—Colo.—Alaska; Eurasia. *Mont.* Jl-S.

2. *C. pacifica* Asch. & Magn. Stem mostly glabrous, 1.5-3 dm. high; leaf-blades ovate, 3-6 cm. long; fruit obovoid, fully 2 mm. long, sparingly pubescent. Woods: Mont.—Colo.—Calif.—B.C. Jl-Au.

FAMILY 92. HALORAGIDACEAE. WATER MILFOIL FAMILY.

Perennial or rarely annual, caulescent herbs, aquatic or amphibious, with alternate, opposite, or whorled leaves, the submerged ones often finely divided. Flowers perfect or monoecious, solitary or clustered, either axillary or in terminal spikes. Sepals 2-4. Petals usually wanting or small, 2-4. Stamens 1-8. Gynoecium of 1-4, somewhat united carpels. Ovary 1-4-celled, inferior, angled or winged; style wanting. Fruit a nutlet or drupe.

Flowers monoecious or polygamous, 4-merous; stamens 4 or 8; submerged leaves finely pinnatifid. 1. MYRIOPHYLLUM.
Flowers perfect, without sepals and petals; stamen 1; leaves all entire. 2. HIPPURIS.

1. MYRIOPHYLLUM (Vaill.) L. WATER MILFOIL.

Aquatic herbs, with slender stems, usually floating. Leaves alternate or whorled, the emerged ones entire or pectinately lobed, the submerged ones finely pectinately dissected into filiform divisions. Flowers monoecious or polygamous, axillary or in terminal spikes, the upper ones usually staminate, with short hypanthium, 2-4 sepals, 2-4 small petals and 4-8 stamens; the intermediate ones often perfect; the lower ones pistillate, with 4 minute sepals, 4 small petals, or none, and a 2-4-celled ovary; stigmas 2-4, plumose. Fruit bony, splitting into 2 or 4, angled nutlets. Seeds solitary in each nutlet.

Floral leaves ovate, entire or dentate, usually shorter than the flowers.

Floral leaves pinnatifid, much longer than the flowers.

1. *M. spicatum*.
2. *M. verticillatum*.

1. *M. spicatum* L. Stem submerged, 3-20 dm. long; leaves verticillate in 4's or 5's, 1-3 cm. long, pinnatifid into filiform divisions; flowers verticillate in an interrupted spike; stigmas rounded, sessile, not elongate; sepals of the staminate flowers usually deep purple. Still water and slow streams: Newf.—Conn.—Kans.—N.M.—Calif.—Alaska; Eurasia. *Plain—Submont.* Je-Au.

2. *M. verticillatum* L. Stem 3–20 dm. long; leaves flaccid, verticillate in 3's or 4's, 1.5–4 cm. long, pinnatifid, the rachis usually broader than the filiform divisions; floral leaves or bracts similar, but shorter and firmer, 6–20 mm. long; stigmas elongate, recurved; sepals of the staminate flowers pale green or pinkish. Still water and slow streams: Que.—N.Y.—Neb.—Ida.—B.C. *Plain—Submont.* Je—Au.

2. *HIPPÜRIS* L. MARE'S-TAIL.

Aquatic perennial herbs, with simple stems. Leaves narrow, entire, verticillate. Flowers perfect, axillary. Hypanthium adherent to the ovary, with a minute entire limb. Sepals and petals none. Stamen solitary. Pistil solitary; style filiform, stigmatic its whole length, placed in a groove of the anther; Fruit 1-celled, 4-seeded.

1. *H. vulgaris* L. Stem simple, 2–6 dm. high; leaves in whorls of 6's–12's, linear, acute, 1–3 cm. long; stamen with a short thick filament and large anther; fruit nearly 2 mm. long. Swamps and ponds: Greenl.—N.Y.—Neb.—N.M.—Calif.—Alaska; Eurasia. *Plain—Mont.* Je—Au.

FAMILY 93. *AMMIACEAE*. CARROT FAMILY.

Herbs, with usually hollow stems. Leaves alternate, usually compound or decomposed, rarely simple, with dilated sheathing leaf-bases. Flowers perfect or polygamous, in simple or compound umbels, or rarely in heads or head-like clusters, the umbels commonly subtended by involucre and involucels, consisting of several bracts or bractlets. Hypanthium adnate to the ovary. Sepals 5, usually small. Petals 5, usually with an inflexed tip, often emarginate. Stamens 5, inserted on an epigynous disk; anthers versatile. Gynoecium of 2 united carpels, each 1-ovuled. Styles 2, distinct, borne on a more or less developed thickened base (*stylopodium*). Fruit of two 1-seeded carpels, separating at maturity; each carpel usually with 5 principal ribs, sometimes with 4 secondary ribs; the faces where the two carpels meet are called the commissures, and the sinuses between the ribs, intervals; the pericarp usually containing oil-tubes in the intervals and on the commissural side; some or all the ribs often winged.

- A. Fruit with the secondary ribs most prominent, in ours ellipsoid, armed with prickles; oil-tubes under the secondary ribs; leaves pinnately compound.
Stylopodium obsolete; calyx-teeth obsolete; fruit flattened dorsally.

1. *DAUCUS*.

Stylopodium conical; calyx-teeth prominent; fruit flattened laterally.

2. *CAUCALIS*.

- B. Fruit with primary ribs only, or ribs wanting; oil-tubes (rarely lacking) in the intervals between the ribs.

I. Fruit scaly or spiny.

Fruit ovoid, covered with hyaline scales or tubercles; leaves coriaceous, spinosely toothed or divided; flowers in dense heads.

3. *ERYNGIUM*.

Fruit with hooked spines, subglobose; flowers in simple or compound few-rayed umbels; leaves not spinose, palmately or pinnately divided.

4. *SANICULA*.

II. Fruit not spiny, only bristly on the ribs in *Osmorrhiza*.

- a. Fruit linear, linear-oblancoate, or linear-lanceolate in outline.

Stylopodium present; oil-tubes obsolete in the mature fruit; fruit thickened above; leafy-stemmed plants with aromatic thick roots and ternately decomposed leaves with toothed segments.

Fruit attenuate at the base, bristly on the ribs.

5. *OSMORRHIZA*.

Fruit glabrous, obtuse at the base.

6. *GLYCOSMA*.

Stylopodium wanting; oil-tubes small but evident; fruit thickest below; acaulescent plants, with globose corms and ternate leaves with linear segments.

7. *LEIBERGIA*.

- b. Fruit oblong to orbicular in outline.

1. Fruit not compressed dorsally, terete in cross-section or somewhat compressed laterally; wings of the lateral ribs (if present) rarely much broader than those of the dorsal ribs.

- a. Ribs not conspicuously winged.

* Ribs at least the dorsal ones filiform or more prominent, but not corky.

{ Ribs unlike, the dorsal ones filiform; the lateral ones corky and inflexed towards those of the other carpel; commissure with a corky projection which connects the carpels to the gynophore, leaving two air spaces between the carpels, this projection, and the lateral wings; plants with corms.

8. OROGENIA.

†† Ribs all nearly alike; commissure not with corky projection.

‡ Stylopodium conic.

Leafy plant with white or pinkish flowers.

Plants with fascicled tuberous roots and few narrow, mostly entire leaf-segments.

Seed-face concave with a longitudinal ridge; oil-tubes several in the intervals.

Seed-face plane; oil-tubes solitary in the intervals.

10. ATENIA.

Plants with taproots or rhizomes.

Fruit round, with sub-globose carpels and very slender inconspicuous ribs; leaves pinnate; oil-tubes several.

11. BERULA.

Fruit ovate or oblong, with more prominent ribs.

Oil-tubes solitary in the intervals; leaves twice or thrice pinnately compound.

12. CARUM.

Oil-tubes several in the intervals; leaves ternately or ternate-pinnately compound or decomposed.

13. LIGUSTICUM.

Acaulescent plants with yellowish green flowers and simply pinnate leaves; oil-tubes several in the intervals.

14. LIGUSTICELLA.

†† Stylopodium flat or wanting; flowers yellow.

Leaves simple; oil-tubes wanting or continuous around the seed cavity.

15. BUPLEURUM.

Leaves compound, or only the basal ones simple; oil-tubes present and not continuous in the intervals.

Cauliscent perennials, with taproots.

Oil-tubes solitary in the intervals; stylopodium wanting; root neither deep-seated nor conspicuously thickened; leaves ternately compound or the basal ones simple, cordate.

16. ZIZIA.

Oil-tubes several in the intervals; stylopodium flat; root deep-seated and usually decidedly thickened, fusiform.

17. MUSINEON.

Acaulescent caespitose perennials, with short branched caudices.

Oil-tubes 2 or 3 in each interval; divisions of the leaves filiform.

18. DAUCOPHYLLUM.

Oil-tubes solitary in the intervals; divisions of the leaves elliptic, ovate, or obovate.

19. ALETES.

** Ribs all corky.

Cespitose perennials with branched caudices; flowers yellow or yellowish.

Fruit not tubercled; dwarf acaulescent plants.

20. OREOXIS.

Fruit tubercled; stem about 3 dm. high, few-leaved.

21. HARBOURLA.

Not caespitose perennials, with short rootstocks and fibrous roots; flowers white; tall plants.

Ribs equal and prominent.

22. SIUM.

Ribs unequal; the dorsal ones very low and broad; the lateral ones prominent and thick.

23. CICUTA.

β. Ribs conspicuously winged.

Plant pseudo-scapose* from a deep-seated fleshy root; leaves fleshy, with obtuse segments.

Seed-face deeply grooved.

24. AULOSPERMUM.

Seed-face shallowly concave.

25. PHELLOPTERUS.

Plant from a caespitose caudex or rootstock.

Seed-face deeply grooved; segments of the leaves ovate or lanceolate.

26. CORIOPHYLLUS.

Seed-face broadly and shallowly concave; leaves with oblong, subulate or linear-filiform divisions.

Ribs broadly winged; main divisions of the leaves ternate; stylopodium wanting; flowers yellow, except in one species.

27. PTERYXIA.

Ribs narrow; leaves bipinnate; stylopodium present but flat; flowers white.

28. PSEUDOREOXIS.

* Stem mostly subterranean, but rising somewhat above ground and bearing at the end a cluster of leaves and peduncles.

2. Fruit flattened strongly dorsally, with the lateral ribs more or less prominently winged.
- α. Stylopodium wanting.
- Dorsal and intermediate ribs or some of them winged.
- Wings thickened and corky towards the margin; plants pseudoscapose from a thick deep-seated root.
29. CYMPTERUS.
- Wings not thickened towards the margin.
- Leafy-stemmed plants with a taproot; calyx-teeth small and equal; leaf-segments thin, not pungent.
30. PSEUDOCYMPTERUS.
- Acaulescent plants with a caespitose caudex; calyx-teeth large and unequal, one or two much larger than the rest; leaf-segments thick and pungent.
31. PSEUDOPTERYXIA.
- Dorsal ribs filiform (or in one species of *Cogswellia* somewhat margined).
- Lateral wings thin, not corky; plants mostly small.
32. COGSWELLIA.
- Lateral wings thick and corky; plants large.
33. LEPTOAENIA.
- β. Stylopodium present.
- Stylopodium depressed.
- Dorsal ribs more or less winged.
- Plant acaulescent or low-stemmed, with narrow leaf-segments; sepals evident; petals yellow.
34. CYNOMARATHRUM.
- Plant caulescent, with broad leaf-segments; sepals obsolete; petals white.
35. ANGELICA.
- Dorsal ribs filiform; plant caulescent; sepals obsolete; petals yellow.
36. PASTINACA.
- Stylopodium conical.
- Plants villous at least in the inflorescence; sepals obsolete.
- Leaves ternate, with rounded-cordate leaflets; oil-tubes prominent, inversely clavate, only in the upper half of the carpels.
37. HERACLEUM.
- Leaves once or twice pinnate; oil-tubes not prominent, running through the whole length of the carpels.
38. SPHENOSCIADIUM.
- Plants glabrous, with linear or lanceolate leaf-segments.
- Sepals obsolete; leaves in ours three or four times compound; oil-tubes several in the lateral intervals.
39. CONIOSELINUM.
- Sepals evident; leaves in our species simply pinnate; oil-tubes solitary in all intervals.
40. OXYPOLIS.

1. DAÛCUS (Tourn.) L. CARROT.

Bristly annuals or biennials. Leaves pinnately decomposed. Flowers white or rarely pinkish, in compound umbels. Bracts foliaceous and pinnately cleft; bractlets entire or toothed. Calyx-teeth obsolete. Fruit oblong, flattened dorsally. Primary ribs 5, slender, bristly; secondary ribs 4, strong, each bearing a row of strong, barbed prickles. Stylopodium depressed or wanting. Oil-tubes solitary under the secondary ribs, 2 on the commissure. Seeds flattened dorsally; face more or less concave.

1. *D. pusillus* Michx. Annual; stem repeatedly pinnately dissected into short linear divisions; bracts bipinnate, with linear divisions; bractlets linear-filiform; fruit ovoid-oblong, 3-5 mm. long. Dry or sandy soil and waste places: S.C.—Fla.—Calif.—B.C.—Ida. *Son.* Mr.—Au.

2. CAÛCALIS L.

Mostly hispid annuals (ours). Leaves pinnately dissected. Flowers white, in umbels. Bracts in ours foliaceous, divided; bractlets entire or toothed. Calyx-teeth prominent. Stylopodium thick and conic; fruit ovate or oblong, flattened laterally; primary ribs 5, filiform, 2 of them pushed down on the commissural side, the other 3 bristly; secondary ribs 4, winged and with barbed or hooked prickles. Oil-tubes solitary under the secondary ribs, and 2 on the commissural side. Seed-face deeply grooved.

1. *C. microcarpa* Hook. & Arn. Slender annual; stem 2-4 dm. high, glabrous or sparingly hispid; leaves repeatedly pinnatifid into numerous linear divisions, glabrous or sparingly hairy; bracts foliaceous, pinnatifid; bractlets small, usually entire; fruit oblong, 4-6 mm. long, armed with rows of hooked prickles. Hills and river-banks: Wash.—Ida.—Ariz.—Calif. *Son.* Mr.—Je.

3. ERYNGIUM (Tourn.) L. RATTLESNAKE-MASTER, ERYNGO.

Glabrous caulescent perennials. Leaves usually rigid, coriaceous, spinosely toothed or divided. Flowers white or blue, in dense, bracted heads. Bractlets intermixed with the flowers. Sepals very prominent, rigid, persistent. Stylopodium wanting. Fruit ovoid or oblong, laterally flattened, covered with hyaline scales or tubercles; ribs obsolete. Oil-tubes usually 5, of which 3 are on the dorsal and 2 on the commissural side. Seed-face plane.

1. E. articulatum Hook. Stem 3-7 dm. high, dichotomously branched, usually with a peduncled head in the forks; basal and lower cauline leaves with nodose petioles, 7-25 cm. long; leaf-blades lanceolate, spinulose-serrate or entire, or in submerged leaves lacking; upper stem-leaves sessile and opposite, more or less lacinate at the base; heads globose or ellipsoid; bracts cuspidate, spiny-toothed below, as long as the heads; bractlets 3-cuspidate; fruit 4-5 mm. long; sepals cuspidate. Wet places: Wash.—Ida.—Calif. *Son.* Je-S.

4. SANÍCULA (Tourn.) L. SNAKE-ROOT, SANICLE.

Smooth perennials, with rootstocks and few-leaved stems. Leaves palmate or rarely pinnate, with incised or pinnatifid divisions. Flowers greenish yellow or purple, in irregularly compound, few-rayed umbels. Involucres and involucels present. Calyx-teeth foliaceous, persistent. Fruit globose, densely covered with hooked bristles; ribs none. Stylopodium wanting. Oil-tubes from 3 to many; usually 5; of these 3 dorsal and 2 commissural. Seed-face plane or concave.

Leaves palmately or pedately 3-7-divided.

Styles longer than the bristles; staminate flowers often in separate umbels.

Styles shorter than the bristles; staminate flowers always intermixed with the fertile ones.

Leaves pinnately twice or thrice ternate.

1. *S. marilandica*.

2. *S. canadensis*.

3. *S. septentrionalis*.

1. S. marilandica L. Stem 4-12 dm. high; basal leaves long-petioled; blades 3-5-divided to the base and the lateral divisions 2-cleft; divisions oblanceolate or obovate, sharply cut and serrate, 5-10 cm. long; the stem-leaves short-petioled or the upper sessile; involucres of few more or less leaf-like bracts; involucels of small bractlets; fruit sessile, 6-7 mm. long, including the bristles. Rich woods: Newf.—Ga.—Colo.—Wash.—B.C. *Plain—Submont.* Je-S.

2. S. canadensis L. Stem more or less branched, 3-12 dm. high; basal leaves long-petioled, palmately 3-divided to the base; lateral divisions 2-parted; divisions incised; the upper leaves short-petioled or subsessile; umbels irregular, few-rayed; involucres and involucels of few small bracts and bractlets; fruit 3-6 mm. long, including the bristles. Rich woods: Vt.—Fla.—Tex.—Wyo. *Plain—Submont.* Je-S.

3. S. septentrionalis Greene. Perennial, with a fusiform root; stem 1-4 dm. high; basal leaves small, ternate or bi-ternate; divisions 1-2 cm. long, obovate, cleft and coarsely serrate; stem-leaves few, their lobes sharply lacinate; bracts of the involucres pinnatifid, leaf-like; bractlets small, oblong, acute, more or less united; flowers yellow; fruit sessile, 4 mm. long. NIGGER-BABIES. *S. apifolia* Greene. Open woods and hillsides: Mont.—Ida.—Calif.—B.C. *Submont.* My-Jl.

5. OSMORRHIZA Raf. SWEET CICELY.

Glabrous or hirsute perennials, with thick aromatic roots and more or less leafy stems. Leaves ternately decompound, with broad, lanceolate or ovate, toothed leaflets. Flowers white or purplish, in few-rayed umbels. Involucres and involucels few-leaved or wanting. Calyx-teeth obsolete. Fruit linear-clavate, attenuate at the base, bristly on the equal ribs. Stylopodium conic or depressed. Oil-tubes obsolete in the mature fruit. Seed-face concave to deeply grooved. [*Washingtonia* Raf.]

Involucels of several bractlets.

Involucels lacking or of a single small bractlet.

Fruit obtuse at the apex, without a neck.

1. *O. longistylis*.

2. *O. obtusa*.

Fruit more or less constricted at the apex into a short neck.

Pedicels longer than the fruit.

Stylopodium short, broad and flat, making the fruit almost truncate at the apex; plants almost glabrous.

Corolla purple.

3. *O. purpurea*.

Corolla white.

4. *O. Leibergii*.

Stylopodium as well as the neck tapering above, the fruit therefore ending in a short beak.

Branches of the umbel in fruit ascending; fruit 15 mm. or more long; beak 2 mm. or more.

5. *O. intermedia*.

Branches of the umbel in fruit divaricate; fruit 12-13 mm. long; beak scarcely more than 1 mm. long.

6. *O. divaricata*.

Pedicels shorter than the fruit.

7. *O. brevipes*.

1. *O. longistylis* (Torr.) DC. Stem stout, glabrous or nearly so, 3-10 dm. high; leaves twice to thrice ternate; ultimate leaflets 3-7 cm. long, acuminate, sparingly hirsute; involucre and involucels of few narrowly lanceolate-acuminate bracts; fruit 2-3 cm. long, with a slender attenuation at the base; stylopodium elongate-conic, 1 mm. long; styles 2 mm. long. *W. longistylis* Britton. Damp woods: N.S.—Ga.—Colo.—Alta. *Plain—Submont.* My—Jl.

2. *O. obtusa* (Coul. & Rose) Fernald. Stem 3-6 dm. high, glabrous or more or less pilose, with spreading or reflexed hairs; leaves twice or thrice ternate; ultimate leaflets ovate or lanceolate, mostly acuminate; umbels with spreading branches; fruit about 15 mm. long; stylopodium flattened, 0.5 mm. long or less; styles very short, recurved. *W. obtusa* Coul. & Rose. Woods in the mountains: Alta.—N.M.—Calif.—B.C.; Gaspe, Que. *Submont.—Subalp.* Je—Au.

3. *O. purpurea* (Coul. & Rose) Suksd. Stem 2-6 dm. high, nearly glabrous; leaves twice ternate; leaflets ovate or lanceolate, acute or acuminate, 2-7 cm. long; branches of fruiting umbels widely spreading; fruit slightly hispid at the base, 10-12 mm. long, slightly beaked at the apex; styles over 0.5 mm. long. *W. purpurea* Coul. & Rose. Woods: Alaska—Mont.—Ore. *Mont.* Je—Au.

4. *O. Leibergii* (Coul. & Rose) Blankinship. Stem 3-6 dm. high, almost glabrous; leaves twice or thrice ternate; leaflets thin, ovate or lanceolate, acuminate; umbels with ascending branches; fruit slightly hispid at the base; styles less than 0.5 mm. long. *W. Leibergii* Coul. & Rose. Moist woods: Ida.—B.C.—Alta.—Wash. *Submont.—Mont.* Jl—Au.

5. *O. intermedia* (Rydb.) Blankinship. Stem 4-8 dm. high, sparingly villous or glabrous; ultimate leaflets rhombic-ovate, acute, somewhat pubescent; branches of umbel ascending in fruit; fruit about 15 mm. long; stylopodium 0.5 mm. long; styles very short. *W. intermedia* Rydb. Woods and copses: Mont.—Colo.—Utah—Alaska. *Submont.—Mont.* Je—Au.

6. *O. divaricata* Nutt. Stem slender, 3-6 dm. high, sparingly pubescent; leaves twice or thrice ternate; ultimate leaflets 2-6 cm. long, ovate, acute or acuminate, more or less pubescent; branches of the umbels very long and divaricate in fruit; fruit 12-13 mm. long; stylopodium 0.25 mm. long; styles of about the same length. *W. divaricata* Britton. Woods: B.C.—Ore.—Utah—S.D.; also Gaspe, Que. *Submont.—Mont.* Je—Jl.

7. *O. brevipes* (Coul. & Rose) Suksd. Stem 3-8 dm. high, pubescent, with short retrorse hairs; leaflets broadly ovate, 2-5 cm. long, obtuse or acutish, more or less pubescent; branches of the umbels 3-7, ascending; pedicels 4-12 mm. long; fruit 14-16 mm. long, with slender attenuation at the base and a distinct beak 2 mm. long; stylopodium conic, less than 0.5 mm. long; style short. *W. brevistylis* Coul. & Rose. Woods and thickets: B.C.—Mont.—Wyo.—Calif. *Submont.—Mont.* My—Jl.

6. GLYCÔSMA Nutt.

Cauliscent perennials, with rootstocks, more or less pubescent, at least at the nodes. Leaves ternately decompound, with lanceolate, toothed leaflets. Flowers yellow, in few-leaved umbels. Calyx-teeth obsolete. Stylopodium conic or depressed. Fruit linear-clavate, glabrous, obtuse at the base; oil-tubes obsolete in the fruit; seed-face concave or grooved.

Fruit 12-16 mm., rarely 18 mm. long, on erect pedicels.
Fruit 20 mm. long or more, on spreading pedicels.

1. *G. occidentalis*.

2. *G. maxima*.

1. **G. occidentalis** Nutt. Stem stout, usually puberulent, 6-12 dm. high; leaves twice or thrice pinnately ternate; leaflets oblong-lanceolate, 3-10 cm. long, acute, serrate; pedicels 2-8 mm. long; fruit distinctly beaked; stylopodium conic, nearly 1 mm. long. *Osmorrhiza occidentalis* Torr. Hillsides and valleys: Alta.—Colo.—Calif.—B.C. *Submont.*—*Mont.* Je—Au.

2. **G. maxima** Rydb. Stem 1 m. high or more, puberulent or glabrous, pilose at the nodes; lower leaves twice compound, first pinnate and the lower primary divisions ternate; the upper leaves ternate or twice ternate; leaflets oblong-lanceolate, 5-10 cm. long, minutely puberulent; pedicels in fruit 1-1.5 cm. long; fruit contracted above into a beak, 2 mm. long; stylopodium conic, 0.5 mm. long. Mountains: Utah—*Mont.* *Submont.* Jl—Au.

7. LEIBERGIA Coult. & Rose.

Slender glabrous acaulescent plants, from small globose corms. Leaves ternately divided into long filiform leaflets. Flowers white, in irregular umbels. Calyx-teeth obsolete. Stylopodium wanting. Fruit slightly flattened laterally, linear, beaked, glabrous. Ribs filiform. Oil-tubes small, solitary in each interval, 2 on the commissural side. Seed-face broad, slightly concave, but in drying becoming involute.

1. **L. orogenioides** Coult. & Rose. Stem 1-5 dm. high; branches of the umbels 3-10, often spreading, 2-12 cm. long; pedicels very short; fruit 8 mm. long, 1 mm. broad. *Cogswellia orogenioides* M. E. Jones, in part. Wet grounds, pine woods: Ida.—Wash. My—Je.

8. OROGENIA S. Wats. TURKEY PEAS.

Dwarf glabrous acaulescent perennials, with tuberous or fusiform corms or roots. Leaves ternate, with linear divisions. Flowers white, in small sub-compound umbels with very unequal rays. Calyx-teeth minute. Stylopodium depressed. Fruit oblong, slightly flattened laterally, glabrous. Carpels strongly flattened dorsally. Dorsal and intermediate ribs filiform; lateral ribs strongly corky thickened and inflexed towards the other carpel, leaving empty cavities between them, the carpels, and a thick corky projection from the middle of the commissure of each carpel. Oil-tubes very small, 3 in each interval, 2-4 on the commissural side. Seed-face slightly concave.

Stem from a deep-seated round corm.
Stem from a fusiform long root.

1. *O. linearifolia*.
2. *O. Leibergii*.

1. **O. linearifolia** S. Wats. Stem scapiform, usually about 1 dm. high; leaves 2-3, ternate or biternate, slender-petioled, glabrous; divisions entire, linear, 2-5 cm. long, 2-6 mm. wide; umbels 2-10-rayed; flowers sessile or nearly so; fruit 3-4 mm. long; ribs rather prominent. Mountain sides and ridges: Wash.—Ore.—Utah—Colo. *Submont.*—*Mont.* Mr—Je.

2. **O. Leibergii** (Coult. & Rose) Rydb. Stem scapiform, 3-4 dm. high, glabrous; leaves twice or thrice ternate; divisions 2-4 cm. long, linear. *O. fusiformis Leibergii* Coult. & Rose. Sand hills: Ida. Je.

9. EULOPHUS Nutt.

Glabrous caulescent perennials, with fascicled tuberous roots. Leaves pinnately or ternately compound, with narrow, linear to oblong-linear leaflets, of which the terminal one usually is elongate. Bracts lanceolate or rarely wanting; bractlets lanceolate, several, subscarious. Flowers white or pinkish, in long-peduncled umbels. Calyx-teeth prominent. Stylopodium conic; styles long, recurved. Fruit laterally flattened, ellipsoid to linear-oblong, glabrous. Ribs filiform; pericarp thin. Oil-tubes 1-5 in the intervals, 4-8 on the commissural side. Seed-face broadly concave, with a central longitudinal ridge.

1. **E. Bolanderi** (A. Gray) Coult. & Rose. Stem 3-6 dm. high; lower leaves twice pinnately compound; leaflets entire or divided into linear or oblong divisions, 1-3 cm. long, the upper less compound or simple; umbels 10-25-rayed; involucre and involucrels of oblanceolate, acuminate, scarious bracts

and bractlets; fruit oblong, 3 mm. long, 1 mm. broad; oil-tubes 2-5 in each interval, 6 on the commissure. Meadows and ridges: Ore.—Ida.—Nev.—Calif. *Son.* My—Jl.

10. *ATËNIA* H. & A. YAMP, SQUAW-ROOT.

Smooth slender herbs, with tuberous or fusiform-fascicled roots. Leaves pinnate, with few linear or linear-lanceolate divisions. Flowers white. Involucres of few or several bracts, rarely wanting; involucels present. Calyx-teeth prominent. Stylopodium conic. Fruit orbicular to oblong, flattened laterally. Ribs filiform, inconspicuous. Oil-tubes large and solitary in each interval, 2 on the commissural side. Seeds somewhat flattened dorsally; face plane.

Leaflets of all the leaves filiform to linear-lanceolate.

Leaflets filiform.

Leaflets linear-lanceolate.

Leaflets of the basal leaves ovate-lanceolate or broadly lanceolate.

1. *A. Gairdneri*.

2. *A. montana*.

3. *A. Garrettii*.

1. *A. Gairdneri* H. & A. Stem 3-10 dm. high; leaves pinnate; leaflets narrowly linear to filiform, 5-15 cm. long; fruit nearly orbicular, usually less than 2 mm. long; calyx-teeth ovate, very small; stylopodium low-conic. *Carum Gairdneri* (H. & A.) A. Gray. Meadows and valleys: Alta.—N.M.—Calif.—B.C. *Plain*—*Submont.* Au—S.

2. *A. montana* (Blankinship) Rydb. Stem 8-12 dm. high; leaves 2-3 dm. long, pinnate, with 7-11 leaflets; leaflets often cleft into 1-4 lanceolate or linear-lanceolate divisions; sepals as long as the depressed conic stylopodium; fruit fully 2 mm. long, orbicular. *Carum montanum* Blankinship. Low thickets: Alta.—Wyo.—Ida. *Submont.* Jl—S.

3. *A. Garrettii* (A. Nels.) Rydb. Stem 6-8 dm. high, glabrous; basal and lower cauline leaves pinnate, with 3-7 leaflets; leaflets 3-5 cm. long, 1-2 cm. wide, ovate or ovate-lanceolate, entire; upper cauline leaves with narrower leaflets or reduced to broad sheaths; bracts and bractlets filiform-subulate; fruit about 2 mm. long, orbicular; stylopodium low-conic, longer than the sepals. *Carum Garrettii* A. Nels. Valleys: Utah. *Submont.* Au—S.

11. *BÉRULA* Hoffm. WATER PARSNIP.

Smooth aquatic perennials, with rootstocks. Flowers white, umbellate. Leaves simply pinnate, with toothed or incised leaflets. Bract and bractlets conspicuous, but narrow. Calyx-teeth minute. Stylopodium conic. Fruit nearly suborbicular, flattened laterally, emarginate at the base, glabrous. Ribs slender, inconspicuous. Oil-tubes numerous and contiguous, closely surrounding the seed cavity. Seeds subterete.

1. *B. erecta* (Huds.) Coville. Stem 2-10 dm. high, glabrous; leaves pinnate, with 11-19 leaflets; leaflets ovate to linear, sharply serrate, incised or laciniately lobed, 1-7 cm. long; fruit scarcely 2 mm. long. *B. angustifolia* (L.) Mert. & Koch. Swamps and streams: Ont.—Ill.—N.M.—Calif.—B.C. *Plain*—*Submont.* Jl—S.

12. *CÀRUM* L. CARAWAY.

Biennials or perennials with taproot, leafy-stemmed. Leaves twice or thrice pinnatifid, with filiform divisions. Involucres and involucels present. Flowers white, in many-rayed umbels. Calyx-teeth prominent. Stylopodium conic. Fruit oblong, somewhat flattened laterally. Ribs rather strong. Oil-tubes solitary in the intervals, 2-6 on the commissural side. Seed-face plane.

1. *C. carui* L. Stem 3-6 dm. high; leaves 3-4 times pinnatifid, with lanceolate to filiform acute segments; involucres of 1-3 linear bracts; involucels usually none; fruit oblong, about 4 mm. long, with conspicuous ribs. Waste places: Newf.—Pa.—Colo.—Alta.; escaped from cultivation; native of Europe. *Plain*—*Mont.* My—Jl.

13. *LIGÚSTICUM* L.

Smooth caulescent perennials, with large aromatic roots. Leaves large, ternately or ternate-pinnately compound or decompound. Flowers white or

pinkish, in many-rayed umbels. Bracts usually wanting; bractlets narrow. Calyx-teeth small or obsolete. Stylopodium conic. Fruit oblong or ellipsoid, flattened laterally if at all, glabrous. Ribs all prominent and equal, acute, sometimes slightly winged. Oil-tubes 2-6 in the intervals, 6-10 on the commissural side. Seeds with rounded or angled back; face from plane to deeply concave.

Stem leafy; divisions of the leaves not filiform.

Ultimate divisions of the leaves 2-3 cm. wide; involuclers none. 1. *L. verticillatum*.

Ultimate divisions of the leaves less than 2 cm. wide, lacinate or pinnatifid.

Ultimate divisions of the leaves ovate to lanceolate.

Lateral primary divisions less than half as long as the terminal one; leaves therefore appearing pinnate; oil-tubes in the intervals 3, on the commissure 6-8. 3. *L. simulans*.

Lateral primary divisions at least two-thirds as long as the terminal one; the leaves therefore appearing ternate; oil-tubes in the intervals 4-6, on commissure 6-10.

Secondary leaflets not cleft to near the midrib; fruit 4 mm. long.

Secondary leaflets cleft to near the midrib; fruit 5-6 mm. long. 2. *L. Canbyi*.

Leaves thin and dark green.

Fruit almost 5 mm. long; stylopodium conic. 4. *L. Leibergii*.

Fruit about 6 mm. long; stylopodium low and broad.

Ultimate lobes of the leaves lanceolate, 5-10 mm. long.

Ultimate lobes of the leaves ovate or oblong-ovate, usually less than 5 mm. long. 5. *L. Porteri*.

Leaves thicker, pale green. 6. *L. brevilobum*.

Ultimate divisions of the leaves or teeth linear or linear-lanceolate. 7. *L. affine*.

8. *L. filicinum*.

Plant subscapose or with a single leaf; ultimate divisions of the leaves linear-filiform. 9. *L. tenuifolium*.

1. *L. verticillatum* (Geyer) Coult. & Rose. Stem 6-7 dm. high; leaves once or twice ternate, then pinnate; leaflets 2.5-7.5 cm. long, ovate to oblong, serrate, pale beneath, glabrous; umbels many-rayed, compact; involuclers none; fruit oblong, 6 mm. long; ribs winged; stylopodium low-conic. Borders of woods: Ida. Submont. Je-Jl.

2. *L. Canbyi* Coult. & Rose. Stem about 6 dm. high; leaves mostly basal, biternate; leaflets lanceolate, 7.5-10 cm. long, pinnately parted below, toothed above; bractlets linear; fruit 4 mm. long; ribs winged; stylopodium slender-conic; oil-tubes 5 or 6 in the intervals, 6-8 on the commissure. Low ground: Mont.—Ida.—Wash.—B.C. Submont.—Mont. Jl-S.

3. *L. simulans* Coult. & Rose. Stem 6-9 dm. high; leaves mostly basal, twice pinnate; leaflets oblong or lanceolate, toothed or cleft; bracts and bractlets linear; fruit oblong, 4-5 mm. long; ribs with narrow thin wings; stylopodium low-conic. Wet meadows: Wyo. Mont. Au.

4. *L. Leibergii* Coult. & Rose. Stem glabrous, 1 m. or more high; leaves twice ternate, then pinnate; leaflets lanceolate, acuminate, laciniately cleft into lanceolate, pointed, sometimes toothed lobes; peduncles often verticillate around a central one, 1-4 dm. long; involuclers few, subulate; fruit oblong, 4-5 mm. long; ribs with narrow wings; stylopodium conic; oil-tubes 4-6 in the intervals. Rich soil: Ida.—Wash. Submont.—Mont. Je-Au.

5. *L. Porteri* Coult. & Rose. Stem 6-10 dm. high, leafy; leaves large, biternate and then pinnate; leaflets numerous, lanceolate or ovate, pinnatifid or toothed, with oblong-lanceolate divisions or teeth; bracts and bractlets usually lacking; fruit oblong, 6-7 mm. long; ribs prominently winged; stylopodium broad and low; oil-tubes 4-6 in the intervals. Woods: Wyo.—N.M.—Ariz. Mont.—Subalp. Jl-Au.

6. *L. brevilobum* Rydb. Stem 6-8 dm. high, glabrous; leaves twice ternate and then pinnate; segments cleft into ovate or oblong-ovate lobes which are seldom more than 5 mm. long, prominently veined; involuclers and involuclers usually wanting; fruit short-oblong, nearly as in the preceding; stylopodium low-conic. Open woods: c Utah. Mont.—Subalp. Jl-Au.

7. *L. affine* A. Nels. Stem 5-10 dm. high; leaves biternate, then once or twice pinnate; leaflets ovate-oblong, deeply cleft into linear-oblong or linear-

lanceolate divisions; bractlets few, linear-subulate, caducous; fruit elliptic, 5 mm. long; ribs winged; oil-tubes usually 5 in the intervals; stylopodium low. Open hillsides: Wyo.—Colo. *Submont.*—*Mont.* Jl—Au.

8. **L. filicinum** S. Wats. Stem 3–10 dm. high, leafy; leaves once or twice ternate, then bipinnate; leaflets pinnatifid into linear or narrowly linear-lanceolate, acute divisions; bracts and bractlets solitary or few, small, linear; fruit narrowly oblong, 6–7 mm. long; ribs somewhat winged; stylopodium conic; oil-tubes 3–5 in the intervals. Mountain valleys: Wyo.—Utah—*Mont.* *Submont.*—*Mont.* Je—Au.

9. **L. tenuifolium** S. Wats. Stem 2–6 dm. high, naked or with a single leaf; leaves ternate, then pinnately decompound; leaflets pinnately divided or laciniate into narrowly linear lobes; bractlets 1 or 2, narrowly linear; fruit oblong, 3–4 mm. long, with narrow ribs; oil-tubes 3–5 in the intervals. Mountain woods: Colo.—Ida.—Ore. *Mont.*—*Subalp.* Au.

14. **LIGUSTICELLA** Coult. & Rose.

Low glabrous acaulescent perennials. Leaves simply pinnate. Flowers yellowish green, in few-rayed compact umbels. Bracts none, or 1 or 2, caducous; bractlets broad and toothed. Calyx-teeth evident; Stylopodium conic. Fruit flattened laterally, glabrous. Oil-tubes 2 or 3 in the intervals, 4 on the commissural side. Ribs filiform. Seeds broader than thick; face nearly plane.

1. **L. Eastwoodae** Coult. & Rose. Leaves pinnate; leaflets 7–13, oval, orbicular or obovate, 2- or 3-lobed, again cleft and toothed, 1–1.5 cm. long; bracts 0–2; bractlets obovate or cuneate, 3–5-toothed; fruit ovoid, 3 mm. long, with small ribs; stylopodium conic; oil-tubes 2–3 in each interval. *Ligusticum Eastwoodae* Coult. & Rose. Mountains: Colo.—Wyo. *Submont.*—*Subalp.* Je—Au.

14. **BUPLEÛRUM** L.

Annuals or perennials, with entire, clasping or perfoliate stem-leaves. Flowers yellow, in small umbels. Involucres present or wanting; involucels of 5 or more ovate bractlets. Calyx-teeth obsolete. Fruit oblong, flattened laterally. Ribs equal, slender or prominent. Stylopodium prominent and flat. Oil-tubes wanting or continuous around the seed-cavity. Seed-face plane or nearly so.

Plant usually over 1 dm. high; bractlets lanceolate, acute, yellowish green; fruit about 5 mm. long.

Plant usually less than 1 dm. high; bractlets obovate or elliptic, obtuse, dark green; fruit 3 mm. long; flowers usually purplish.

1. **B. americanum** Coult. & Rose. Perennial, with a woody caudex; stem 1–3 dm. high, glabrous; basal leaves linear-lanceolate, tapering into a short petiole, parallel-veined; stem-leaves clasping, oblong to linear; petals light yellow; oil-tubes about 4 in each interval. Mountains: Alaska—Ida.—Wyo.—Mack. *Mont.*—*Subalp.* Jl—Au.

2. **B. purpureum** Blankinship. Perennial, with a woody caudex; stem 1 dm. high or less, glabrous; basal leaves linear-lanceolate, 2–5 cm. long, the cauline ones lanceolate or oblong, clasping; petals purple, rarely yellow; oil-tubes 3 or less in each interval. High mountains: *Mont.* *Mont.*—*Alp.* Jl—Au.

16. **ZIZIA** Koch. ALEXANDERS, MEADOW PARSNIP.

Smooth caulescent perennials. Leaves simple or ternately compound, with broad serrate leaflets. Flowers yellow, umbellate. Bracts wanting; bractlets small. Calyx-teeth prominent. Stylopodium wanting; styles long, erect. Fruit flattened laterally, ellipsoid or oblong, glabrous. Ribs filiform. Oil-tubes large, solitary in each broad interval, 2 on the commissural side. Seed pentagonal in cross-section; face plane.

Basal leaves, at least the earlier ones, simple, cordate.
Basal leaves ternate.

1. **Z. cordata**.
2. **Z. aurea**.

1. **Z. cordata** (Walt.) Koch. Stem 3–7 dm. high, glabrous; basal leaf-blades cordate or rounded-cordate, 2–10 cm. long, crenate; stem-leaves ternate,

with ovate to lanceolate, serrate or incised leaflets; fruit ovate, 3 mm. long. Wet meadows and open woods: Conn.—Ga.—Utah—Ore.—B.C. *Plain—Submont.* My—Au.

2. *Z. aurea* (L.) Koch. Stems 3–10 dm. high; leaves all except the uppermost twice or thrice ternate; leaflets ovate to lanceolate, sharply serrate, 2–10 cm. long; fruit oblong, about 4 mm. long. Fields and meadows: N.B.—Fla.—Tex.—Wyo.—Mont.—Sask. *Plain—Submont.* My—Jl.

17. *MUSÍNEON* Raf.

Low glabrous or scabrous perennials, with thick elongated roots and dichotomously branched stems. Leaves pinnately decomposed, usually with more or less winged rachis. Flowers yellow, rarely white, in long-peduncled umbels. Bracts wanting; bractlets few and narrow. Calyx-teeth prominent. Stylopodium depressed. Fruit ovate or ovate-oblong, flattened laterally. Ribs equal and filiform. Oil-tubes usually 3 in each interval, unequal in size, 2–4 on the commissural side. Seed-face broadly concave. [*Musenium* Nutt.]

Divisions of the leaves obovate or oblong, toothed; rachis dilated.

Fruit glabrous or slightly puberulent.

Plant evidently caulescent; basal leaf-sheath not scarious, slightly dilated.

Plant with the stem above ground very short; basal sheath strongly dilated and scarious.

Fruit strongly scabrous-puberulent.

Divisions of the leaves obtuse.

Divisions of the leaves acute or acuminate.

Divisions of the leaves linear or linear-oblong, entire; rachis not dilated; leaf-sheath strongly dilated.

1. *M. divaricatum*.

2. *M. pedunculatum*.

3. *M. trachyspermum*.

4. *M. angustifolium*.

5. *M. vaginatum*.

1. *M. divaricatum* (Pursh) Coult. & Rose. Stems ascending or decumbent, 1–2 dm. high; leaves bipinnatifid; segments obovate, 3–5-toothed; branches of the umbels 10–25, 1–2 cm. long; pedicels very short; fruit 4 mm. long. Dry ground: Sask.—Neb.—Colo.—Alta. *Plain—Submont.* My—Jl.

2. *M. pedunculatum* A. Nels. Stem very short, less than 1 dm. high; peduncles 1–2 dm. long; leaves thick, somewhat glaucous, bipinnate; the ultimate divisions obovate, 2–5-toothed; rays of the umbels 10–20, 1.5–2.5 cm. long; fruit 4–5 mm. long. Clayey soil: Wyo. *Submont.* Je.

3. *M. trachyspermum* Nutt. Perennial, with a thick fusiform deep-seated root; stems decumbent or ascending, 0.5–2 dm. long, somewhat puberulent; leaves bipinnatifid; divisions obovate, obtusish, 3–5-toothed; flowers yellow; fruit 2–3 mm. long, scabrous-tuberculate, with prominent ribs. *M. divaricatum Hookeri* T. & G. Dry plains: Sask.—Neb.—Colo.—Alta. *Plain—Submont.* My—Jl.

4. *M. angustifolium* Nutt. Stem decumbent or ascending, 1.5 dm. long or less, puberulent; leaves bipinnatifid; rachis with very narrow wings; segments lanceolate, acute, 3–5-toothed or cleft; fruit about 3 mm. long, scabrous-tuberculate, with rather prominent ribs. Sandy and gravelly plains: Sask.—Colo.—Alta. *Plain—Submont.* My—Jl.

5. *M. vaginatum* Rydb. Stem less than 1 dm. high, glabrous; leaves twice or thrice ternate; divisions linear or linear-oblong, obtuse, about 5 mm. long; stem-leaves with a scarious-margined sheath; petals white or sometimes yellowish; fruit oblong, 3 mm. long; seed-face plane. Mountains: Mont.—Wyo. *Submont.—Mont.* Je—Jl.

18. *DAUCOPHYLLUM* (Nutt.) Rydb.

Low caespitose perennials, acaulescent or nearly so, with a branched caudex. Leaves numerous, basal, or 1 or 2 cauline, pinnate or bipinnate, with filiform or narrowly linear divisions. Flowers cream-colored to yellow, in dense umbels. Bracts wanting; bractlets few, narrow, linear. Calyx-teeth prominent. Stylopodium wanting. Fruit ovoid or oblong, granular on the intervals. Ribs equal, rather strong, but not at all winged. Oil-tubes 2 or 3 in the intervals, 4–6 on the commissural side. Seeds terete or somewhat depressed; face plane.

Leaves bi- or tri-pinnate; segments filiform; bractlets not exceeding the pedicels; seeds subterete. 1. *D. tenuifolium*.
 Leaves pinnate; segments narrowly linear; bractlets longer than the pedicels; seeds somewhat depressed. 2. *D. linearis*.

1. *D. tenuifolium* (Nutt.) Rydb. Leaves glaucous; peduncles 1-2.5 dm. high, glabrous; flowers cream-white or ochroleucous; fruit 3-4 mm. long, puberulent or nearly glabrous; oil-tubes 2 or 3 in the intervals. *Musenium tenuifolium* Nutt. Dry hills and plains: S.D.—Neb.—Wyo. *Plain*—*Submont.* My—Jl.

2. *D. linearis* Rydb. Stems glabrous, weak, 1-2 dm. high; leaf-segments entire, 1-3 cm. long; branches of the umbels 2-4 mm. long; fruit nearly sessile, oblong, 3-4 mm. long, strongly ribbed; oil-tubes 2 or 3 in the intervals. *Aletes tenuifolia* Coult. & Rose. Mountains: Utah. *Submont.* Jl.

19. ALÈTES Coult. & Rose.

Low caespitose, acaulescent perennials. Leaves pinnate, with broad, sharply toothed or cleft, distant leaflets. Flowers yellow, in small umbels. Calyx-teeth prominent. Stylopodium wanting. Fruit flattened laterally, oblong, glabrous. Ribs equal and prominent, but not winged. Oil-tubes large and solitary in each broad interval, 2 on the commissural side, and a small one in each rib. Seeds sulcate beneath each oil-tube; face slightly concave or plane.

Peduncles longer than the leaves; branches of the umbels short.

Leaflets rounded-obovate in outline; their teeth ovate; fruit 5-6 mm. long.

Leaflets rhombic-cuneate in outline, incised-toothed, with lanceolate-acuminate teeth; fruit 4-5 mm. long.

Peduncles shorter than the leaves; branches of the umbels nearly as long as the peduncles.

1. *A. obovata*.

2. *A. acaulis*.

3. *A. humilis*.

1. *A. obovata* Rydb. Peduncles 1-3 dm. high; leaves 1-2 dm. long, pinnate with 4-5 pairs of leaflets; these broadly obovate, 1-2 cm. long, more or less cleft and toothed, with short ovate teeth, strongly veined beneath; branches of the umbel 2-2.5 cm. long in fruit; fruit 5-6 mm. long and 1.5 mm. in diameter; ribs rather thick. Mountains: Colo. *Submont.* Ap—Je.

2. *A. acaulis* (Torr.) Coult. & Rose. Peduncles 1-3 cm. high; leaflets rhombic or rhombic-ovate, cut with lanceolate-acuminate teeth; branches of the umbels 1-2 cm. long; fruit 4-5 mm. long, almost sessile. High mountains: Colo.—N.M. *Submont.*—*Mont.* My—Au.

3. *A. humilis* Coult. & Rose. Peduncles 2-5 cm. long; leaflets usually 5, entire or few-toothed, elliptic to obovate; branches of umbels spreading, 2.5-3 cm. long; fruit ovate, 3 mm. long. Mountains: Colo. *Mont.* Je.

20. OREÓXIS Raf.

Acaulescent caespitose perennials. Leaves pinnate, the leaflets cut into lanceolate, acute divisions. Flowers yellow or yellowish, in small umbels. Involucres none; involucels of narrow bractlets. Calyx-teeth prominent. Fruit globose to oblong, slightly flattened laterally. Ribs prominent, thick and corky. Stylopodium wanting. Oil-tubes 1-3, in the very narrow intervals, 2 on the commissural side. Seeds slightly depressed, somewhat sulcate under the oil-tubes; face plane or nearly so.

Oil-tubes more than one in each interval; plant less than 1 dm. high, glabrous.

Bractlets linear, entire.

Bractlets obovate or oblanceolate, toothed.

Oil-tubes solitary in each interval.

Plant less than 1 dm. high, more or less puberulent, at least the upper part of the peduncle; leaflets cleft into 1-7 linear divisions, which are 4-5 mm. long; fruit 4-5 mm. long.

Plant 1-2 dm. high, glabrous; leaflets ovate or lanceolate, few-toothed, 5-15 mm. long; fruit oblong, 6-7 mm. long.

1. *O. humilis*.

2. *O. Bakeri*.

3. *O. alpina*.

4. *O. MacDougali*.

1. *O. humilis* Raf. Leaves 4-7 cm. long; leaflets cut into 3-7 linear-lanceolate divisions; peduncles 2-7 cm. long, glabrous or slightly puberulent below the umbel; flowers bright yellow; fruit 3-4 mm. long; oil-tubes 2 or 3 (rarely 1) in the intervals. High mountain peaks: Colo. *Subalp.*—*Alp.* Je—Au.

2. O. Bakeri Coult. & Rose. Leaves 2-7 cm. long, glabrous; leaflets divided into 3-5 linear or linear-lanceolate lobes; peduncles 3-8 cm. long; fruit 3-4 mm. long; oil-tubes 2-5 in the intervals. High mountain peaks: Colo.—Utah. *Subalp.*—*Alp.* Jl—Au.

3. O. alpina (A. Gray) Coult. & Rose. Leaves pale green, 2-7 cm. long; leaflets divided into 1-7 linear divisions; peduncles 2-8 cm. long, puberulent or sometimes nearly glabrous; bractlets usually narrowly lanceolate, more or less united at the base; flowers pale yellow or nearly white; fruit 4-5 mm. long, puberulent, at least when young. *Cymopterus alpinus* A. Gray. High mountain peaks: Colo.—Utah. *Subalp.*—*Alp.* Jl—Au.

4. O. MacDougali (Coult. & Rose) Rydb. Leaves 5-15 cm. long; leaflets 3-7, obovate, ovate, or cuneate in outline, with 2-5 coarse teeth; peduncles 1-1.5 dm. long, glabrous; bractlets few, linear; flowers yellow; fruit oblong, retuse at each end, 6-7 mm. long. *Aletes MacDougali* Coult. & Rose. Cañons: n Ariz.—s Utah. *Son.* Je—Jl.

21. HARBOÛRIA Coult. & Rose.

Glabrous caespitose perennials, with few-leaved stems and woody caudex. Leaves ternately decomposed, with narrowly linear or filiform divisions. Flowers yellow, in long-peduncled umbels. Bracts and bractlets few, subulate. Calyx-teeth evident. Stylopodium depressed or wanting. Fruit ovate, flattened laterally, with narrow commissure, tuberculate-roughened. Ribs broad, obtuse, prominent. Oil-tubes large, solitary in each interval, 2 on the commissural side. Seed nearly round in cross-section.

1. H. trachypleura (A. Gray) Coult. & Rose. Stem 3-6 dm. high, glabrous; leaves several times ternately decomposed into filiform, mucronulate divisions; umbels 15-25-rayed; flowers yellow; fruit broadly ovate, 4 mm. long. *Cicuta trachypleura* A. Gray. Mountains: Colo.—Wyo. *Submont.*—*Mont.* My—Jl.

22. SÌUM (Tourn.) L. WATER PARSNIP.

Smooth caulescent perennials, with rootstocks, growing in water or wet places. Leaves pinnate, with serrate or pinnatifid leaflets. Flowers white in large umbels. Bract and bractlets numerous, narrow. Calyx-teeth minute. Stylopodium depressed; styles short, recurved. Fruit flattened laterally, oval in outline, glabrous. Ribs equal, prominent and corky. Oil-tubes 1-3 in each interval, 2-6 on the commissural side. Seed not compressed; face plane.

1. S. cicutaefolium Gmel. Stem 6-10 dm. high; leaves pinnate, with 7-17 leaflets, or if growing in water the submerged leaves twice or thrice pinnatifid; leaflets in the emersed leaves linear or lanceolate, 3-10 cm. long, sharply serrate; fruit 3 mm. long, with prominent ribs. Water and wet places: Newf.—Va.—Calif.—B.C. *Plain*—*Mont.* Je—Au.

23. CICÛTA L. COW BANE, POISON OR WATER HEMLOCK.

Smooth poisonous marsh plants, with short often erect rootstock and leafy stems. Leaves pinnate or bipinnate, with serrate leaflets. Flowers white, in compound umbels. Bracts few or none. Bractlets several and slender. Calyx-teeth rather prominent. Stylopodium low, but sometimes low-conic. Fruit oblong to orbicular, flattened laterally, glabrous. Ribs strong, corky, flattish, the lateral ones largest. Oil-tubes solitary in the intervals, 2 on the commissure. Seed-face plane or nearly so.

Axils of the leaves not bearing bulblets; leaflets lanceolate.

Bractlets scarious-margined.

Bractlets not scarious.

Fruit orbicular in outline; rootstock usually horizontal or ascending.

Fruit oval in outline; rootstock exceedingly short, erect.

Axils of the leaves (especially the upper ones) bearing bulblets; leaflets narrowly linear.

1. *C. cinicola*.

2. *C. vagans*.

3. *C. occidentalis*.

4. *C. bulbifera*.

1. C. cinicola A. Nels. Stem stout, 2 m. high; lower leaves bipinnate, with some of the larger pinnæ bifoliolate; leaflets ovate or broadly lanceolate,

1-2 dm. long, coarsely serrate; upper stem-leaves 3-foliate or simple, with linear-lanceolate leaflets, 2-3 cm. long; involucre none, or of 1-3 scarious-margined linear bracts; bractlets lance-linear; fruit laterally compressed, 3 mm. long. Near brooks in volcanic soil: Ida. *Son.* Jl.

2. **C. vagans** Greene. Stem stout, 5-15 dm. high; leaves twice or thrice pinnate; leaflets thin, lanceolate or linear-lanceolate, 3-7.5 cm. long, remotely serrate, not strongly reticulate; fruit orbicular, 2-3 mm. long; ribs broad; intervals narrow; oil-tubes small. Swamps, lakes, and wet meadows: B.C.—Mont.—Ida.—Calif. *Son.*—*Submont.* Jl—Au.

3. **C. occidentalis** Greene. Stem stout, 1-2 m. high; leaves twice pinnate; leaflets lanceolate or linear-lanceolate, 5-8 cm. long, sharply serrate; fruit ellipsoid, 3 mm. long, constricted at the commissure; oil-tubes large. (?) *C. subfalcata* Greene. Swamps and wet meadows: Alta.—S.D.—N.M.—Calif.—B.C. *Plain*—*Submont.* Je—S.

4. **C. bulbifera** L. Stem slender, 3-9 dm. high; leaves twice or thrice ternate; leaflets linear, sparsely toothed, 2-5 cm. long; fruit rather rare, orbicular, 2 mm. long, constricted at the commissure; ribs broad and low; intervals narrow. Swamps: Me.—Md.—Ore.—B.C. *Plain.* Jl—S.

24. AULOSPERMUM Coult. & Rose.

Perennial herbs, with deep-seated fleshy root. Stem partly subterranean, covered at the base by scarious sheath and bearing at the end a cluster of leaves and naked scapes. Leaves pinnately dissected, fleshy, with obtuse segments. Flowers yellow or white or purple. Bracts mostly wanting; bractlets small, narrow. Calyx-teeth evident. Stylopodium wanting. Fruit oblong in outline. Ribs or most of them with thin broad wings; intervals broad. Oil-tubes several in each interval and on the commissural side. Seeds not dorsally flattened; face with a narrow and deep groove.

Involucres present.

1. *A. glaucum*.

Involucres wanting.

Corolla yellow.

Rachis of the primary leaf-segments dilated; secondary segments confluent, broad, toothed or merely cleft.

2. *A. longipes*.

Rachis of the primary leaf-segments not dilated; secondary segments distinct, finely dissected into oblong lobes.

3. *A. angustum*.

Corolla not yellow.

Corolla white.

4. *A. ibapense*.

Corolla purple.

5. *A. planosum*.

1. **A. glaucum** (Nutt.) Coult. & Rose. Leaves twice or thrice pinnatifid, glaucous; segments crowded, obovate, toothed; bracts and bractlets linear-subulate; flowers white or ochroleucous (at least in age); fruit about 6 mm. long; wings narrow. *Cymopterus glaucus* Nutt. Dry places: Mont.—Ida. *Plain.* Je.

2. **A. longipes** (S. Wats.) Coult. & Rose. Naked portion of stem 5-15 cm. long; leaves glaucous, pinnate or bipinnate, the ultimate divisions oval or obovate, mucronate; fruiting peduncles 1-2.5 dm. long; bractlets subulate; fruit 6-8 mm. long; wings broad and thin. *C. longipes* S. Wats. Dry hills and benchlands: Utah—Colo.—Wyo.—Ida. *Son.*—*Submont.* Ap—My.

3. **A. angustum** Osterhout. Stem about 1 dm. long; leaves ovate in outline, thrice pinnatifid, glaucous; ultimate divisions small, obovate or oblong, acute; bractlets subulate; fruit 6-7 mm. long; wings very narrow. River valleys: Colo. *Submont.* Je.

4. **A. ibapense** (M. E. Jones) Coult. & Rose. Leaves tripinnate, glaucous, the ultimate divisions crowded, oblong, obtuse; bractlets linear, acute; fruit 4-5 mm. long; wings broad and somewhat thickened at the insertion. *C. ibapense* M. E. Jones. Dry places: Utah—Nev. *Son.* My—Je.

5. **A. planosum** Osterhout. Stem 5-7 cm. long; leaves glaucous, ovate in outline, 7-8 cm. long, tripinnatifid, with small oblong or obovate divisions; bractlets few, subulate; fruit oblong, 6 mm. long, broadly winged. Dry places: Colo. *Submont.* Je.

25. **PHELLÓPTERUS** Nutt.

Perennial herbs, with deep-seated fleshy roots, a subterranean stem merely reaching the surface of the ground and there bearing a cluster of leaves and naked peduncles. Leaves from once to thrice pinnate, rather fleshy. Flowers white or purplish. Calyx-teeth evident. Stylopodium wanting. Fruit oblong to orbicular in outline, nearly orbicular in cross-section. Ribs or most of them with thin broad wings, which sometimes are somewhat thickened at the insertion; the lateral distinct from those of the other carpel. Oil-tubes usually more than one in each interval. Seeds more or less flattened dorsally; face broadly and shallowly concave.

Wings of the fruit thin and broad, scarcely rugose.

Peduncles even in fruit shorter than the leaves; wings thickened at the insertion.

Flowers white; fruit 6-8 mm. long.

1. *P. montanus*.

Flowers purple; fruit 10-14 mm. long.

2. *P. macrocarpus*.

Peduncles at least in fruit equalling or exceeding the leaves; wings not thickened at the insertion; fruit more than 8 mm. long.

Involucels 1-3-nerved; corolla purplish.

3. *P. bulbosus*.

Fruit oblong.

4. *P. utahensis*.

Fruit orbicular.

Involucels 5-13-nerved.

Bracts white with green middle; corolla white or pink.

5. *P. camporum*.

Bracts and corolla purple.

6. *P. multinervatus*.

Wings of the fruit thick, somewhat corky and rugose.

7. *P. Jonesii*.

1. ***P. montanus*** Nutt. Leaves twice or thrice pinnate, with oblong toothed divisions, somewhat glaucous; peduncles 1-5 cm. long; involucre inconspicuous, hyaline and lobed; involucels conspicuous, of obovate entire distinct bractlets; fruit broadly elliptic to nearly orbicular, 6-8 mm. long. *Cymopterus montanus* T. & G. Dry plains: S.D.—Kans.—Colo.—Wyo. Plain—Submont. Ap—My.

2. ***P. macrocarpus*** Osterhout. Leaves narrow in outline, 1 dm. long, glaucous, bipinnate, with oblong divisions; flowers purple; involucres small, scarious, divided; bractlets distinct, white and scarious, with green midrib; fruit orbicular or rounded-oval, 10-14 mm. long; oil-tubes 3-5 in the intervals and usually 6 on the commissure. Dry plains: Colo. Plain. Ap—My.

3. ***P. bulbosus*** (A. Nels.) Coult. & Rose. Leaves bipinnatifid; divisions cleft into oblong lobes, crowded; peduncles 5-10 cm. long; involucre of broad hyaline bracts united at the base; involucels of obovate hyaline bracts, with greenish midribs; fruit elliptic, 8 mm. long. *C. bulbosus* A. Nels. Clayey hills: Wyo. Submont. My—Je.

4. ***P. utahensis*** (M. E. Jones) Woot. & Standl. Leaves twice or thrice pinnatifid, with obovate or oblong, toothed or lobed divisions; peduncles 1-1.5 dm. long; involucres and involucels conspicuous, of white or purplish bracts, with 1-3 green or purple veins; fruit orbicular or oval, 10-12 mm. long. *P. purpurascens* Coult. & Rose. *C. utahensis* M. E. Jones. Clayey or gravelly soil: N.M.—Colo.—Ida.—Nev.—Ariz. Son. Ap—My.

5. ***P. camporum*** Rydb. Leaves twice to thrice pinnatifid, petioled, pale-green; ultimate divisions oblong, obtusish, 3-6 mm. long; peduncles 5-20 cm. long, usually exceeding the leaves; involucres of white hyaline bracts; bractlets orbicular, 5-7 mm. long; fruit with the very broad wings 10-13 mm. long and 9-11 mm. wide. Dry mesas: Colo. Son.—Submont. My.

6. ***P. multinervatus*** Coult. & Rose. Leaves as in the preceding; peduncles about 1 dm. long; involucres low hyaline-lobed sheaths or sometimes resembling the involucels, which are composed of broad bracts united at the base; fruit orbicular, 12-15 mm. long. *C. purpurascens* M. E. Jones. Dry places: N.M.—Utah—Nev.—s Calif. F—My.

7. ***P. Jonesii*** (Coult. & Rose) Rydb. Leaves somewhat fleshy, oblong to ovate in outline; leaflets 3, the lateral ones deeply 2-cleft, the terminal one 3-cleft; divisions cleft and crenate; umbels solitary; bractlets distinct to near the base, ovate, acuminate; fruit 3 mm. long. *Rhysopterus Jonesii* Coult. & Rose. Dry places: Utah. Submont. Ap.

26. CORIOPHYLLUS (M. E. Jones) Rydb. INDIAN PARSNIP.

Perennial herbs, with more or less fleshy roots, somewhat branched rootstocks covered with fibrous sheaths, and leafy stems. Flowers yellow to purple. Bracts none; bractlets present, but narrow. Leaves pinnately dissected, subcoriaceous, rigid, not fleshy, with ovate or lanceolate, cuspidate or spinulose-tipped lobes. Calyx-teeth evident. Stylopodium wanting. Fruit orbicular to oval in outline, usually emarginate at both ends, compressed laterally if any. Ribs with broad wings. Oil-tubes 1-5 in the intervals, 2-8 on the commissural side. Seeds little if at all flattened dorsally; face deeply grooved. [*Cymopterus* § *Coriophyllus* M. E. Jones.]

Wings thickened at the insertion.

Leaves ternately bipinnatifid; oil-tubes solitary in each interval. 1. *C. Jonesii*.

Leaves pinnate, with lobed or divided leaflets; oil-tubes several in each interval.

Leaves ovate to ovate-oblong in outline; flowers pedicelled. 2. *C. Rosei*.

Leaves reniform to oblong-cordate in outline; flowers sessile. 3. *C. basalticus*.

Wings not thickened at the insertion.

Flowers purplish; oil-tubes on the commissure 8.

Flowers greenish yellow; oil-tubes on the commissure 4.

4. *C. purpureus*.

5. *C. Betheli*.

1. *C. Jonesii* (Coul. & Rose) Rydb. Leaves ternate, then pinnate or bipinnate; ultimate segments broad, obovate, with spinulose-tipped teeth; bractlets lanceolate, small; flowers purple; fruit globose, 8 mm. long; wings broad, but very thick at the insertion. *Cymopterus* and *Aulospermum Jonesii* Coul. & Rose. Dry places: Utah. Submont. Je.

2. *C. Rosei* (M. E. Jones) Rydb. Leaves leathery, smooth, pinnate, with obovate-triangular, toothed, mucronate segments; peduncles 5-10 cm. long; bractlets lanceolate, purplish, barely united at the base; flowers purple; fruit broadly elliptic, 8-10 mm. long; wings broad, thin, slightly thickened at the insertions. *A. Rosei* M. E. Jones. Slopes and mesas in alkaline soil: Utah. Submont. Je.

3. *C. basalticus* (M. E. Jones) Rydb. Leaves 5-7 cm. long; blades 2.5-4 cm. long, reniform or oblong-cordate in outline, 3-5-lobed; lobes pinnatifid and fan-shaped, with apiculate teeth; peduncles thick, 1-1.5 dm. long; flowers white or purplish, sessile; involuclers of 8 oval or triangular bractlets; fruit broader than long, emarginate at both ends, 4 mm. long, 3-winged. *Cymopterus basalticus* M. E. Jones. Bare knolls: Utah. Submont.

4. *C. purpureus* (S. Wats.) Rydb. Leaves broadly triangular in outline, ternate, then pinnate or bipinnate; divisions obovate, dentate, with mucronate teeth; peduncles 1-2.5 dm. high; bractlets lanceolate, united at the base; fruit 8-10 mm. long; wings broad, scarcely thickened at the insertions. *Cymopterus purpureus* S. Wats. *A. purpureum* Coul. & Rose. Dry plains: Colo.—N.M.—Ariz.—Utah. Son.—Submont. Ap-Je.

5. *C. Betheli* (Osterhout) Rydb. Leaves broadly ovate in outline, first ternate, the main divisions bipinnate; leaflets broad, coarsely toothed; peduncles 5-10 cm. long; bractlets linear, acuminate; fruit 7-8 mm. long, 6-7 mm. wide; oil-tubes 3-5 in the intervals. *A. Betheli* Osterhout. *Cymopterus duchesneensis* M. E. Jones may be the same. Dry hills: Colo.—Utah. Submont. My-Je.

27. PTERÝXIA Nutt.

Low caespitose perennials, clothed at the base with fibrous sheaths. Leaves finely dissected, the main divisions being ternate, then repeatedly pinnate, with short linear or subulate, pungent divisions. Bracts mostly wanting; bractlets narrow, not at all hyaline. Flowers yellow or in one species white. Calyx-teeth evident. Stylopodium wanting. Fruit oblong to orbicular in outline, nearly round in cross-section. Ribs all or most of them more or less winged, the lateral ones at least broad-winged; wings thin throughout. Oil-tubes several in the intervals. Seeds usually strongly flattened dorsally; face broadly and shallowly concave.

Petals yellow.

Leaves broadly rhombic in outline.

Dorsal ribs with broad wings.

1. *P. foeniculacea*.

Dorsal ribs with narrow wings.
Leaves oblong or ovate in outline.
Pinnæ very small and distant.
Pinnæ larger and crowded.

Petals white.

2. *P. Elrodi*.

3. *P. petraea*.

4. *P. calcarea*.

5. *P. albiflora*.

1. ***P. foeniculacea*** Nutt. Stem few-leaved below or nearly scapiform, 1-3 dm. high; leaves 3-4 times ternate, then pinnatifid into oblanceolate-toothed divisions, which are scarcely salient; fruit broadly oval, 6-7 mm. long, wings broad, scarcely undulate. *Cymopterus foeniculaceus* T. & G. Gravelly soil and dry places: Wyo.—Colo.—Utah—Ore.—Wash. *Son.*—*Submont.* Ap-Jl.

2. ***P. Elrodi*** (M. E. Jones) Rydb. Stem few-leaved below, about 3 dm. high; leaves ovate or deltoid in outline, ternate, then pinnately decomposed; segments filiform, pungent, about 2.5 mm. long; bractlets needle-shaped and short; fruit about 9 mm. long and half as wide, truncate at the apex and slightly emarginate at the base; oil-tubes 5 in the intervals and 14 on the commissure. *Cymopterus Elrodi* M. E. Jones. Among loose rocks and gravel: Mont. Jl.

3. ***P. petraea*** (M. E. Jones) Coult. & Rose. Stem few-leaved, 3 dm. high; leaves mostly basal, twice pinnate, with distant pinnæ, and then pinnately divided into short narrow segments; fruit narrowly oval, 4-6 mm. long; lateral wings half as broad as the body; dorsal wings still narrower. *C. petraeus* M. E. Jones. Dry places: Ore.—Ida.—Nev. *Son.*—*Submont.* Je-Jl.

4. ***P. calcarea*** (M. E. Jones) Coult. & Rose. Stem few-leaved, 2-3 dm. high; leaves 3-4 times pinnately dissected into linear crowded divisions; fruit elliptic, 6-7 mm. long; dorsal wings rather narrow. *C. calcarea* M. E. Jones. Stony draws and foot-hills: Wyo.—Utah—Nev.—Ore. *Submont.* Je-Jl.

5. ***P. albiflora*** Nutt. Stem 1-2 dm. high; leaves twice or thrice ternate, the ultimate divisions divaricate and 3-cleft; involucels of several linear bractlets; fruit nearly orbicular, 4 mm. long; wings more or less undulate. *C. albiflorus* T. & G. Mountains: Mont.—Ida.—Wyo. *Submont.* Jl.

28. PSEUDOREÓXIS Rydb.

Low caespitose acaulescent perennials, with branched caudex. Leaves bipinnate, the segments cleft into small lance-oblong to linear-oblong divisions. Flowers white, in small umbels; bracts wanting; bractlets obovate or oblanceolate, cuspidate or acuminate, white, with green midrib. Calyx-teeth evident, but small. Stylopodium low and flat; styles reflexed. Fruit somewhat flattened laterally, oblong. Ribs all with narrow wings, the lateral wings scarcely wider than the dorsal ones. Oil-tubes 3 or 4 in the intervals, 6-8 on the commissure. Seed-face slightly concave.

1. ***P. bipinnatus*** (S. Wats.) Rydb. Leaves 5-8 cm. long, glaucous, more or less puberulent, rarely glabrous; peduncles 1-2 dm. high; flowers white; fruit 3-4 mm. long. *Cymopterus bipinnatus* S. Wats. *Pseudocymopterus bipinnatus* Coult. & Rose. *Cynomarathrum Macbridei* A. Nels. Dry mountains: Mont.—Wyo.—Ore. *Submont.*—*Mont.* Je-Jl.

29. CYMÓPTERUS Raf.

Dwarf subacaulescent perennials, with deep-seated thick root. Leaves pinnate or bipinnate. Bracts wanting or rarely few, small and linear; bractlets conspicuous, foliaceous. Flowers white or yellow. Calyx-teeth obsolete or evident. Fruit flattened dorsally, oval, in ours glabrous. Dorsal and intermediate ribs filiform or some of them usually winged; the lateral ones with broad thickened corky wings. Stylopodium wanting. Oil-tubes 4-12 in the intervals, 8-14 on the commissure (in ours). Seed-face plane.

Umbels dense, globular; petals white; involucre wanting.

Involucels of linear to oblong bractlets.

Ultimate divisions of the leaves linear or linear-oblong, acutish; fruit orbicular, 6-8 mm. long.

Ultimate divisions of the leaves short, broadly oblong, obtuse; fruit 7-10 mm. long.

Bractlets oblong, rarely lanceolate, obtuse; fruit orbicular, 8-10 mm. broad; wings strongly thickened.

1. *C. acaulis*.

2. *C. Parryi*.

Bractlets linear or lanceolate, acute; fruit oval, 6-8 mm. broad; wings moderately thickened.

Involucels of broad membranous, more or less 3-cleft bractlets; fruit fully 10 mm. long, broadly elliptic.

Umbels open; petals yellow; involucre present, although often a mere vestige.

Divisions of the leaves narrow.

Divisions of the leaves broad.

3. *C. lucidus*.

4. *C. Leibergii*.

5. *C. Fendleri*.

6. *C. Newberryi*.

1. *C. acaulis* (Pursh) Rydb. Stem above ground less than 1 dm. high; leaves clustered, bipinnatifid; segments entire or few-toothed; peduncles shorter than the leaves; bractlets linear, entire, more or less united, foliose; fruit 6-8 mm. long; wings of the fruit broad, moderately thick throughout. Dry arid places: Sask.—Kans.—Colo.—Alta. Plain—Submont. Ap-Je.

2. *C. Parryi* (Coul. & Rose) M. E. Jones. Leaves bipinnatifid, with oblong or oval obtuse segments; branches oblong or lanceolate, obtuse, united below; fruit 8-10 mm. long, with broad thick wings. *Coloptera Parryi* Coul. & Rose. Hills: Mont.—Colo. Plain—Submont. My-Je.

3. *C. lucidus* Osterhout. Leaves narrowly ovate in outline, bipinnate, glabrous, with ovate ultimate divisions; flowers in close head-like umbels; bractlets united at the base; wings of fruit 3 or 4, moderately thickened in the outer portion. Dry plains: Colo. Plain. Ap-Je.

4. *C. Leibergii* Coul. & Rose. Leaves tripinnate, with short obtuse segments; peduncles as long or longer than the leaves; fruit broadly elliptic, 10 mm. long. Dry places: Ore.—Ida. Je.

5. *C. Fendleri* A. Gray. Leaves twice or thrice pinnate, with obovate lobed divisions; involucre of a short sheath toothed or sometimes with linear lobes; bractlets united at the base, exceeding the flowers; fruit 8-10 mm. long; wings thin at the margin and at the insertion. *C. decipiens* M. E. Jones. Gravelly hills: N.M.—Colo.—Utah. Son. My.

6. *C. Newberryi* (S. Wats.) Jones. Leaves shorter than the peduncles, pinnately 3-5-foliolate; leaflets obovate, cleft into broad obovate lobes; bractlets conspicuous, oblong to obovate, foliaceous; fruit sessile or nearly so, 6-8 mm. long; lateral wings broad and thick; dorsal ribs narrowly winged or some filiform. Sandy places: Utah—Colo.—N.M. Son. My-Je.

30. PSEUDOCYMOPTERUS Coul. & Rose.

Perennial herbs, with taproots and leafy stems (in two species very short). Leaves bipinnate, with narrow, but not filiform, soft divisions. Flowers yellow or purplish, in small umbels. Bracts usually wanting; bractlets present and linear. Calyx-teeth evident but minute. Stylopodium wanting. Fruit oval, flattened dorsally, glabrous. Dorsal and intermediate ribs prominent and acute, or some of them usually more or less winged; the lateral ones with wings which are distinct from those of the other carpel. Seed-face plane.

Petals light yellow; bractlets linear-subulate, longer than the flowers.

Plant over 1 dm. high, with distinct leafy stems.

Ultimate divisions of the leaves short, ovate or lanceolate; leaves ovate in outline.

Ultimate divisions of the leaves linear, elongate.

Leaves, at least the basal ones, ovate in outline.

Leaves, at least the basal ones, broadly rhombic in outline.

Plant slender; leaves mostly twice compound, with very long and few divisions.

Plant low; leaves thrice pinnate with shorter, more numerous divisions.

Plant less than 1 dm. high, nearly acaulescent.

Petals purple, or orange tinged with purple; bractlets linear-lanceolate or lanceolate, shorter than the flowers.

Stem 2-3 dm. high; ultimate leaf-segments narrowly linear.

Stem 0.5-1.5 dm. high, nearly leafless; ultimate divisions of the leaves short, oblong or lanceolate.

1. *P. montanus*.

2. *P. sylvaticus*.

3. *P. tenuifolius*.

4. *P. multifidus*.

5. *P. Tidestromii*.

6. *P. versicolor*.

7. *P. purpureus*.

1. *P. montanus* (A. Gray) Coul. & Rose. Stem 3-6 dm. high, few-leaved; leaves pinnate; leaflets deeply divided into short ovate or lanceolate divisions; fruit 4-5 mm. long; lateral wings nearly as broad as the body; dorsal ribs with

narrow or no wings. *Thaspium montanum* A. Gray. Mountain woods: Wyo.—N.M.—Ariz. *Submont.*—*Subalp.* Je—Au.

2. *P. sylvaticus* A. Nels. Stem glabrous, 3–8 dm. high; leaves few, oblong or ovate in outline, bipinnate; segments linear, acute, long; fruit broadly elliptic, 5 mm. long; lateral wings thin, as broad as the body; the dorsal ribs usually narrowly winged. Woods: Colo.—Wyo. *Mont.*—*Subalp.* Je—Jl.

3. *P. tenuifolius* (A. Gray) Rydb. Stem 3–6 dm. high; leaves ternate, then pinnatifid into narrowly linear, rather stiff divisions; fruit broadly oval, 5 mm. long; lateral ribs slightly narrower than the body; dorsal ribs with narrow or no wings. *Thaspium montanum tenuifolium* A. Gray. Woody hillsides: Colo.—N.M.—Ariz. *Submont.*—*Mont.* F—Jl.

4. *P. multifidus* Rydb. Stem 1–3 dm. high, few-leaved; leaves twice or thrice pinnatifid into linear divisions; fruit about 4 mm. long, nearly orbicular; lateral wings thick, as broad as the body; dorsal ones narrow. Hills and open woods: Colo.—N.M. *Submont.*—*Mont.* Je—Jl.

5. *P. Tidestromii* Coult. & Rose. Mostly acaulescent perennial; leaves pinnate, less than 1 dm. long, bipinnatifid into narrowly lanceolate or linear divisions; peduncles 1–2 dm. high; fruit about 4 mm. long; ribs thick, acute. High mountains: Utah. *Subalp.*—*Alp.* Jl—Au.

6. *P. versicolor* Rydb. Stem glabrous, about 3 dm. high, few-leaved; leaves 1–2 dm. long, broadly ovate in outline, thrice pinnatifid into linear divisions; rays 1–2 cm. long; petals orange, tipped with reddish purple; fruit oval, about 4 mm. long; lateral ribs nearly as broad as the body, the dorsal ones narrower. Hillsides: Utah. *Mont.*

7. *P. purpureus* (Coult. & Rose) Rydb. Plant almost acaulescent, 5–15 dm. high; leaves less than 1 dm. long, twice to thrice pinnatifid into short oblong or lanceolate divisions; flowers usually dark purple, but sometimes rose or orange, tinged with purple; fruit nearly 5 mm. long, rounded-oval; wings rather thick. *P. montanus purpureus* Coult. & Rose. Mountains: Ariz.—Utah. *Mont.*—*Subalp.* Je—Au.

31. PSEUDOPTERYXIA.

Densely caespitose acaulescent strong-scented perennials, with multicapital caudices covered with numerous sheaths of old leaves. Leaves pinnatifid or bipinnatifid, with thick and firm pungent divisions. Flowers yellow; involucre wanting; bractlets linear-subulate. Calyx-teeth very prominent, one or two of them much larger than the rest. Stylopodium wanting. Fruit oblong, glabrous. Dorsal and intermediate ribs sharp or some of them winged, the lateral ones with broad wings, distinct from those of the other carpel. Carpels flattened dorsally. Oil-tubes 1–3 in the intervals, 2–4 on the commissural side. Seed-face plane.

Leaves with long petioles; scape 1–3 dm. high.

Primary divisions of the leaves once or twice dissected, with narrowly linear divisions.

Ultimate divisions of the leaves 5–10 mm. long; fruit about 6 mm. long.

Ultimate divisions of the leaves 3–5 mm. long; fruit about 4 mm. long.

Primary divisions broad, cuneate-flabellate, cleft or toothed, with short, ovate or lanceolate teeth.

Leaves on short petioles; divisions linear; scape less than 1 dm. high.

1. *P. longiloba* Rydb. Leaves twice pinnatifid, with linear-subulate, pungent divisions; peduncles 2–3 dm. high, stout; fruit about 6 mm. long; lateral wings thick, narrow; some of the wings of the dorsal ribs often fully as broad; calyx-teeth less prominent than in *P. anisata*. Dry hills: Utah. *Son.*

2. *P. anisata* (A. Gray) Rydb. Leaves pinnate, the primary leaflets once or twice pinnatifid, with linear, divergent divisions; peduncles 1–3 dm. high; fruit about 4 mm. long; lateral wings thick, narrower than the body; dorsal ribs either prominent or with narrow wings. *Pseudocymopterus anisatus* Coult. & Rose. *Cymopterus asinatus* A. Gray. Mountains among rocks: Wyo.—Colo.—Utah—Nev. *Mont.*—*Subalp.* Je—Jl.

3. *P. aletifolia* Rydb. Leaves once or twice pinnate, dark green, glabrous, stiff and shining, 1-2 dm. long; leaf-segments obovate to rhombic-cuneate, deeply cleft; lobes usually 3-toothed with lanceolate acuminate teeth; scapes 1-1.5 dm. long; sepals in fruit 1-2 mm. long; fruit 5-6 mm. long, 2.5-3 mm. wide; lateral wings evident but rather narrow; dorsal ribs acute or slightly winged. *Pseudocymopterus aletifolius* Rydb. Mountains among rocks: Colo. Submont. —Mont. My-Je.

4. *P. Hendersonii* (Coul. & Rose) Rydb. Leaves short-petioled, very pale, pinnate; leaflets ovate in outline, deeply cleft into 3-5 linear entire segments; peduncles longer than the leaves; bractlets linear, entire. *Pseudo-cymopterus Hendersonii* Coul. & Rose. Mountains: Ida. Alp. Au.

32. COGSWELLIA Spreng. COUS, BISCUIT ROOT,

WHISK-BROOM PARSLEY.

Acaulescent or short-stemmed perennials, with thickened, tuberous roots. Leaves ternately, rarely pinnately, dissected. Flowers yellow, white, or purple. Bracts wanting; bractlets usually present. Calyx-teeth usually obsolete. Stylopodium wanting. Fruit strongly flattened dorsally. Dorsal and intermediate ribs filiform, close together, the lateral ones winged, the wings coherent to those of the other carpel till maturity. Oil-tubes solitary or few in the intervals, 2-10 on the commissural side. Seed-face plane or rarely slightly concave. [*Peucedanum* Am. auth. *Lomatium* Raf.]

Plants slender with thick rounded corms.

Corolla white.

Bracts not scarious.

Fruit puberulent.

Fruit glabrous.

Divisions of the leaves oblong, very short, 5 mm. long or less; oil-tubes solitary in the intervals. 1. *C. Gormanii*.

Divisions of the leaves linear, 1-7 cm. long.

Wings of the fruit more than half as broad as the body; oil-tubes none. 2. *C. Canbyi*.

Wings of the fruit less than half as broad as the body; oil-tubes several. 3. *C. Geyeri*.

Bracts scarious-margined. (See *C. orientalis*, *C. nevadensis*, &c.) 4. *C. farinosa*.

Corolla yellow.

Fruit linear in outline.

Divisions of the leaves few, long and linear.

Umbellets open; pedicels 4-8 mm. long.

Umbellets compact; fruit nearly sessile.

Divisions of the leaves filiform.

Fruit oval in outline; divisions of the leaves oblong.

Caulicent; fruit glabrous; oil-tubes solitary in the intervals. 5. *C. ambigua*.

6. *C. leptocarpa*.

7. *C. bicolor*.

Acaulescent or nearly so. 8. *C. circumdata*.

Fruit puberulent; oil-tubes solitary in the intervals. 9. *C. Cous*.

Fruit glabrous; oil-tubes several in the intervals. 10. *C. montana*.

Plant generally stouter from a thickened root or rootstock, rarely corm-like.

Bractlets of the involuclers many, conspicuous, often broad, or united at the base.

Bractlets obovate or spatulate; whole plant glabrous; corolla yellow.

Involucre present, consisting of a scarious sheath, sometimes produced into linear green lobes. 11. *C. concinna*.

Involucre wanting. 12. *C. montana*.

Bractlets lanceolate, oblong or linear.

Corolla white.

Bractlets scarious-margined, as well as the whole plant puberulent or rarely glabrate.

Fruit glabrous; oil-tubes solitary in the intervals. 13. *C. orientalis*.

Fruit pubescent; oil-tubes several in the intervals. 14. *C. nevadensis*.

Bractlets not scarious-margined, villous. 15. *C. macrocarpa*.

Corolla yellow or purple.

Wings of the fruit half as wide as the body or broader.

Bractlets more or less united, densely villous; corolla yellow. 16. *C. villosa*.

Bractlets distinct, less densely villous; corolla often tinged with purple. 17. *C. Jonesii*.

Wings of the fruit less than half as wide as the body; bractlets linear, distinct. 18. *C. MacDougalii*.

Bractlets of the involuclers none or very few, linear or subulate.

Leaves finely dissected, with numerous small divisions.

Fruit oval in outline.

- Plant glabrous throughout.
 Divisions of the leaves filiform. 18. *C. Grayi*.
 Divisions of the leaves oblong or broadly linear.
 Flowers white; dorsal ribs of the fruit somewhat wing-margined. 19. *C. lapidosa*.
 Flowers yellow; dorsal ribs of the fruit not wing-margined. 20. *C. Donnellii*.
- Plant puberulent.
 Leaf-sheath with broad white scarious margins; fruit puberulent. 21. *C. Sandbergii*.
 Leaf-sheath not broadly scarious-margined; fruit glabrous. 22. *C. juniperina*.
 Fruit oblong-linear in outline; leaves finely dissected into filiform divisions, slightly puberulent. 7. *C. bicolor*.
 Leaves simply or doubly (rarely 3 or 4 times) ternate, with comparatively large divisions; flowers yellow. 24. *C. leptophylla*.
 Leaf-divisions linear or narrowly linear-lanceolate, mostly attenuate.
 Wings of the fruit as broad as the body or broader. 23. *C. simplex*.
 Fruit glabrous; leaflets usually linear-lanceolate. 24. *C. leptophylla*.
 Fruit puberulent; leaflets usually narrowly linear.
 Wings of the fruit narrower than the body. 25. *C. triternata*.
 Ovary and fruit glabrous. 26. *C. robustior*.
 Ovary and young fruit puberulent.
 Leaf-divisions from linear-oblong to oval, obtuse or acutish.
 Fruit puberulent; leaf-segments many; peduncles not thickened. 27. *C. anomala*.
 Fruit glabrous; leaf-segments few; peduncles in fruit usually inflated at the apex. 28. *C. nudicaulis*.
 Fruit elliptic; oil-tubes solitary in the intervals; leaflets at least twice as long as broad. 29. *C. platyphylla*.
 Fruit oval; oil-tubes several in each interval; leaflets usually not twice as long as broad.

1. C. Gormanii (Howell) M. E. Jones. Corm small; leaves bipinnate, with the ultimate segments linear or oblong; bractlets few, setaceous, or none; fruit sessile or nearly so, rough puberulent, ovate, 6 mm. long; wings more than half as broad as the body. *Peucedanum Gormanii* Howell. *P. confusum* Piper. Mountains: Ore.—Ida.—Wash. Ap—My.

2. C. Canbyi (Coul. & Rose) M. E. Jones. Corm 1–2.5 cm. thick; scape 7–20 cm. high; leaves ternate, then pinnatifid; bractlets narrowly linear, scarious-margined; fruit ovate-oval, glabrous, 8 mm. long, 5 mm. broad; wings about half as broad as the body. *P. Canbyi* Coul. & Rose. Stony ground: Ore.—Ida.—Wash. Son.—Submont. Ap—My.

3. C. Geyeri (S. Wats.) M. E. Jones. Corm small, globular; scape 1–4 dm. high; leaves once or twice ternate, then pinnate; segments linear, 1–5 cm. long; bractlets numerous, purplish, lanceolate, acuminate, united; fruit oval, 8–10 mm. long, 5 mm. broad; wings membranous. *P. Geyeri* S. Wats. Sandy or gravelly ground: Wash.—Ida.—B.C. Son. My—Je.

4. C. farinosa (Hook.) M. E. Jones. Corm globose or sometimes several corms in succession; stem scapiform or few-leaved, 2–3 dm. high; leaves ternate or biternate; leaflets 1–8 cm. long; bractlets several, linear, acuminate; fruit linear-oblong, glabrous, 6–8 mm. long, 2–3 mm. wide. *P. farinosum* Hook. Rocky places: Ore.—Ida.—B.C. Submont. Ap—My.

5. C. ambigua (Nutt.) M. E. Jones. Corm sometimes globose, sometimes fusiform, occasionally with several successive thickenings; sheaths very conspicuous; leaf-blades once or twice ternate, with elongate linear or linear-filiform leaflets; bractlets none; pedicels 4–8 mm. long; fruit narrowly oblong, 6–8 mm. long, 2 mm. wide, very narrowly winged. *P. ambiguum* Nutt. Sandy or gravelly hillsides or valleys: B.C.—Mont.—Wyo.—Utah—Ore. Son.—Submont. My—Au.

6. C. leptocarpa (Nutt.) M. E. Jones. Corm globose; plant subacaulescent; scape 2–3 dm. high; leaves ternate, then once or twice pinnate, with elongate linear divisions; bractlets small, linear-subulate; fruit nearly sessile, 9–10 mm. long, 2 mm. broad, with very narrow wings. *P. leptocarpum* Nutt. *P. bicolor gumbonis* M. E. Jones. Stony hillsides and plains: Ore.—Ida.—Colo.—Calif. Plain—Submont. My—Je.

7. *C. bicolor* (S. Wats.) M. E. Jones. Corm napiform; stem 1-4.5 dm. high, glabrous or slightly puberulent; leaves ternate, then repeatedly pinnate, with numerous filiform divisions; sheath inflated; bractlets 1-8, linear-subulate; pedicels very short; fruit linear-oblong, glabrous, 10-12 mm. long, 2-5 mm. wide; wings very narrow. *P. bicolor* S. Wats. Hillsides: Utah—Ida.—Mont. *Son.*—*Submont.* My—Je.

8. *C. circumdata* (S. Wats.) M. E. Jones. Corm subglobose; stem 2-3 dm. high, more or less leafy; leaves ternate, then once or twice pinnate; ultimate segments linear, 2-12 mm. long; sheath of the stem-leaves broadly dilated; bractlets oblanceolate, becoming scarious; fruit oblong-elliptic, 6-8 mm. long, 3 mm. wide, with narrow wings. *P. circumdatum* S. Wats. Hillsides: Wash.—Mont.—Ida.—Ore. *Submont.* Ap—Je.

9. *C. Cous* (S. Wats.) M. E. Jones. Corm globose or napiform, 1-2.5 cm. thick; stem scapiform, 5-15 cm. high; leaves ternate, then twice pinnately dissected; ultimate segments short, linear, entire or few-toothed; bractlets broadly oblanceolate, scarious-margined; fruit elliptic, scarious-puberulent, 6-8 mm. long, 3-4 mm. wide, with narrow wings. *P. Cous* S. Wats. Stony ridges: Ore.—Ida.—Wash. *Plain*—*Submont.* Ap—Je.

10. *C. montana* (Coult. & Rose) M. E. Jones. Corm napiform or fusiform, or plant sometimes with thickened roots; scape 1-3 dm. high; leaves usually ternate and then once or twice pinnate; leaflets short-oblong, crowded; bractlets obovate or oblanceolate, with white or purplish scarious margins; fruit elliptic, glabrous, 5-6 mm. long, 2-3 mm. wide; wings about half as broad as the body. *Lomatium montanum* Coult. & Rose. *L. purpureum* A. Nels. Hillsides: Ore.—Wyo.—N.D. *Submont.*—*Mont.* My—Je.

11. *C. concinna* Osterhout. Perennial, from a fleshy root; stem 2-3 dm. high, much branched near the ground; leaves sheathing at the base, 1 dm. long, ovate in outline, glabrous, twice pinnately divided into linear-oblong divisions; peduncles 1-2 dm. long, decumbent at the base; bractlets united, forming a single leaf, divided into oblong lobes; fruit oval, 7-8 mm. long; wings broad; oil-tubes 5-10 in the intervals, 8-15 on the commissure. Hills: Colo. *Submont.* My.

12. *C. orientalis* (Coult. & Rose) M. E. Jones. Perennial, with a thick taproot; stem often scapiform, 1-3 dm. high; leaves bipinnate; segments oblong or lanceolate, pinnately cleft into short oblong divisions, grayish-pilose with short hairs; bractlets lanceolate, distinct, scarious-margined; fruit glabrous, oval, 5 mm. long, 4 mm. wide; wings not as broad as the body. *P. nudicaule* Nutt. in part. *Lomatium orientale* Coult. & Rose. Dry plains: Minn.—Kans.—N.M.—Ariz.—Mont. *Plain*—*Submont.* Ap—Je.

13. *C. nevadensis* (S. Wats.) M. E. Jones. Perennial, with a fusiform root; stem short, 1-4 dm. high, puberulent; leaves twice or thrice pinnatifid, grayish-pilose, with small oblong divisions; bractlets linear-lanceolate, usually distinct; fruit oval or ovate, somewhat pubescent, 6-10 mm. long, 4-8 mm. wide; wings almost as broad as the body. *P. nevadense* S. Wats. Mountains: Ore.—Utah—Ariz.—Calif. *Son.*—*Submont.* Ap—My.

14. *C. macrocarpa* (Nutt.) M. E. Jones. Perennial, with an elongate fusiform root; stem 1-6 dm. high, more or less pubescent, branched at the base; leaves three or four times pinnately (or the first division ternately) dissected into short linear or oblong divisions, more or less pubescent; bractlets somewhat foliaceous, lanceolate or linear, often united and unilateral; calyx-teeth evident; fruit elliptic, glabrous, 1-2 cm. long, 5-7 mm. wide; wings nearly as broad as the body. *P. macrocarpum* Nutt. Hills and plains: Sask.—Colo.—Calif.—B.C. *Plain*—*Submont.* Ap—Je.

15. *C. villosa* (Raf.) Schultes. Perennial, with a fusiform root; leaves finely dissected, first ternate, then several times pinnate, villous; segments numerous, linear, crowded; bractlets conspicuous, lanceolate, more or less united, very tomentose; pedicels 2-6 mm. long; fruit oval, puberulent or pilose, 5-8 mm. long, 4-5 mm. wide. *L. villosum* Raf. Dry plains and hills: Sask.—w Kans.—Wyo.—Alta. *Plain*—*Submont.* My—Je.

16. *C. Jonesii* (Coul. & Rose) M. E. Jones. Perennial, with a fusiform root, acaulescent; scape 1-2 dm. high; leaves ternate and then repeatedly pinnate, villous, with very small crowded, oblong segments; bractlets linear, distinct, villous; pedicels 3-12 mm.; flowers yellow or tinged with purple; fruit oval, pubescent, 8 mm. long, 6-7 mm. wide. *L. Jonesii* Coul. & Rose. Dry plains and cañons: Alta.—Utah—Ida. *Plain—Submont.* Ap—My.

17. *C. MacDougalii* (Coul. & Rose) M. E. Jones. Perennial, with a fusiform root, acaulescent; scape 1-2 dm. high; leaves first ternate, then several times pinnate, with numerous very small linear segments, densely pilose, with short hairs; bractlets linear, distinct or nearly so, hirsute; fruit elliptic, somewhat pubescent, 6-7 mm. long, 4 mm. wide. *L. MacDougalii* Coul. & Rose. Dry places: Ariz.—Utah—Nev. *Son.* Mr—My.

18. *C. Grayi* Coul. & Rose. Perennial, with a fusiform root, glabrous throughout; scapes 1-4 dm. high; leaves ternate, then repeatedly pinnate; segments very numerous, linear-filiform; bractlets linear-subulate, distinct; flowers yellow; fruit oval, 10-16 mm. long, 7-9 mm. wide; wings nearly as broad as the body. *Peucedanum millefolium* S. Wats., not Sonder. *P. Grayi* Coul. & Rose. Plains and hills: Wyo.—Colo.—Utah—Ore.—Wash. *Plain—Submont.* Mr—My.

19. *C. lapidosa* (M. E. Jones) Rydb. Perennial, with a fusiform deep-seated root; stem barely rising above ground, bearing a crown of leaves and peduncles; leaves 5-10 cm. long, bipinnate, with crowded obovate cleft divisions; bracts and bractlets several, linear; fruit oblong, glabrous, 6-7 mm. long, 2-2.5 mm. broad; lateral wings half as broad as the body; dorsal ribs prominent, but not winged; calyx-teeth evident; stylopodium depressed. *Peucedanum* and *Cymopterus lapidosus* M. E. Jones. Among rocks: Utah—Wyo. My—Je.

20. *C. Donnellii* (Coul. & Rose) M. E. Jones. Perennial, with a fusiform root; stem 1.5-3 dm. high, glabrous; leaves ternate and then twice or thrice pinnatifid; ultimate lobes linear or oblong, glabrous; bractlets linear, acuminate; fruit oval, glabrous, 7-8 mm. long, 4-6 mm. wide; wings less than half as wide as the body. *P. Donnellii* Coul. & Rose. Dry valleys and sage-brush flats: Ore.—Ida. *Son.* My—Je.

21. *C. Sandbergii* (Coul. & Rose) M. E. Jones. Perennial, with an elongate taproot; stem 1-3 dm. high, rough-puberulent; leaves ternate and then repeatedly pinnately dissected into short linear divisions, more or less puberulent; sheaths much enlarged and with conspicuous white scarios margins; bractlets distinct, linear-lanceolate; flowers bright yellow; fruit oval, puberulent, 4-5 mm. long, 3 mm. wide; wings narrow. *P. Sandbergii* Coul. & Rose. Mountains: Alta.—Mont.—Ida.—B.C. *Plain—Submont.* Je—Au.

22. *C. juniperina* M. E. Jones. Perennial, with a fusiform root; stems more or less purplish, ashly puberulent, 1-3 dm. high; leaves ternate or biternate and then bipinnate; ultimate segments linear to lanceolate, 2-5 mm. long; sheath enlarged; bractlets several, lanceolate to filiform-subulate; flowers yellow; fruit elliptic, 6-8 mm. long, 4 mm. wide; wings narrower than the body. *P. juniperinum* M. E. Jones. Among junipers on hills: Utah—Wyo. *Son.* My—Je.

23. *C. simplex* (S. Wats.) Rydb. Perennial, with an elongate taproot; stem stout, 2-5 dm. high, puberulent; leaves ternate or biternate; leaflets linear-lanceolate, 5-10 cm. long, puberulent beneath; fruit broadly elliptic to nearly orbicular, 6-12 mm. long, 4-10 mm. wide. *P. simplex* Nutt. *Lomatium platycarpum* (Torr.) Coul. & Rose. *Cogswellia platycarpa* M. E. Jones. *C. allensis* M. E. Jones, a form with narrow leaf-segments. Mountains and hillsides: Alta.—Colo.—Utah—Ore.—Wash. *Submont.* My—Je.

24. *C. leptophylla* (Hook.) Rydb. Perennial, with taproot; stems more or less puberulent, 3-4 dm. high; leaves usually twice ternate; leaflets linear, sometimes almost filiform, 2-7 cm. long, 1-4 mm. wide, puberulent; fruit puberulent, 6-7 mm. long, 3.5-4.5 mm. wide. *P. triternatum leptophyllum* Hook. Hills and mountains: Mont.—Ida. *Submont.* Ap—Je.

25. *C. triternata* (Pursh) M. E. Jones. Perennial, with an elongate taproot; stem 3-7 dm. high, puberulent; leaves biternate or triternate; leaflets linear

to linear-lanceolate, 5–10 cm. long; pedicels 2–4 mm. long; fruit narrowly oblong; glabrous, 6–12 mm. long, 3–4 mm. wide. *P. triternatum* (Pursh) Nutt. Hillsides: Calif.—Wyo.—Alta.—B.C. *Submont.* My-Je.

26. *C. robustior* Coult. & Rose. Perennial, with a taproot; stem 3–6 dm. high; leaves puberulent below, three to four times ternate, with linear-lanceolate to oblong divisions, 1–3 cm. long; fruit oblong, 12–14 mm. long, 5 mm. wide. *P. triternatum macrocarpum* Coult. & Rose. *P. triternatum robustius* Coult. & Rose. Valleys: Ore.—Ida.—Wash. *Son.—Submont.* Ap-Je.

27. *C. anomala* M. E. Jones. Perennial, with a large taproot; stem 3–5 dm. high, stout, somewhat puberulent; leaves ternate, then bipinnate; leaflets linear-oblong or oblanceolate, mostly obtuse, 1–7 cm. long; bractlets linear or setaceous; fruit elliptic, 10–12 mm. long, 4–5 mm. broad; wings not half as broad as the body. *Lomatium anomalum* M. E. Jones. Hillsides and slopes: Ida.—Ore. *Submont.* My-Je.

28. *C. nudicaulis* (Pursh) M. E. Jones. Perennial, with a long fleshy taproot; stem 3–6 dm. high, glabrous; leaves biternate, ternately quinately, or sometimes ternate; leaflets thickish, ovate or lanceolate, 2.5–5 cm. long, entire or toothed at the apex; bractlets none; fruit narrowly elliptic, 9–14 mm. long, 3–6 mm. wide, narrowly winged. Gravelly soil: Calif.—Ida.—B.C. *Son.—Submont.* My-Je.

29. *C. platyphylla* Coult. & Rose. Perennial, with a taproot; stem 2–4 dm. high; leaves once or twice ternate; leaflets ovate, orbicular or obovate, entire or toothed at the apex; bractlets none; fruit 8–12 mm. long, 5–6 mm. wide; wings narrow. *P. latifolium* Nutt. *P. Nuttallii* S. Wats. *Lomatium platyphyllum* Coult. & Rose. Dry plains: Ore.—Nev.—Ida.—Wash. *Son.—Submont.* Ap-Je.

33. LEPTOTAËNIA Nutt. WILD PARSNIP.

Tall, stout, acaulescent perennials, with thick fusiform roots. Leaves large, pinnately decomposed. Flowers yellow or purplish, in large umbels. Bracts few or none; bractlets numerous, small. Calyx-teeth obsolete or minute. Fruit strongly flattened dorsally, oblong or elliptic, glabrous. Stylopodium wanting. Dorsal and intermediate ribs filiform or obscure, the lateral ones with thick and corky wings. Oil-tubes 3–6 in the intervals, 4–6 on the commissural side, mostly small, sometimes obsolete. Seeds very flat; face plane or slightly concave.

Flowers yellow or salmon-colored.

Foliage puberulent; dorsal ribs faint; flowers yellow.

Fruit sessile or nearly so; staminate flowers with long pedicels. 1. *L. foliosa*.

Fruit with pedicels longer than those of the staminate flowers.

Fruit 8–12 mm. long, usually without oil-tubes; leaves finely dissected into linear divisions. 2. *L. multifida*.

Fruit 14–18 mm. long, with oil-tubes; leaves less dissected into oblong divisions. 3. *L. Eatonii*.

Foliage glabrous; dorsal ribs strong.

Fruit broadly oblong, 5–6 mm. broad.

Fruit narrowly oblong, 4 mm. broad.

Flowers purple.

4. *L. salmoniflora*.

5. *L. filicina*.

6. *L. purpurea*.

1. *L. foliosa* (Hook.) Coult. & Rose. Stem about 6 dm. high; leaves twice or thrice ternately compound, then twice or thrice pinnatifid, with linear lobes, slightly puberulent; bracts several, linear; bractlets few, linear; fruit almost sessile; staminate flowers on slender pedicels. Hillsides: Ida. *Submont.* My-Je.

2. *L. multifida* Nutt. Stem 3–10 dm. high; leaves twice or thrice ternate, then three or four times pinnatifid into linear divisions, more or less puberulent; involucre usually none; bractlets few, linear-filiform; fruit 8–12 mm. long; dorsal ribs almost obsolete. Rich soil in the mountains: Alta.—Colo.—Calif.—B.C. *Submont.—Mont.* My-Jl.

3. *L. Eatonii* Coult. & Rose. Stem 3–10 dm. high; leaves twice ternate, then once or twice pinnate; leaflets ovate, cleft and lobed, with oblong or lance-oblong divisions; bracts few, linear-subulate, or none; fruit 14–18 mm. long, 7–10 mm. wide, often with 4–6 small oil-tubes in the intervals. Hills and mountains in rich soil: Wyo.—Colo.—Nev.—Ida. *Submont.—Mont.* Je-Jl.

4. *L. salmoniflora* Coult. & Rose. Stem 3-5 dm. high, glabrous; leaves large, biternate, then twice or thrice pinnately decomposed, with short linear-filiform segments, glabrous; bracts none; bractlets filiform; flowers salmon-colored; fruit oblong, 10 mm. long; dorsal ribs strong but low; oil-tubes solitary in the intervals. Basaltic rocks: Ida.—Wash. *Submont.* Ap-My.

5. *L. filicina* M. E. Jones. Stem about 1 m. high, glabrous; leaves with inflated petioles, ternate, then pinnately decomposed into filiform short divisions; bractlets few, inconspicuous; fruit 12-15 mm. long, 4 mm. wide; lateral wings very narrow; oil-tubes solitary in the intervals, 2-4 on the commissural side; seed-face nearly flat. Mountains: Ida. *Submont.* Jl.

6. *L. purpurea* (S. Wats.) Coult. & Rose. Stem about 3 dm. high; leaves twice or thrice ternately dissected into linear or filiform divisions, perfectly glabrous; involucre usually none; bractlets several, linear, acuminate; fruit 18-24 mm. long, as long as the pedicels; lateral ribs very corky; oil-tubes 3 in the intervals, 4 on the commissure; dorsal ribs evident. Rich soil: Ore.—Alta.—B.C. *Submont.* My-Je.

34. *CYNOMARÁTHRUM* (Nutt.) Coult. & Rose.

Acaulescent perennial, with multicapital caudices densely covered by old leaf-sheaths. Leaves narrow in outline, pinnately dissected, with very narrow divisions. Flowers yellow or perhaps sometimes white. Calyx-teeth evident. Stylopodium evident, flat, apparently somewhat spongy. Fruit strongly flattened dorsally, oblong. Dorsal and intermediate ribs sharp or more or less winged, the lateral ones broadly winged. Oil-tubes mostly several in each interval, or obscure. Seed-face plane.

Leaves glabrous.

Leaves bipinnate.

Leaf-segments linear.

Pedicels in fruit 1-6 mm. long.

Divisions of the leaves elongate-linear, 1-5 cm. long; bractlets 5-10 mm. long.

1. *C. Nuttallii*.

Divisions of the leaves less than 1 cm. long; bractlets 3-4 mm. long.

2. *C. megarrhizum*.

Pedicels in fruit 8-16 mm. long; divisions of the leaves short, usually less than 5 mm. long.

3. *C. Parryi*.

Leaf-segments lanceolate.

4. *C. latilobum*.

Leaves biternate.

5. *C. brecciarum*.

Leaves scabrous.

Pedicels 12-18 mm. long; wings of the fruit about as broad as the body.

6. *C. Eastwoodae*.

Pedicels 2-6 mm. long; wings of the fruit half as broad as the body.

7. *C. scabrum*.

1. *C. Nuttallii* (A. Gray) Coult. & Rose. Scape 2-5 dm. high; leaves pinnate or bipinnate; leaflets cuspidate, 1-5 cm. long, ascending; bractlets lanceolate, often more or less united below; petals yellow; pedicels in fruit 2-6 mm. long; fruit elliptic, 8-10 mm. long, 4 mm. wide, narrowly winged. *Peucedanum graveolens* S. Wats. *P. Kingii* S. Wats. Dry hills: w Neb.—Wyo.—Utah. *Plain*—Mont. My-Jl.

2. *C. megarrhizum* A. Nels. Scape 1.5-3 dm. high; leaves pinnate or bipinnate; leaflets few; ultimate segments linear or oblong, cuspidate, 5-10 mm. long; petals pale yellow; fruit elliptic, 6-8 mm. long, 3-4 mm. broad; wings scarcely half as broad as the body. *P. megarrhizum* A. Nels. Dry hills: Wyo. *Submont.* Je.

3. *C. Parryi* (S. Wats.) Coult. & Rose. Scape 2-3 dm. high, glabrous; leaves twice pinnate, 1-3 dm. long; leaflets linear, cuspidate, more or less arcuate-spreading, 4-8 mm. long; bractlets green, linear and entire or some oblanceolate and toothed at the apex; fruit oblong, 10-12 mm. long; lateral wings about half as broad as the body. *P. Parryi* S. Wats. Rocky ledges: s Utah—Nev.—Calif. *Son.* Ap-My.

4. *C. latilobum* Rydb. Scape 1-1.5 dm. long, stout; leaves about 1 cm. long, pinnate, glabrous; leaflets entire or 2- or 3-cleft into broadly lanceolate, reticulate, pointed segments, 5-15 mm. long, thick; rays 1-2 cm. long; bractlets

linear or lance-linear, 5-6 mm. long; flowers apparently straw-colored or ochroleucous; fruit about 9 mm. long, 6 mm. wide; lateral wings about as broad as the body; oil-tubes 2-4 in the intervals, 4-6 on the commissure, rather obscure. Cañons: Utah. *Son.* JI.

5. *C. brecciarum* (M. E. Jones) Rydb. Leaves biternate; leaflets 2.5 cm. long, tapering at both ends, narrowly linear, glabrous; rays few and unequal; bracts none; involuclers setaceous; pedicels 4-5 mm. long; flowers greenish yellow, turning purplish; fruit over 1 cm. long, with narrow and thick lateral wings; dorsal ribs sharp, raised; oil-tubes 2 in the intervals. *Cogswellia brecciarum* M. E. Jones. High mountains: Mont. *Mont.* Au.

6. *C. Eastwoodae* Coult. & Rose. Leaves very narrow in outline, once or twice pinnate, very scabrous; segments short and narrow, cuspidate; pedicels 12-18 mm. long; bractlets several, linear, entire; fruit glabrous, 8-10 mm. long; wings nearly as broad as the body. Hills and plains: Colo. *Submont.* My-Je.

7. *C. scabrum* Coult. & Rose. Scape 1-2 dm. high, scabrous throughout; leaves very scabrous, narrowly lanceolate in outline, bipinnate; ultimate divisions short, ovate, cuspidate; bractlets setaceous, somewhat scarious and united at the base; pedicels 2-6 mm. long; flowers yellow; fruit oval, glabrous, 7-9 mm. long, 4-6 mm. wide; wings half as broad as the body. Dry hills: Utah. *Son.*—*Submont.* Ap-Je.

35. ANGÉLICA L. ANGELICA.

Stout perennials, with a woody root. Leaves ternate-pinnately or pinnately compound, usually with broad segments. Flowers white, or rarely greenish yellow or purplish, in large umbels. Bracts scanty or none, in one species foliaceous; bractlets small or wanting. Calyx-teeth mostly wanting. Stylopodium conic. Fruit flattened dorsally, ovate or oblong, glabrous or pubescent, with a prominent crenulate disk. Dorsal and intermediate ribs strong, the lateral ones broadly winged; wings distinct from those of the other carpel. Oil-tubes one to several in each interval, or indefinite, 2-10 on the commissural side. Seed-face plane or slightly concave.

Oil-tubes mostly solitary in the intervals, not continuous around the seed; rays of the umbels ascending.

Involucre and involuclers of several foliaceous, lacerately toothed bracts.

1. *A. Dawsoni*.

Involucre none or consisting of 1-2 small bracts.

Involuclers of many bractlets.

Bractlets lanceolate, acuminate.

2. *A. Grayi*.

Bractlets linear-filiform.

3. *A. genuiflexa*.

Involuclers none, or of a few linear-subulate or filiform bractlets.

Plant glabrous up to the inflorescence.

Fruit glabrous or nearly so.

Fruit 3-3.5 mm. long; oil-tubes solitary in the interval, except in the lateral ones, where they are usually in pairs.

4. *A. leporina*.

Fruit over 5 mm. long; oil-tubes solitary in all the intervals.

Leaves once pinnate, or the lower primary divisions short-petioled and again pinnate.

5. *A. pinnata*.

Leaves ternate and then pinnate, the lower primary divisions long-petioled.

Divisions of the leaves and their teeth lanceolate, acuminate.

6. *A. arguta*.

Divisions of the leaves and their teeth ovate, acute or obtuse.

Teeth of the leaves acute; plant perfectly glabrous.

7. *A. Lyallii*.

Teeth of the leaves obtuse, with a callous mucro; leaves slightly pubescent on the sheaths, leaf-stalks, and veins beneath.

8. *A. Piperi*.

Fruit hispid; leaves twice compound.

Rays numerous; leaflets broadly ovate or obovate; pedicels longer than the fruit.

9. *A. dilatata*.

Rays few; leaflets lanceolate or linear-lanceolate; pedicels and fruit subequal.

10. *A. Kingii*.

Plant more or less scabrous or pubescent, at least on the sheath, leaf-stalks, and veins beneath.

Fruit glabrous; leaves sparingly short-hispid on the sheaths, petioles, and veins.

8. *A. Piperi*.

Fruit hispid or rough-puberulent; leaves rough-pubescent.

Oil-tubes solitary in the intervals; pedicels and fruit rough-puberulent.

11. *A. Roseana*.

Oil-tubes in pairs in the lateral intervals; pedicels and fruit hispid.

Oil-tubes many, continuous around the seeds; rays of the umbels widely spreading.

12. *A. Wheeleri*.

13. *A. ampla*.

1. **A. Dawsoni** S. Wats. Stem 3-9 dm. high, slender, glabrous; leaves twice or thrice ternate; leaflets lanceolate, 2-5 cm. long, sharply and finely serrate, yellowish green, acute or acuminate; umbels solitary; bracts and bractlets foliaceous, oblanceolate, lacerate-toothed; flowers greenish ochroleucous; fruit glabrous, 5 mm. long; stylopodium minute. River banks and rocky places: Alta.—Mont.—Ida.—B.C. *Mont.* Jl—Au.

2. **A. Grayi** Coult. & Rose. Stem stout, 2-6 dm. high, glabrous up to the inflorescence; leaves once or twice ternate, but with the middle division larger, then pinnate; leaflets oblong or ovate, 2-3 cm. long, acute, serrate; bractlets about 1 cm. long, longer than the pedicels; fruit oblong, glabrous, 4-5 mm. long; wings prominent and rather thick. *Scelinum Grayi* Coult. & Rose. Mountains: Colo.—s Wyo. *Mont.—Alp.* Jl—Au.

3. **A. genuiflexa** Nutt. Stem glabrous up to the puberulent peduncles, 6-12 dm. high; leaves twice ternate, the lateral divisions often deflexed; leaflets ovate or broadly lanceolate, acuminate, irregularly and sharply serrate; fruit 3-4 mm. long; dorsal wings low; lateral wings broader than the body; stylopodium conic. Wet places: Ore.—B.C.—Alaska. *Submont.* Jl—S.

4. **A. leporina** S. Wats. Stem glabrous, 3-9 dm. high; leaves bipinnate; leaflets linear to lanceolate, long-acuminate, distantly serrate, 3-8 cm. long; fruit glabrous, about 3 mm. long; wings rather prominent, the lateral ones narrower than the body. Wet places: Utah. *Son.—Submont.* Jl—Au.

5. **A. pinnata** S. Wats. Stem glabrous, 6-10 dm. high; leaves simply pinnate, or the lower pairs sometimes again pinnate; leaflets lanceolate, sharply serrate, 3-15 cm. long; flowers yellowish or purplish; fruit oblong, glabrous, 4-6 mm. long; wings thick and prominent, the lateral ones scarcely as wide as the body; stylopodium slightly conic. Wet meadows: Alta.—N.M.—Utah. *Plain—Mont.* Jl—Au.

6. **A. arguta** Nutt. Stem glabrous up to the inflorescence, 5-10 dm. high; leaves ternate and then pinnate or bipinnate; leaflets mostly small, ovate or lanceolate, 2-5 cm. long, acute, sharply serrate; fruit elliptic, glabrous, 6-8 mm. long; dorsal wings low and thick; lateral wings fully as broad as the body, more or less corky. Wet places: Ore.—Ida.—Mont.—Wash. *Submont.* Jl—Au.

7. **A. Lyallii** S. Wats. Stem stout, 6-15 dm. high; leaves ternate and then twice pinnate; leaflets ovate to lanceolate, acute, serrate, with ovate teeth; fruit oblong, glabrous, 4-6 mm. long; dorsal wings low and thick; lateral wings as broad or broader than the body. Wet meadows: Alta.—Wyo.—Utah—Ore.—B.C. *Submont.—Mont.* Jl—Au.

8. **A. Piperi** Rydb. Stem about 1 m. high, stout, glabrous or nearly so; leaves ternate and then twice pinnate; leaflets ovate, 5-15 cm. long, coarsely toothed, with rounded-ovate teeth; rays 10-25, mostly scabrous-puberulent, 2-6 cm. long; bractlets 1 or 2, subulate; fruit elliptic, 5-6 mm. long; dorsal wings low and thick; lateral wings about as broad as the body. Wet woods: Wash.—Ida. *Submont.—Mont.* Je—Au.

9. **A. dilatata** A. Nels. Stem 5-15 dm. high; lower leaves ternate, then pinnate; the upper simply pinnate; leaflets broadly obovate or ovate, obscurely or irregularly serrate; umbels 10-30-rayed; fruit sparingly scabrous, oblong-elliptic, 5 mm. long or less. Along streams: Utah. Jl—Au.

10. **A. Kingii** (S. Wats.) Coult. & Rose. Stem glabrous up to the inflorescence, 3-6 dm. high; lower leaves bipinnate, the upper ones simply pinnate; leaflets lanceolate to linear-lanceolate, 3-7 cm. long, coarsely and unevenly serrate; fruit broadly oval, hispid, 4-6 mm. long; wings thick and rather low; stylopodium low-conic. Wet meadows: Calif.—Ida.—Nev. *Son.* Jl—Au.

11. **A. Roseana** Henderson. Stem low and stout, 3-6 dm. high, glabrous up to the scabrous inflorescence; leaves twice or thrice ternate, then pinnate;

leaflets broadly ovate to lanceolate, thick, with prominent veins, sharply serrate, with salient mucronate or cuspidate teeth, 2-4 cm. long, obtuse or acute; flowers greenish or tinged with purple; fruit broadly elliptic, more or less scabrous, 4-5 mm. long; dorsal ribs nearly as prominent as the lateral ones. Mountains: Mont.—Wyo.—Utah—Ida. *Submont.—Mont.* Jl—Au.

12. A. Wheeleri S. Wats. Stem tall and stout, puberulent; leaves biternate; leaflets ovate-oblong, 5-7 cm. long, acute, incisely serrate, with broad, mucronulate teeth; pedicels hispid; fruit broadly elliptic, 6 mm. long, somewhat pubescent; dorsal ribs thick, narrower than the thick lateral ones. Wet places: Utah. *Son.*

13. A. ampla A. Nels. Stem stout, 1.5-2.5 m. high, glabrous, purplish; leaves ternate, then twice pinnate; leaflets ovate or obovate, short-acuminate, serrate or toothed, 5-20 cm. long; bractlets setaceous; fruit broadly oblong, glabrous, 5-7 mm. long; dorsal ribs sharp, hardly winged; lateral wings narrow and thin. Wet meadows and stream banks: Wyo.—Colo. Jl—S.

36. PASTINÀCA L. PARSNIP.

Stout caulescent biennial, with thick taproot. Leaves pinnately compound, with broad leaflets. Flowers yellow in large umbels. Calyx-teeth obsolete. Stylopodium flat. Dorsal and intermediate ribs slender, the lateral ones strongly winged. Fruit oval or elliptic, glabrous. Seed-face plane.

1. P. sativa L. Biennial, with a fusiform root; stem 6-15 dm. high; leaves pinnate; leaflets ovate or oval, sessile, 2-12 cm. long, lobed and incised or dentate; fruit broadly oval, 5-7 mm. long, 4-6 mm. broad, glabrous. Roadsides and waste places: Vt.—Fla.—Calif.—B.C.; escaped from cultivation; native of Eu.

37. HERACLËUM L. COW PARSNIP, COW CABBAGE.

Tall stout leafy-stemmed perennials. Leaves ternately compound, with large, broad leaflets. Flowers white, in large umbels. Bracts deciduous; bractlets numerous. Calyx-teeth small or obsolete. Stylopodium thick, conic. Fruit broadly obovate, strongly flattened dorsally, pubescent. Dorsal and intermediate ribs filiform; lateral ribs with broad wings, contiguous to those of the other carpel, strongly nerved towards the outer margin. Oil-tubes solitary in the intervals, conspicuous, about half as long as the carpels, 2-4 on the commissural side. Seeds very strongly flattened; face plane.

1. H. lanatum Michx. Tall perennial; stem stout, 1-2.5 m. high, villous, especially above; leaves ternate; sheaths much dilated; leaflets stalked, round-cordate, 1-3 dm. broad, palmately cleft and incised; bracts and bractlets subulate; fruit orbiculate, about 1 cm. long, somewhat pubescent. Wet ground: Vt.—N.C.—Calif.—Alaska. *Plain.—Mont.* Je—Au.

38. SPHENOSCIÀDIUM A. Gray.

Thick-rooted perennials, with stout stems, glabrous up to the inflorescence. Leaves once or twice pinnate, with much dilated petioles. Flowers white or sometimes purplish, in umbellate heads. Calyx-teeth obsolete. Stylopodium small, at first flat, becoming conic. Fruit flattened dorsally, cuneate-obovate, hirsute. Carpels strongly flattened, strongly ribbed below, winged above; the dorsal and intermediate wings narrow, the lateral ones broader. Oil-tubes solitary in the intervals, 2 on the commissural side. Seed-face plane.

1. S. capitellatum A. Gray. Perennial, with a short caudex and thick root; stem stout, 3-15 dm. high; leaves twice pinnate, glabrous; leaflets lanceolate to oblong or nearly linear, serrate to laciniate, or of the lower leaves entire; inflorescence white-villous; branches 4-15, 2.5-5 cm. long; fruit cuneate-obovoid, about 5 mm. long. Wet meadows: Ore.—Ida.—Calif. *Son.* Jl—Au.

39. CONIOSELÏNUM Fisch. HEMLOCK-PARSLEY.

Glabrous perennials, with a thick root. Leaves ternate, and then pinnately decomposed, with toothed leaflets. Flowers white, in large umbels. Bracts

more or less conspicuous, or wanting; bractlets numerous, elongate, narrow. Calyx-teeth obsolete. Stylopodium slightly conic. Fruit oblong, dorsally flattened, glabrous. Dorsal and intermediate ribs prominent, sometimes narrowly winged, the lateral ones broadly winged and thick. Oil-tubes usually solitary in the dorsal intervals, 1-several in the lateral ones, and 2-8 on the commissural side. Seed-face plane or slightly concave.

Fruit fully 6 mm. long; oil-tubes 1 or 2 in each interval.
Fruit about 5 mm. long; oil-tubes 2-5 in each interval.

1. *C. scopulorum*.
2. *C. coloradense*.

1. ***C. scopulorum*** (A. Gray) Coult. & Rose. Stem 6-10 dm. high, glabrous; leaves twice or thrice ternate and then once or twice pinnate; leaflets ovate, pinnately cleft into oblong divisions; bractlets several, linear, elongate; fruit elliptic or oval, about 6 mm. long. Mountain woods: Colo.—N.M.—Ariz.—Ore. *Mont.*—*Subalp.* Jl—Au.

2. ***C. coloradense*** Osterhout. Stem 5-6 dm. high; lower leaves biternate and the upper ternate, then pinnate; segments narrowly ovate, cleft; bracts and bractlets few, subulate, scarious; fruit broadly oval, 5 mm. long. Mountain woods: Colo.—Wyo. *Mont.*—*Subalp.* Jl—Au.

40. OXYPOLIS Raf.

Smooth, erect, swamp plants, with fascicled tubers. Leaves simply pinnate, or ternate, or reduced to phyllodia. Flowers white. Bract few or none; bractlets numerous, small, or wanting. Calyx-teeth evident. Stylopodium short, thick, conic. Fruit flattened laterally, ovate to obovate, glabrous. Dorsal and intermediate ribs filiform; wings of the lateral ribs closely continuous to those of the other carpel. Oil-tubes solitary in the intervals, 2-6 on the commissural side. Seed-face plane. [*Tiedemannia* DC.]

1. ***O. Fendleri*** (A. Gray) Heller. Stem simple, 3-6 dm. high; leaves pinnate; leaflets 5-9, ovate or oblong, or those of the upper leaves linear-lanceolate, 3-5 cm. long, coarsely serrate; bracts and bractlets none; fruit ovoid, scarcely 4 mm. long; wings thick, about half as broad as the body. *T. Fendleri* A. Gray. Wet creek-banks in the mountains: Wyo.—N.M. *Mont.*—*Subalp.* Je—Au.

FAMILY 94. ARALIACEAE. GINSENG FAMILY.

Aromatic herbs, shrubs, or trees. Leaves alternate or whorled, simple or compound. Flowers inconspicuous, variously disposed, the ultimate divisions of the inflorescence usually umbellate, perfect or polygamous, regular. Sepals 5, often minute. Petals 5 or 10, valvate, or imbricate, inserted in the margin of an epigynous disk. Stamens 5 or 10, alternate with the petals; filaments short, distinct; anthers introrse. Gynoecium of 2-5 united carpels; ovary 2-5-celled; styles usually as many; stigmas simple. Ovules solitary in each cavity, anatropous. Fruit a berry or a drupe. Endosperm copious, fleshy. Embryo straight.

Petals imbricate; drupe 5-celled; leaves pinnately or ternately compound; ours unarmed herbs.

Petals valvate in the buds; drupe 2- or 3-celled; leaves simple, palmately lobed; prickly shrubs.

1. ARALIA.
2. ECHINOPANAX.

1. ARALIA (Tourn.) L. SARSAPARILLA, SPIKENARD, WILD GINSENG.

Perennial herbs (ours), or shrubs or trees. Leaves alternate, petioled, pinnately or ternately compound, with toothed leaflets. Flowers perfect or polygamous, in racemose or paniculate umbels, or in compound umbels. Sepals 5, often obsolete. Petals 5, imbricate, with obtuse or inflexed tips. Stamens 5; filaments incurved. Ovary 5-celled; styles 5, spreading. Drupe 5-lobed, 5-celled, black, fleshy. Seeds flattened.

1. ***A. nudicaulis*** L. Acaulescent perennial herb, with a long rootstock; leaves ternate, long-petioled; primary divisions pinnately 3-5-foliate; leaflets

oval or ovate, acuminate, finely serrate, 5-13 cm. long; peduncles 2-3 dm. long; flowers greenish; fruit globose, purplish black. Woods: Newf.—N.C.—Colo.—Ida.—B.C. *Submont.*—Mont. My.—Je.

2. ECHINOPANAX Dec. & Planch. DEVIL'S CLUB, DEVIL'S WALKING-STICK.

Prickly shrubs. Leaves simple, palmately lobed. Flowers in paniculate umbels. Calyx-teeth obsolete. Petals 5, greenish, valvate in the buds. Stamens 5; filaments filiform; anthers oblong. Ovary 2-celled, rarely 3-celled. Styles usually 2, filiform. Fruit laterally flattened. [*Fatsia* Benth. & Hook., in part, not Dec. & Planch.]

1. E. horridum (J. E. Smith) Dec. & Planch. A shrub, 1-4 m. high, densely prickly, leafy above; leaf-blades nearly orbicular in outline, 1.5-6 dm. broad, cordate at the base, palmately 3-7-lobed, with scattered prickles on both sides, sharply serrate; inflorescence terminal, 1-3 dm. long; fruit 4-5 mm. long, scarlet. *F. horrida* Benth. & Hook. Rocky woods: Mich.—Mont.—Ore.—Alaska. *Boreal*—Mont. Je.

FAMILY 95. **CORNACEAE.** DOGWOOD FAMILY.

Shrubs or trees, rarely perennial herbs. Leaves alternate or opposite, without stipules, often firm, usually entire. Flowers perfect or unisexual, in cymes or heads, or the staminate ones in ament-like spikes. Sepals 4 or 5. Petals 4 or 5, or rarely numerous, imbricate or valvate, inserted at the base of the epigynous disk, or wanting. Stamens as many as the petals; anthers attached at the base or the back. Gynoecium of 1-4 united carpels; styles united; stigmas entire, lobed, or cleft. Ovules usually solitary in each cavity, anatropous, pendulous. Fruit a drupe; stone 1-4-celled. Endocarp fleshy.

Flowers dioecious; stigmas lateral; staminate flowers in ament-like spikes.

1. GARRYA.

Flowers perfect, cymose or umbellate; stigmas terminal.

Flowers in open cymes, not subtended by an involucre; shrubs.

2. SVIDA.

Flowers in head-like umbels, subtended by an involucre of 4 white leaves; herbs with rootstocks.

3. CHAMAEPERICLIENUM.

1. GARRYA A. Gray.

Shrubs, with 4-angled branches. Leaves opposite, persistent, entire or slightly lobed. Flower dioecious; the staminate ones in ament-like spikes, with 4 narrow sepals, no petals, 4 stamens, and a rudimentary pistil. Pistillate flowers with 2 sepals, and 1-celled ovary, 2 stigmas, and 2 pendulous ovules. Fruit drupaceous, with persistent styles. Seeds 3, rarely 1, flattened.

1. G. flavescens S. Wats. Shrub 1-3 m. high, branched from the base; bark gray or that of the young branches yellow; leaves short-petioled; blades obovate or oblanceolate, or oval, 3-5 cm. long, appressed-pubescent on both sides, becoming glabrate above, paler beneath; fruit 6-8 mm. long, densely grayish pubescent. Rocky hills and cañons: s Utah—Ariz.—Nev. *Son.* My.

2. SVIDA Opiz. CORNEL, DOGWOOD, KINNIKINNIK.

Shrubs or trees, with hard wood and mostly opposite branches. Leaves opposite or rarely alternate, entire. Flowers perfect in naked, open, dichotomous cymes. Sepals 4, usually small. Petals 4, valvate, white. Stamens 4; filaments filiform or subulate. Ovary 2-celled, or rarely 5-celled. Fruit drupaceous, with thin pulp; stone bony, usually 2-celled. Seeds flattened. [*Cornus* L., in part.]

Young branches and inflorescence villous.

Leaves broadly oval or ovate, the larger obtuse at the base, densely villous beneath; inflorescence long-villous; stone usually broader than long.

1. *S. pubescens*.

Leaves ovate or ovate-lanceolate, acute at the base, silky beneath or slightly villous on and near the veins; inflorescence short-villous; stone as long as broad or longer.

Young branches appressed-strigose or nearly glabrous.

2. *S. interior*.
3. *S. instolonea*.

1. ***S. pubescens*** (Nutt.) Standl. Shrub 2-4.5 m. high; branches smooth, purplish; leaves oval or ovate, usually somewhat acuminate, strigose above, villous beneath, 3-12 cm. long; sepals minute; fruit white; stone compressed, mostly oblique, 4 mm. high, 5 mm. broad, furrowed on the edge, the sides usually with ridges. *Cornus pubescens* Nutt. *C. occidentalis* Coville. Along streams and in wet places: Calif.—Ida.—B.C. *Submont.* My—Jl.

2. ***S. interior*** Rydb. A shrub, 2-5 m. high; bark of the old stems grayish; leaves elliptic or oval, acute at both ends, 5-9 cm. long, finely short-strigose on both sides and more or less villous on the veins and in their angles beneath; sepals minute; fruit white, about 5 mm. in diameter; stone elliptic, slightly oblique, longer than broad, nearly smooth. River banks: N.D.—Kans.—Colo.—Yukon. *Plain—Submont.* Je—Jl.

3. ***S. instolonea*** A. Nels. Shrubs, 2-5 m. high, not stoloniferous; bark of the old stems gray; young twigs brownish; leaves usually oval or elliptic, acute, thin, light green and less pale beneath than in the eastern *S. stolonifera*, lanceolate to oval, acute or short-acuminate, obtuse or acute at the base, strigose on both sides, 3-12 cm. long; fruit white; stone higher than broad, 5 mm. long, 3-3.5 mm. broad, smooth. *S. stolonifera riparia* Rydb. River banks: Man.—Kans.—N.M.—Calif.—Alaska. *Plain—Mont.* My—Jl.

3. CHAMAEPERICLIMENUM Aschers. & Graebn. BUNCHBERRY.

Low perennial herbs, with rootstocks. Leaves opposite, or the upper whorled, entire. Flowers perfect in close head-like clusters, subtended by 4 petal-like bracts. Sepals 4, tipped each with a short deciduous bristle. Petals 4, valvate. Stamens 4. Ovary 2-celled, sessile. Ovules solitary in each cell. Drupe globular, red; stone 2-celled. [*Cornella* Rydb.]

Flowers greenish; stone smooth, higher than broad.

1. *C. canadense*.

Flowers purple; stone ridged on each side, as broad as long.

2. *C. unalaschkense*.

1. ***C. canadense*** (L.) Aschers. & Graebn. Stem simple, 5-20 cm. high; leaves subsessile, mostly in an apparent whorl of 4-6 at the summit, oval, ovate, or obovate, acute at each end, 3-7 cm. long, and a pair of smaller ones at about the middle of the stem; bracts 4, white or cream-colored. *Cornus canadensis* L. *Cornella canadensis* Rydb. Woods: Lab.—N.J.—Minn.—N.M.—Calif.—Alaska. *Submont.—Mont.* My—Au.

2. ***C. unalaschkense*** (Ledeb.) Rydb. Stem 10-15 cm. high, simple, rarely branched; leaves usually subverticillate at the summit, with two smaller ones below, or sometimes in pairs, oval, ovate, or obovate, acute at each end; bracts 4, white, ovate, 8-18 mm. long; petals purple or at least purple-tipped; fruit 4-8 mm. in diameter, red. *Cornus unalaschkensis* Ledeb. *C. canadensis intermedia* Farr. Woods: Alaska—B.C. *Boreal—Mont.* My—Je.

FAMILY 96. PYROLACEAE. WINTERGREEN FAMILY.

Perennial, mostly evergreen herbs, with elongated rootstocks. Leaves basal or crowded on the short stem or at the end of the branches, thick and leathery, entire or toothed. Flowers perfect, often slightly irregular, in racemes or corymbs. Sepals 4-5, persistent. Petals 4-5, wax-like. Stamens twice as many as the petals; filaments usually subulate; anthers introrse, becoming inverted in anthesis, opening by pores or slits. Gynoeceum of 4 or 5 united carpels; ovary superior, 4- or 5-celled; styles united; stigma 5-lobed. Capsule loculicidal, valvate. Seeds minute, numerous.

Plants leafy-stemmed; flowers corymbose; style very short and ending in the peltate stigma; filaments dilated and hairy at the middle.

Plant scapose, with a basal rosette of leaves; flowers racemose or solitary; style evident; filaments subulate, naked.

1. CHIMAPHILA.

Flowers solitary; petals spreading; valves of the capsule not cobwebby on the margins.

2. *MONÈSES*.

Flowers racemose; petals more or less converging, concave; valves of the capsule cobwebby on the margins when opening.

Flowers without hypogynous disk; petals without tubercles.

Style exserted, deflexed, curved; stigma narrower than the style.

3. *PYROLA*.

Style short, straight; stigma thicker than the style, peltate.

4. *ERXLEBENIA*.

Flowers with a 10-lobed hypogynous disk; petals with a pair of tubercles at the base.

5. *RAMISCHIA*.

1. *CHIMÁPHILA* Pursh. PIPSISSEWA, PRINCE'S PINE.

Perennial herbs, with more or less caespitose, horizontal rootstock and short leafy stems. Leaves persistent, coriaceous, opposite or whorled, short-petioled and serrate. Flowers perfect, in terminal corymbs. Sepals 5, persistent. Corolla white or pink, wax-like; petals 5, broad, concave, sessile. Stamens 10; filaments very short; anthers incurved; sacs opening by pores at the ends of the basal ascending beaks. Ovary 5-celled; stigma orbicular, peltate, barely 5-crenate; style very short. Capsule 5-celled, the latter loculicidal from the top; valves not cobwebby on the margins; seeds many.

Leaves lanceolate to ovate, broadest below the middle, usually pale-mottled along the midveins; dilated portion of the filaments hairy.

1. *C. Menziesii*.

Leaves oblanceolate, broadest above the middle; dilated portion of the filaments hairy only along the margins.

2. *C. occidentalis*.

1. *C. Menziesii* Spreng. Stem about 1 dm. high; leaves 2-5 cm. long, serrulate, acute; peduncles 1-3-flowered, 3-6 cm. long; bracts ovate or rotund; sepals orbicular, crenulate; petals orbiculate, not ciliate; capsule globose, 6 mm. in diameter. Woods: B.C.—Ida.—Calif. Je—Jl.

2. *C. occidentalis* Rydb. Stems 1-2 dm. high, terete; leaves whorled; blades 3-10 cm. long, oblanceolate, acute, sharply serrate, dark green and shining above, pale beneath; peduncles 5-10 cm. long, corymbosely 4-7-flowered; bracts narrow; sepals suborbicular or orbicular-ovate, 2 mm. long, rounded and erose-ciliate; petals nearly orbicular, ciliate on the margin; capsule depressed-globose, 5-6 mm. in diameter. *C. umbellata* Am. Auth., in part, not Nutt. In dry woods: Mont.—N.M.—Calif.—Alaska. *Submont.*—Mont. Je—Au.

2. *MONÈSES* Salish. ONE-FLOWERED WINTERGREEN, SINGLE BEAUTY.

Perennial herbs, scapose or short-stemmed, with slender rootstocks. Leaves persistent, coriaceous, opposite or in 3's, short-petioled, crenate or serrate. Flowers perfect, solitary, on a long peduncle, nodding. Sepals 5 (rarely 4), persistent. Petals white or rose-colored, 5 (rarely 4), orbicular or broadly ovate, spreading. Stamens 10 or 8; filaments short, subulate, somewhat dilated, incurved. Ovary 4-5-celled; style straight; stigma peltate, with 4-5 narrow, at first erect, at length radiating lobes. Capsule depressed-globose, 4-5-celled, loculicidally 4-5-valved from the summit; valves not woolly on the edges.

Leaf-blades orbicular or obovate, crenate, usually rounded at the apex.

1. *M. uniflora*.

Leaf-blades ovate, strongly reticulate, serrate, usually acute or acutish at the apex.

2. *M. reticulata*.

1. *M. uniflora* (L.) A. Gray. Stem 5-15 cm. high; leaves mostly crowded near the base; blades 8-25 mm. long, acute or rounded at the base, thin; sepals oval, obtuse, 3 mm. long, ciliate; petals ovate to orbicular, obtuse, 8-12 mm. long; capsule 6-8 mm. in diameter. In woods: Greenl.—Pa.—Colo.—Ore.—Alaska; Eurasia. *Mont.*—*Subalp.* Je—Au.

2. *M. reticulata* Nutt. Stem 5-10 cm. high; leaf-blades rounded-ovate, 1-2.5 cm. long, strongly veiny and coarsely toothed; sepals oval, ciliate; petals white, ovate, obtuse, about 1 cm. long; capsule about 1 cm. in diameter. Shady woods: Wash.—Mont.—Alaska. *Mont.*

3. *PÝROLA* (Tourn.) L. WINTERGREEN.

Scapose perennials, with slender, stoloniferous rootstocks. Leaves persistent, firm, subcoriaceous, mainly basal, or in one species usually none and replaced by scales. Flowers racemose, nodding, perfect. Sepals 5, persistent, spreading.

Petals 5, concave, sessile. Stamens 10; filaments declined; anthers contracted under the terminal pores. Ovary 5-celled; hypogynous disk none; style long, declined and curved upwards towards the end, which is enlarged, truncate and concave and forming a ring or collar; stigma much narrower, 5-lobed. Capsule 5-celled, 5-lobed, loculicidally 5-valved; valves opening from the base and cobwebby on the margins.

Leaves ample, not scale-like.

Leaves not mottled.

Leaves not spatulate, dark green.

Petals pink or purplish.

Leaf-blades crenulate, not callous-denticulate, obtuse.

Leaf-blades round-reniform to orbicular.

Leaf-blades orbicular to round-ovate.

Leaf-blades more or less distinctly callous-denticulate by the protruding ends of the veins, rounded-ovate, acute.

Petals white or greenish.

Leaf-blades oval, longer than the petioles.

Leaf-blades orbicular, usually shorter than the petioles.

Leaves spatulate, pale or yellowish green.

Leaves mottled.

Leaves reduced to lanceolate scales.

1. *P. asarifolia*.

2. *P. uliginosa*.

3. *P. bracteata*.

4. *P. elliptica*.

5. *P. chlorantha*.

6. *P. dentata*.

7. *P. picta*.

8. *P. aphylla*.

1. *P. asarifolia* Michx. Leaf-blades reniform to orbicular, usually broader than long, shining, finely crenulate, 2.5–6 cm. wide; scape 1–3 dm. high; bracts lanceolate; sepals lanceolate, acute or acuminate, about 2 mm. long; petals oval, pink or purplish, 5–6 mm. long. Wet woods and swamps: N.B.—N.Y.—Minn.—N.M.—B.C. *Submont.*—*Mont.* Je—Jl.

2. *P. uliginosa* Torr. Leaf-blades broadly oval to orbicular, usually longer than broad, shining, finely crenulate, 2–6 cm. broad, 2.5–8 cm. long; scape 1–3 dm. high; bracts lanceolate, usually purplish; sepals ovate or triangular-lanceolate, acute or short-acuminate, about 2 mm. long; petals oval or obovate, pink or purplish, 5–7 mm. long. *P. rotundifolia incarnata* A. Gray, scarcely DC. Wet woods and bogs: N.S.—N.Y.—Minn.—Colo.—Calif.—B.C. *Submont.*—*Subalp.* Je—Jl.

3. *P. bracteata* Hook. Leaf-blades ovate, acute, shining, 2.5–6 cm. wide, 3–8 cm. long; scape 2–4 dm. high; bracts lanceolate, acuminate, the lower at least much exceeding the petioles; sepals lanceolate, acuminate, 3 mm. long or more; petals pink or purplish, oval or obovate, 7–9 mm. long. In wet woods: Alaska—Ore.—B.C.—Yukon. *Submont.* Je—Au.

4. *P. elliptica* Nutt. Leaf-blades oval, acute at the base, rounded, retuse or short-acuminate at the apex, rather thin, crenulate and the teeth often callous-mucronate, 1.5–6 cm. wide, 2–8 cm. long; bracts narrowly lanceolate to subulate; sepals triangular-ovate, acute or acuminate, often less than 2 mm. long; petals greenish white, oval, 5–6 mm. long. Rich woods: N.S.—D.C.—Minn.—N.M.—B.C. *Submont.*—*Mont.* Je—Au.

5. *P. chlorantha* Swartz. Leaf-blades orbicular to broadly oval or obovate, crenulate, thick, but rather dull, rounded or acute at the base, 1–4 cm. wide; sepals triangular-ovate, about 1.5 mm. long, obtuse or acute; petals greenish white, oval, about 7 mm. long. In woods and swampy places: Lab.—D.C.—Calif.—B.C.; n Eu. *Submont.*—*Subalp.* Je—Jl.

6. *P. dentata* Smith. Leaf-blades spatulate or oblanceolate, tapering at the base, acute or obtuse at the apex, callous-denticulate, thick, dull, 1–2 cm. wide, 1.5–4 cm. long; sepals triangular-ovate, acute, about 1.5 mm. long; petals oval, 5–6 mm. long, greenish or purplish. In woods: B.C.—Calif.—Mont. *Submont.*—*Mont.* Je—Au.

7. *P. picta* Smith. Leaf-blades ovate or oval, acute at both ends, callous-denticulate, firm and coriaceous, blotched white above and purple beneath, 1–5 cm. wide, 1–6 cm. long; sepals triangular-ovate, acute, about 1.5 mm. long; petals oval, greenish or purplish, about 6 mm. long. Woods: B.C.—Calif.—Ariz.—Colo.—Mont. *Submont.*—*Mont.* Jl—Au.

8. *P. aphylla* Smith. Proper leaves usually replaced by lanceolate scales, only on sterile shoots sometimes producing small lanceolate green leaf-blades;

sepals ovate or lanceolate, acute, 2-3 mm. long; petals obovate or oval, white or greenish, 7-10 mm. long. In coniferous woods: B.C.—Calif.—w Mont. *Submont.* Je—Au.

4. **ERXLEBÈNIA** Opiz.

Scapose perennials, with stoloniferous rootstocks. Leaves persistent, basal, firm, petioled. Flowers racemose, perfect. Sepals 5, persistent, spreading. Petals 5, concave. Stamens 10; filaments erect, connivent; anthers opening by oblique pores at the end, not produced into tubes. Ovary 5-celled; style straight, erect, in ours short, without a collar; stigma peltate, thicker than the style, with 5 marginal papillae. Capsule as in *Pyro'a*.

1. **E. minor** (L.) Rydb. Leaf-blades oval or orbicular, 1-3 cm. wide, 1-4 cm. long, finely crenulate, light green; sepals ovate or triangular-ovate, 1.5 mm. long, acute or acutish; petals white or pinkish, orbicular, 4-5 mm. long; capsule 5-6 mm. in diameter. *Pyrola minor* L. In woods: Greenl.—Conn.—Colo.—Calif.—Alaska; Eurasia. *Mont.*—*Subalp.* Je—Au.

5. **RAMÍSCHIA** Opiz.

Perennials, usually with a short leafy stem and slender, stoloniferous rootstocks. Leaves persistent, but thin. Flowers racemose, nodding and decidedly secund. Sepals 5, persistent, spreading. Petals oblong, erect, with a pair of tubercles at the base within. Stamens 10; filaments slender, not declined, all equally connivent; anthers not contracted beneath the pores. Ovary 5-celled; hypogynous disk present and 10-lobed; style long and straight; stigma peltate, 5-lobed. Capsule 5-celled, 5-lobed, loculicidally 5-valved; valves opening from below, cobwebby on the margins.

1. **R. secunda** (L.) Gareke. Leaf-blades ovate, oval or lanceolate, thin, acute at both ends or rarely obtuse, 2-5 cm. long, 1-3 cm. wide, crenulate or serrulate; sepals less than 1 mm. long, triangular; petals oblong, greenish white, about 4 mm. long. *Pyrola secunda* L. In woods: Lab.—D.C.—Calif.—Alaska; Eurasia. *Mont.*—*Subalp.* Je—Au.

FAMILY 97. **MONOTROPACEAE.** INDIAN PIPE FAMILY.

Saprophytic herbs or root-parasites, with densely matted roots. Leaves scale-like, destitute of chlorophyll. Flowers perfect, usually drooping. Sepals 2-6, distinct, imbricate, deciduous. Petals distinct or partially united, rarely wanting. Stamens 6-12, hypogynous; filaments distinct or united at the base; anthers 2-celled or with confluent sacs, opening by valves or pores. Gynoecium of 1-6 united carpels; ovary 1-6-celled, superior; styles united; stigma capitate, disk-like, or funnelform. Ovules numerous, anatropous. Fruit a 1-celled loculididal capsule. Seeds numerous.

Flowers in elongate racemes; corolla gamopetalous, globular or nearly so; anther 2-awned.

Flowers in short, few-flowered racemes, or solitary; corolla of 4-6 erect, distinct petals; anthers awnless.

Flowers solitary; stigma naked.

Flowers racemose; terminal flower 5-merous, the lateral ones 3- or 4-merous; stigma glandular or hairy on the margins.

1. **PTEROSPORA.**

2. **MONOTROPA.**

3. **HYPOPITYS.**

1. **PTERÓSPORA** Nutt. PINE-DROPS, GIANT BIRD'S-NEST.

Purplish or brown plants, without proper leaves, and with numerous roots forming rounded masses often 5 cm. or more in diameter. Flowers in long, many-flowered racemes. Sepals 5, oblong. Corolla globose, gamopetalous, with 5 reflexed lobes. Stamens 10, included; filaments subulate, glabrous; anthers introrse, the sacs longitudinally dehiscent. Ovary 5-lobed, 5-celled; style short, straight; stigma capitate, 5-lobed. Capsule depressed-globose, 5-valved. Seeds with a terminal reticulate wing.

1. P. Andromedea Nutt. Plant 2-15 dm. high, viscid-hairy; scales lanceolate or linear, numerous; sepals oblong, obtuse; corolla 6-8 mm. long, whitish; capsule 8-12 mm. in diameter. In rich woods: Que.—Pa.—S.D.—N.M.—Calif.—B.C.; n Mex. *Submont.* Je—Au.

2. MONÓTROPÁ L. INDIAN PIPE.

White or pink, leafless plants, with sessile scales. Flowers perfect, solitary, nodding, but in fruit erect. Sepals 2-4, similar to the upper bracts. Petals 5 or 6, somewhat dilated at the apex, erect, tardily deciduous. Stamens 10-12; filaments linear-subulate, more or less pubescent; anthers becoming equally and transversely 2-valved. Hypogynous disk 10-12-toothed. Ovary 5-celled; styles very short; stigma funnelform, crenate on the edge. Capsule 5-celled, loculicidally 5-valved, erect. Seeds numerous; testa produced at both ends.

1. M. uniflora L. Plant 1-3 dm. high, white or pink, turning black in drying; flowers 1.5-2 cm. long; petals abruptly dilated above, strigillose within. Deep woods: Newf.—Fla.—Calif.—B.C.; Mex.; Japan to India. *Submont.* Je—Au.

3. HYPÓPITYS (Dill.) Adans. PINESAP.

Yellowish or reddish, violet-scented, leafless plants, with sessile scales. Flowers perfect, few or several in a raceme, the terminal one 5-merous, the lateral ones 3-4-merous. Calyx regular; sepals not resembling the bracts. Petals distinct, as many as the sepals, saccate at the base. Stamens 6-10; anthers horizontal, opening by two transverse, unequal valves. Hypogynous disk, 6-10-toothed. Ovary 3-5-celled; style short; stigma funnelform or disk-like. Capsule 3-5-celled, erect, loculicidally 3-5-valved. Seeds numerous.

1. H. latisquama Rydb. Plant pink, 1-3 dm. high, more or less short-pubescent above; scales of the stems broadly ovate, obtuse, 1-1.5 cm. long; sepals spatulate or cuneate, 8-10 mm. long, abruptly acuminate, ciliate; petals cuneate or obovate, 11-12 mm. long, rounded and sinuate at the apex, pubescent and ciliate. Woods: Mont.—N.M.—B.C. *Submont.* Jl.

FAMILY 98. ERICACEAE. HEATH FAMILY.

Perennial herbs, shrubs, or trees, with alternate, opposite, or whorled leaves, commonly leathery and persistent, without stipules. Flowers perfect. Sepals 4 or 5, or rarely 6-10, distinct or partially united. Corolla regular or slightly irregular; petals as many as the sepals, usually more or less united. Stamens as many or twice as many, hypogynous; anthers two-celled, sometimes prolonged into terminal tubes, opening by terminal pores or lengthwise, often with horn-like awns. Gynoecium of 2-5 united carpels; ovary with as many cells; styles united; stigma capitate or peltate. Fruit usually a capsule, sometimes a berry or drupe.

Fruit a capsule.

Fruit septicial; valves separating from the central columella, which bears the placenta; anther awnless.

Petals distinct, spreading; flowers from separate strobilaceous buds.

1. LEDUM.

Petals united, forming a gamopetalous corolla.

Corolla without sacs for the anthers.

Corolla large, white, rotate or rotate-campanulate. 2. AZALIASTRUM.

Corolla small, urceolate or campanulate.

Heath-like evergreen undershrubs, with the flowers umbellately or racemously arranged at the ends of the branches, from the axils of the leaves. 3. PHYLLODOCE.

Deciduous-leaved shrubs, with the flowers from strobilaceous buds, ending the branches of the preceding year. 4. MENZIESIA.

Corolla rotate, with 10 sacs enclosing the anthers in bud.

5. KALMIA.

Fruit loculicidal; the valves carrying with them the partitions; anthers in our genera awned.

Calyx and hypanthium neither accrescent, nor enclosing the capsule, nor berry-like.

Sepals or calyx-lobes valvate in bud; corolla globose-urceolate; shrubs; leaves neither imbricate nor scale-like.

Sepals imbricate in the bud; corolla campanulate; undershrubs, with scale-like imbricate leaves.

Calyx and hypanthium accrescent, enclosing the capsule, berry-like.

Fruit a drupe or berry.

Leaves thin, deciduous; fruit juicy.

Leaves evergreen, leathery; fruit mealy.

6. ANDROMEDA.

7. CASSIOPE.

8. GAULTHERIA.

9. ARCTOUS.

10. ARCTOSTAPHYLOS.

1. LĚDUM L. LABRADOR TEA.

Resinous shrubs, with scaly buds and fragrant foliage. Leaves alternate, thick and leathery, with more or less revolute margins. Flowers in terminal corymbs. Bracts deciduous. Calyx persistent; sepals 5. Petals 5, obtuse, spreading, imbricate in the bud. Stamens 5-10, exserted; filaments filiform; anthers didymous, the sacs opening by terminal pores. Disk annular, 8-10-lobed. Ovary 5-celled, usually covered by scales; style filiform; stigma 5-lobed. Capsule oblong or ovate, 5-celled, septicidally 5-valved from the base.

Leaves densely ferruginous-tomentose beneath and with strongly revolute margins.

Leaves glabrous on both sides, paler and glandular-punctate beneath, not revolute.

1. *L. groenlandicum*.

2. *L. glandulosum*.

1. **L. groenlandicum** Oeder. Shrub 3-10 dm. high, with rusty tomentose twigs; leaf-blades oblong or elliptic, obtuse at both ends, 1.5-5 cm. long, 0.5-2 cm. wide, dark green above, densely tomentose beneath, with rusty hairs; pedicels 2-2.5 cm. long, in fruit recurved; sepals minute, triangular; petals white, about 5 mm. long; capsule lance-ovoid, puberulent, 5-7 mm. long, 2-3 mm. thick. *L. latifolium* Ait. In bogs: Greenl.—N.J.—Wash.—Alaska. *Boreal—Subarctic.* Je—Jl.

2. **L. glandulosum** Nutt. Shrub, 3-10 dm. high, with glabrous or minutely puberulent branches; leaf-blades elliptic or oval, 1.5-3 cm. long, 1-2 cm. wide, green above, pale and minutely resiniferous beneath; sepals oblong, obtuse, about 1.5 mm. long; petals white, broadly oval, 5-7 mm. long; capsule ovoid, 4-5 mm. long, 3-4 mm. thick. Mountain swamps: B.C.—Calif.—Utah—Alta. *Mont.—Subalp.* Je—Au.

2. AZALIÁSTRUM (Planch.) Rydb. WHITE RHODODENDRON, AZALEA.

Shrubs, with erect branches and deciduous leaves. Flowers perfect, in 1-3-flowered umbels, from lateral scaly buds. Sepals 5, membrano-foliaceous. Corolla open-campanulate or saucer-shaped, 5-lobed. Stamens 10, included; filaments bearded at the base; anthers awnless, opening by terminal pores. Ovary 5-celled; style included; stigma peltate, 5-lobed. Capsule ovoid, 5-celled, septicidal.

Leaves hirsute with brown hairs.

Leaves glabrate, only glandular-ciliolate on the margins.

1. *A. albiflorum*.

2. *A. Warrenii*.

1. **A. albiflorum** (Hook.) Rydb. Shrub 0.5-2 m. high, with branches glandular-strigose when young, in age glabrous; leaf-blades membranous, oblanceolate, oval or oblong, pale green, 4-7 cm. long, 1.5-2 cm. wide; sepals oblong, 8-10 mm. long, glandular-pubescent, obtuse; corolla white, 12-20 mm. long; lobes rounded; capsule woody, about 8 mm. in diameter. In woods: B.C.—Wash.—Mont.—Alta. *Mont.* Jl—Au.

2. **A. Warrenii** A. Nels. A low shrub, 3 dm. or less, with grayish bark on the stem and brown twigs; leaves ovate, oval, or obovate, 1-2 cm. long; flowers axillary, solitary or a few close together; sepals narrowly elliptic, 7-10 mm. long, covered with short gland-tipped hairs; corolla 10-15 mm. long, white; lobes orbicular. Mountain slopes: Colo. *Mont.* Jl.

3. PHYLLÓDOCE Salisb. MOUNTAIN HEATH.

Evergreen low branching shrubs, with alternate crowded leaves, thick, grooved beneath, the margin revolute-thickened. Flowers in terminal umbels,

perfect. Sepals normally 5, imbricate, persistent. Corolla open-camp: nulate to urn-shaped, 5-lobed. Stamens 10, included; anthers dehiscent by oblique chinks. Ovary 5-celled; style filiform; stigma capitate or obscurely 5-lobed. Capsule subglobose, septicial, 5-valved to the middle; seeds numerous, with coriaceous testa.

Corolla not contracted at the throat, open-campanulate, rose-colored to scarlet; sepals obtuse.

Corolla urceolate, contracted at the throat, yellow; sepals acute.

1. *P. empetriformis*.
2. *P. glanduliflora*.

1. ***P. empetriformis*** (Smith) G. Don. Branched shrub, 1-3 dm. high; leaves subsessile, linear, rather crowded on the branches, 5-12 mm. long, 1-1.5 mm. wide, thick, grooved on both sides, glabrous, scabrous, denticulate on the margins; sepals oblong or ovate, obtuse, about 2 mm. long, usually pink or scarlet; corolla 6-8 mm. long, glabrous. RED OR PURPLE HEATHER. Mountain sides and swamps: Alaska—n Calif.—Colo.—Alta. *Subalp.*—*Alp.* Jl—Au.

***P. empetriformis* × *glanduliflora*.** Where the two species grow together, hybrids often occur. These are of two forms, both having cylindraceous corolla. On one, *P. intermedia* (Hook.) Rydb., the corolla is pink and the sepals acute, in the other, *P. hybrida* Rydb., the corolla is yellowish and the sepals obtuse.

2. ***P. glanduliflora*** (Hook.) Coville. Branched shrub, 1-3 dm. high; leaves subsessile, linear-oblong, obtuse, 4-8 mm. long, 1.5-2 mm. wide, otherwise as in the preceding; sepals lanceolate, very acute, 4-5 mm. long, glandular-hairy; corolla about 8 mm. long, sulphur-yellow and more or less glandular-puberulent. YELLOW HEATHER. Mountain sides and swamps: Alaska—Wash.—Wyo.—Alta. *Subalp.*—*Alp.* Je—Au.

4. MENZIËSIA Smith.

Shrubs, with erect branching stems and alternate deciduous leaves. Flowers perfect, in terminal clusters from early buds. Calyx 4-5-lobed, often obsolete. Corolla urn-shaped, campanulate or globose, usually 4-lobed. Stamens 5-10, mostly 8, included; filaments subulate, flattened; anthers linear-sagittate, awnless, opening by terminal oblique pores or chinks. Disk 8-10-lobed. Ovary 4- (rarely 5-) celled; style included; stigma truncate, with 4 or 5 lobes. Capsule septicial, 4-valved.

Pedicels and petioles glandular-puberulent; seeds tailed at both ends; leaf-blades obtuse.

Pedicels and petioles glandular-hirsute; seeds merely apiculate at the acute.

1. *M. glabella*.
2. *M. ferruginea*.

1. ***M. glabella*** A. Gray. Erect shrub, 2-3 m. high; leaf-blades obovate or elliptic, 3-6 cm. long, 1-3 cm. wide, green and sparingly short-hairy above, glabrous or nearly so and pale beneath; corolla urceolate, 8-9 mm. long; capsule ovoid, about 6 mm. long, glabrous or minutely puberulent. Woods: B.C.—Ore.—Wyo.—Alta. *Submont.* Je—Jl.

2. ***M. ferruginea*** Smith. Erect shrub, 2-3 m. high; leaf-blades broadly oblanceolate, hirsute-strigose and green above, pale and glabrous beneath, except the veins and margin, 3-5 cm. long, 1-2.5 cm. wide; corolla cylindro-urceolate, 8-10 mm. long, 6-7 mm. wide; capsule ovoid, about 8 mm. long, glabrous or with scattered hairs. *M. urceolaria* Salisb. Woods: Alaska—Ore.—Wyo.—Mont. *Submont.*—*Mont.* My—Jl.

5. KÁLMIA L. AMERICAN LAUREL, SWAMP LAUREL.

Evergreen shrubs or trees, with alternate, opposite, or whorled leaves. Flowers perfect, in terminal or axillary corymbs or umbels, with early deciduous bracts. Sepals 5, persistent, leathery. Corolla rotate, pink or white, with 10 pouches at first enclosing the anthers, 10-keeled and rounded 5-lobed. Stamens 10; filaments shorter than the corolla, straightening elastically at maturity; anthers awnless, opening by terminal pores. Disk 1-lobed. Ovary 5-celled. Capsule globose, depressed at the apex, septicial, 5-valved.

1. ***K. microphylla*** Heller. Low branched shrub, 1-3 dm. high; leaves opposite, with very short petioles; leaf-blades 1-1.5 cm., seldom 2.5 cm.

long, 5-10 mm. wide, oval, glabrous, dark green above, glaucous beneath, somewhat revolute on the margins; sepals ovate, concave, about 3 mm. long, purple; corolla bluish purple, 10-14 mm. wide. Cold bogs: Alaska—Calif.—Colo.—Alta. *Mont.*—*Subalp.* Je—Au.

6. ANDRÓMEDA L. BOG ROSEMARY.

Glabrous evergreen shrubs, with coriaceous, entire, revolute-margined leaves. Flowers perfect, in terminal umbels. Sepals 5, persistent. Corolla globose-urceolate, 5-toothed, with recurved teeth. Stamens 10, included; filaments bearded, unappendaged; anthers short, ovate, obtuse; sacs opening by a terminal pore, each with an ascending awn. Disk 10-lobed. Ovary 5-celled; style columnar; ovules many. Capsule subglobose, 5-angled, 5-valved, loculicidal. Seeds with smooth testa, coriaceous, shining.

1. *A. polifolia* L. Shrub, 1-3 m. high, with acid foliage; leaf-blades oblong to linear, 3-5 cm. long, 3-8 mm. wide, dark green above, white beneath, mucronulate, the margins usually strongly revolute; bracts ovate, glaucous; pedicels 5-10 mm. long; sepals triangular, acute, about 1 mm. long; corolla pink, about 9 mm. long. In swamps: Lab.—N.J.—Ida.—Wash.—Alaska; Eurasia. Je—Jl.

7. CASSIOPE D. Don. MOSS-PLANT, WHITE HEATHER.

Evergreen low branching shrubs, with thick, opposite, crowded, imbricate, 4-ranked leaves and axillary nodding flowers. Sepals usually 5, not bracted, imbricate, thickened at the base. Corolla campanulate, usually 5-lobed. Stamens 8-10, included; anthers attached to the filaments near the apex; sacs opening by large terminal pores and tipped with recurved awns. Disk 10-crenate. Ovary 4-5-celled; style slender, somewhat thickened below. Capsule globose or ovoid, loculicidal, 4-5-valved.

Leaves with a deep furrow on the back.
Leaves without furrow on the back.

1. *C. tetragona*.

2. *C. Mertensiana*.

1. *C. tetragona* (L.) D. Don. Tufted shrub, with erect or ascending branches, 1-3 dm. high; leaves very thick, ovate, 2-5 mm. long, more or less pubescent; peduncles 1-2.5 cm. long, glabrous or nearly so; sepals ovate, 2-2.5 mm. long, acute; corolla white or rose-colored, 5-6 mm. long. Wet places: Greenl.—Lab.—B.C.—Alaska; Eurasia. *Subalp.*—*Alp.* Jl—Au.

2. *C. Mertensiana* (Bong.) D. Don. Tufted shrub, with ascending branches, 1-3 dm. high; leaves ovate, 2-4 mm. long, round-keeled on the back, glabrous or nearly so; peduncles 1-1.5 cm. long, glabrous or puberulent; sepals 2-3 mm. long, ovate, usually pinkish, acute; corolla 5-8 mm. long, white or slightly tinged with rose. Wet places in the mountains: Alaska—n Calif.—Mont.—Alta. *Subalp.*—*Alp.* Jl—Au.

8. GAULTHERIA (Kalm) L. CREEPING WINTERGREEN.

Shrubs or undershrubs, with alternate evergreen leaves. Flowers perfect, solitary, axillary, or in axillary racemes. Hypanthium and calyx enlarging and becoming fleshy, enclosing the capsule and forming a berry-like fruit. Sepals 5. Corolla campanulate or urn-shaped. Stamens 10; filaments dilated below, included; anther-sacs opening by terminal pores, 2-awned or 2-pointed. Disk 10-toothed. Ovary and capsule 5-celled, 5-lobed.

Glabrous; leaves oval or orbicular.

1. *G. humifusa*.

Calyx, pedicels, and upper part of the stem sparingly hirsute; leaves ovate.

2. *G. ovatifolia*.

1. *G. humifusa* (Graham) Rydb. Cespitose, depressed, procumbent undershrub, 3-10 cm. high, glabrous; leaf-blades finely crenate or entire-margined, 1-2 cm. long; corolla open-campanulate, 5-lobed, white, about 3 mm. long; filaments glabrous; fruit scarlet, 5-6 mm. in diameter. *G. Myrsinites* Hook. Wooded mountain sides: B.C.—Calif.—Colo.—Alta. *Submont.*—*Subalp.* Jl.

2. *G. ovatifolia* A. Gray. Low depressed shrub, 1-2 dm. high, with more or less hirsute stems; leaf-blades ovate, acute, serrate, glabrous, rather thick,

1.5-3.5 cm. long; pedicels one-flowered; corolla white, about 4 mm. long; fruit scarlet, 7-8 mm. in diameter. Woods: B.C.—Ore.—Ida. *Submont.* Je—Jl.

9. ARCTŌUS (A. Gray) Niedzu. ALPINE BEARBERRY.

Low caespitose shrubs, with shreddy bark and alternate deciduous leaves, clustered towards the ends of the branches. Flowers few, in fascicles from terminal scaly buds. Sepals 4-5, short. Corolla globose-urceolate, 4-5-toothed. Stamens 8-10, included; anther-sacs with 2 recurved dorsal awns. Fruit drupaceous, with 4-5 1-seeded nutlets. [*Mairiania* Neck.]

Fruit black; corolla-lobes ciliate; leaves less than 3 cm. long.

1. *A. alpina*.

Fruit red; corolla-lobes not ciliate; leaves usually more than 3 cm. long.

2. *A. erythrocarpa*.

1. *A. alpina* (L.) Niedzu. Depressed-prostrate shrub, with branches 5-12 cm. high; leaf-blades spatulate or obovate, tapering below into short petioles, 2-3 cm. long, 1-1.5 cm. wide, crenate, strongly veined, glabrous, except the ciliate margin; corolla white or pink; fruit 5-7 mm. in diameter, bluish black when ripe. *Arctostaphylos alpina* (L.) Spreng. In alpine-arctic localities: Greenl.—N.H.—B.C.—Alaska; Eurasia. *Subalp.*—*Alp.* My—Je.

2. *A. erythrocarpa* Small. A depressed shrub, 1-2 cm. high; leaf-blades spatulate, 3-6 cm. long, tapering below into short petioles, crenate, glabrous, not ciliate; corolla white or pinkish, turning yellowish; fruit 7-10 mm. in diameter, bright red. Mountains: Alta.—B.C.—Yukon. *Subalp.*—*Alp.* My—Je.

10. ARCTOSTÁPHYLOS Adans. BEARBERRY, KINNIKINICK,
MANZANITA.

Shrubs or small trees, with alternate, thick, evergreen leaves. Flowers perfect in terminal, bracteolate racemes, often pendulous. Sepals 5, persistent. Corolla urn-shaped, with 4-5 recurved lobes. Stamens 8-10; filaments dilated and hairy at the base; anthers with 2 reflexed awns on the backs, opening by terminal pores. Ovary 4-10-celled, with a single pendulous ovule in each cell. Fruit drupaceous, either with a 1-8-seeded stone or 1-8 one-seeded more or less coalescent stones. [*Uva-ursi* Mill.]

Depressed creeping glabrous plant, with spatulate leaves.

1. *A. Uva-ursi*.

Erect shrubs or trees, 1-6 m. high, with oval leaves.

Young branches puberulent; leaves usually pungent-cuspidate.

2. *A. pungens*.

Branches glabrous; leaves usually not cuspidate.

3. *A. platyphylla*.

1. *A. Uva-ursi* (L.) Spreng. Depressed and trailing, diffusely branched shrub, forming patches 1-2 m. across; leaves short-petioled, coriaceous; blades spatulate, entire-margined, obtuse, glabrous or nearly so, 1-3 cm. long, finely reticulate; racemes short and crowded; sepals ovate, acute; corolla ovoid-urn-shaped, white, about 4 mm. long; fruit rather dry, insipid, mealy, red, 6-10 mm. in diameter. Woods: Lab.—N.J.—Colo.—Calif.—Alaska; Eurasia. *Submont.*—*Mont.* My—Je.

2. *A. pungens* H.B.K. Shrub 1-7 m. high, with puberulent branches; leaf-blades very thick, entire-margined, elliptic or oval, rounded at the base, pungent, acuminate at the apex, glabrous above, minutely puberulent beneath, 1.5-3 cm. long; sepals ovate; corolla 5-6 mm. long; fruit 8 mm., rarely 10 mm. in diameter. Wooded mountains: Mex.—N.M.—s Utah—s Calif. *Son.* Ap—My.

3. *A. platyphylla* (A. Gray) Rydb. Shrub about 1 m. high, with glabrous branches; leaf-blades ovate, entire-margined, merely acute, 2-4 cm. long, thick and light green; sepals ovate, obtuse or acutish; corolla about 6 mm. long; fruit usually 1 cm. or more in diameter. Woody mountain sides: e Colo.—Utah—Calif. *Son.*—*Mont.* My—Jl.

FAMILY 99. VACCINIACEAE. HUCKLEBERRY FAMILY.

Shrubs or small trees, or rarely delicate vines. Leaves alternate, simple, sometimes evergreen. Flowers perfect, clustered or solitary. Hypanthium well developed, more or less completely enclosing and adnate to the ovary.

Sepals 4 or 5. Corolla usually gamopetalous, 5- or 4-lobed, rarely of free petals. Stamens twice as many as the lobes of the calyx or corolla. Gynoecium of 5 or 4 united carpels. Ovary 4–10-celled, inferior, crowned by an epigynous disk. Fruit a berry or drupe, pulpy.

Petals united into a gamopetalous corolla.

Ovary half-inferior; berry white, acute; low creeping plants. 1. *CHIOGENES*.

Ovary wholly inferior; berry blue, black, or red, rounded; shrubs or undershrubs.

Filaments glabrous; anthers 2-awned on the back; leaves deciduous.

2. *VACCINIUM*.

Filaments pubescent; anthers awnless.

Ovary and berry incompletely 10-celled, by a false partition, intruding from the back of each cell; leaves thin, deciduous. 3. *CYANOCOCCUS*.

Ovary and berry 4- or 5-celled; no false partitions; leaves leathery, persistent.

4. *VITIS-IDAEA*.

5. *OXYCOCCUS*.

Petals distinct; delicate prostrate vines.

1. *CHIOGENES* Salisb. CREEPING SNOWBERRY, MOXIE PLUM, CAPILLAIRE.

Evergreen shrubs, with prostrate stems. Leaves alternate, 2-ranked. Flowers solitary, subtended by two bracts. Sepals 4, free. Corolla campanulate, with 4 rounded lobes. Stamens 8, included; filaments rough; anthers awnless; sacs not prolonged into tubes at the apex. Ovary and berry 4-celled, the latter white, mealy.

1. *C. hispidula* (L.) T. & G. Stems slender, creeping, 1–3 dm. long, strigose; leaves short-petioled, dark green and glabrous above, pale and with scattered brown appressed hairs beneath, ovate, acute, 3–6 mm. long; pedicels very short; corolla short-campanulate, 1.5–2 mm. long; berry hispid, 5–6 mm. in diameter. Cold woods: Newf.—N.C.—Mich.—Ida.—B.C. *Boreal*. My—Je.

2. *VACCINIUM* L. BILBERRY, WHORTLEBERRY, HUCKLEBERRY.

Low shrubs, with alternate, thin, deciduous leaves. Flowers on drooping pedicels, solitary or two to four together. Calyx-lobes 5 or 4, small. Corolla more or less urceolate, 5- or 4-toothed, rose-colored or white. Filaments glabrous; anthers 2-awned on the back, included. Stamens 8–10. Ovary and fruit 4–5-celled, without false partitions. Fruit sweet and edible, blue, black, or red, with or without a bloom.

Branches not angled.

Leaves entire-margined.

Leaves broadly obovate or oval, strongly reticulate.

1. *V. uliginosum*.

Leaves oblong-obovate to oblanceolate, pale, not strongly reticulate.

2. *V. occidentale*.

Leaves serrate.

3. *V. caespitosum*.

Branches angled.

Fruit purplish, black, or blue; leaves more than 1 cm. long.

Corolla depressed-globular; fruit purple; leaves obtuse or acute, crenulate or subentire.

4. *V. globulare*.

Corolla rounded-ovoid.

Leaves subentire, obtuse; fruit blue, with a bloom.

5. *V. ovalifolium*.

Leaves serrate, acute or acuminate; fruit black, without a bloom.

Shrub tall; leaves 2–5 cm. long; fruit 8–10 mm. in diameter.

6. *V. membranaceum*.

Shrub low, 1–3 dm. high; leaves 1–1.5 cm. long; fruit 5–8 mm. in diameter.

7. *V. oreophilum*.

Fruit bright red; leaves usually less than 1 cm. long.

Leaves serrate, light green on both sides.

8. *V. scoparium*.

Leaves entire, dull and pale, especially beneath.

9. *V. parvifolium*.

1. *V. uliginosum* L. Shrub 1–6 dm. high; leaves glabrous, green above, pale beneath, 1–2 cm. long; corolla pink, ovoid-urceolate, only slightly contracted at the throat, 4–5-toothed; berry blue, with a bloom, globose-ellipsoid, about 6 mm. in diameter. Bogs: Greenl.—N.Y.—B.C.—Alaska; Eurasia. My—Jl.

2. *V. occidentale* A. Gray. Shrub 2–10 dm. high; leaves thin, 1–2 cm. long, only slightly paler beneath; corolla ovoid-urceolate, about 5 mm. long; berry blue, with a bloom, 4–5 mm. in diameter. Wet places in the mountains: B.C.—Calif.—Utah—Mont. *Submont.*—Mont. Je—Au.

3. *V. caespitosum* Michx. Shrub 0.5-3 dm. high; leaves rather thin, obovate, cuneate or oblanceolate, glabrous; corolla ovoid-urceolate, 4-5 mm. long; berry blue, with a bloom, 6-8 mm. in diameter. Alpine-arctic situations: Lab.—N.H.—Colo.—B.C. *Subalp.—Alp.*

4. *V. globulare* Rydb. Shrub 3-8 dm. high; leaf-blades 1-4 cm. long, thin, broadly oval or obovate, somewhat paler beneath; corolla yellowish white, about 6 mm. in diameter; berry dark purplish blue, 6-8 mm. in diameter. Woods: B.C.—Ore.—Utah—Mont. *Submont.—Mont.* My—Jl.

5. *V. ovalifolium* Smith. Shrub 2-3.5 dm. high; leaf-blades elliptic, oval, or oblong-oval, entire-margined, bright green above, pale beneath, 3-5 cm. long; corolla ovoid-urceolate, about 8 mm. long and 5-6 mm. in diameter; berry 8-10 mm. in diameter. Woods: Alaska—Ore.—Mich.—Que. *Submont.—Mont.* My—Jl.

6. *V. membranaceum* Dougl. Shrub 3-15 dm. high; leaf-blades thin, oval, only slightly paler beneath, 3-5 cm. long; corolla ovoid-urceolate, about 5 mm. long, 4 mm. wide; berry 8-10 mm. in diameter. *V. myrtilloides* Hook. Woods: B.C.—Calif.—Wyo.—Mich. *Submont.—Mont.* Je—Jl.

7. *V. oreophilum* Rydb. Shrub 1-3 dm. high; leaf-blades ovate or oval, thin, veiny, green on both sides, 1-1.5 cm. long; corolla ovoid-urceolate, about 4 mm. long; berry 5-8 mm. in diameter. *V. Myrtilus* Hook., not L. Mountain woods: B.C.—N.M.—Alta. *Mont.—Alp.* Je.

8. *V. scoparium* Leiberger. Shrub 1-2 dm. high; leaf-blades light green, thin, 1 cm. or less, ovate or lance-ovate, acute at both ends, serrulate; corolla ovoid-urceolate, 3 mm. or less long; berry red, about 5 mm. in diameter. *V. erythrococcum* Rydb. GROUSE-BERRY. Mountain sides: B.C.—Calif.—Colo.—Alta. *Submont.—Subalp.* Je—Jl.

9. *V. parvifolium* Smith. Shrub 2-4 m. high; branches green, sharply angled; leaves oblong or oval, obtuse or rounded at both ends, pale and dull, entire, 6-20 mm. long; corolla globular; pedicels nodding in fruit; berry light red, rather dry. Shady woods: Calif.—Ida.—B.C.—Alaska. *Submont.—Mont.*

3. CYANOCÓCCUS (A. Gray) Rydb. BLUEBERRY.

Shrubs with alternate, thin, deciduous leaves. Flowers in fascicles or very short racemes, developed with the leaves, from separate scaly buds; bracts and bractlets scaly, mostly deciduous. Calyx-lobes 5, usually small. Corolla in ours campanulate, white or slightly rose-colored; lobes 5. Stamens 10; filaments hairy; anthers awnless. Ovary and fruit incompletely 10-celled, by false partitions or projections from the back of each carpel; berry blue or black, with a bloom, sweet and edible, many-seeded.

Leaves entire, as well as the branches pubescent.

Leaves serrate, glabrous, except sometimes the veins and margins; branches glabrous or with pubescent lines.

1. *C. canadensis*.

2. *C. pennsylvanicus*.

1. *C. canadensis* (Richards.) Rydb. Shrub 3-6 dm. high; leaves broadly lanceolate, acute at both ends, softly pubescent, especially beneath, 2-4 cm. long, 8-18 mm. wide; corolla cylindro-campanulate, about 4 mm. long and 3 mm. in diameter; berry bluish black, with a bloom, 5-8 mm. in diameter. *Vaccinium canadense* Richards. Moist places: Lab.—Va.—Ill.—Sask. *Boreal.* My—Je.

2. *C. pennsylvanicus* (Lam.) Rydb. Shrub 1-4 dm. high, with warty branches; leaves oblong or oblong-lanceolate, slightly pubescent on the veins beneath and the margins, acute at both ends, 2-4 cm. long; corolla as in the preceding; berry 6-10 mm. in diameter, bluish black, with a bloom, very sweet. *V. pennsylvanicum* Lam. Hillsides and woods: Newf.—N.J.—Ill.—Sask. *Boreal.* My—Je.

4. VITIS-IDAËA (Tourn.) Moench. MOUNTAIN CRANBERRY, SWEDISH CRANBERRY.

Low shrubs, with coriaceous, persistent leaves. Flowers in short racemes from separate buds. Calyx-teeth small, 4 or 5. Corolla urceolate or campanu-

late, 4- or 5-toothed. Stamens 8-10; filaments hairy; anthers awnless. Ovary and fruit 4-5-celled, without false partitions. Fruit in ours red, sour.

1. **V. Vitis-Idaea** (L.) Britton. Low shrub, 1-5 dm. high; leaves thick, persistent, dark green and shining above, pale and black-dotted beneath, glabrous, obovate or oval, obtuse or rounded at the apex, 5-15 mm. long, with revolute margins; corolla campanulate, about 4 mm. long, 4-lobed; stamens 8; berry 8-10 mm. in diameter, red. *Vaccinium Vitis-Idaea* L. Rocky places and open woods; Greenl.—Mass.—Alta.—Alaska; Eurasia. Je-Jl.

5. **OXYCOCUS** (Tourn.) Hill. CRANBERRY.

Delicate trailing or creeping vines. Leaves alternate, persistent, entire, leathery, with more or less revolute margins. Flowers solitary or few together, on slender pedicels. Sepals 4. Petals 4, pink or red, distinct, narrow, and recurved. Stamens 8; anther-sacs produced into slender tubes, opening with terminal pores. Ovary and fruit 4-celled. Fruit globose or ellipsoid, red, sour.

Leaves ovate or lanceolate, 4-8 mm. long; fruit globose; bracts subulate or filiform.

Leaves strongly revolute, acute; fruit 6-9 mm. in diameter; flowers strictly terminal.

Leaves not revolute, mostly obtusish; fruit 10-12 mm. in diameter; flowers often surpassed by a leafy shoot.

Leaves elliptic or oblong, obtuse, 6-14 mm. long; flowers mostly lateral; bractlets lanceolate or oblong, foliaceous; fruit rounded-ellipsoid.

1. **O. Oxycoccus** (L.) MacM. Stems slender, creeping and rooting, 1-4 dm. long; leaves thick, rounded or cordate at the base, dark green above, white beneath, 4-6 mm. long; flowers in small umbel-like corymbs from scaly terminal buds; petals oblong, 5-7 mm. long; berry globose, 6-9 mm. in diameter, usually spotted. *Vaccinium Oxycoccus* L. *Oxycoccus palustris* Pers. Cold bogs: Greenl.—N.J.—Mich.—Wash.—Alaska. *Boreal—Subarctic*. My-Jl.

2. **O. intermedius** (A. Gray) Rydb. Stems coarser than in the preceding, 3-6 dm. long; leaves thick, broadly ovate or oval, rounded or cordate at the base, green above, white beneath, slightly revolute, 8-12 mm. long; berry globose, 10-12 mm. in diameter. *V. Oxycoccus intermedius* A. Gray. In bogs: Alaska—Wash.—Ida.; e Asia. My-Je.

3. **O. macrocarpus** (Ait.) Pers. Stems 3-10 dm. long; leaves oblong-elliptic, usually rounded at both ends, 8-15 mm. long, green above, pale beneath, slightly revolute; inflorescence racemose from a terminal bud, nearly always produced into a leafy branch; berry nearly always longer than broad, 10-18 mm. in length, not spotted. Bogs: Newf.—N.C.—Minn.—Sask. *Boreal*. Je-Au.

FAMILY 100. **PRIMULACEAE**. PRIMROSE FAMILY.

Cauliscent or scapose herbs. Leaves opposite, alternate, or whorled, without stipules. Flowers perfect, in ours regular. Sepals 4-9, partially united. Corolla hypogynous, usually gamopetalous, or rarely wanting; lobes 4-9. Stamens as many as the calyx-lobes and alternate with them, partly adnate to the corolla-tube or the calyx; filaments sometimes united at the base. Pistil single; ovary free or nearly so, 1-celled, with a central placenta. Fruit a 1-celled capsule, opening by 2-8 valves.

Ovary wholly superior and free.

Corolla present.

Corolla-lobes erect or spreading; stamens distinct, except in *Lysimachia*.

Corolla salverform or funnelform, its lobes imbricate; stamens included; plants scapose; leaves in rosettes, either on the basal crown or at the ends of short branches of the caudex.

Corolla-tube equalling or exceeding the calyx; style filiform.

Truly scapose perennials, simple, bearing a single tuft of leaves on the short crown; seeds numerous.

Low suffruticose perennials; leaves rosulate or imbricate at the ends of the branches of the caudex; seeds few.

Corolla-tube shorter than the calyx, its throat constricted; style very short. Cespitose, rosulate perennials; capsule few-seeded.

1. PRIMULA.

2. DOUGLASIA.

3. DROSACE.

- Scapose annuals; capsule many-seeded. 4. ANDROSACE.
 Corolla rotate, its lobes convolute or involute in bud; stamens exserted; plants leafy-stemmed.
 Capsule opening lengthwise; erect plants.
 Flowers mostly 7-merous; corolla white; proper leaves clustered near the top of the stem, the lower ones reduced. 5. TRIENTALIS.
 Flowers mostly 5-merous; leaves scattered on the stem, opposite or verticillate.
 Staminoa wanting; filaments united at the base; flowers solitary or racemose. 6. LYSIMACHIA.
 Staminoa present; filaments distinct.
 Flowers solitary; staminodia conspicuous; corolla-lobes broad.
 Flowers in short axillary spikes; staminodia tooth-like; corolla-lobes long and linear. 7. STEIRONEMA.
 Capsule circumscissile; low depressed herbs. 8. NAUMBURGIA.
 Corolla longer than the calyx; filaments pubescent, adnate to the base of the corolla. 9. ANAGALLIS.
 Corolla shorter than the calyx; filaments glabrous, adnate to the corolla-tube. 10. CENTUNCULUS.
 Corolla-lobes reflexed; stamens more or less monadelphous; plants scapose. 12. DODECATHEON.
 Corolla wanting; calyx with 5 petaloid lobes; flowers solitary, sessile, axillary. 11. GLAUX.
 Ovary partly inferior, the lower portion included in and adnate to the hypanthium; plant leafy-stemmed. 13. SAMOLUS.

1. PRIMULA L. PRIMROSE, COWSLIP.

Perennial scapose herbs. Leaves all in a basal rosette. Flowers in ours umbellate. Calyx tubular, campanulate or funnelform, persistent, usually angled, 5-lobed, the lobes imbricate. Corolla salver-shaped or trumpet-shaped, with a funnelform throat, the tube longer than or equalling the calyx. Stamens 5, distinct, inserted in the tube or the throat of the corolla. Style filiform; stigma capitate. Capsule 1-celled, 5-valved at the apex, many-seeded.

- Bracts of the involucre more or less gibbous at the base; lobes of the corolla deeply 2-cleft.
 Plant usually less than 1 dm. high, rarely mealy.
 Calyx about one-half as long as the corolla-tube; lobes oblong, obtuse; leaves thin. 1. *P. mistassinica*.
 Calyx at least two-thirds as long as the corolla-tube; lobes acutish; leaves rather thick. 2. *P. MacCalliana*.
 Plant taller, 1-4 dm. high, usually more or less mealy; leaves oblong or oblong-spatulate.
 Bracts lanceolate, thick, obtusish. 3. *P. incana*.
 Bracts linear-subulate, thin. 4. *P. specuicola*.
 Bracts of the involucre not gibbous below; lobes of the corolla merely emarginate or notched, or entire.
 Plant less than 1 dm. high, 1-few-flowered; flowers less than 2 cm. long.
 Scape usually 1-flowered, rarely 2-flowered; bracts subulate, small, less than 5 mm. long. 5. *P. angustifolia*.
 Scapes 2-4-flowered; bracts conspicuous, oblong, more than 5 mm. long. 6. *P. Broadheadae*.
 Plant 1.5-5 dm. high, many-flowered; flowers more than 2 cm. long. 7. *P. Parryi*.

1. *P. mistassinica* Michx. Leaf-blades spatulate or obovate, denticulate or repand, 1-3 cm. long, obtuse or rounded at the apex; scape 1-1.5 dm. high, slender; bracts subulate; calyx-lobes nearly as long as the tube; corolla pink or pale purple; lobes of the limb usually 4-5 mm. long, obcordate. Wet banks: Greenl.—Nev.—Minn.—Alta. *Boreal*. My-Jl.

2. *P. MacCalliana* Wiegand. Leaf-blades broadly spatulate or obovate-cuneate, rather thick, 1-2.5 cm. long, obtuse or rounded and crenate at the apex; scape 5-12 cm. high; bracts subulate, 5 mm. long; corolla deep rich blue, with a large orange eye; lobes 5-6 mm. long, broadly obcordate. Wet places in the Rockies: Alta.—B.C. *Mont.* Je.

3. *P. incana* M. E. Jones. Leaf-blades oblong or oblong-oblanceolate or spatulate, 2-8 cm. long, obtuse at the apex, sinuate-dentate or subentire, more or less mealy beneath; scape 1-3 dm. high; bracts 6-10 mm. long; calyx 6-8 mm. long, nearly equalling the corolla-tube, more or less mealy; lobes oblong, obtuse or acutish; corolla lilac, 8-9 mm. long; lobes obcordate, 2-3 mm. long. *P. amer-*

icana Rydb. Swamps and wet meadows: Sask.—Colo.—Utah—Alta. *Submont.* Je—Au.

4. **P. specuicola** Rydb. Leaves 5–13 cm. long, thin, slightly farinose when young, in age glabrate, spatulate or elliptic, obtuse at the apex, sinuate-dentate; scape 1–1.5 cm. long; umbels 10–20-flowered; bracts 5–10 mm. long; calyx densely farinose; tube deeply campanulate, 3–5 mm. long; lobes linear-oblong, 2.5–3.5 mm. long, obtusish; corolla-tube yellowish; lobes cuneate, merely emarginate, with a broad sinus, dark violet, about 3 mm. long. Under overhanging cliffs: s Utah. *Son.* F—Je.

5. **P. angustifolia** Torr. Leaf-blades from linear-oblong to spatulate, 1–5 cm. long, glabrous and fleshy, entire-margined, obtuse; scape 1–5 cm. high, usually 1-flowered; calyx three-fourths as long as the corolla-tube to almost equalling it; calyx-tube obconic; lobes linear-lanceolate, acute; corolla about 1 cm. long; lobes emarginate, 5–8 mm. long. Alpine peaks: Colo. *Alp.* Je—Jl.

6. **P. Broadheadae** M. E. Jones. Leaf-blades elliptic, 2–8 cm. long, glabrous, entire-margined, rather thick, rounded at the apex; scape 5–10 cm. high, 1–4-flowered; calyx half as long as the corolla-tube, about 6 mm. long; lobes lanceolate, acute; corolla purple; lobes rounded, emarginate, 4–6 mm. long. Marshy places: Ida.—Utah. *Submont.*—*Mont.* My—Je.

7. **P. Parryi** A. Gray. Leaf-blades oblong or oblanceolate, 5–15 cm. long, fleshy, puberulent, callous-denticulate or entire, acute or obtuse and mucronate; scape 1–3 dm. high, several- to many-flowered; bracts lanceolate, 0.5–2 cm. long; calyx usually shorter than the corolla-tube; lobes lanceolate, acuminate; corolla strongly scented, 12–15 mm. long, purple; lobes rounded, notched. Wet places among rocks and along streams: Mont.—Colo.—Ariz.—Ida. *Submont.*—*Subalp.*

2. DOUGLÁSIA Lindl. MOUNTAIN PINK.

Depressed and tufted perennials, with suffruticose bases. Leaves imbricate and crowded at the ends of the branches. Flowers in small umbels, sometimes reduced to one flower. Calyx campanulate, persistent, 5-lobed. Corolla salver-shaped; tube equalling or surpassing the calyx; throat more or less contracted, and 5-fornicate within. Stamens included, with short filaments. Style filiform; ovary 1-celled, 5-ovuled. Capsule 1–2-seeded.

Peduncles with several flowers in an umbel; leaves stellate-pruinose, not ciliate.

Peduncles 1–3-flowered; leaves ciliolate on the margins.

1. *D. nivalis*.
2. *D. montana*.

1. **D. nivalis** Lindl. Plant 5–10 cm. high, 3–4-chotomously branched, with several successive tufts of leaves; leaves thick, sessile, linear, obtusish, stellate-pruinose, not ciliate, 6–12 mm. long; bracts similar to the leaves, but shorter; calyx shorter than the corolla-tube; lobes lanceolate, acute; corolla 7–8 mm. long; lobes oval, about 4 mm. long. High mountains: B.C.—Wash.—Alta. *Alp.*

2. **D. montana** A. Gray. Cespitose perennial; leaves 3–8 mm. long; peduncles 0.5–3 cm. long; bracts subulate; calyx equalling the corolla-tube; lobes lanceolate; corolla purple or lilac, 6–8 mm. long; lobes cuneate or obovate, 3–4 mm. long. *D. biflora* A. Nels. Mountain tops and dry hills: Mont.—Wyo.—Ore. *Submont.*—*Subalp.* My—Jl.

3. DRÓSACE A. Nels.

Tufted perennials, with a cespitose caudex. Leaves rosulate at the ends of the branches. Flowers umbellate, on short scapes. Calyx campanulate, persistent. Corolla white, with a yellow eye, short salver-shaped; tube shorter than the calyx; throat more or less constricted. Stamens 5, included. Style short; stigma capitate. Capsule few-seeded.

Leaves without thickened midrib, linear-oblong, about 1 cm. long; pedicels much longer than the calyx, nearly equalling the bracts.

Leaves oblanceolate, about 5 mm. long, at least the old ones with the midrib thickened on the under side; pedicels shorter than the calyx.

1. *D. albertina*.
2. *D. carinata*.

1. *D. albertina* Rydb. Cespitose perennial, but scarcely pulvinate; leaves narrowly oblanceolate, about 1 cm. long, sparingly ciliate; scape 5–10 cm. long, slender, sparingly hairy; bracts linear-lanceolate, 3–4 mm. long; calyx-lobes elliptic, obtuse; corolla-lobes 2–3 mm. long. *Androsace albertina* Rydb. High mountains: Alta.—Mont. *Subalp.* Je—Au.

2. *D. carinata* (Torr.) A. Nels. Densely tufted and pulvinate perennial; leaves numerous, crowded, oblanceolate, 4–6 mm. long, acute, ciliate; scape 1–5 cm. high, white-hirsute; bracts oblong or linear, about 5 mm. long; calyx-lobes oval or oblong, obtuse; corolla white or yellowish, with a yellow eye; lobes oval, 3–4 mm. long. *A. Chamaejasne* A. Gray, not Host. *A. carinata* Torr. *Douglasia Johnstoni* A. Nels. High mountains: Colo.—Utah—Alta. *Mont.*—Alp. Je—Jl.

4. ANDRÓSACE (Tourn.) L.

Small scapose annuals. Leaves rosulate at the base of the stem. Flowers umbellate, inconspicuous. Calyx campanulate or turbinate, persistent, 5-lobed or 5-parted. Corolla salver-shaped, almost funnelform; tube shorter than the calyx; throat constricted; lobes of the limb 5, imbricate in the bud. Stamens 5, included, with short filaments. Style very short; stigma capitate. Capsule short, 5-valved; seeds usually many.

Calyx-tube in fruit obpyramidal, its green teeth surpassing the capsule.

Bracts of the involucre ovate or oblong.

Calyx-teeth longer than the tube; leaves linear-oblanceolate, thin.

Calyx-teeth shorter than the tube; leaves spatulate or oblanceolate, thicker.

Scapes and pedicels several, diffuse or ascending.

Scape single, 1–4-flowered, erect; pedicels almost erect.

Bracts of the involucre lanceolate or subulate.

Calyx-teeth erect, lanceolate, usually shorter than the tube.

Peduncles, pedicels and calyx-lobes densely puberulent, the latter exceeding the fruit.

Peduncles and pedicels sparingly puberulent or glabrous; calyx-lobes glabrous or nearly so, not exceeding the fruit.

Corolla longer than the calyx.

Peduncles 1–2 dm. high, many times longer than the strongly ascending or suberect pedicels.

Calyx-lobes triangular, less than half as long as the calyx-tube.

Calyx-lobes lanceolate, more than half as long as the calyx-tube.

Peduncles less than 3 cm. high, often equalled or exceeded in length by the spreading pedicels.

Corolla shorter than the calyx.

Calyx-teeth more or less spreading, ovate-triangular, foliaceous, equalling or exceeding the whitish tube; corolla shorter than the calyx.

Calyx-tube in fruit hemispherical; teeth broadly triangular.

1. *A. arizonica*.

2. *A. occidentalis*.

3. *A. simplex*.

4. *A. puberulenta*.

5. *A. septentrionalis*.

6. *A. pinetorum*.

7. *A. subumbellata*.

8. *A. diffusa*.

9. *A. subulifera*.

10. *A. filiformis*.

1. *A. arizonica* A. Gray. Leaves oblanceolate, 5–15 mm. long, acute, entire or denticulate, thin, minutely puberulent; scapes usually few, ascending or erect, slender, 3–8 cm. high; bracts broadly spatulate or oval, usually acute, 2–6 mm. long; pedicels ascending; calyx-lobes lanceolate to ovate, 2–3 mm. long, rather spreading; corolla much shorter than the calyx. Plains and valleys: Ariz.—Utah. *Son.* Mr—My.

2. *A. occidentalis* Pursh. Leaves oblanceolate or spatulate, 5–15 mm. long, entire or denticulate, puberulent; scapes 2–6 cm. high, puberulent; bracts spatulate, obtuse, about 5 mm. long; pedicels ascending or spreading; calyx-lobes lanceolate, ascending; corolla much shorter than the calyx. In dry or sandy soil: Man.—Ill.—Mo.—Tex.—B.C. *Plain*—*Submont.* Ap—Je.

3. *A. simplex* Rydb. Leaves oblanceolate, 3–6 mm. long, acute, entire, minutely puberulent; scape 2–7 cm. high; bracts oval or lance-oval, 2–4 mm. long; pedicels suberect; calyx-lobes lanceolate, about 1.5 mm. long, acute; corolla small, shorter than the calyx. Poor soil: B.C.—Utah—Alta. *Son.*—*Submont.* Ap—My.

4. *A. puberulenta* Rydb. Leaves oblanceolate, 1–3 cm. long, acute, entire or sinuately denticulate; peduncles 3–10 cm. long; bracts narrowly lanceolate, 3–4 mm. long; pedicels spreading; calyx-lobes lanceolate, strongly keeled; corolla

white, about equalling the calyx. Hills and mountains: Yukon—Sask.—N.M.—Ariz. *Plain*—*Submont.*

5. *A. septentrionalis* L. Leaves oblanceolate or oblong, acute, dentate or entire, rather thick, 1–2 cm. long; scapes 1–2 dm. high, slightly puberulent; bracts subulate, 3–4 mm. long; calyx-lobes triangular, scarcely 1 mm. long, glabrous or nearly so; corolla about 4 mm. long, exceeding the calyx. Sandy plains and banks: Hudson Bay—Alta.—Wyo.—Ida.—Alaska; Eurasia. *Boreal.* My—Je.

6. *A. pinetorum* Greene. Closely resembling the preceding and scarcely distinct; scapes more numerous, 1–1.5 dm. high; calyx-lobes longer and narrower, sometimes 1.5 mm. long. Pine woods: Colo.—N.M. *Submont.*—*Subalp.* My—Jl.

7. *A. subumbellata* (A. Nels.) Small. Leaves oblanceolate, acute, thin, entire or denticulate, puberulent, 1–2 cm. long; bracts subulate, 2–3 mm. long; pedicels 1–5 cm. long; calyx-lobes lanceolate, scarcely 1 mm. long; corolla nearly 4 mm. long, slightly exceeding the calyx. Mountains, especially in gravelly soil: Hudson Bay—Colo.—Ariz.—B.C. *Submont.*—*Subalp.* Jl—S.

8. *A. diffusa* Small. Leaves oblanceolate, acute, entire or denticulate, puberulent; scapes many, ascending, 3–15 cm. high; bracts subulate, 2–3 mm. long; pedicels glabrous, spreading, 2–7 cm. long; calyx-lobes lanceolate, nearly 1 mm. long; corolla scarcely 3 mm. long, shorter than the calyx. *A. elongata* Richards., not L. Hills and plains: Mack.—N.M.—Ariz.—B.C. *Submont.*—*Mont.* My—Jl.

9. *A. subulifera* (A. Gray) Rydb. Leaves oblanceolate, thin, acute, puberulent, usually dentate, acute at the apex, 1–4 cm. long; scapes several, 5–15 cm. long, slightly puberulent or glabrous; bracts subulate, 2–7 mm. long; pedicels 3–10 cm. long, spreading; calyx-lobes 1–3 mm. long, more or less foliaceous; corolla shorter than the calyx. *A. septentrionalis subulifera* A. Gray. Cañons and valleys: Alta.—Colo. *Plain*—*Mont.* Je—Au.

10. *A. filiformis* Retz. Leaves ovate-lanceolate or spatulate, 5–15 mm. long, thin, usually dentate, glabrous; scapes several, 2–10 cm. high, filiform; bracts subulate, 1–2 mm. long; pedicels 1–3 cm. long, spreading; calyx-tube about 1 mm. long, in fruit almost hemispheric; corolla slightly exceeding the calyx. *A. capillaris* Greene. Sandy or gravelly river shores or in mud: Wash.—Colo.—Mont.; Asia. *Submont.*—*Subalp.* Je—Au.

5. *TRIENTALIS* L. STARFLOWER.

Low perennial herbs, with rootstocks and simple stems. Leaves mostly clustered at the end of the stem, the lower leaves being much reduced or even scale-like. Flowers in the upper axils, with filiform pedicels. Sepals mostly 7, nearly distinct, linear, imbricate. Corolla white or pinkish, rotate, deeply 5–7-parted to near the base, with convolute lobes. Stamens mostly 7; filaments long and slender, slightly united into a ring at the base. Style filiform. Capsule with about 5 revolute valves. Seeds few.

Lower reduced leaves lanceolate to linear-subulate, acute, scale-like.

Verticillate leaves lanceolate, long-acuminate.

Verticillate leaves broadly oval or obovate, acute or abruptly acuminate.

1. *T. americana*.

2. *T. latifolia*.

3. *T. arctica*.

Lower reduced stem-leaves oblanceolate or spatulate, obtuse.

1. *T. americana* Pursh. Stem 1–2.5 dm. high, naked below or with a few scale-like lanceolate leaves, at the summit with a verticil of 5–10 short-petioled or sessile leaves; blades 3–10 cm. long, thin, entire-margined or minutely crenulate; corolla 8–12 mm. wide; lobes ovate or lanceolate, acuminate. Damp woods and thickets: Lab.—Va.—Ill.—Sask. *Boreal.* My—Je.

2. *T. latifolia* Hook. Stem 0.5–2 dm. high, with a few scales below and a verticil of 4–7 short-petioled or subsessile leaves at the summit; blades 3–7 cm. long; corolla white or pinkish, 10–15 mm. wide; lobes ovate or lanceolate, abruptly acuminate. Woods: B.C.—Calif.—Ida. *Submont.* Mr—My.

3. T. arctica Fisch. Stem about 1 dm. high; upper leaves verticillate, obovate, rounded or obtuse at the apex, cuneate at the base, 1-4 cm. long, entire or nearly so; corolla 10-15 mm. in diameter; lobes ovate. Wet places: Alaska—Yukon—B.C.—Ore. *Subalp.* My—Jl.

6. LYSIMACHIA (Tourn.) L. LOOSESTRIFE.

Perennial or rarely annual caulescent herbs. Leaves opposite or whorled, entire, glandular-punctate. Flowers axillary, solitary or in terminal or axillary racemes. Sepals 5, practically distinct. Corolla rotate or short-funnelform, yellow, its lobes entire, convolute. Stamens 5; staminodia wanting; filaments united at the base; anthers short. Styles filiform; ovary 1-celled. Capsule globose, few-several-seeded.

1. L. terrestris (L.) B.S.P. Glabrous perennial, with a rootstock, and often bulbiferous in the axils; leaves opposite or some of them alternate, lanceolate, acute at both ends, usually black-punctate, 2-8 cm. long; flowers in terminal bracted racemes; corolla rotate, deeply parted, yellow with purple streaks or dots, nearly as long as the sepals. *L. stricta* Ait. In swamps: Newf.—Ga.—Ark.—Sask.—B.C. *Boreal.* Jl—S.

7. STEIRONÈMA Raf. FRINGED LOOSESTRIFE.

Perennial, caulescent herbs. Leaves opposite, or whorled above, entire, with ciliate petioles, without glandular dots. Flowers axillary, solitary, on nodding pedicels. Sepals 5, essentially distinct. Corolla rotate, yellow, 5-lobed, the lobes erose-denticulate. Stamens and staminodia 5; filaments distinct; anthers linear. Style filiform; ovary 1-celled. Capsule round, 10-20-seeded.

1. S. ciliatum (L.) Raf. Perennial, with a horizontal rootstock; stem 3-12 dm. high, glabrous; leaves with ciliate petioles; blades ovate or lanceolate, acute or acuminate at the apex, acute, rounded, truncate, or subcordate at the base, 5-15 cm. long, glabrous except the ciliate margins; peduncles axillary, 1-5 cm. long; corolla 1.5-2.5 cm. broad, yellow; lobes erose-denticulate, broadly obovate. Moist thickets and swamps: N.S.—Ga.—Ariz.—B.C. *Plain—Submont.* Je—Au.

8. NAUMBURGIA Moench. TUFTED LOOSESTRIFE.

Erect perennial caulescent water-herbs. Leaves opposite, entire, narrow. Flowers in axillary spikes. Sepals 5-7, linear, imbricate. Corolla yellow, deeply 5-7-parted, with narrow segments. Stamens 5-7, alternating with as many tooth-like staminodia; filaments slender, glabrous. Style slender; stigma capitate. Capsule 5-7-valved, few-seeded.

1. N. thyrsiflora (L.) Duby. Perennial, with a rootstock; stem 3-8 dm. high, simple, glabrous or slightly villous; leaves sessile, 5-10 cm. long, lanceolate to linear-lanceolate, acute; racemes 1-2.5 cm. long; flowers nearly sessile, crowded; corolla 4-6 mm. broad, yellow, with black spots; divisions linear. In water and swamps: N.S.—Pa.—Colo.—Calif.—Alaska; Eurasia. *Plain—Submont.* My—Jl.

9. ANAGALLIS (Tourn.) L. POOR MAN'S OR SHEPHERD'S WEATHERGLASS, PIMPERNEL.

Annual or rarely perennial decumbent, caulescent herbs. Leaves mostly opposite or whorled, entire. Flowers axillary, solitary, on slender pedicels. Calyx 5-cleft, persistent. Corolla blue, pink, or white, rotate; lobes 5, entire, convolute. Stamens 5; filaments slender, adnate to the base of the corolla, sometimes pubescent. Style filiform; stigma capitate; ovary 1-celled; ovules half-anatropous. Capsule circumscissile, subglobose; seeds numerous.

1. A. arvensis L. A glabrous annual; stems spreading, 5-30 cm. long, 4-angled; leaf-blades ovate or oval, 5-20 mm. long, entire, sessile or clasping; peduncles axillary, filiform, 1-2 cm. long; corolla scarlet, pink, or white, 5-7 mm. broad. Waste places: Newf.—Fla.—Calif.—B.C.; Mex.; nat. from Eurasia and Africa. Je—Au.

10. CENTÚNCULUS L. FALSE PIMPERNEL, CHAFFWEED.

Small depressed caulescent annuals. Leaves alternate or the lower opposite. Flowers minute, axillary, solitary. Sepals 4 or 5, united below, persistent. Corolla not exceeding the calyx; tube subglobose; lobes entire, spreading. Stamens 4 or 5, inserted in the throat; filaments dilated; anthers cordate. Ovary 1-celled; style filiform; stigma capitate. Ovules numerous, half-anatropous. Capsule subglobose, circumscissile; seeds numerous.

1. *C. minimus* L. Slender annual, 2–15 cm. high; leaves subsessile, obovate or oblong, 4–8 mm. long; flowers sessile or nearly so; sepals linear or linear-lanceolate, acuminate; corolla pink; lobes lanceolate. Moist soil: Ill.—Fla.—L. Calif.—B.C.; Eu. and S. Am. *Plain—Submont.* Ap—S.

11. GLAUX (Tourn.) L. BLACK SALTWORT, SEA MILKWORT.

Small caulescent herbs, perennial. Leaves opposite, entire, sessile. Flowers small, axillary. Calyx campanulate, 5-lobed; the lobes petaloid, pink or white, imbricate in the bud. Corolla wanting. Stamens 5, inserted at the base of the calyx, alternate with its lobes; filaments filiform-subulate; anthers cordate. Capsule 5-valved at the top, few-seeded.

1. *G. maritima* L. Succulent leafy perennial; stems 0.5–3 dm. high, glabrous; leaves sessile, from oval to linear-oblong, 4–12 mm. long; calyx campanulate, about 3–4 mm. long, pinkish or white; lobes oval, rounded. Saline soil: Newf.—N.J.—Colo.—Ore.—Alaska; Eurasia. *Plain—Submont.* Je—Au.

12. DODECÂTHEON L. SHOOTING STAR, AMERICAN COWSLIP, BIRD-BILLS.

Scapose perennials, with short rootstocks. Leaves in basal rosettes. Flowers umbellate on solitary scapes, nodding. Calyx-lobes 4 or 5, longer than the tube, reflexed in flower. Corolla hypogynous; tube very short; lobes 5 or 4, imbricate in the bud, reflexed, many times as long as the tube. Stamens 5 or 4, exserted; filaments usually united; anthers attached by their bases. Ovary 1-celled, free; style filiform; stigma capitate. Ovules numerous, half-anatropous. Capsule partially 5-valved, the very apex in some species separating off as a lid. Seeds numerous.

Anthers subsessile or nearly so; tube of the filaments if any less than 0.5 mm. long.

Leaf-blades thin, ovate, sinuately dentate, truncate, subcordate or obtuse at the base; anthers strictly sessile. 1. *D. dentatum*.

Leaf-blades thicker, linear, oblanceolate or oval, entire or minutely denticulate, gradually tapering at the base.

Filaments purple; plant with a distinct, often bulbiferous rootstock.

Leaf-blades linear or narrowly linear-oblanceolate, entire.

Plant low; corolla-lobes 10–18 mm. long.

Plant tall; corolla-lobes 20–25 mm. long.

Leaf-blades broadly oblanceolate or elliptic; margins callous-denticulate.

2. *D. alpinum*.

3. *D. Jeffreyi*.

4. *D. viviparum*.

Filaments yellow; rootstock merely a short vertical crown, bearing the leaves and fleshy roots; bulblets none.

Leaves glabrous.

Leaves distinctly petioled.

Scape low, few-flowered; capsule circumscissile near the apex; connective rugose.

Leaf-blades oval, elliptic, or obovate; capsule 10–12 mm. long.

5. *D. conjugens*.

Leaf-blades oblanceolate or oblong, spatulate; capsule 15–20 mm. long.

6. *D. cylindrocarpum*.

Scape tall, many-flowered; capsule opening by valves from the apex; connective not rugose.

7. *D. multiflorum*.

Leaves subsessile.

8. *D. pulchrum*.

Leaves pubescent.

9. *D. pubescens*.

Anthers not subsessile; filaments united into a distinct tube, 1–3 mm. long.

Leaves glabrous.

Capsule circumscissile near the apex; anthers more than twice as long as the tube of the filaments.

Filaments and throat of the corolla indigo blue; leaf-blades obovate.

10. *D. Hendersoni*.

Filaments and throat of the corolla yellow.

Petals oblong-lanceolate, obtuse or acutish.

6. *D. cylindrocarpum*.

Petals lanceolate, long-acuminate.

11. *D. acuminatum*.

Capsule opening by valves from the apex.

Anthers more than twice as long as the short filaments.

Leaf-blades oval or oblong; bracts oblong, mostly obtuse; plant slender; flowers 1-3 (rarely 4-5).

12. *D. philoscia*.

Leaf-blades oblanceolate; bracts lanceolate, acute; plant usually stout and many-flowered.

13. *D. radiculatum*.

Anthers less than twice as long as the filaments.

Whole plant glabrous.

Bracts lanceolate, acute; anthers 4-5 mm. long, half longer than the filament-tube.

14. *D. pauciflorum*.

Bracts oblong, obtuse; anthers 3-4 mm. long, only slightly longer than the filament-tube.

15. *D. salinum*.

Bracts, upper part of the peduncle, and pedicels puberulent; bracts small, lanceolate, acute; anthers 3-4 mm. long.

16. *D. puberulentum*.

Leaves pubescent.

Plant 1-2 dm. high, usually more than one-flowered; leaves with long petioles.

17. *D. cusickii*.

Plant about 5 cm. high, usually 1-flowered; petioles obsolete.

18. *D. uniflorum*.

1. *D. dentatum* Hook. Leaves with winged petioles, 3-10 cm. long; blades elongate-ovate, sinuate-dentate, obtuse, 3-10 cm. long, very thin, glabrous; scape 2-3 dm. high, few-flowered; calyx-tube about 5 mm. long, glabrous; lobes lanceolate, acuminate, about 4 mm. long; corolla white; lobes oblong, obtuse, 8-10 mm. long; anthers about 5 mm. long, tapering upwards, but obtuse; connective purple, smooth; capsule oblong, about 1 cm. long, opening by valves from the apex. *D. Meadia latilobum* A. Gray. Rich wet soil in woods: Ore.—Utah—Ida.—B.C. Je—Jl.

2. *D. alpinum* (A. Gray) Greene. Leaves linear-ob lanceolate, 3-15 cm. long, 5-10 mm. wide, glabrous, obtuse at the apex, entire; scape 1-3 dm. high, usually few-flowered; calyx-tube 2 mm. long; lobes lanceolate, acute, 3-4 mm. long; corolla bluish purple; lobes lanceolate, 10-18 mm. long; anthers linear, about 7 mm. long; connective purple, smooth; capsule oblong-ellipsoid, about 7 mm. long, opening by valves from the summit. Mountain valleys: Calif.—Utah. *Submont.*—*Mont.* Je—Au.

3. *D. Jeffreyi* Moore. Leaves linear or linear-ob lanceolate, 1-2 dm. long, 1-2 cm. wide, glabrous, acutish, entire; scape 2-4 dm. high, several-flowered; calyx-tube 4-5 mm. long; lobes lanceolate, acute; corolla bluish purple; lobes 2-2.5 cm. long, lanceolate; anthers about 1 cm. long; connective smooth, purple; capsule opening by valves from the summit. ? *D. dispar* A. Nels. Mountain valleys: Calif.—Ida.—B.C. *Submont.*—*Mont.* Je—Au.

4. *D. viviparum* Greene. Leaves oblong to oblanceolate, 6-15 cm. long, acute or obtuse, sinuately toothed; scape 1.5-4 dm. high; calyx-tube 3-4 mm. long; lobes lanceolate, acute or acuminate; corolla purple; lobes linear, 1-2 cm. long, acute or obtuse; anthers linear, 7-9 mm. long; connective narrow, purple; capsule circumscissile near the apex and later splitting, ovoid, about 1 cm. long. *D. crenatum* Greene. Wet places in the mountains: Alaska—*Mont.*—Ore. *Submont.*—*Mont.* Jl—Au.

5. *D. conjugens* Greene. Leaves glabrous, oval, elliptic, or rarely obovate, 1.5-4 cm. long, 1-2 cm. wide, rounded at the apex, abruptly contracted at the base; scape 1-2 dm. high, 1-4-flowered; calyx-tube 4 mm. long; lobes lanceolate, acute, about 5 mm. long; corolla from deep purple to rose or white; lobes linear, acute, 15-18 mm. long; anthers 7-8 mm. long, mostly obtuse; connective broad, lanceolate, white, rugose; capsule oblong, 10-12 mm. long, circumscissile near the apex. Moist places: Ore.—Wyo.—*Mont.* *Submont.*—*Mont.* Ap.

6. *D. cylindrocarpum* Rydb. Leaf-blades oblanceolate, or oblong-spatulate, glabrous, 4-10 cm. long, 1-2 cm. wide, obtuse at the apex, gradually tapering below; scape 1-2 dm. high, glabrous; calyx-tube 3-4 mm. long; lobes 3-4 mm. long; corolla purple or white; lobes linear to lanceolate, 1-2 cm. long; anthers 5-7 mm. long, usually acute; connective lanceolate, white, rugose; capsule 15-20 mm. long, circumscissile near the apex. *D. albidum* Greene. Wet places: e Wash.—*Mont.* *Mont.* My.

7. *D. multiflorum* Rydb. Leaves about 2 dm. long, sinuate-denticulate, obtusish, narrowly oblanceolate, tapering below; scape stout, 3-4 dm. high;

flowers 10–20; calyx-tube 5–6 mm. long; lobes lanceolate, about 5 mm. long; corolla bluish violet, paler in the throat, but without any markings; lobes oblong, obtuse; anthers narrowly linear-lanceolate, acute, 7–8 mm. long; connective narrow, lance-subulate; capsule about 12 mm. long, cylindric-ovoid, septicial from the apex. River valleys: Colo.—Wyo. *Mont.* Je–Jl.

8. *D. pulchrum* Rydb. Leaves glabrous, obovate-elliptic, 7–8 cm. long, without distinct petioles, thin, wavy, acute or obtuse; scape about 2 dm. high, 5–7-flowered; corolla rose or purplish, with a deep purple wavy line in the throat; lobes about 2 cm. long, broadly oblong; anthers 6–7 mm. long, obtuse; connective purple, lanceolate, rugose at the base. Creek-banks: Yellowstone Park. *Mont.* Je.

9. *D. pubescens* Rydb. Leaves 2–4 cm. long, elliptic or broadly spatulate, densely and finely pubescent, obtuse at the apex, abruptly contracted into short petioles; scape about 1 dm. long, 2–5-flowered; calyx-lobes lanceolate, acute, about 4 mm. long; corolla bluish purple; lobes linear-oblong, acutish, about 7 mm. long; anthers about 5 mm. long, acute; connective lanceolate, yellow, rugose; capsule cylindric about 1 cm. long. Wet places: w Mont. *Submont.* Ap.

10. *D. Hendersoni* A. Gray. Leaves thick, 4–10 cm. long; blades orbicular, oval, broadly oval or obovate, entire or callous-denticulate, rounded at the apex, abruptly contracted into short petioles; scape 2–3 dm. high, 6–12-flowered; calyx-tube 4–5 mm. long; lobes lanceolate, acuminate, about 4 mm. long; corolla with a dark indigo lobed center; outer part of the throat light-colored; lobes oblong, obtuse, 15–20 mm. long, purple or lilac; anthers linear, 4–5 mm. long, obtuse; capsule oblong, about 1 cm. long. Hillsides: B.C.—Calif.—Ida. *Submont.* Mr–My.

11. *D. acuminatum* Rydb. Leaves 5–6 cm. long, rather fleshy, glabrous or minutely puberulent; blades entire-margined, oblong-elliptic, usually obtuse at the apex, tapering into short petioles; scape 1–1.5 dm. high, 3–5-flowered; calyx-lobes lanceolate; corolla whitish, tinged with purple or rose; lobes lanceolate, 12–15 mm. long, acuminate; anthers 6–7 mm. long; connective purple, broad and rugulose at the base. Wet open slopes: Mont.—Wyo. *Submont.* Ap–Jl.

12. *D. philoscia* A. Nels. Leaves 3–10 cm. long, rather thin, glabrous; blades oval to oblong, obtuse or rounded at the apex, contracted into short petioles; scape 1–2 dm. high, slender, 1–3-flowered (rarely 4–6-flowered); calyx-tube about 2 mm. long; lobes lanceolate, 2–3 mm. long; corolla purple or violet, usually with a dark wavy line in the throat; lobes linear-oblong or linear, acute or obtuse, 12–18 mm. long; anthers linear, acute, about 6 mm. long; capsule oblong, 8–10 mm. long. Gravelly margins of streams: Wyo.—Colo. *Submont.*—*Mont.* Je–Au.

13. *D. radicatum* Greene. Leaves 5–20 cm. long; blades oblanceolate, or rarely elliptic, entire-margined or (in the v. *sinuatum*) sinuate, obtuse or acutish at the apex, tapering below into short petioles; scape 1–4 dm. high, 5–15-flowered; calyx-tube 3–4 mm. long; lobes linear-lanceolate, about 6 mm. long; corolla purple, with a very dark wavy line in the throat; lobes linear or oblong, obtuse, 15–18 mm. long; anthers linear, acute, 5–6 mm. long; capsule oblong-ovoid, about 12 mm. long. Wet meadows: S.D.—Kans.—N.M.—Wyo. *Plain*—*Mont.* My–Jl.

14. *D. pauciflorum* (Durand) Greene. Leaves glabrous, 3–10 cm. long; blades oblanceolate, entire-margined, obtuse at the apex, tapering into more or less elongate petioles; scape 1–4 dm. high, 1–10-flowered; calyx-tube 2 mm. long; lobes lanceolate, about 4 mm. long; corolla purple, with a very dark wavy line in the throat; anthers 4–5 mm. long, linear, usually obtuse; capsule elongate-oblong, 12–15 mm. long. Wet meadows: Mack.—Sask.—Colo.—Wash.—B.C. *Plain*—*Mont.* Je–Au.

15. *D. salinum* A. Nels. Leaves 2–4 cm. long, spreading, glabrous; blades elliptic or oblanceolate, rarely obovate, obtuse, thin, entire-margined, tapering

below into petioles; scape slender, 1-2 dm. high, purplish above, glabrous, 3-12-flowered; calyx-tube about 2 mm. long; lobes lanceolate, 3 mm. long; corolla lilac-purple, with yellowish throat, often with a wavy purple line; lobes oblong, obtuse or acutish; anthers purple, often with whitish margins, acutish; capsule oblong, about 8 mm. long. Saline flats: Sask.—N.D.—Utah—I da. *Submont.*—*Mont.* My-Jl.

16. *D. puberulentum* Heller. Leaves 3-8 cm. long; blades oblanceolate or spatulate, glabrous, entire-margined, obtuse, contracted below into short petioles; scape 1-2 dm. high, puberulent above; calyx-tube 2 mm. long; lobes lanceolate, acute; corolla purplish, with the throat yellowish; lobes oblong, 8-10 mm. long; capsule about 8 mm. long. Wet places: I da. *Submont.* Ap.

17. *D. Cusickii* Greene. Leaves 3-7 cm. long, puberulent; blades oblanceolate or oblong or rarely obovate, rounded or acutish at the apex, contracted below into winged petioles; scape 1-3 dm. high, puberulent; calyx-tube 2-3 mm. long; lobes lanceolate, acuminate; corolla purple, with a yellow throat; lobes oblong or elliptic, acutish, about 1 cm. long; anthers 3-5 mm. long, acute; capsule cylindric, about 8 mm. long. *D. Meadia puberulum* Nutt. Grassy slopes: B.C.—Wash.—Mont.—Alta. *Submont.* Ap—My.

18. *D. uniflorum* Rydb. Leaves spatulate or oblanceolate, almost sessile, densely puberulent, 1-2 cm. long, obtuse or acutish; scape 5 cm. or less; calyx-lobes linear-lanceolate, 2-3 mm. long; corolla dark bluish purple, with a yellow throat, which has or has not a dark wavy line; lobes oblong, about 1 cm. long; anthers 3 mm. long, dark purplish blue, with yellowish sides; capsule cylindric, 6-10 mm. long, splitting into valves. Mountain sides: Mont. *Mont.*—*Subalp.* Je-Jl.

13. *SÁMOLUS* (Tourn.) L. WATER PIMPERNEL, BROOKWEED.

Annual or perennial, caulescent herbs. Leaves alternate, entire. Flowers in terminal racemes or panicles. Sepals united at the base, persistent. Hypanthium more or less developed. Corolla perigynous, short-salverform; tube very short; lobes rounded, imbricate. Stamens 5, adnate to the corolla-tube; staminodia sometimes present, narrow; anthers cordate. Ovary 1-celled; stigma capitate. Ovules numerous, half-anatropous. Capsule short, 5-valved at the apex. Seeds numerous.

1. *S. floribundus* H.B.K. Stem 1-6 dm. high; leaves few, spatulate, or oval, obtuse, 3-15 cm. long, narrowed into winged petioles; upper stem-leaves subsessile and ovate; sepals ovate or triangular; corolla white, 3 mm. broad; staminodia 5, at the sinuses of the corolla. Wet places: Newf.—Fla.—Calif.—B.C.; Mex. *Plain.* Je—Au.

FAMILY 101. *OLEACEAE*. OLIVE FAMILY.

Shrubs or trees, rarely herbs. Leaves opposite, exceptionally alternate or whorled, without stipules, simple or pinnately compound. Flowers mostly paniculate, perfect, polygamous, or dioecious, regular, complete or incomplete. Sepals usually 4, partially united, rarely wanting. Petals 2-6, distinct or partially united, narrow, imbricate or valvate, or wanting. Stamens 2 or 4, adnate to the base of the corolla, if the latter is present. Gynoecium of 2 united carpels; ovary 2-celled, free; stigmas capitate or 2-lobed. Fruit a loculicidal, 2-valved capsule, a samara, or a berry. Seeds usually solitary, sometimes 2-4.

Fruit indehiscent; plant dioecious or polygamous; corolla in ours wanting; calyx-lobes 4.
Fruit a samara.

Fruit a drupe.
Fruit a dehiscent, didymous capsule; flowers perfect; corolla present, rotate, 5-lobed; calyx 5-15-lobed.

1. FRAXINUS.
2. FORESTIERA.
3. MENODORA.

1. *FRÁXINUS* (Tourn.) L. ASH.

Trees or shrubs. Leaves opposite, usually odd-pinnate, rarely simple. Flowers inconspicuous, polygamous or dioecious, usually in panicles. Calyx small,

4-lobed, or wanting. Corolla in ours wanting, otherwise rarely present, of 4 distinct or more or less united petals. Stamens 2, rarely 3 or 4; filaments short or elongate, inserted at the base of the petals, or hypogynous; anthers linear or oblong, introrse. Ovary 2-celled; styles united; stigma 2-cleft; ovules 2 in each cell, pendulous. Fruit a samara.

Flowers polygamous; leaves simple or rarely 3-foliolate.

Flowers dioecious; leaves pinnately 5-9-foliolate.

Leaflets sessile, rather thin.

Leaflets petiolulate, thick, subcoriaceous.

1. *F. anomala*.

2. *F. campestris*.

3. *F. coriacea*.

1. ***F. anomala*** Torr. A small tree, 5-10 m. high, with 4-angled twigs; leaves simple, slightly pubescent when young, soon glabrate, petioled, ovate, rounded, rhombic-ovate or even subcordate, acute to rounded at the apex, 3-5 cm. long, or rarely 3-foliolate, with rhombic-ovate or rhombic-lanceolate leaflets; calyx campanulate, with 4 erose teeth; samara oblong or obovate, 1.5-2 cm. long; wing extending around the body. Cañons: s Utah—sw Colo.—Ariz. Son.—Submont. Ap—My.

2. ***F. campestris*** Britton. A tree, 8-12 m. high, with round twigs; leaves mostly 7-foliolate; leaflets ovate to lanceolate, usually long-acuminate, toothed, more or less hairy beneath or glabrous on both sides, 3-10 cm. long; calyx small, 4-toothed; samara spatulate, about 3 cm. long; wing narrow, decurrent on the body to the middle or below. Valleys and hillsides: Man.—Kans.—Wyo.—Sask. Plain.

3. ***F. coriacea*** S. Wats. A tree, 10-12 m. high; twigs light gray, somewhat hairy; leaves 5-foliolate, rarely 3-foliolate; leaflets thick, rhombic-lanceolate, oblong, or elliptic, 5-8 cm. long, usually more or less acuminate at both ends, somewhat toothed to nearly entire, smooth and shining above, more or less pubescent beneath; calyx campanulate, with lanceolate teeth; samaras narrowly oblanceolate, 2-3 cm. long, 5 mm. wide; wing decurrent on the body to about the middle. Dry regions: Nev.—Utah—Ariz.—s Calif. Son. Ap—My.

2. FORESTIÈRA Poir.

Shrubs or trees, often widely branching. Leaves opposite, simple. Flowers inconspicuous, polygamo-dioecious, appearing before the leaves. Calyx usually present, but small, 4-6-lobed. Corolla usually wanting, rarely with 1 or 2 deciduous petals. Stamens 2-4; anthers extrorse. Ovary 2-celled; stigma thick, sometimes 2-lobed; ovules 2 in each cavity. Fruit a drupe; seeds solitary, rarely 2. Endosperm fleshy. [*Adelia* P. Br.]

1. ***F. neomexicana*** A. Gray. Shrub, 1.5-3 m. high, glabrous; leaves spatulate-oblong, obtuse or obtusely acuminate, 1-4 cm. long, obsoletely crenate; pistillate flowers in sessile fascicles, pedicelled; calyx minute, persistent; drupe black, ellipsoid, obtuse; staminate flowers fasciculate, sessile, with yellowish deciduous bud scales. *Adelia neomexicana* Kuntze. Dry regions: w Tex.—Colo.—Utah—Ariz. Son. Ap.

3. MENODÒRA H.B.K.

Shrubs or undershrubs, rarely herbs. Leaves opposite or alternate, simple, entire, toothed, or lobed. Flowers solitary at the ends of the branches, sometimes cymose. Calyx persistent; tube very short; lobes 5-15, narrow. Corolla white, yellow, or reddish, rotate to campanulate; lobes 5 or 6, imbricate. Stamens 2 or 3, exerted. Ovary 2-celled; stigmas capitate; ovules 4, rarely 2. Capsule membranous, didymous. Seeds usually 2 in each cavity.

1. ***M. scabra*** A. Gray. An undershrub, woody and branched at the base; herbaceous stems 1-3 dm. high, flax-like; leaves mostly alternate, linear or oblong, entire, 1-2 cm. long, scabrous, thick, subcoriaceous; flowers cymose; corolla rotate, bright yellow; lobes obovate, 6-8 mm. long; calyx-lobes 7-15, linear or subulate; fruit didymous-obcordate, 7-8 mm. high. Dry and arid regions: w Tex.—s Utah—Ariz. Son.—Submont. My—Au.

FAMILY 102. **LOGANIACEAE.** LOGANIA FAMILY.

Herbs, shrubs, or vines. Leaves opposite or whorled, simple. Flowers perfect, regular, in cymes or panicles. Calyx inferior, 4- or 5-lobed. Corolla gamopetalous, 4- or 5-lobed; lobes imbricate or convolute. Stamens 4 or 5, alternate with the corolla-lobes. Anthers opening lengthwise. Ovary superior, 2-celled (rarely 3-5-celled); styles more or less united. Ovules solitary or two (rarely numerous) in each cavity, amphitropous or anatropous. Fruit sometimes capsular, 2-valved, or a berry or drupe.

1. **BUDDLEIA** L.

Shrubs or trees, or undershrubs. Leaves opposite, with more or less developed stipules. Flowers in dense heads, rarely in panicles. Calyx campanulate, 4-lobed or 5-lobed. Corolla rotate-campanulate to salverform. Stamens 4, rarely 5; filaments adnate to the corolla-tube. Ovary 2-celled; styles united. Capsule globular or oblong, septicial, 2-valved.

1. **B. utahensis** Coville. Shrub 2-3 dm. high; young branches, leaves, and calyces densely tomentose; leaves linear-oblong, irregularly undulate, revolute-margined, thick, venose-reticulate, 1.5-2 cm. long, obtuse; inflorescence of 2-9 verticels, about 1.5 cm. in diameter; calyx-lobes 1-nerved; corolla purple or brownish purple; tube tomentose without; lobes rounded, spreading; anthers sessile in the throat of the corolla. Rocky places: Utah—Nev. *Son.*

FAMILY 103. **GENTIANACEAE.** GENTIAN FAMILY.

Annual or perennial caulescent herbs, or in warmer climates rarely shrubs. Leaves normally opposite, sometimes connate at the base. Inflorescence cymose. Flowers regular, perfect. Calyx of 2, 4, or 5, more or less united sepals. Corolla of 4 or 5 more or less united petals; lobes convolute or imbricate, entire or fringed. Stamens as many as the corolla-lobes and alternate with them, partly adnate to the corolla. Gynoecium of two united carpels; ovary 1-celled, superior, with 2 parietal placentae. Fruit a capsule.

Corolla not spurred.

Style filiform, mostly deciduous.

Corolla small, red, rose, or yellowish; tube surpassing the calyx; filaments spirally twisted.

Corolla large, blue, purple, or white; tube much shorter than the calyx; stamens recurved.

Style stout, short, persistent, or none.

Corolla without nectariferous pits, glands (except in species of *Amarella*), or scales.

Corolla campanulate, funnelform, or salver-shaped; calyx 4- or 5-lobed; stamens inserted in the corolla-tube.

Corolla without plaits or lobes in the sinuses; calyx without an inter-calyxine membrane; sepals imbricate.

Flowers 4-merous, rather large, usually more than 3 cm. long; corolla-lobes more or less fringed or toothed; inner sepals broader, membranous-margined.

Flowers 5-merous (rarely 4-merous), small, less than 2 cm. long; outer sepals broader; corolla-lobes never fringed, rarely toothed.

Corolla plicate in the sinuses, the plaits more or less extended in membranous lobes or teeth; calyx with an inter-calyxine membrane; its lobes valvate.

Anthers cordate-versatile; dwarf annuals or biennials, with terminal solitary flowers.

Anthers linear or oblong, extrorse; perennials, with mostly axillary flowers.

Corolla rotate; calyx parted to near the base; stamens inserted on the base of the corolla.

Corolla rotate, with nectariferous pits, glands, or scales.

Style none; leaves opposite, rarely alternate; corolla without a crown at the base.

Style manifest; leaves opposite or verticillate.

Each division of the corolla with a single gland; capsule flattened parallelly to the valves.

Corolla without a crown; leaves not white-margined.

Corolla with a decurrent crown contiguous with the gland; leaves white-margined.

Each division of the corolla with a pair of oblong glands and a separate crown below; capsule flattened contrary to the valves.

Corolla spurred.

9. FRASERA.
10. LEUCOCRASPEDUM.
11. TESSARANTHIUM.
12. TETRAGONANTHUS.

1. CENTAÛREUM Hill. CENTAURY.

Annual, biennial, or rarely perennial caulescent herbs. Leaves opposite, entire, sessile or clasping. Flowers in terminal cymes, pedicelled. Calyx with 4 or 5 keeled lobes. Corolla salver-shaped, rose-colored, pink, white, or yellow; lobes 4 or 5, convolute. Stamens 4 or 5, partially adnate to the corolla-tube; filaments short; anthers at last twisted. Ovary 1-celled; placentae 2, sometimes intruding. Capsule oblong or fusiform, 2-valved. Seeds many, reticulate. [*Erythraea* Neck.]

Corolla-lobes 4–6 mm. long, about half as long as the tube; annuals.

Corolla-lobes oblong, obtuse.

Corolla-lobes ovate or lanceolate, acute.

Corolla-lobes 7–10 mm. long, about three-fourths as long as the tube; perennials.

1. *C. exaltatum*.

2. *C. Nuttallii*.

3. *C. arizonicum*.

1. *C. exaltatum* (Griseb.) M. F. Wight. Stem 1–3 dm. high, slender, glabrous, with erect or strongly ascending branches; leaves sessile, oblong to linear, 1.5–4 cm. long; corolla-tube yellow, 8–10 mm. long; lobes rose-colored, 4–5 mm. long. *Erythraea Douglasii* A. Gray. *E. exaltata* (Griseb.) Coville. Wet meadows and river bars: Wash.—Calif.—Utah—Neb. Plain—Submont. My-Jl.

2. *C. Nuttallii* (S. Wats.) Heller. Stem 1.5–4 dm. high, with strongly ascending branches; leaves oblong, acute; corolla-tube yellowish, about 10 mm. long; lobes 5–6 mm. long. *Erythraea Nuttallii* S. Wats. Valleys: Utah—Nev.—Ida. Submont. Jl-S.

3. *C. arizonicum* (A. Gray) Heller. Stem angled, 2–4 dm. high; basal leaves spatulate; stem-leaves oblong to linear, usually acute, 2–5 cm. long; corolla-tube about 12 mm. long, yellow; lobes elliptic or oblong, acute, 9–12 mm. long. *Erythraea calycosa arizonica* A. Gray. River bottoms: Ariz.—s Utah. Son. Je—Au.

2. EUSTÔMA Salisb.

Annual caulescent herbs, or perennials by means of rosettes. Leaves opposite, sessile or clasping, glaucous. Flowers in terminal cymose panicles, or solitary. Calyx with 4 or 5 narrow keeled lobes. Corolla deeply campanulate, blue, purple, or white; lobes 5 or 6, convolute in bud, erose-denticulate. Stamens 5 or 6, adnate to the corolla-tube; filaments filiform; anthers versatile. Ovary 1-celled; stigmas 2. Seeds numerous, pitted.

1. *E. Russelianum* (L.) Griseb. Annual, or perennial with rosettes, with a taproot; stem 3–6 dm. high; leaves ovate to lanceolate or oblong, 3-ribbed, 2–4 cm. long; calyx 15–20 mm. long; lobes subulate; corolla deep purple, rarely white, 3–4 cm. long; lobes obovate. *E. Andrewsii* A. Nels. Meadows: Neb.—Tex.—N.M.—Colo. Plain—Submont. Je—Au.

3. ANTHOPÔGON Necker. FRINGED GENTIAN.

Annual, biennial, or perennial caulescent herbs. Leaves opposite, entire, sessile. Flowers solitary at the end of the stem or its branches, perfect, 4-merous. Calyx large; lobes keeled, the inner distinctly wider than the outer, scarious- or hyaline-margined. Corolla showy, funnelform; lobes erose or fimbriate, without plaits in the sinuses, convolute. Stamens with glands at the base of the filaments. Ovary 1-celled; ovules numerous. Capsule stipitate.

Annuals or biennials; flowers on naked long peduncles terminating the branches, not bracteate.

Corolla enclosed in the ventricose wing-angled calyx.

Corolla much longer than the merely angled calyx.

Inner calyx-lobes ovate, fully twice as broad as the outer linear-lanceolate ones; stem-leaves linear.

1. *A. ventricosus*.

Filaments hairy at the middle.

Filaments glabrous.

All calyx-lobes lanceolate, the inner not twice as broad as the outer ones; stem-leaves oblong or lanceolate.

Inner calyx-lobes decidedly broader than the outer; corolla-lobes distinctly fringed on the sides.

Inner calyx-lobes slightly broader than the outer; corolla-lobes dentate, rarely with a few bristles on the sides.

Perennials with a taproot; flowers short-peduncled in the axils of two bract-like leaves.

2. *A. Macounii*.

3. *A. tonsus*.

4. *A. thermalis*.

5. *A. simplex*.

6. *A. barbellatus*.

1. *A. ventricosus* (Griseb.) Rydb. Stem simple or branched above, 2-3 dm. high, slightly angled; basal leaves spatulate, 1-1.5 cm. long; stem-leaves lanceolate to oblong-ovate, about 3 cm. long; calyx nearly 2 cm. long, ventricose, wing-angled; outer sepals lanceolate, long-acuminate, the inner broader, acute; corolla-lobes elliptic, serrate-fimbriate. *Gentiana ventricosa* Griseb. Wet places: Hudson Bay—Sask. *Boreal*.

2. *A. Macounii* (Holm.) Rydb. Stem strict, angular, 0.5-3 dm. high, branched near the base; basal leaves spatulate or oblanceolate, 1-2 cm. long, obtuse; stem-leaves acute, 2-3 cm. long; calyx purplish green; tube about 1 cm. long; lobes acuminate, the outer about 10 mm. long; corolla deep bluish, 1.5-3 cm. long; lobes broadly obovate, toothed at the summit and fringed on the sides, veiny. *G. Macounii* Holm. Prairies, gravelly soil, and edges of marshes: James Bay—Alta.—Mont.—B.C. *Boreal*—*Submont.* JI-S.

3. *A. tonsus* (Lunell) Rydb. Stem branched above, 3-4 dm. high, slightly angled; basal leaves oblanceolate or spatulate-obtuse, 1-2 cm. long; stem-leaves 4-7 cm. long; calyx-tube about 1 cm. long; outer lobes 10-14 mm. long; inner, 8-12 mm. long, 3-4 times as broad as the outer; corolla blue or purple, 3-4 cm. long; lobes oblong to obovate, fimbriate-toothed around the summit. *Gentiana detonsa tonsa* Lunell. Wet meadows: Sask.—Minn.—Alta. *Plain.* JI-S.

4. *A. thermalis* (O. Kuntze) Rydb. Stem 2-3 dm. high, angled, usually branched near the base; basal leaves spatulate, obovate or oblanceolate, 1-3 cm. long, obtuse, tapering below; stem-leaves sessile, 2-4 cm. long; calyx angled, green, with purple spots; tube 10-15 mm. long; lobes 8-15 mm. long, acuminate; corolla 3-5 cm. long, bluish to purple, veined; lobes obovate-oblong, dentate around the apex, usually fimbriate on the sides; filaments broadly winged, naked. *G. elegans* A. Nels. *G. lineata* Greene. *G. thermalis* Kuntze, based on depauperate specimens. Wet mountain meadows: Mack.—Colo.—Ariz.—Ida. *Submont.*—*Subalp.* JI-Au.

5. *A. simplex* (A. Gray) Rydb. Stem 1-2 dm. high, 1-flowered; leaves linear-oblong to lanceolate, about 1 cm. long; calyx scarcely angled; lobes almost equal; corolla 1.5-2 cm. long; lobes oblong-spatulate, erose-dentate on the sides below. Mountain meadows: Calif.—Ida.—Ore. *Submont.*—*Subalp.* JI-Au.

6. *A. barbellatus* (Engelm.) Rydb. Stem angled, 5-15 cm. high, branched at the base; basal leaves thick and fleshy, oblanceolate or spatulate, 3-5 cm. long; stem-leaves linear or linear-oblanceolate, 3-4 cm. long; bracts linear, 2-3 cm. long; calyx-tube about 1 cm. long; outer lobes linear-lanceolate, 10-15 mm. long; inner ones ovate-lanceolate, shorter; corolla bright blue, 3-4 cm. long; lobes oblong, erose-dentate above, conspicuously fimbriate on the sides. *G. barbellata* Engelm. *G. Moseleyi* A. Nels. High mountains: Colo.—Wyo. *Mont.*—*Alp.* Au-S.

4. AMARÉLLA Gilib. GENTIAN.

Annual, biennial or perennial herbs. Leaves opposite, entire, sessile. Flowers perfect, solitary or cymose, 4-merous or 5-merous. Calyx-lobes imbricate, the outer two often somewhat larger, without a membrane within the lobes. Corolla funnelform or salverform; lobes entire or sparingly toothed, but without plaits in the sinuses. Ovary 1-celled; ovules numerous.

Corolla with a fringed crown in the throat; glands at the base of the corolla obsolete or wanting.

Flowers solitary on 2-10 cm. long peduncles; stems depressed, caespitose.

1. *A. monantha*.

Flowers numerous, short-peduncled; stem erect, more leafy, simple at the base.

Calyx-lobes very unequal, the outer two large, foliaceous, ovate or oval, much broader than the rest. 2. *A. heterosepala*.

Calyx-lobes somewhat unequal, but all oblong, lanceolate, or linear.

Stem-leaves lanceolate or broader.

Flowers numerous, crowded, very short-pedicelled, the whole inflorescence dense and spike-like; leaves usually equalling or exceeding the internodes. 3. *A. strictiflora*.

Flowers comparatively few, distinctly pedicelled; middle internodes elongate and usually longer than the leaves.

At least the outer calyx-lobes lance-oblong; stem-leaves, except the uppermost, oblong or oval, obtuse. 4. *A. anisosepala*.

Calyx-lobes linear or linear-lanceolate; stem-leaves lanceolate or ovate-lanceolate, acute.

Larger calyx-lobes usually half as long as the corolla or longer; plant stout, 2-4 dm. high; stem-leaves lanceolate. 5. *A. scopulorum*.

Calyx-lobes less than half as long as the corolla; plant slender, 1-2 dm., seldom 3 dm. high; stem-leaves usually ovate-lanceolate.

6. *A. plebeia*.

7. *A. tortuosa*.

Stem-leaves linear or linear-lanceolate.

Corolla without a crown; glands at the base of the corolla evident.

Corolla-lobes obtuse or merely acute, not cuspidate; leaves narrowly linear-lanceolate. 8. *A. ventorum*.

Corolla-lobes cuspidate-tipped.

Stem-leaves lanceolate, rarely ovate-lanceolate; corolla-lobes lanceolate to ovate. 9. *A. propinqua*.

Stem-leaves ovate; corolla-lobes broadly ovate. 10. *A. arctophila*.

1. *A. monantha* (A. Nels.) Rydb. Low annual, less than 1 dm. high, usually with a few decumbent branches at the base; leaves oblong to spatulate, 5-10 mm. long; calyx-lobes only slightly unequal, oblong-lanceolate, acutish; corolla about 12 mm. long; lobes lanceolate, acute. *Gentiana monantha* A. Nels. High mountains: Colo.—Utah—Ida. *Mont.*—*Subalp.* JI-S.

2. *A. heterosepala* (Engelm.) Greene. Strict annual, 2-3 dm. high; basal leaves and lower stem-leaves spatulate, 1-3 cm. long, rounded or obtuse at the apex; upper leaves lanceolate, strongly 3-ribbed, acute or obtusish at the apex, 2.5-4 cm. long; flowers 1-3 in the axils of the leaves; corolla 10-15 mm. long; bristles of the crown numerous. *Gentiana heterosepala* Engelm. *A. distegia* Greene. ? *G. polyantha* A. Nels., a many-flowered form. Mountains: Utah—Colo.—N.M. *Submont.*—*Mont.* JI-Au.

3. *A. strictiflora* (Rydb.) Greene. Strict annual; stem 2-4 dm. high, simple or with erect branches; basal leaves spatulate, 2-3 cm. long; upper stem-leaves lanceolate, 3-5-ribbed, 2-5 cm. long, acute or acuminate; calyx-lobes moderately unequal, linear or lanceolate, acute, 5-8 mm. long; corolla 8-12 (rarely 14) mm. long, varying from greenish yellow to azure or white, with blue lobes; crown well developed, but setae often rather few. *G. strictiflora* (Rydb.) A. Nels. *A. conferta* Greene. Wet meadows and open woods: Alaska—Calif.—Colo.—Sask. *Submont.*—*Subalp.* JI-S.

4. *A. anisosepala* Greene. Strict annual; stem simple, or with a few ascending branches, 1-3 dm. high; basal leaves obovate or spatulate, 1-3 cm. long; middle stem-leaves oblong to oval, 1.5-3 cm. long, rounded at the apex; uppermost leaves lanceolate or ovate, acutish or obtuse; flowers mostly 1-3 in the axils, on naked pedicels; the longer calyx-lobes 6-10 mm. long, the smaller 4-6 mm.; corolla 8-10 mm. long, blue; lobes usually obtuse; crown well developed. *G. anisosepala* Greene. Wet woods: B.C.—Wash.—Wyo.—Mont. *Submont.*—*Mont.* Je-Au.

5. *A. scopulorum* Greene. Annual; stem 2-4 dm. high, simple or with ascending branches; basal leaves spatulate, 1-3 cm. long, obtuse; stem-leaves lanceolate, often acuminate at the apex, 2-6 cm. long; flowers 1-4 in the axils of the leaves, usually on naked pedicels; calyx-lobes linear, acute, the longer 10-12 mm. long; corolla 15-18 mm. long, blue or rarely greenish yellow; lobes ovate-lanceolate, acute; crown well developed. *Gentianella Clementis* Rydb. Mountains: Mont.—Ariz.—N.M.—N.D. *Submont.*—*Subalp.* JI-Au.

6. *A. plebeia* (Cham.) Greene. Strict annual; stem simple or with a few branches, 1-3 dm. high; basal leaves spatulate, 1-3 cm. long, obtuse; stem-leaves oblong, elliptic, or lanceolate, 1-3 cm. (usually about 2 cm.) long, obtuse

or the uppermost acute; flowers 1-3 in each axil; calyx-lobes linear, slightly unequal, 3-7 mm. long; corolla blue or bluish, 10-15 mm. long; lobes acute or obtuse; setae of crown numerous. *Gentiana plebeia* Cham. Mountains: Alaska —(? Calif.)—Colo.—Sask.—Mack.; e Asia. *Mont.*—*Subalp.* Jl—Au.

7. *A. tortuosa* (M. E. Jones) Rydb. Low annual, with spreading branches, about 1 dm. high or less; leaves all linear or linear-lanceolate, 1-3 cm. long; flowers numerous, fascicled in the axils; calyx-lobes subequal, about 6 mm. long; corolla yellowish, 8-10 mm. long; crown in the throat well developed. *Gentiana tortuosa* M. E. Jones. In meadows: South-central Utah. *Mont.* S.

8. *A. ventorum* Rydb. Low annual or biennial, branched near the base; stems 5-10 cm. long, branched; basal leaves oblanceolate; stem-leaves linear or linear-lanceolate, about 2 cm. long; flowers 1-3 in the axils; calyx-lobes linear-lanceolate, 3-5 mm. long, acute, scabrous on the margins; corolla about 5 mm. long; lobes ovate, obtuse or acute. Mountains: Wind River Mountains, Wyo. Au.

9. *A. propinqua* (Richards.) Greene. Annual, often branched near the base; stems 0.5-3 dm. high, often purplish; basal leaves spatulate or oblanceolate, 1-2 cm. long; stem-leaves lanceolate, 1-2 cm. long, acute; flowers 1-3 in the axils, on naked pedicels; calyx-lobes very unequal, the two outer ovate or oblong, acute, 5-7 mm. long, the rest linear, 3-5 mm. long; corolla blue, 10-17 mm. long. *G. propinqua* Richards. Moist slopes and glades: Alaska—B.C.—Alta.—Mack.; e Asia. *Subalp.*—*Alp.* Jl—Au.

10. *A. arctophila* (Griseb.) Greene. Low annual, branching at the base; branches 2-10 cm. high, decumbent; basal leaves spatulate or obovate, about 1 cm. long; stem-leaves 1 cm. or less long, acute; flowers 1-2 in the axils; calyx-lobes ovate, 5-8 mm. long; corolla 15-18 mm. long. *G. arctophila* Griseb. Arctic coast: Alta.—B.C. *Alp.* Au—S.

5. CHONDROPHÝLLA A. Nels. MOSS GENTIAN.

Small annuals or biennials. Leaves numerous, small, opposite, imbricate, with white scarious or cartilaginous margins. Flowers solitary and terminal. Calyx narrow, 4- or 5-lobed. Corolla salverform, plicate, with broad emarginate plaits in the sinuses. Ovary 1-celled. Anthers versatile. Capsule more or less stipitate. Seeds oblong, with close coat.

Leaves and calyx-lobes with broad scarious margins; capsule long-stipitate, at last exserted from the corolla.

Leaves and calyx-lobes slightly scarious-margined; capsule short-stipitate, not exserted.

1. *C. Fremontii* (Torr.) A. Nels. Low biennial, branched at the base, 1-10 cm. high; leaves glaucous and with broad white margins, the basal ones orbicular or obovate or ovate, about 5 mm. long; stem-leaves oblong to linear-lanceolate, acute, appressed, 3-5 mm. long; calyx-tube 5-7 mm. long; corolla 10-15 mm. long, light greenish purple. *Gentiana humilis* A. Gray, not Stev. Grassy banks in the mountains: Wyo.—Colo.—Alta. *Subalp.*—*Alp.* Je—Jl.

2. *C. americana* (Engelm.) A. Nels. Low biennial, branched at the base, 1-12 cm. high; leaves green, slightly if at all white-margined; basal ones orbicular or obovate, 2-5 mm. long; stem-leaves ovate, about 5 mm. long, scarcely appressed; calyx-tube 5-8 mm. long; corolla 10-20 mm. long, azure-blue; lobes ovate. *Gentiana prostrata americana* Engelm. Alpine-arctic regions: Alaska—Colo.—Alta. *Subalp.*—*Alp.* Je—Au.

6. DASYSTÉPHANA Adans. GENTIAN.

Mostly perennial, rarely annual, caulescent herbs. Leaves opposite, entire or merely erose-ciliolate. Flowers perfect, cymose, sessile or nearly so, rarely solitary and pedicelled. Calyx with a membrane inside the calyx-lobes, which vary from obsolete to foliaceous. Corolla salverform, funnelform, or clavate, without glands and crowns, but with cleft plaits between the convolute lobes. Stamens with converging or cohering anthers. Ovary 1-celled; ovules numerous. Capsule stipitate.

Seed-coats lamellose-rugose, the lamellae white, forming hexagonal areas; basal rosettes of leaves remaining at flowering time; perennials with short rootstocks.

Corolla 12–18 mm. long; leaves ovate or oval.

1. *D. glauca*.

Corolla 30–40 mm. long; leaves linear or linear-oblancoaleate.

2. *D. Romanzovii*.

Seed-coats smooth, but often produced into wings; basal rosettes none at flowering time; caespitose perennials.

Corolla closed; lobes in ours obsolete or nearly so; limb as well as the plaits incurved.

3. *D. Andrewsii*.

Corolla open, campanulate; lobes spreading or ascending.

Calyx-lobes broadly ovate or oval; seeds wingless.

Corolla-lobes rounded at the apex; calyx-tube 5–6 mm. long.

4. *D. obtusiloba*.

Corolla-lobes acute; calyx-tube 7–10 mm. long.

Leaves broadly ovate, usually obtuse at the apex and subcordate at the base; calyx-lobes obtuse.

5. *D. calycosa*.

Leaves ovate or lance-ovate, acute at both ends; calyx-lobes acute.

6. *D. monticola*.

Calyx-lobes linear, lanceolate, or none.

Floral leaves more or less broadened and more or less scarious; seeds usually wingless.

7. *D. Parryi*.

Floral leaves narrow, not scarious; seeds winged.

Calyx-lobes erect or none; corolla-lobes ascending or nearly erect, not toothed; plaits equally lobed.

Flower-cluster dense, its branches, peduncles, and internodes very short.

Leaves all except the floral ones ovate, oblong, or lanceolate.

Calyx-lobes well developed; calyx-tube truncate at the apex.

Leaves ovate or rarely lanceolate; calyx-lobes oblong or oblong-lanceolate; corolla open-funnelform.

8. *D. oregana*.

Leaves oblong or lanceolate; calyx-lobes linear or linear-lanceolate; corolla narrowly funnelform.

9. *D. affinis*.

Calyx-lobes none or minute; calyx-tube irregular, more or less lobed or cleft.

10. *D. Forwoodii*.

Upper stem-leaves linear or lance-linear.

Plant erect, many-flowered; corolla nearly cylindraceous, 2–2.5 cm. long.

11. *D. Bigelovii*.

Plant decumbent, few-flowered; corolla funnelform, 2.5–3 cm. long, or more.

9. *D. affinis*.

Flower-cluster lax, its branches, lower peduncles, and internodes elongate.

12. *D. interrupta*.

Calyx-lobes widely spreading, linear-lanceolate; corolla-lobes in anthesis strongly spreading, more or less denticulate; plaits unequally 2-lobed.

13. *D. puberula*.

1. *D. glauca* (Pallas) Rydb. Stem simple, 2–10 cm. high; basal leaves rosulate, oval or obovate, 0.5–1.5 cm. long, rather fleshy; stem-leaves 2–3 pairs, oval or obovate, about 1 cm. long; calyx-tube 5–6 mm. long; lobes lanceolate, about 1.5 mm. long; corolla blue; lobes ovate, obtuse; lobes of the plaits ovate, entire. *Gentiana glauca* Pallas. Arctic-alpine situations: Alaska—B.C.—Mont.; e Asia. *Subalp.*—*Alp.* JI–Au.

2. *D. Romanzovii* (Ledeb.) Rydb. Basal leaves many, linear-oblancoaleate to narrowly linear, 3–10 cm. long; stem-leaves linear or linear-oblong, 2.5–5 cm. long; stem 5–10 cm. long; calyx-tube 12–15 mm. long; lobes linear-oblong, obtuse, 5–10 mm. long; corolla yellowish white, tinged with blue and purple-dotted; lobes triangular, acute; plaits entire, with a very broadly triangular summit. *G. frigida* A. Gray, not Haenke. *G. Romanzovii* Ledeb. Arctic-alpine situations: Alaska—Utah—Colo.—Mont. *Mont.*—*Alp.* JI–Au.

3. *D. Andrewsii* (Griseb.) Small. Stem glabrous, simple, 3–6 dm. high, leafy; leaves lanceolate or ovate-lanceolate, 7–15 cm. long, 3–7-ribbed; flowers in terminal clusters and in the axils of the uppermost leaves; calyx-tube 8–12 mm. long; lobes lanceolate or ovate, ciliolate, spreading; corolla broadly clavate, bluish or white, closed; lobes obsolete, rounded; lobes of the plaits rounded, erose, yellowish. *G. Andrewsii* Griseb. Wet meadows and among bushes: Que.—Ga.—Nev.—Neb.—S.D. *Plain.* Au–O.

4. *D. obtusiloba* Rydb. Stems erect or ascending, about 1 dm. high; internodes short, equalling or a little longer than the leaves; leaves very broadly ovate, 3–5-ribbed, usually acute at the apex and subcordate at the base; calyx-tube 5–6 mm. long; lobes broadly oval, rounded at the apex, often overlapping, about 8 mm. long; corolla dark blue, about 3.5 cm. long; lobes of the plaits about half as long as the corolla-lobes. High mountains: Mont. *Submont.* JI–Au.

5. *D. calycosa* (Griseb.) Rydb. Stems 1-3 dm. high, ascending, erect or decumbent; internodes short, about equalling the leaves; leaves 2-3 cm. long, 3-5-ribbed; flowers usually solitary, sessile, and subtended by the upper broad leaves; calyx-lobes ovate, foliaceous, 7-10 mm. long, obtuse; corolla dark blue, or (in var. *xantha* A. Nels.) yellow, green-spotted, 3-4 cm. long; lobes ovate, triangular-acute at the apex; plaits with a lanceolate, more or less lacinate, acuminate prolongation, half as long as the corolla-lobes or longer. *G. calycosa* Griseb. High mountains: Wash.—Calif.—w Wyo. *Mont.*—*Subalp.* Jl-S.

6. *D. monticola* Rydb. Stem about 1 dm. high, erect; internodes usually shorter than the leaves; leaves 3-ribbed; flowers solitary and sessile, subtended by the broad upper leaves; calyx-tube 7-9 mm. long; lobes lance-ovate, 8-10 mm. long; corolla dark blue, about 3 cm. long; lobes of the plaits lanceolate, acuminate, lacinate or toothed, half as long as the corolla-lobes or longer. High mountains: Wash.—Mont.—nw Wyo. *Mont.*—*Subalp.* Au.

7. *D. Parryi* (Engelm.) Rydb. Stems erect or ascending, many-leaved, 1-4 dm. high; leaves from linear-lanceolate to ovate, fleshy and somewhat glaucous, 1.5-4 cm. long; flowers 1-6 at the summit of the stem; calyx-tube 10-15 mm. long, white and scarious; lobes linear or lanceolate, 4-8 mm. long; corolla bright blue, about 4 cm. long; lobes obovate, acute; lobes of the plaits ovate, usually 2-cleft, toothed, two-thirds as long as the corolla-lobes. *G. Parryi* Engelm. *G. bracteosa* Greene. High mountains: Wyo.—Colo.—Utah. *Mont.*—*Subalp.* Jl-S.

8. *D. oregana* (Engelm.) Rydb. Stems erect, 3-4 dm. high, leafy; leaves 2-4 cm. long, 3-5-ribbed, acutish or obtuse, rounded to acute at the base; flowers short-pedicelled in the upper axils; calyx-tube about 1 cm. long; lobes 5-8 mm. long; corolla purple, 3-3.5 cm. long; lobes ovate, acute; lobes of the plaits triangular, with 2 acuminate lobes. *G. oregana* Engelm. Meadows: Wash.—Calif.—Mont. *Submont.* Jl-S.

9. *D. affinis* (Griseb.) Rydb. Stems 1-3 dm. high, leafy; leaves 1.5-3 cm. long; calyx-tube 5-7 mm. long; lobes 2-10 mm. long, acute; corolla blue or purple, 2.5-3 cm. long; lobes ovate, acute; lobes of the plaits ovate, 2-cleft, acuminate, lacinate, two-thirds as long as the corolla-lobe. *G. affinis* Griseb. Mountains and hills: B.C.—(? Calif.)—Colo.—Sask. *Mont.*—*Subalp.* Au-S.

10. *D. Forwoodii* (A. Gray) Rydb. Closely related to *D. affinis*; stem 1-3 dm. high, leafy; leaves 1.5-3 cm. long, rather thick; flowers short-pedicelled in the upper axils, forming a dense spike-like inflorescence; calyx-tube 5-8 mm. long, usually purplish; corolla blue or purple, about 3 cm. long; lobes obovate, acute; lobes of the plaits 2-cleft, lanceolate, acuminate, a little shorter than the corolla-lobes. *G. Forwoodii* A. Gray. Hills and mountains: Alta.—Colo.—Ida. *Submont.*—*Mont.* Jl-Au.

11. *D. Bigelovii* (A. Gray) Rydb. Stem 2-3 dm. high, erect; lower leaves oblong, the upper linear or lance-linear; floral leaves and calyx-lobes glandular-ciliate; flowers short-pedicelled in the upper axils, forming a many-flowered spike; calyx-tube 5-6 mm. long; lobes linear-subulate, 5-7 mm. long; corolla cylindro-funnelform, 2-2.5 cm. long; lobes acute; lobes of the plaits triangular, 2-cleft, acute, half as long as the corolla-lobes. *G. Bigelovii* A. Gray. Mountains: Colo.—N.M.—Ariz. *Submont.* Au-O.

12. *D. interrupta* (Greene) Rydb. Stem 3-4 dm. high; lower leaves ovate or oblong, 1-2 cm. long, the upper narrowly linear, 2-4 cm. long; lower flowers on peduncles 1-2 cm. long; calyx-tube 5-6 mm. long; lobes linear or subulate, 2.5-4 mm. long; corolla open-funnelform, 2.5-3 cm. long; lobes obovate; lobes of the plaits 2-cleft; divisions lanceolate, acute, two-thirds as long as the corolla-lobes. *G. interrupta* Greene. Mountains: Wash.—Ore.—Colo.—Sask. *Submont.* Au-S.

13. *D. puberula* (Michx.) Small. Stem strict, erect, 3-5 dm. high, more or less scabrous, leafy; leaves lanceolate, firm, scabrous-puberulent on the margins and midrib, paler beneath, 3-5 cm. long; flowers subsessile, forming a dense spike; calyx-tube not scarious, about 1 cm. long; lobes subulate, 8-12 mm. long,

spreading; corolla blue, about 4 cm. long, open-funnelform; lobes obovate, obtuse or acute; lobes of the plaits 2-cleft, often laciniate, half as long as the corolla-lobes. *G. puberula* Michx. Prairies: Ohio—Ga.—Kans.—Sask. *Plain.*

7. PLEURÓGYNE Eschsch. MARSH FELWORT.

Low slender annuals. Leaves opposite, entire. Flowers perfect. Calyx deeply 4- or 5-cleft. Corolla rotate, 4- or 5-cleft, its divisions acute, with a pair of scale-like appendages on their base. Stamens inserted on the base of the corolla; anthers introrse, versatile. Style none; stigmas decurrent on the sutures; ovary 1-celled. Capsule lanceolate or oblong, not stipitate. Seeds numerous.

1. *P. fontana* A. Nels. Glabrous annual, 1-4 dm. high, with erect branches; leaves linear, thin, with strong midrib and faint lateral ribs, 2-2.5 cm. long; flowers in narrow racemes or panicles, pentamerous; sepals linear, 3-nerved; corolla whitish, about 12 mm. long, often slightly shorter than the sepals; lobes oblong, acute. *P. rotata tenuifolia* Griseb. Bogs in the mountains: Alta.—Colo. *Mont.*—*Subalp.* Jl—Au.

8. SWÉRTIA L.

Simple-stemmed, caulescent perennials. Leaves opposite or some alternate. Flowers perfect, blue or rarely white, in a thyrsoid inflorescence. Calyx 4- or 5-parted. Corolla rotate, usually 5-parted, each division bearing a pair of nectariferous pits; lobes convolute in the buds. Stamens inserted on the base of the corolla. Style very short or none; stigma 2-lobed; ovary 1-celled; capsule ovate; placentae not intruded. Seeds large, flat, commonly margined.

Inflorescence elongate; corolla-lobes linear or oblong.

Leaves with 3-5 parallel ribs from the base.

Leaves not parallel-ribbed.

Petals not spotted; basal leaf-blades much longer than the petioles.

Petals spotted; basal leaf-blades not longer than the petioles.

Inflorescence congested; corolla-lobes oval-elliptic.

1. *S. parallela*.

2. *S. scopulina*.

3. *S. Fritillaria*.

4. *S. congesta*.

1. *S. parallela* Greene. Stem about 3 dm. high; lower leaves 10-15 cm. long, oblong-ob lanceolate or oblong-elliptic; upper stem-leaves oblong, sessile, opposite; inflorescence narrow; corolla lurid-purple; lobes lance-oblong, obtuse, about 1 cm. long; glands with rather long fringe. Mountains: Mont.—Ida. *Mont.* Jl.

2. *S. scopulina* Greene. Stem 1-3 dm. high; basal leaves and lower stem-leaves alternate, 10-15 cm. long, thin, oblong or elliptic to oblanceolate, obtuse, pinnately-veined; upper stem-leaves opposite, elliptic or lanceolate, sessile; corolla dark blue or purple; lobes linear to oblong, obtuse, about 1 cm. long; glands orbicular with short, subulate appendages. *S. palustris* A. Nels. Mountains, in wet places: Mont.—Colo.—Utah. *Mont.*—*Subalp.* Jl—Au.

3. *S. Fritillaria* Rydb. Stem 1.5-3 dm. high; basal leaves and lower stem-leaves alternate, 6-10 cm. long, thin, obovate-spatulate, rounded at the apex; middle and upper stem-leaves all alternate or a single pair of opposite ones, oblanceolate or oblong; corolla-lobes lanceolate, mostly acute, greenish white along the midrib and azure along the margins, all over dotted with dark blue spots; glands inconspicuous, with rather long blue fringes. Wet places in cañons: Utah. *Mont.* Au.

4. *S. congesta* A. Nels. Stem about 1 dm. high; basal leaves and lower stem-leaves alternate, 5-10 cm. long, elliptic to oblanceolate, feather-veined, obtuse; upper stem-leaves usually a single pair, opposite, oblong, sessile; corolla dark bluish purple; lobes obtuse or emarginate, 8-10 mm. long; glands cup-shaped, with long appendages; stamens surrounded by a ring of setae. Swales: Wyo.—Utah—Ida.—Mont. *Mont.*—*Alp.* Au.

9. FRÀSERA Walt. AMERICAN COLUMBO.

Perennial herbs, with hollow stems and taproots. Leaves opposite or more often whorled, entire, thickish. Flowers perfect, in terminal paniculate cymes.

Sepals 4, nearly distinct, narrow. Corolla rotate, deeply 4-cleft; lobes convolute in bud, each with a single round gland, without a crown. Stamens 4, inserted at the base of the corolla; filaments subulate; anthers versatile. Ovary 1-celled; stigma 2-lobed. Capsule flattened parallelly to the valves. Seeds orbicular, wing-margined.

1. *F. fastigiata* (Pursh) Heller. Stem 6–10 dm. high, glabrous; basal leaves 2–4 dm. long, glabrous, oblanceolate to broadly spatulate, obtuse or acute, 5–8 cm. wide, thin, feather-veined; stem-leaves verticillate, usually in 3's, oblong or lanceolate, sessile, acute; inflorescence an interrupted, much compound panicle or thyrsus; corolla pale blue; lobes lance-oblong or elliptic, acute, thin. Hillsides and open woods: Ida.—Wash.—Ore. *Submont.* My-Jl.

10. *LEUCOCRÁSPEDUM* Rydb.

Perennials with taproots. Leaves opposite or whorled, narrow, firm, with white margins. Flowers perfect, thyrsoid or paniculate. Sepals 4, almost distinct, persistent. Corolla rotate, deeply 4-parted, marcescent; lobes each with a single gland usually contiguous with a decurrent crown, saccate at the base. Stamens inserted on the base of the corolla; filaments subulate to ovate. Style slender; ovary 1-celled. Capsule usually flattened parallelly to the flat-tish valves. Seeds mostly flat and margined.

Scales between the stamens wanting (represented by merely hairs); corolla greenish yellow.

Basal leaves oblanceolate; lower stem-leaves linear.

1. *L. albomarginatum*.

Basal leaves lanceolate; lower stem-leaves long-acuminate from an ovate base.

2. *L. utahense*.

Scales between the stamens present, fringed or cleft.

Flowers creamy white; plant glabrous.

3. *L. montanum*.

Flowers blue.

Plant puberulent; inflorescence dense; interstaminal scales lanceolate.

4. *L. albicaule*.

Plant glabrous; inflorescence more open; interstaminal scales obovate or orbicular.

5. *L. coeruleum*.

1. *L. albomarginatum* (S. Wats.) Rydb. Stem 3–10 dm. high, glabrous; basal leaves about 1 dm. long, glabrous; stem-leaves linear or the floral ones reduced to subulate bracts, verticillate in 3's or 4's, rarely opposite; inflorescence open, often flat-topped; sepals lanceolate, 4–5 mm. long; corolla greenish yellow; lobes ovate, cuspidate-acuminate, 6–8 mm. long; gland elongate, extending from the base to above the middle of the corolla-lobe, obovate at the summit. *Frasera albomarginata* S. Wats. Dry regions: s Utah—Nev.—Ariz. *Son.*

2. *L. utahense* (M. E. Jones) Rydb. Stem glabrous, 1–2 m. high, erect; basal leaves lanceolate, long-acuminate, 2–4 cm. wide, strongly 3-ribbed and with intermediate ribs; lower stem-leaves opposite, 7–10 cm. long, about 2 cm. wide, gradually tapering to a slender point, the upper bract-like; inflorescence open, its branches divaricate; sepals broadly ovate, acute or abruptly acuminate, about 4 mm. long; corolla yellowish green, with purple spots; lobes oblong-obovate, obtuse. *F. utahensis* M. E. Jones. Mountains: s Utah. *Son.* Je.

3. *L. montanum* (Mulford) Rydb. Stem glabrous, 3–9 dm. high; basal leaves narrowly oblanceolate, glabrous, 1.5–2 dm. long; stem-leaves opposite, linear, the upper spreading or reflexed; inflorescence many-flowered, dense; sepals linear-subulate, about 6 mm. long; corolla creamy white; lobes 6–8 mm. long, oblong, acute; glands oblong-obovate, near the base of the corolla-lobes and of scarcely one-third their length, short-fringed on the margins. *F. montana* Mulford. Mountains: Ida. *Submont.* Jl.

4. *L. albicaule* (Dougl.) Rydb. Stems about 3 dm. high, erect, strict, finely puberulent; basal leaves narrowly linear-oblanceolate, about 1 dm. long, 4–15 mm. wide, 3-ribbed; white margins very narrow; stem-leaves opposite, narrowly linear, 6–10 cm. long, the upper spreading or reflexed; sepals linear-lanceolate or linear-subulate, 6–8 mm. long; corolla blue; lobes ovate-lanceolate, acuminate, thin, 8–10 mm. long; gland linear, extending from the base of the corolla-lobes to their middle, fringed at the margin. *F. albicaulis* Dougl. Hillsides and meadows: Wash.—Ore.—Ida. *Submont.* My-Je.

5. *L. coeruleum* (Mulford) Rydb. Stems erect, 1.5–4 dm. high, glabrous; basal leaves linear-ob lanceolate, glabrous, 1–1.5 dm. long; stem-leaves narrowly linear, opposite, 4–8 cm. long; floral ones bract-like; sepals lanceolate, white-margined, about 6 mm. long; corolla blue; lobes ovate, acute, 6–8 mm. long; gland linear, green, extending from the base to near the middle of the corolla-lobes, fringed on the margin. *F. coerulea* Mulford. Mountains: Ida.—Ore. *Submont.*—*Mont.*

11. *TESSARÁNTHIUM* Kellogg. DEER'S TONGUE.

Stout perennials with taproots. Leaves in whorls of 4, entire, strongly parallel-veined, rather firm. Flowers perfect, in an elongate many-flowered thyrsus. Sepals nearly distinct, narrowly linear, at least equalling the corolla. Corolla rotate, deeply 4-cleft; each division with a pair of oblong glands, and a separate crown below them, dull white or greenish white, dark spotted. Stamens inserted on the base of the corolla; filaments subulate. Capsule compressed contrary to the deeply boat-shaped valves. Seed oblong, flat, margined.

Corolla-lobes 18–22 mm. long, usually exceeded by the long sepals.

Plant glabrous; inflorescence simple with verticillate pedicels; basal leaves over 1 dm. wide.

Plant puberulent; inflorescence compound; some branches simple, others again branched; basal leaves about 5 cm. wide.

Corolla-lobes about 15 mm. long or less; inflorescence compound.

Sepals narrowly linear, usually much exceeding the petals.

Sepals linear-lanceolate or subulate, scarcely equalling the petals.

Stem-leaves oblanceolate.

Stem-leaves linear-lanceolate.

1. *T. macrophyllum*.

2. *T. scabrum*.

3. *T. stenosepalum*.

4. *T. speciosum*.

5. *T. angustifolium*.

1. *T. macrophyllum* (Greene) Rydb. Stem 1–2 m. high, very leafy; basal leaves oblanceolate, 3–5 dm. long, 6–13 cm. wide, rather thin, glabrous, 9–15-ribbed; stem-leaves lanceolate, verticillate; pedicels of various length, 3–15 cm. long, usually simple; sepals linear-subulate, 2–3.5 cm. long; corolla-lobes obovate, 18–22 mm. long; fringes of the crown long, almost equalling the narrowly oblong glands. *Frasera macrophylla* Greene. Rich hillsides: Wyo.—N.M. *Submont.*—*Mont.* Jl–Au.

2. *T. scabrum* (M. E. Jones) Rydb. Stem 1 m. or less high, leafy; basal leaves 1–3 dm. long, 3.5–6 cm. wide, oblanceolate, acute, with 7–9 strong ribs, scabrous-puberulent; stem-leaves linear-lanceolate; peduncles axillary, some simple, one-flowered, others branched and 2–5-flowered; sepals linear-subulate, 12–30 mm. long; corolla-lobes 18–20 mm. long, oblong-obovate, obtuse; fringes of the crown equalling the oblanceolate glands. *F. speciosa scabra* M. E. Jones. Hills and mesas: Ariz.—Utah—Colo.—N.M. *Submont.*—*Mont.* Je–Jl.

3. *T. stenosepalum* Rydb. Stem 1 m. high or less; basal leaves oblanceolate, 1.5–3 dm. long, 3–5 cm. wide, scabrous-puberulent, thick, 11–13-ribbed, very acute; stem-leaves lanceolate; flowers numerous, on axillary, simple or rarely branched peduncles; sepals 1–2 cm. long; corolla-lobes elliptic, about 15 mm. long, acute; fringes of the crown equalling the oblong glands. *F. speciosa stenosepala* Rydb. Foot-hills and mountain-sides: Wyo.—N.M. *Submont.*—*Mont.* Je–Au.

4. *T. speciosum* (Dougl.) Rydb. Stem 3–15 dm. high; basal leaves oblanceolate, acute, 1–3 dm. long, 3–5 cm. wide, more or less scabrous-puberulent; sepals 10–15 mm. long; corolla-lobes oval, acutish, 12–15 mm. long; fringes of the crown usually shorter than the oblong glands. *F. speciosa* Dougl. Hills and mountains: Ore.—Calif.—Colo.—S.D.—*Mont.* *Plain*—*Mont.* Je–Au.

5. *T. angustifolium* Rydb. Stem 3–6 dm. high, puberulent; basal leaves mostly reduced and scale-like or a few linear or linear-lanceolate, 5–8 cm. long, 0.5–1.5 cm. wide; peduncles usually simple and 1-flowered; sepals linear-subulate, 8–10 mm. long; corolla-lobes about 12 mm. long, oval, acute; fringes of the crown scarcely equalling the oblong glands. *F. speciosa angustifolia* Rydb. Hills: *Mont.*—Colo. *Submont.*—*Mont.*

12. *TETRAGONÁNTHUS* J. F. Gmel. SPURRED GENTIAN.

Annual or perennial caulescent herbs. Leaves opposite, entire. Flowers perfect, in terminal or axillary cymes or panicles. Calyx deeply 4-cleft. Cor-

olla white, yellow, blue, or purple, with a short tube, 4-lobed; each lobe produced into a spur or sack at the base. Stamens 4, inserted on the lower part of the corolla-tube; filaments filiform or dilated at the base; anthers versatile. Ovary 1-celled; placentae intruded; style short or wanting; stigma 2-lobed. Capsule ovoid or oblong. Seeds slightly flattened, smooth. [*Halenia* Borkh.]

1. **T. deflexus** (Smith) Kuntze. An annual, usually simple, 1.5–4.5 dm. high; basal leaves obovate or spatulate, petioled; stem-leaves oblong or the upper ovate, acute, 3–5-ribbed, 2–4 cm. long; sepals lanceolate, acuminate; corolla yellowish or greenish white, or purplish, 6–8 mm. long; lobes triangular-ovate, acute; spurs slightly spreading, rather slender. *H. deflexa* (Smith) Griseb. Damp woods: N.S.—N.Y.—S.D.—B.C. *Boreal*—*Submont.* Jl—Au.

FAMILY 104. **MENYANTHACEAE.** BUCKBEAN FAMILY.

Perennial aquatic or bog plants with horizontal rootstocks. Leaves alternate, but often all basal, simple or trifoliolate. Flowers perfect, solitary or in terminal clusters or racemes. Calyx of 5 partially united sepals. Corolla from rotate to funnelform; lobes induplicate-valvate. Stamens 5; filaments adnate to the corolla-tube. Gynoecium of 2 united carpels; ovary 1-celled with two parietal placentae; stigmas 2. Fruit a capsule, indehiscent, irregularly bursting, or valvate.

1. **MENYANTHES** (Tourn.) L. BUCKBEAN, MARSH TREFOIL, BOG-BEAN.

Perennial bog plant. Leaves long-petioled, trifoliolate, basal. Flowers perfect, racemose or paniculate, on a long scape. Calyx 5-parted. Corolla short funnelform, 5-lobed, its lobes fimbriate or bearded within, white, spreading. Stamens inserted on the tube of the corolla; filaments filiform; anthers sagittate. Capsule ovoid, indehiscent or at last ruptured. Seeds few, subglobose, shining.

1. **M. trifoliata** L. Perennial, with a stout rootstock; scape 1–3 dm. high; leaflets oval or elliptic, thick, glabrous, 5–10 cm. long; corolla white, tinged with rose, campanulate-funnelform, about 15 mm. long; lobes copiously fimbriate within. In water and bogs: Lab.—Newf.—Pa.—Colo.—Calif.—Alaska. *Plain*—*Mont.* My—Jl.

FAMILY 105. **APOCYNACEAE.** DOGBANE FAMILY.

Perennial herbs (all ours), vines, shrubs, or trees, with milky juice. Leaves opposite or alternate, without stipules, simple. Flowers perfect, regular. Calyx of 5 persistent sepals, imbricate in the bud. Corolla of 5 partially united petals, with convolute lobes. Stamens 5, alternating with the corolla-lobes; anthers 2-celled. Gynoecium of two, distinct (in ours) or united carpels; if united, the ovary either 2-celled, or 1-celled, with two parietal placentae; styles united. Fruit in ours of two follicles.

Anthers unappendaged at the base, not connected with the stigma; flowers without a disk; leaves alternate.

1. **AMSONIA.**

Anthers appendaged at the base, converging around and coherent to the stigma; calyx-tube partly attached to the gynoecium by means of a thick disk; leaves opposite.

2. **APOCYNUM.**

1. **AMSONIA** (Clayt.) Walt.

Perennial herbs. Leaves alternate, entire. Flowers in terminal corymbiform cymes. Calyx-lobes 5. Corolla salverform; tube slightly enlarging upwards, villous within; lobes narrow. Disk wanting. Stamens included; anthers unappendaged. Carpels 2, united by the styles. Stigmas appendaged by a reflexed membrane. Follicles 2, erect, several-seeded. Seeds unappendaged.

Plant glabrous or nearly so.

Sepals lanceolate, short-acuminate, a little more than 1 mm. long; pod not torulose.

1. *A. latifolia.*

Sepals subulate, long-attenuate, 2-4 mm. long; pod more or less torulose or constricted around the seeds.

Leaves ovate or those of the branches lanceolate.

Leaves narrowly lanceolate, those of the branches linear.

Plant densely villous.

2. *A. brevifolia*.

3. *A. Eastwoodiana*.

4. *A. tomentosa*.

1. *A. latifolia* M. E. Jones. Perennial, with a woody base; stems several, 2-5 dm. high, glabrous; leaves ovate to lanceolate, acute or acuminate, 3-5 cm. long, sessile; corolla lead-purple, about 15 mm. long; lobes oblong, two-thirds as long as the tube; follicles about 4 cm. long, 3-4 mm. thick, not torulose. *A. texana* Rydb. (Fl. Colo.). Clayey or alkaline soil: w Colo.—Utah—Ariz. *Son.*

2. *A. brevifolia* A. Gray. Perennial, often with a woody base; stem glabrous, 3-5 dm. high; leaves thick; corolla about 1.5 cm. long, constricted at the mouth, and bearded within the throat; lobes ovate or oblong, half as long as the tube; follicles 5-7 cm. long, thickish. Arid regions: Utah—Ariz.—Calif. *Son.* My-Je.

3. *A. Eastwoodiana* Rydb. Perennial, with a short woody base; stem 3-5 dm. high; leaves 3-5 cm. long; corolla 16-20 mm. long; tube narrowly trumpet-shaped; lobes nearly 4 mm. long; follicles 5-8 cm. long, about 8 mm. thick, often breaking off between the seeds. In cañons of desert regions: Utah—Ariz. *Son.* Je-Jl.

4. *A. tomentosa* Torr. Perennial, with a woody base; stems 2-4 dm. high, villous; leaves cinereous-villous, lanceolate to linear, sessile, 3-5 cm. long; calyx-lobes subulate, about 3 mm. long; corolla about 15 mm. long, contracted at the throat, which is bearded within; lobes oblong, half as long as the tube; follicles 7-8 cm. long, not torulose. Sandy plains: Tex.—s Utah—Ariz. *L. Son.*

2. *APÓCYNUM* (Tourn.) L. DOGBANE, INDIAN HEMP.

Perennial herbs with branched stems. Leaves opposite, entire. Flowers in corymbose cymes. Sepals 5. Corolla campanulate; tube with five small appendages, alternating with the stamens; lobes 5. Stamens adnate to the base of the corolla-tube; anthers sagittate, at least coherent to the stigma. Follicles 2, slender. Seeds numerous, tipped with a long coma.

Corolla fully twice as long as the calyx; its lobes spreading in anthesis.

Leaves more or less pubescent beneath.

Sepals broadly lanceolate; corolla open campanulate; leaves thick, dark green, decidedly pubescent beneath.

Leaves oval, acute at both ends; plant usually tall.

Leaves more or less ovate, rounded, truncate, or cordate at the base; plant low, diffuse.

Leaves rounded, rarely truncate at the base; stem and branches glabrous.

Leaves subcordate or at least truncate at the base; stem and branches mostly pubescent.

Sepals narrowly lanceolate; corolla narrower, almost cylindro-campanulate; leaves pale green, pubescent merely on the petioles and the veins beneath, the lower truncate, the upper acute at the base.

Leaves perfectly glabrous.

Leaf-blades lanceolate or rarely ovate, pale; corolla almost white, narrowly campanulate.

Leaves broadly or rounded ovate, thicker and dark green; corolla rose-colored, open campanulate.

Sepals acute; corolla 5-6 mm. long.

Sepals acuminate; corolla 7-9 mm. long.

Corolla less than twice as long as the calyx; its lobes erect or nearly so.

Leaves acute at the base, petioled.

Leaves, at least those of the main stem, truncate or subcordate at the base and subsessile.

6. *A. ambigens*.

7. *A. macranthum*.

8. *A. cannabinum*.

9. *A. sibiricum*.

1. *A. androsaemifolium* L. Stem erect, 3-15 dm. high, glabrous; leaf-blades 4-10 cm. long, pale beneath; calyx-lobes ovate, acuminate, scarcely 1 mm. long; corolla pink; tube 4-5 mm. long; lobes ovate, obtuse. Thickets and fields: Anticosti—Ga.—Ariz.—Ida.—B.C. *Plain—Mont.* Je-Jl.

2. *A. scopulorum* Greene. Stem 3-6 dm. high, glabrous; leaf-blades ovate, rounded or truncate at the base, 3-6 cm. long, thick, dark green above, pale beneath; calyx-lobes lanceolate, acute or somewhat acuminate, 1.5-2 mm. long;

corolla pink; tube about 4 mm. long; lobes reflexed, ovate, obtuse. Hillsides and open woods: Sask.—Colo.—Ida.—Yukon. *Plain—Mont.*

3. **A. pumilum** (A. Gray) Greene. Stem 1–5 dm. high, more or less pubescent; leaf-blades rounded-ovate, 2–6 cm. long, dark green above, pale and finely pubescent beneath, rounded at the apex, the lower usually truncate or cordate at the base; calyx-lobes lanceolate, acuminate, 2–3 mm. long; corolla rose-colored; tube 4–5 mm. long; lobes oblong, reflexed, obtuse. *A. polycardium* and *A. griseum* Greene. Mountain sides and open woods: Wash.—Mont.—Utah—Calif. *Son.—Mont. Je—Au.*

4. **A. lividum** Greene. Stem 1 m. or more high, glabrous, with ascending branches; leaf-blades elliptic-lanceolate or oblong-ovate, 7–10 cm. long, pale green above, glaucous beneath; calyx-lobes lanceolate, acute, 2–2.5 mm. long, whitish, thin; corolla pale flesh-colored or white; tube about 3.5 mm. long; lobes fully 2 mm. long, oblong, obtuse, spreading or reflexed. Mountains: Utah—Colo. *Submont. Jl.*

5. **A. convallarium** Greene. Stem tall, 1 m. high or more, glabrous, with ascending branches; leaf-blades glaucous beneath, acute and mucronate at the apex, the lower rounded or subcordate at the base; calyx-lobes lanceolate, pale, acute, about 2 mm. long, corolla white or nearly so; lobes 2 mm. long, oblong, obtuse, spreading. *A. vacillans* Greene. *A. Elmeri* Greene. *A. occidentale* Rydb. Plains and rocky hills: Mont.—Wyo.—Ariz.—Wash. *Plain—Submont. Je—Jl.*

6. **A. ambigena** Greene. Stem 3–6 dm. high, glabrous, often tinged with purple above, with ascending branches; leaf-blades thick, dark green above, paler beneath, rounded or sometimes subcordate at the base, 3–6 cm. long; calyx-lobes lanceolate, acute, 2 mm. long, usually purple-tinged; corolla flesh-colored or rose, 4–4.5 mm. long; lobes 2 mm. long, oblong, obtuse, reflexed. River bottoms and hillsides: Mont.—S.D.—Colo.—Utah—Wash. *Submont.—Mont. Je—Au.*

7. **A. macranthum** Rydb. Stem 3–4 dm. high, glabrous, with rather spreading branches; leaf-blades thick, dark green above, paler beneath, rounded-ovate, 4–5 cm. long, rounded at the base; calyx-lobes lanceolate, acuminate, 3 mm. long, tinged with purple; corolla pink; lobes oblong, reflexed, 3–3.5 mm. long. Copses: Ida. *Submont. Jl.*

8. **A. cannabinum** L. Stem 5–15 dm. high, glabrous, with erect or ascending branches; leaf-blades oblong, lanceolate-oblong or ovate-oblong, light green above, glaucous beneath, usually perfectly glabrous; calyx-lobes lanceolate, acute or acuminate, about 2.5 mm. long; corolla greenish white; lobes ovate, about 1.5 mm. long. Thickets and fields: Anticosti—Fla.—L. Calif.—B.C. *Plain—Submont. Je—Au.*

9. **A. sibiricum** Jacq. Stem 3–6 dm. high, glabrous, with ascending branches; leaves oblong, oblong-lanceolate, or oval, 2–8 cm. long, cordate-clasping, rounded or truncate at the base, obtuse or acute and mucronate at the apex, pale green and glabrous; calyx-lobes lanceolate, acute, 2.5 mm. long; corolla greenish white, campanulate; lobes lance-oblong, erect; follicles 5–9 cm. long. *A. hypericifolium* Ait. *A. cervinum* Greene. River valleys and hillsides: Ont.—Ohio—N.M.—B.C. *Plain—Submont. Je—Au.*

FAMILY 106. ASCLEPIADACEAE. MILKWEED FAMILY.

Perennial herbs or vines, or in warmer climates shrubs, with milky juice. Leaves opposite, whorled, or alternate, without stipules. Flowers perfect, regular, mostly umbellate. Sepals distinct or nearly so, imbricate in bud. Corolla campanulate, urceolate, funnelform or rotate, 5-lobed, the lobes usually reflexed. A 5-lobed crown is usually present between the corolla and the stamens, adnate to either or both. Stamens 5, adnate to the base of the corolla; filaments monadelphous; anthers attached by the base, in-

trorse. Gynoecium of 2 carpels. Styles 2, connected at the summit by the stigmas. Ovules numerous, anatropous, pendulous. Fruit of two carpels. Seeds many, compressed, appendaged by a long coma.

Crowns wanting; corolla urceolate or campanulate; stem twining. 1. **ASTEPHANUS**.
Crowns present; corolla rotate or open-campanulate.

Crowns double, the outer of a shallow undulate ring; plants twining.

Crowns simple; plants erect or decumbent, not twining. 2. **PHILIBERTELLA**.
Corolla-lobes reflexed during anthesis.

Hoods of the crown crestless or with an obscure crest within.

Hoods of the crown with a horn-like or tooth-like crest within. 3. **ACERATES**.

Corolla-lobes erect-spreading during anthesis. 4. **ASCLEPIAS**.
5. **ASCLEPIODORA**.

1. **ASTÉPHANUS** R. Br.

Perennial herbs or suffruticose plants, ours twining. Flowers perfect, regular, umbellate. Calyx 5-lobed, destitute of glands. Corolla urceolate or campanulate, 5-cleft; lobes slightly convolute. Crown wanting. Stamens inserted on the base of the corolla-tube. Follicles long-acuminate, smooth.

1. **A. utahensis** Engelm. Perennial from a thick root; stem slender, filiform; leaves linear-filiform; umbels short-peduncled, 3-5-flowered; corolla dull yellow, campanulate, 2 mm. wide; lobes ovate, somewhat hooded, papillose-puberulent within. Dry sandhills: s Utah—Ariz. *L. Son.*

2. **PHILIBERTÉLLA** Vail.

Twining perennial herbs, or partly shrubby. Leaves opposite, linear, cordate, or hastate. Flowers perfect, regular, umbellate. Calyx small, 5-lobed. Corolla campanulate or rotate, with a double crown; outer crown in the throat ring-like, undulate; lobes 5, longer than the tube. Staminal crown represented by 5 turgid fleshy or hard scales or flat appendages at the base of the sub sessile column. Follicles slender, naked. [*Philibertia* Benth. & Hook., not H.B.K.]

Crowns separate by a short column; stem glabrous.

Crowns contiguous; stem puberulent or pubescent.

1. *P. cynanchoides*.

2. *P. heterophylla*.

1. **P. cynanchoides** (Dec.) Vail. Stem 2-12 m. high; leaves 1.5-6 cm. long, deeply cordate, sagittate, or hastate, cuspidate; corolla white or cream-colored, purple-tinged at the apex; outer crown shallow; scales of staminal crown broadly oval, obtuse or acutish; follicles 3-7 cm. long, long-attenuate. *Philibertia cynanchoides* A. Gray. Along rivers: Tex.—s Utah—Ariz.; Mex. and C.Am. *L. Son.* Je-S.

2. **P. heterophylla** (Engelm.) Cockerell. Twining perennial; leaves 3-5 cm. long, 2-4 mm. wide, some acute, some rounded or cordate-auriculate or truncate at the base; corolla yellowish, purplish, or whitish; lobes ovate, smooth; follicles 6-8 cm. long, attenuate at the apex, 6-7 mm. thick, puberulent. *Philibertia linearis heterophylla* A. Gray. Dry ground: Ariz.—s Utah—s Calif.; Mex. *L. Son.* Ja-D.

3. **ACERATES** Ell. GREEN MILKWEED.

Perennial caulescent herbs. Leaves opposite or alternate. Flowers perfect, regular, umbellate. Calyx small, usually with 2 glands in the sinuses of the 5 acute lobes. Corolla rotate; lobes 5, reflexed in anthesis. Hoods mostly attached over the short or obsolete column, erect, involute-concave, saccate at the base, entire, emarginate, or 2- or 3-toothed at the apex, with broad auricles at the base, without horns or crests within. Follicles fusiform. Seeds with a coma.

Auricles of the hoods when present, concealed within; leaves oval to linear.

Umbel solitary, terminal; plant hirsute.

Umbels several, lateral; plant glabrate or tomentose when young.

Auricles of the hoods conspicuously spreading; umbels lateral; leaves narrowly linear.

Hoods emarginate or truncate at the summit, crestless within; umbels distinctly peduncled.

Hoods trilobed at the summit, with an internal crest-like midrib terminating in the middle lobe; umbels sessile or on very short peduncles.

1. *A. lanuginosa*.

2. *A. viridiflora*.

3. *A. auriculata*.

4. *A. angustifolia*.

1. *A. lanuginosa* (Nutt.) DC. Stem erect, 1-4 dm. high; leaves oblong or elliptic, short-petioled, 3-10 cm. long; corolla greenish; lobes oblong, about 5 mm. long; hood purplish, oblong, with an auricle or fold on the ventral margins. Prairies: Ill.—Minn.—Mont.—Wyo. Je—Au.

2. *A. viridiflora* (Raf.) Eat. Stem 2-6 dm. high, often decumbent; leaves oval or oblong and obtuse or retuse or acute, or elongated lanceolate and acuminate (var. *Ivesii* Britton), or narrowly linear (var. *linearis* A. Gray), becoming leathery, with undulate margins; umbels sessile or nearly so, many-flowered; corolla-lobes oblong-lanceolate, about 5 mm. long; hood dull purple or at least tinged with purple, lance-oblong, entire except for the small infolded auricles at the base. Dry or sandy soil: Mass.—Fla.—N.M.—Mont. Plain—Submont. Je—Jl.

3. *A. auriculata* Engelm. Stem 2-8 dm. high, mostly solitary; leaves alternate, scattered, narrowly linear, 5-15 cm. long, with scabrous, often revolute margins; corolla-lobes greenish, about 4 mm. long; hood yellowish, with purplish keel, erect, emarginate or truncate, the involute sides with broad auricles at the base. Plains and prairies: Neb.—Utah—N.M.—Tex. Plain—Submont. Je—Au.

4. *A. angustifolia* (Nutt.) Dec. Stem several from a thick rootstock, 3-6 dm. high, puberulent or glabrate in age; leaves narrowly linear, 5-12 cm. long, revolute-margined; umbels subsessile; corolla-lobes 5 mm. long, oblong, greenish; hood white, erect, as high as the anthers, laterally compressed, 3-dentate at the apex, the inner margins with an erose truncate lobe. *Asclepias stenophylla* A. Gray. Dry plains: S.D.—Colo.—Tex.—Mo. Plain. Je—Au.

4. *ASCLÈPIAS* (Tourn.) L. MILKWEED, SILKWEED, BUTTERFLY-WEED.

Perennial herbs, with deep taproots, sometimes woody at the base. Leaves opposite, alternate, or whorled. Flowers perfect, regular, in axillary or terminal umbels. Calyx small, usually with small glands at the base of the 5 lobes. Corolla rotate, deeply 5-cleft; lobes valvate-convolute in bud, reflexed in anthesis. Hoods of the crown involute, arising from the base of the corolla-lobes or on a short column, concave, hooded, bearing within a horn- or tooth-like projection, and sometimes additional processes between the anthers. Follicles fusiform, naked or with soft processes or warty. Seeds mostly with a coma.

Plant more or less hirsute; hoods orange; leaves mostly alternate; juice not milky.

1. *A. tuberosa*.

Plant not hirsute; hoods greenish, purplish, yellowish, or white; leaves mostly opposite or verticillate; juice milky.

Leaves orbicular to linear-lanceolate, opposite (except No. 14).

Follicles with soft spinulose processes, tomentose; leaves large and broad, tomentose, transversely veined, oval or ovate.

Hoods oblong-ovate, obtuse, slightly exceeding the stamens.

2. *A. syriaca*.

Hoods lanceolate, produced, about three times as long as the stamens.

3. *A. speciosa*.

Follicles without processes.

Flowers very large; petals over 1 cm. long; column none; corolla spherical in outline; horns included in the hoods; leaves almost orbicular, sub-cordate at the base.

4. *A. cryptoceras*.

Flowers middle-sized or small; petals much less than 1 cm. long; column usually present and horns exserted.

Leaves broadly oval or rectangular-oval or nearly orbicular, obtuse or retuse at both ends; umbels sessile.

Plant puberulent when young, glabrate in age; column very short.

5. *A. latifolia*.

Plant tomentulose; column half as long as the anthers.

6. *A. arenaria*.

Leaves ovate or lanceolate, or rarely oval, acute.

Leaves ovate or ovate-lanceolate, more or less tomentose, at least when young.

Hoods truncate, slightly longer than the anthers; leaves sessile, with rounded or subcordate bases.

7. *A. erosa*.

Hoods ovate-oblong to lanceolate, much exceeding the stamens; leaves petioled.

Corolla yellowish; hoods with a tooth on each margin, not auricled or gibbous at the base; peduncles shorter than the pedicels.

8. *A. ovalifolia*.

- Corolla purple; hoods without teeth; peduncles longer than the pedicels.
 Hoods not auricled or gibbous at the base; leaves permanently tomentose, at least beneath. 9. *A. curvipes*.
 Hoods with two gibbosities at the base; leaves puberulent when young, glabrous in age. 10. *A. Hallii*.
 Leaves linear-lanceolate; hoods truncate, little if at all longer than the anthers.
 Column short; leaves pale.
 Plant more or less tomentose or puberulent, at least when young.
 Hoods shorter than the anthers; corolla purple; leaves in age glabrate or nearly so.
 Hoods about half as long as the anthers; umbels peduncled. 11. *A. brachystephana*.
 Hoods only slightly shorter than the anthers; umbel sessile. 12. *A. uncinatis*.
 Hoods longer than the anthers; corolla purplish outside, green within; leaves permanently tomentose. 13. *A. macrosperma*.
 Plant glabrous; corolla greenish white; hoods white. 14. *A. labriformis*.
 Column more than half as long as the anthers; corolla purple. 15. *A. incarnata*.
 Leaves narrowly linear, verticillate or scattered.
 Corolla usually ash-colored; leaves 4-8 mm. wide. 16. *A. mexicana*.
 Corolla greenish and white; leaves 1-3 mm. wide.
 Plant tall, 4-6 dm. high, from a rootstock; leaves verticillate.
 Hoods entire. 17. *A. verticillata*.
 Hoods dorsally hastate-sagittate. 18. *A. galioides*.
 Plant low, 1-2 dm. high, bushy, from a ligneous base; leaves scattered, crowded. 19. *A. pumila*.

1. ***A. tuberosa* L.** Stem 3-6 dm. high, coarsely hirsute, very leafy; leaves usually alternate, short-petioled or subsessile, lance-linear or lance-oblong, subcordate to acute at the base, 5-10 cm. long, with revolute margins; corolla-lobes linear-oblong, obtuse, 6-8 mm. long, greenish or reddish orange; column about 1 mm. long; hoods linear-oblong or linear-lanceolate, bright orange or yellow, 5-6 mm. long; follicles 7-10 cm. long, minutely pubescent. Dry fields and meadows: Ont.—Fla.—Tex.—Ariz.—Minn. *Plain.* Je-S.

2. ***A. syriaca* L.** Stem 5-15 dm. high, canescent or in age glabrate; leaf-blades elliptic to lance-oblong, 1-1.5 dm. long, 4-11 cm. wide, rounded, truncate or acute at the base, obtuse or mucronate at the apex, green and glabrous or nearly so above, tomentulose beneath; corolla-lobes dull greenish purple, 8 mm. long, more or less pubescent; column less than 1 mm. long; hoods whitish or greenish purple; follicles 7-9 cm. long, lance-ovate, tomentose. *A. Cornuti* Dec. Fields and waste places: N.B.—Ga.—Kans.—Sask. *Plain.* Je-S.

3. ***A. speciosa* Torr.** Stem tall, 1-2 m. high, finely canescent-tomentose; leaves oval, subcordate at the base, thick; corolla greenish purple; lobes oblong or ovate-oblong, 9-13 mm. long; column short or none; hoods lanceolate, 11-15 mm. long, with two blunt teeth below; follicles 7-10 cm. long, with numerous processes. Valleys: Sask.—Minn.—Kans.—Calif.—B.C. *Plain—Submont.* My-Jl.

4. ***A. cryptoceras* S. Wats.** Stems several from a woody thick root, decumbent, 1-2 dm. high, glabrous; leaves very short-petioled or subsessile; blades ovate-orbicular, 4-6 cm. long, glabrous and glaucous, strongly veined, subcordate at the base; corolla-lobes greenish yellow, ovate, acute, about 1 cm. long; column none; hoods flesh-colored, saccate-ovate, about 7 mm. long, rounded on the sides; follicles ovate. Sandy plains, rocky hills, and clay benches: Wyo.—Colo.—Calif.—Ore. *Plain—Submont.* My-Je.

5. ***A. latifolia* (Torr.) Raf.** Stem simple, stout, 3-8 dm. high, minutely puberulent when young; leaves sessile or short-petioled; blades rounded-oval, mucronate and often emarginate at the apex, cordate or subcordate at the base, 7-15 cm. long, minutely puberulent; corolla-lobes ovate, 7-10 mm. long, greenish; column thick, very short; hood truncate; follicles ovoid, 6 cm. long, glabrate. *A. Jamesii* Torr. Dry plains: Neb.—Tex.—Ariz.—Utah. *Plain.* Jl—Au.

6. ***A. arenaria* Torr.** Stem decumbent or ascending, tomentose, 3-6 dm. long; leaf-blades rectangular-oval or obovate, truncate or retuse and often muc-

ronate at the apex, subcordate or truncate at the base, 5-10 cm. long, tomentose; corolla-lobes oval-oblong, greenish white; hoods oblong, truncate, with a triangular tooth on each margin; follicles puberulent, 5-10 cm. long. In sandy soil: Neb.—Tex.—Colo.; n Mex. *Son.*—*Plain.* Je—S.

7. *A. erosa* Torr. Stem 5-10 dm. high, puberulent when young; leaves canescent with white wool when young, glabrate in age, sessile, ovate or ovate-lanceolate, 10-15 cm. long, thick, rounded or subcordate at the base; corolla-lobes oval, 6-7 mm. long, greenish white; column fully 1 mm. long; hoods yellowish, obovate, truncate; follicles about 7 cm. long, lance-ovoid, curved, canescent-puberulent when young. River valleys: s Utah—Ariz.—Calif.; Sonora. *Son.* My—Jl.

8. *A. ovalifolia* Dec. Stem simple, erect, 3-6 dm. high, finely tomentose; leaf-blades oval, ovate, or ovate-lanceolate, 5-8 cm. long, acute at both ends, finely tomentose or the upper surface glabrate in age; lobes of the corolla greenish white or purplish, ovate-oblong, obtuse, about 5 mm. long; hoods orange or yellow, oval-oblong, with a large tooth on each margin; follicles pubescent. Woods and prairies: Man.—Ill.—Neb.—Alta. *Plain*—*Submont.* Je—Jl.

9. *A. curvipes* A. Nels. Stems usually several, ascending or erect, 4-8 dm. high, obscurely puberulent, in age glabrous; leaves short-petioled; blades ovate-lanceolate, rounded or acute at the base, minutely pubescent beneath, glabrate above, 7-15 cm. long; corolla purple; its lobes ovate-elliptic, obtuse or emarginate, 6-7 mm. long; hoods yellowish, with purplish middle, ovate, obtuse, round-lobed on the sides; follicles lanceolate, acuminate, 7-10 cm. long, densely white-tomentose. Sandy banks: Wyo. Jl.

10. *A. Hallii* A. Gray. Stem stout, 3-4 dm. high, finely puberulent; leaf-blades lanceolate or ovate-lanceolate, acute at the apex, rounded or acute at the base, 5-12 cm. long, puberulent or in age glabrate; corolla greenish, tinged with purple; its lobes oblong, about 6 mm. long; hood oblong, hastately 2-gibbous at the base, entire, obtuse; follicles about 8 cm. long, lanceolate, tomentulose, in age glabrate. Gravelly soil in the mountains: Colo. *Submont.*—*Mont.* Jl.

11. *A. brachystephana* Engelm. Stems several, usually branched, ascending or spreading, 1.5-2.5 dm. high, minutely puberulent; leaf-blades narrowly linear-lanceolate, long-attenuate, 5-8 cm. long, puberulent or in age glabrate; corolla greenish purple; its lobes about 4 mm. long, oblong, acute; column almost none; hood ovate, obtuse, with large triangular lobes on the margins; follicles lance-ovoid, acuminate, 5-7 cm. long, tomentose. Dry soil: Kans.—Tex.—Ariz.—Wyo.; n Mex. *Son.* Ap—Au.

12. *A. uncinatis* Greene. Stems usually several, less than 1 dm. high, puberulent; leaf-blades lanceolate to narrowly linear-lanceolate, acuminate, 3-5 cm. long, sparingly puberulent or soon glabrate; corolla dull greenish purple; column very short; hood orbicular, obtuse, with large triangular-ovate lobes. Dry places: N.M.—Wyo. *Submont.* Ap.

13. *A. macrosperma* Eastw. Stems several from a woody rootstock, decumbent, 0.5-3 dm. high, tomentulose; leaves alternate; blades lanceolate or ovate-lanceolate, acuminate at the apex, obtuse, truncate or subcordate at the base, 3-7 cm. long, glabrous or nearly so above, tomentulose beneath; corolla-lobes 4-8 mm. long, purplish beneath, greenish and puberulent above, membranous-margined and notched; column short; hoods rounded at the summit; follicles 6 cm. long, lance-ovate, acuminate, tomentulose. Sandy soil: se Utah. *L. Son.* Au.

14. *A. labriformis* M. E. Jones. Stems erect, glabrous; leaves all but the lower alternate; blades glabrous, linear-lanceolate or lanceolate, 7-12 cm. long, glabrous, acute at both ends; corolla-lobes oval, white, 5 mm. long; column nearly 1 mm. long; hood oblong, truncate, greenish white; follicles glabrous, ovate-oblong, acuminate, 3-4 cm. long. Sandy gulches: s Utah. *L. Son.* Jl.

15. *A. incarnata* L. Stem glabrous or minutely puberulent, 6-20 dm. high, very leafy; leaves opposite; leaf-blades 4-17 cm. long, oblong-lanceolate to linear-lanceolate, acute to subcordate at the base; corolla deep rose-purple to pink or

white; lobes oblong, 4-6 mm. long; column 1-1.5 mm. long, slender; hoods oblong, obtuse at the apex, the rounded margins overlapping; follicles 5-7 cm. long, lance-ovoid, acuminate, glabrous or minutely puberulent. The southwestern plant is usually tall, over 1 m. high and with long, narrow leaves (var. *longifolia* A. Gray). In swamps: N.B.—Fla.—N.M.—Wyo.—Man. *Plain—Submont.* Je—Au.

16. A. mexicana Cav. Stem 1-2 m. high, branched and woody at the base; leaves verticillate in 3's to 6's, rarely opposite, short-petioled or subsessile; blades linear or linear-lanceolate, 6-15 cm. long, glabrous; corolla ash-colored or rarely greenish, tinged with purple; lobes oblong, 4 mm. long; column about 1 mm. long; hood white, broadly ovate, without lobes; follicles linear-lanceolate, 6-8 cm. long, puberulent. Grassy slopes and valleys: Calif.—Wash.—Ida.—Ariz.; Mex. *Son.* Ap—Au.

17. A. verticillata L. Stem angled, glabrous or pubescent in lines, 4-10 dm. high; leaves narrowly linear to almost filiform, 5-10 cm. long, verticillate in whorls of 2's to 4's; corolla greenish, sometimes tinged with purple; lobes oblong, 4 mm. long; column about 1 mm. long; hood white, broadly ovate, truncate at the apex, lobed on the sides near the base; follicles linear-lanceolate, 7-10 cm. long, glabrous or minutely puberulent. Dry and sterile soil: Me.—Fla.—Tex.—Mex.—Ariz.—N.D. *Plain—Son.* Ap—Au.

18. A. galioides H.B.K. Stem erect, solitary, glabrous or minutely puberulent in lines, 4-10 dm. high; leaves in whorls of 3's to 6's, narrowly linear, 6-8 cm. long; corolla-lobes greenish white, oblong, obtuse, 4 mm. long; column nearly 1 mm. long; hoods erect-spreading, broadly rounded at the apex, entire-margined, hastate-sagittate on the back; follicles 5-7 cm. long, glabrous or minutely puberulent, lanceolate. Dry plains: Tex.—Kans.—Colo.—Calif.; Mex. *Son.* Je—Au.

19. A. pumila (A. Gray) Vail. Stems tufted, glabrous or nearly so, 1-2.5 dm. high, simple; leaves very numerous, crowded, irregularly scattered on the stem, about 3.5 cm. long, linear-filiform, revolute, glabrous or minutely scabrous-puberulent; corolla greenish white; lobes oblong, 4-5 mm. long; column about 0.5 mm. long; hoods oblong, erect, entire; follicles narrowly lanceolate, 3-5 cm. long, minutely puberulent. Dry plains: S.D.—Ark.—N.M.—Colo.—Mont. *Plain—Submont.* JI—S.

5. ASCLEPIÓDORA A. Gray. SPIDER MILKWEED.

Perennial herbs. Leaves opposite or alternate. Flowers perfect, regular, purplish, greenish, or white, in terminal, solitary or corymbose umbels. Calyx-lobes narrow, acute. Corolla rotate, 5-lobed, the lobes acute, spreading or erect. Hoods inserted over the whole short column, arising from the base of the corolla-lobes, saccate at the base, obtuse at the apex, crested within, with 1 or 2 small appendages between the hoods, simulating an inner crown. Follicles fusiform, often soft-spinulose.

1. A. decumbens (Nutt.) A. Gray. Perennial, with a woody rootstock; stems usually several, 2-4 dm. high; leaves 4-15 cm. long, lanceolate to linear, attenuate, thick, alternate or whorled in 3's; corolla globose in bud; lobes greenish; hood purplish, incurved, obtuse, 2-lobed on the ventral margin; follicles about 8 cm. long, pubescent, smooth, or with a few soft processes. Dry sandy soil: Kans.—Ark.—Tex.—Ariz.—Nev.; Mex. *Son.—Submont.* Je—S.

FAMILY 107. CONVULVULACEAE. MORNING-GLORY FAMILY.

Annual or perennial, twining or trailing herbs or vines, or rarely trees or shrubs. Leaves alternate, without stipules. Flowers perfect, regular, either solitary, axillary, or in cymes. Sepals 5, rarely 4, more or less united. Corolla gamopetalous, usually funnelform, either plicate and the plaits convolute, or induplicate-valvate, rarely imbricate in the bud, 5-lobed, or

rarely 4-lobed. Stamens 5, alternate with the corolla-lobes, partially adnate to the corolla-tube; anthers 2-celled, erect or incumbent. Gynoecium of 2 or 3 united carpels; ovary 2- or 3-celled, or by false partitions 4- or 6-celled; styles usually united; ovules 1 or 2 in each cavity. Fruit a capsule, 2-6-celled, or by breaking down of the septum 1-celled. Seeds large; endosperm mucilaginous; embryo curved with large plaited or crumpled cotyledons.

Styles distinct or partly so.

Corolla not plaited; styles simple.

Corolla plaited; styles 2-cleft.

Styles united up to the stigmas.

Stigmas subglobose.

Stigmas linear to oblong-cylindric.

1. CRESSA.

2. EVOLVULUS.

3. IPOMOEA.

4. CONVULVULUS.

1. CRÉSSA L.

Perennial plants, branched, and somewhat suffrutescent at the base. Leaves small or reduced to scales, alternate. Flowers perfect, regular, solitary in the upper axils. Sepals 5, equal, distinct, imbricate. Corolla funnelform, persistent, 5-lobed. Stamens 5, exserted. Ovary more or less perfectly 2-celled; styles distinct; ovules 2 in each cavity.

Stem erect; pedicels longer than the leaves.

Stem decumbent; pedicels shorter than the leaves.

1. *C. erecta*.

2. *C. depressa*.

1. *C. erecta* Rydb. Stem 2-3 dm. high, with erect branches, silvery-canescenscent; leaves elliptic, 5-7 mm. long, acute at both ends, sessile, silvery-canescenscent; bracts elliptic, 3 mm. long; sepals 4-5 mm. long, oval, equalling the corolla-tube; corolla white; lobes elliptic, acutish, rarely spreading; filaments filiform, slightly pubescent; ovary densely pubescent. Saline places near hot springs: Utah. *Son.* Jl.

2. *C. depressa* Goodding. Stem many-branched, depressed, spreading, 1-2 dm. long, loosely canescenscent; leaves loosely canescenscent, oblong to oval, subacute, 5-10 mm. long, 3-4 mm. wide; sepals 4 or 5, elliptic or oval, 5 mm. long, subtended by two bracts; corolla campanulate; lobes oval, subacute, reflexed, silky pubescent; filaments broadly subulate; ovary silky-lanate at the summit. Saline ground: Utah—Nev.—s Calif. *Son.* My—O.

2. EVÓLVULUS L.

Annual or perennial pubescent herbs. Leaves alternate, entire. Flowers perfect, regular, solitary in the axils, or in terminal racemes or panicles. Sepals 5, nearly equal. Corolla funnelform, campanulate or rotate, white, pink, or blue, with 5-angled or 5-lobed limb. Stamens 5, with filiform filaments. Styles 2, distinct, each 2-cleft; stigmas slender. Capsule short, 2-4-valved; seeds 1-4, glabrous.

1. *E. Nuttallianus* R. & S. Perennial, with a more or less woody base; stems branched below, ascending or spreading, 1.5-2.5 dm. high, silky-hirsute; leaves subsessile, silky-hirsute on both sides, oblong or oblanceolate, 1-1.5 cm. long, acute; sepals silky, linear-lanceolate, acuminate; corolla about 1 cm. broad. *E. argenteus* Pursh., not R. Br. *E. pilosus* Nutt., not Lam. Sandy soil: S.D. —Mo.—Tex.—Ariz.—Colo. *Plain—Submont.* My—Jl.

3. IPOMOËA L. MORNING-GLORY.

Annual or perennial, usually climbing or trailing vines, or rarely erect. Leaves alternate, entire or lobed. Flowers perfect, regular, solitary and axillary, or cymose. Sepals 5, closely imbricate. Corolla funnelform, of various colors, with a spreading limb. Stamens 5, included. Ovary 2- or 4-celled; styles united. Capsule septical, 2- or 4-valved. Seeds often pubescent.

Plant bushy, not climbing; leaves linear.

Plant climbing; leaf-blades cordate.

1. *I. leptophylla*.

2. *I. purpurea*.

1. *I. leptophylla* Torr. Perennial, with a deep-seated enormous fleshy root; stems several, erect or ascending, 3-12 dm. high, glabrous; leaves linear,

5-15 cm. long, acute, entire; sepals ovate or orbicular-ovate, 5-10 mm. long, the inner larger than the outer; corolla pink-purple, 5-7 cm. long. BUSH MORNING GLORY, BIG ROOT. Plains and prairies: S.D.—Tex.—N.M.—Mont. *Plain*. Je—Au.

2. ***I. purpurea*** (L.) Roth. Annual; stem high, climbing, twining, retrorsely-hirsute; leaf-blades cordate, short-acuminate; flowers umbellate on long peduncles; calyx bristly-hairy; corolla purple or rarely pink or white, 4.5-7 cm. long. COMMON MORNING-GLORY. Cultivated ground, waste places, etc.: N.S.—Fla.—Tex.—Colo.; escaped from cultivation; native of trop. Am.

4. **CONVÓLVULUS** (Tourn.) L. BINDWEED, MORNING GLORY.

Annual or perennial, trailing or twining herbaceous vines, rarely shrubs. Leaves alternate, usually sagittate or cordate at the base. Flowers perfect, regular, solitary or clustered, on axillary peduncles. Sepals 5, rarely equal, or the outer larger. Corolla funnelform or campanulate, with plaited, entire, 5-angled or 5-lobed limb. Stamens 5, included; filaments filiform or dilated at the base. Ovary 1-2-celled; styles united; stigmas linear to oblong; ovules 4. Capsule subglobose, 2-4-valved. Seeds glabrous.

Calyx not closely subtended by the bracts.

Plant not canescent; leaf-blades hastate, but otherwise entire.

Whole plant glabrous or nearly so.

Stem and lower surface of the leaves with scattered long hairs.

1. *C. arvensis*.

2. *C. ambigens*.

Plant more or less canescent; leaves usually lobed or dissected.

Main divisions of the leaf-blades ovate or oblong, obtuse, lobed; sepals auricled at the base.

3. *C. hermannioides*.

Main divisions of the leaf-blades linear, entire, the basal lobes usually deeply cleft; sepals not auricled.

4. *C. incanus*.

Calyx closely subtended and enclosed by the large bracts.

Plants climbing or trailing; bracts cordate.

Leaf-blades hastate; the basal lobes often sinuate-dentate, acute; stem and leaves glabrous or slightly hairy.

5. *C. americanus*.

Leaf-blades more sagittate; basal lobes rounded, entire; stem and leaves densely pubescent.

6. *C. interior*.

Plants erect or decumbent; bracts oval or oblong.

7. *C. Macounii*.

1. ***C. arvensis*** L. Stem branched at the base, prostrate or low-twining, 2-8 dm. long, glabrous; leaf-blades oblong or ovate-sagittate to linear-hastate, 1-5 cm. long, obtuse or acutish; basal lobes more or less spreading, acute; bracts subulate; corolla white or rose-tinged, 1.5-2 cm. long and broad. Waste places and fields: N.S.—N.J.—Nev.—Wash.—B.C. *Plain*—*Submont*. Je—Au.

2. ***C. ambigens*** House. Stem prostrate or trailing, 2-10 dm. long, finely cinereous, or glabrate in age; leaf-blades ovate-oblong or triangular-oblong, 1.5-4 cm. long, abruptly acute, truncate or nearly so at the base; basal lobes spreading, acute, often subtoothed below; flowers axillary, solitary; corolla 1.5-2 cm. long and about as broad, white or with pink stripes. River valleys and loose soil: Mont.—N.M.—Calif.—Ore. *Plain*—*Submont*. Je—Au.

3. ***C. hermannioides*** A. Gray. Stem branched at the base, spreading or procumbent, 3-15 dm. long, silky-tomentose; leaf-blades ovate, oblong or oblong-lanceolate, 1.5-7 cm. long, sinuately-toothed, cordate or sagittate at the base; corolla white, 2-2.5 cm. long, 1.5-2 cm. wide, angulate. Dry plains: Tex.—s Colo. *Son*. Ap—S.

4. ***C. incanus*** Vahl. Stem branched at the base, procumbent, 3-10 dm. long, cinereous; leaf-blades variable, linear-sagittate to lanceolate-hastate, with the basal lobes spreading, more or less lobed, or pedately cleft, 2.5-5 cm. long, often mucronate; sepals becoming 6-8 mm. long; corolla white or pink, about 12 mm. long, 15 mm. broad; lobes acuminate. Dry hills and plains: Neb.—Ark.—Tex.—Ariz. *Son*. Je—Au.

5. ***C. americanus*** (Sims) Greene. Stem twining, 1-3 m. high, glabrate; leaf-blades glabrous, broadly hastate or ovate-hastate, 5-12 cm. long, acuminate or apiculate; basal lobes more or less spreading, broadly triangular, with a smaller lobe below; bracts broadly ovate-cordate, obtuse or acutish; corolla 4-5 cm. long, 5-7 cm. broad, pink or rose-purple. Closely related to *C. sepium* L., of Europe.

Thickets and fence-fows: N.S.—N.C.—N.M.—Wash.—B.C. *Plain—Submont.*
My—Au.

6. *C. interior* House. Stems prostrate or somewhat climbing, 2–8 dm. long, densely and softly pubescent; leaf-blades deltoid or hastate-ovate, 2.5–4 cm. long, glabrous above, pubescent beneath; base shallowly cordate or truncate; bracts broadly ovate, obtuse, closely investing the calyx; corolla white, 3.5–4 cm. long, the limb entire, 3–4 cm. broad. Sandy soil: N.D.—Okla.—Ariz.—Colo. *Plain.* My—Jl.

7. *C. Macounii* Greene. Stem erect, 7–15 cm. high, glabrous; leaves broadly sagittate, about 5 cm. long, glabrous; bracts broad, oval, obtuse, 2–2.5 cm. long, auricled at the base; corolla white, fully 5 cm. long. Sandy soil: Sask.—B.C. *Plain.* Au.

FAMILY 108. **CUSCUTACEAE.** DODDER FAMILY.

Herbaceous parasites, with twining stems, at first germinating in the ground, but soon attaching themselves to some other plant by means of aerial rootlets, and taking their nourishment from these, the lower part of the stem having decayed early. Leaves reduced to minute alternate scales. Flowers perfect, regular, in compact or open cymes. Calyx inferior; sepals 5, or rarely 4, distinct or more or less united. Corolla campanulate or subglobose, 5-lobed, or rarely 4-lobed, the lobes being imbricate, usually with crenulate or fringed scales in the throat, alternating with the lobes. Stamens 5, rarely 4, partly adnate to the corolla; anthers 2-celled. Styles 2, mostly distinct; stigmas capitate or elongate. Capsule subglobose or ovoid, 2-celled, circumscissile or bursting irregularly. Embryo curved or spiral, in a fleshy endosperm.

1. **CŪSCUTA** (Tourn.) L. DODDER, LOVE-VINE, CORAL-VINE.

Characters of the family.

Stigmas elongate, linear; styles equal; capsule circumscissile.

Corolla globose-urceolate; scales inside the corolla crenate.

Corolla open-campanulate; scales inside the corolla deeply fringed.

Calyx-lobes obtuse.

Calyx-lobes acute.

Stigmas capitate; styles usually unequal.

Capsule circumscissile; calyx and corolla-lobes acuminate; inflorescence umbel-like.

Capsule indehiscent or bursting irregularly.

Calyx gamosepalous, usually not bracted.

Capsule depressed-globose.

Lobes of the corolla triangular or lanceolate, acuminate or acute.

Calyx-lobes acute or acuminate; corolla-lobes erect or somewhat spreading, in fruit connivent; flowers pedicelled.

Calyx-lobes rounded; corolla-lobes strongly spreading with inflexed tips; flowers subsessile.

Lobes of the corolla oblong, very obtuse.

Corolla deeply campanulate, 4-merous, about 2 mm. wide; tube longer than the calyx.

Corolla open-campanulate, about 4 mm. wide; tube shorter than the calyx.

Capsule ovoid-globose, acute.

Corolla-lobes not incurved.

Lobes of the corolla and the calyx obtuse.

Flowers less than 2 mm. long; calyx-lobes very short, rounded and denticulate.

Flowers 2.5–3 mm. long; calyx-lobes ovate, not denticulate.

Scales incurved over the ovary; styles about half as long as the ovary or longer.

Scales appressed to the corolla-tube; styles one-third to one-fourth as long as the ovary.

Lobes of the corolla and calyx acute.

Corolla-lobes incurved at the apex.

Capsule 4 mm. or less broad; inflorescence rather open.

13. *C. indecora*.

1. *C. gracilis*.

2. *C. planiflora*.

3. *C. Anthemi*.

4. *C. umbellata*.

5. *C. californica*.

6. *C. arvensis*.

7. *C. cephalanthi*.

8. *C. plattensis*.

9. *C. denticulata*.

10. *C. Gronovii*.

11. *C. curta*.

12. *C. salina*.

Capsule 5-6 mm. broad; inflorescence globular clusters.

Calyx of 5 almost distinct and overlapping sepals, subtended by 2 or more similar bracts.

14. *C. megalocarpa*.

15. *C. cuspidata*.

1. *C. gracilis* Rydb. Stem filiform, about 0.25 mm. in diameter; flowers in dense globular clusters; calyx gamosepalous but left to near the base; lobes ovate; corolla less than 2 mm. high; lobes ovate, widely spreading, acute; scales ovate, crenate, almost half as long as the corolla-tube; capsule about 2 mm. high, acute-globose, circumscissile near the base. Parasitic on *Eriogonum*, *Chrysothamnus*, *Solanum*, etc.: Wyo. Plain—Submont. Je.

2. *C. planiflora* Tenore. Stem filiform, reddish; flowers in dense glomerules, 5-10 mm. in diameter; calyx obconic; lobes round, short, obtuse, carinate beneath; corolla-tube very short; lobes 5, always reflexed, ovate, apiculate. *C. epilinum* and *C. epithymum* of western reports. Parasitic on alfalfa and other herbs: Colo.—Wyo.—Utah—Mont.; introduced in alfalfa from s. Eu. Je—Au.

3. *C. Anthemi* A. Nels. Stem filiform, 2-3 dm. long; flowers sessile in small capitate clusters; calyx-lobes broadly ovate, acute; corolla less than 2 mm. long, broadly campanulate; lobes ovate, acute, equalling or exceeding the tube; scales oval, fringed; capsule globose, 1 mm. thick. Parasitic on *Artemisia*: Wyo.

4. *C. umbellata* H.B.K. Stem capillary, low; flowers few, umbellate; calyx-lobes lanceolate, acute; corolla 3-4 mm. long, campanulate; lobes lanceolate-subulate; scales deeply fringed, exceeding the tube; capsule capped by the remains of the corolla. On *Amaranthaceae*, *Portulacaceae*, *Zygophyllaceae*, *Nyctaginaceae*, and rarely *Compositae*: Tex.—Colo.—Ariz.; Mex. and W. Ind. Son.

5. *C. californica* Choisy. Stems very slender, filiform; flower-clusters rather open; pedicels slender but short; calyx turbinate, the lobes triangular or lanceolate; corolla-lobes lance-linear, in fruit mostly erect and connivent; scales wanting; capsule enveloped by the corolla. On herbs of arid regions, *Eriogonum*, etc.: Calif.—Utah—Ariz. Son. My—Au.

6. *C. arvensis* Beyr. Stems slender; flowers in head-like clusters, sessile, less than 2 mm. long; calyx-lobes rounded, obtuse; corolla-lobes longer than the tube, acute or acuminate, triangular; scales large and deeply laciniate. On various herbs: Mass.—Fla.—Calif.—B.C.; Mex. and W. Ind. Plain—Submont. Ap—N.

7. *C. cephalanthi* Engelm. Stem filiform; flowers cymose-paniculate, about 2 mm. long, 4-merous, or even 3-merous; corolla deeply campanulate; scales ovate or spatulate; capsule 2-2.5 mm. in diameter. *C. tenuiflora* Engelm. On coarse herbs and shrubs: Pa.—Tex.—Sask. Plain. Je—S.

8. *C. plattensis* A. Nels. Stem yellowish green; flowers densely or loosely cymose, short-pedicelled; calyx-lobes suborbicular, obtuse, fully 1 mm. long; corolla marcescent at the base of the capsule; lobes at first erect, at last reflexed; scales broadest at the truncate fringed summit; capsule 5 mm. at maturity, indehiscent. On *Grindelia*, *Solidago*, *Helianthus* and other Composites: Wyo. Jl—Au.

9. *C. denticulata* Engelm. Stem capillary-filiform; flowers few in small clusters; corolla-tube included in the calyx; lobes rounded-ovate, less than 1 mm. long; scales reaching to the base of the stamens, denticulate at the rounded apex; capsule covered by the marcescent corolla, ovoid. On herbs and low shrubs: Utah—Nev.

10. *C. Gronovii* Willd. Stem rather coarse, high-climbing; flowers paniculate-cymose; calyx-lobes elliptic; corolla deeply campanulate; lobes elliptic, obtuse, spreading, flat; scales ovate, fringed, spreading; capsule broadly ovoid, 4-5 mm. in diameter. On coarse herbs or shrubs: N.S.—Fla.—Tex.—Colo.—N.D.—Man. Plain. Jl—O.

11. *C. curta* (Engelm.) Rydb. Stems rather slender; flowers in small cymes; calyx short; lobes rounded, obtuse; corolla deeply campanulate, 3 mm. long; lobes short, broadly oval; scales short, bifid or truncate, appressed to the tube; capsule ovoid, the marcescent corolla surrounding or covering the upper portion. On coarse herbs: Colo.—Utah—Nev. Au.

12. *C. salina* Engelm. Stem filiform, low; flowers in small clusters; calyx-lobes ovate-lanceolate, as long as the tube of the corolla; corolla 3-5 mm. long; lobes lanceolate; scales fringed, small or reduced; capsule rounded but acute, surrounded but not covered by the marcescent corolla. On *Salicornia* and other salt plants: B.C.—Utah—Ariz.—Calif. *Son.* Ap-S.

13. *C. indecora* Choisy. Stem filiform, high twining; flowers loosely paniculate-cymose; calyx-lobes ovate or lanceolate, acute; corolla campanulate, 3-5 mm. long; lobes ovate-lanceolate, erect or more commonly spreading; scales large, broadly oval, fringed; capsule enveloped by the corolla, rounded-ovoid. On herbs and low shrubs, mostly *Compositae* and *Leguminosae*: Fla.—Ill.—Utah—Calif.; Mex., C. Am., W. Ind. and S. Am. JI-S, or in the south Ja-D.

14. *C. megalocarpa* Rydb. Stem stout, usually over 1 mm. in diameter; flowers in dense globular clusters; calyx-lobes rounded, scarcely 1 mm. long; corolla about 3 mm. high and broad; lobes broadly triangular, acutish, about 1 mm. long, with incurved tip; scales deeply 2-lobed, and fringed only in the open sinuses. On willows: Mont.—Colo. *Submont.* JI-S.

15. *C. cuspidata* Engelm. Stem filiform; flowers in loose panicles, with bracted pedicels; bracts and sepals ovate-orbicular; corolla 3-5 mm. long, campanulate; lobes oblong, cuspidate or mucronate, rarely obtuse; scales large, deeply fringed; capsule capped by the marcescent corolla. On *Ambrosiaceae* and rarely *Leguminosae*: Mo.—Tex.—Utah. *Son.* Au-S.

FAMILY 109. POLEMONIACEAE. PHLOX FAMILY.

Annual or perennial herbs, or rarely shrubby plants. Leaves alternate or opposite, entire, pinnatifid, or pinnately compound. Flowers perfect, regular or nearly so. Sepals 5, partly united. Corolla of 5 united petals, regular or nearly so, 5- or rarely 4-lobed, from rotate to salver- or trumpet-shaped; lobes convolute in aestivation. Stamens 5, rarely 4, often unequal; filaments adnate to the corolla-tube, often inserted at different heights. Gynoeceum of 3 united carpels; ovary 3-celled; styles wholly united; stigmas 3. Fruit a 3-celled, loculicidal capsule. Seeds often with a mucilaginous coat.

Calyx wholly herbaceous; leaves pinnately compound.

Calyx more or less scarious between the lobes, or the lobes spinulose-tipped and pungent; leaves simple or pinnatifid, but not compound.

Calyx distinctly enlarging in fruit, not ruptured by the capsule.

Calyx soon ruptured by the fruit, or if not ruptured, slightly if at all enlarged in fruit and calyx-teeth spinescent.

Corolla strictly salver-shaped with a narrow throat.

Perennials, with leaves opposite; seeds not mucilaginous when wetted.

Annuals, with the floral leaves alternate; seeds mucilaginous when wetted.

Corolla campanulate, funnelform, trumpet-shaped, or if somewhat salver-shaped, the throat open.

Anthers sagittate at the base; calyx-lobes and 3-5-cleft bracts densely woolly, pungent.

Anthers not sagittate; calyx-teeth and bracts usually not woolly, but if somewhat so, not pungent.

Corolla elongate, with a narrow tube and funnelform or spreading throat.

Calyx-teeth either unequal in size or spinulose-laciniate, or both; pungent-leaved annuals.

Calyx-teeth neither unequal nor spinulose-laciniate; perennials or non-pungent annuals.

Calyx not at all scarious in the sinuses; mostly undershrubs, with pungent leaves.

Calyx decidedly scarious in the sinuses.

Stem leafy; bracts not connate.

Leaves alternate; seeds mostly with spiracles; corolla with a long tube and a funnelform throat.

Lower segments of the leaves not changed into bristles; calyx-lobes not long-setose.

Lower segments of the leaves changed into bristles; calyx-lobes long-setose.

Leaves opposite; seeds without spiracles; corolla short salver-shaped or short funnelform.

10. LINANTHUS.

8. GLIA.

9. LANGLOISIA.

10. LINANTHUS.

10. LINANTHUS.

- Stem without proper leaves, but with persistent connate cotyledons and connate bracts subtending the head-like flower-clusters. 11. *GYMNOSTERIS*.
 Corolla rotate, or campanulate, with very short proper tube, and rather open.
 Corolla campanulate or short-funnelform.
 Leaves mostly opposite; flowers medium sized; corolla funnelform. 10. *LINANTHUS*.
 Leaves alternate; corolla very small, campanulate. 12. *TINTINABULUM*.
 Corolla rotate. 13. *GILLASTRUM*.

1. POLEMONIUM (Tourn.) L. JACOB'S LADDER, SKUNK-WEED.

More or less caulescent perennial or annual herbs, with pinnate leaves. Flowers perfect, solitary or clustered. Calyx wholly foliaceous, campanulate, more or less glandular, 5-cleft, not ruptured by the fruit. Corolla campanulate or rotate-funnelform to almost tubular. Stamens 5; filaments adnate mostly to the lower part of the corolla-tube, rarely unequally adnate to the upper part. Style elongate. Ovules three to many (rarely 1 or 2) in each cell. Seeds remaining unchanged when wetted.

Annuals; corolla almost rotate, shorter than the calyx. I. *MICRANTHA*.
 Perennials; corolla longer than the calyx.

Corolla campanulate; filaments with pilose appendages at the base; inflorescence usually open; leaflets never verticillate.

Low, 1-3 dm. high, caespitose; basal leaves numerous and stem-leaves few.

II. *PULCHELLA*.

Stem tall, leafy, usually solitary from the rootstock, 4-10 dm. high.

III. *CAERULEA*.

Corolla funnelform to trumpet-shaped; filaments without appendages at the base; inflorescence dense, spiciform; leaflets (except in the first species) verticillate.

IV. *VISCOSA*.

I. *MICRANTHA*.

One species.

1. *P. micranthum*.

II. *PULCHELLA*.

Stem and leaves viscid-pubescent, with long flat hairs; leaflets inclined to be ovate or ovate-lanceolate.

Corolla over 1 cm. long; plants light green; leaflets 1.5-2 cm. long.

2. *P. columbianum*.

Corolla less than 1 cm. long; plant dark green; leaflets 5-15 mm. long.

3. *P. delicatum*.

Stem and leaves viscid-puberulent, the latter often glabrate.

Inflorescence and leaflets crowded; sepals obtuse or rounded at the apex.

4. *P. parvifolium*.

Inflorescence and leaflets scarcely crowded; sepals acutish.

5. *P. pulcherrimum*.

Stem-leaves 1-3; inflorescence open.

6. *P. Haydeni*.

Stem-leaves 3-5; inflorescence narrow.

III. *CAERULEA*.

Upper leaflets decurrent and confluent; plants with a woody base.

Corolla straw-colored or white.

7. *P. albiflorum*.

Corolla purple.

Corolla 2 cm. high, or nearly so; leaves glabrous.

8. *P. Archibaldae*.

Corolla 8-15 mm. high; leaves pubescent.

Stem and inflorescence long-villous, scarcely at all viscid.

9. *P. molle*.

Stem and inflorescence short-hairy; the latter at least distinctly viscid.

Corolla over 12 mm. long; inflorescence conical or ovoid in outline; main peduncle usually exceeding the branches.

10. *P. robustum*.

Corolla less than 12 mm. long; inflorescence flat-topped; main peduncle exceeded in length by the branches.

11. *P. foliosissimum*.

Upper leaflets not confluent; plant with a creeping rootstock.

Flowers in a narrow thyrsus; leaflets usually less than 3 cm. long.

12. *P. occidentale*.

Flowers in an open corymbiform or paniculate inflorescence; leaflets 3-5 cm. long.

13. *P. intermedium*.

IV. *VISCOSA*.

Corolla purple.

Leaflets not verticillate.

14. *P. speciosum*.

Leaflets more or less verticillate.

Corolla 2 cm. long or less, campanulate-funnelform, with a rather broad tube.

Calyx densely viscid, but not conspicuously long-hairy.

15. *P. viscosum*.

Calyx conspicuously villous with long white viscid hairs.

16. *P. Grayanum*.

Corolla 2-3 cm. long, funnelform, with a narrow tube.

17. *P. confertum*.

Corolla yellow, ochroleucous, or greenish.

Corolla funnelform; stamens adnate to the middle of the corolla-tube.

18. *P. mellitum*.

Corolla almost tubular; stamens almost wholly adnate to the corolla-tube.

19. *P. Brandegei*.

1. ***P. micranthum*** Benth. Annual; stem branched from the base, glandular-puberulent, erect or ascending, 0.5–2.5 dm. high, leafy; leaves viscid-villous; leaflets 11–13, rounded, 3–6 mm. long; flowers axillary, solitary, pedicelled; corolla whitish; filaments dilated at the base; ovules 2–3 in each cell. Sandy places: B.C.—Mont.—Utah—Calif. *Submont.* Ap—My.

2. ***P. columbianum*** Rydb. Stems several, 2–3 dm. high, distinctly glandular in the inflorescence; leaves 5–15 cm. long, sparingly viscid, pubescent; leaflets 9–19, elliptic or lance-elliptic, acute, 1.5–3 cm. long; calyx about 6 mm. long; lobes lanceolate, acute, fully equalling the tube; corolla violet, with yellowish base; lobes rounded-truncate at the apex; stamens slightly longer than the corolla. Woods: Ida.—Wash.—Ore. *Submont.* Je—Au.

3. ***P. delicatum*** Rydb. Stem very slender, about 1 dm. high; leaves 3–8 cm. long; leaflets 11–23, ovate, ovate-lanceolate, or oblong, mostly acute, 3–10 mm. long; calyx glandular, 4–5 mm. long; lobes lanceolate, acute; corolla violet, about 7 mm. high and 8 mm. broad; stamens nearly equalling the corolla. *P. humile pulchellum* A. Gray, not *P. pulchellum* Burge. *P. scopulinum* Greene. Mountains: Colo.—Utah—Ariz.—N.M. *Mont.—Alp.* Jl—Au.

4. ***P. parvifolium*** Nutt. Stems rarely more than 1 cm. high, glandular-puberulent, almost scapose; leaflets 11–25, oval or suborbicular, rounded, 2–4 mm. long; inflorescence dense; calyx about 4 mm. long; lobes oval or elliptic; corolla dark violet, 7–9 mm. long; lobes rounded; stamens nearly equalling the corolla. *P. mexicanum* Nutt. Mountains: Mont. Je—Jl.

5. ***P. pulcherrimum*** Hook. Stems 1–3 dm. high, glandular-puberulent; leaflets 15–27, oval, mostly obtuse, 5–10 mm. long; calyx about 5 mm. long; lobes lanceolate; corolla 8–10 mm. long, violet or rose-colored, with a yellowish base; lobes rounded; stamens shorter than the corolla. Mountains: Alta.—Wyo.—B.C. *Mont.—Subalp.* Je—Au.

6. ***P. Haydeni*** A. Nels. Stems several, 2–3 dm. high, glandular-puberulent, especially above; leaflets 15–25, oval, oblong, or oblanceolate, 5–10 mm. long; calyx narrowly campanulate, 5–6 mm. long, glandular-puberulent; corolla blue, campanulate, 10–15 mm. long; stamens often equalling the corolla. Mountainsides: Wyo.—Mont.—Ida. Je—Jl.

7. ***P. albiflorum*** Eastw. Stems solitary or few, 3–6 dm. high, glandular-puberulent or pubescent; leaflets 11–15, lanceolate, acuminate, 1–3 cm. long; calyx 7 mm. long, densely glandular; lobes lanceolate, acute or obtuse; corolla cream-colored or white, about 15 mm. long; stamens usually longer than the corolla. Mountains: Utah—Nev. *Submont.—Mont.* Je—Jl.

8. ***P. Archibaldae*** A. Nels. Stem 4–7 dm. high, glabrous below, glandular above; inflorescence openly cymose-corymbose, minutely glandular; leaflets 13–19, oblong-lanceolate, 2–4 cm. long; calyx 6–8 mm. long; lobes lanceolate, acute; corolla-lobes orbicular; stamens much shorter than the corolla; filaments pubescent at the base. *P. grande* Greene. Mountains: Colo.—Utah. *Mont.* Jl—Au.

9. ***P. molle*** Greene. Stem 3–6 dm. high, densely villous; leaflets 13–21, oblong or lanceolate, 1.5–2.5 cm. long; flowers openly paniculate; calyx about 8 mm. long; lobes lanceolate, acute; corolla campanulate, 10–12 mm. long; stamens shorter than the corolla. Mountains: Colo.—N.M. *Mont.* Je—Jl.

10. ***P. robustum*** Rydb. Stem 4–10 dm. high; leaflets 11–17, lanceolate or lance-oblong, acute, 1.5–2.5 cm. long; inflorescence much branched; calyx glandular-villous, 7–8 mm. long; lobes lanceolate; corolla rose or purplish, 12–15 mm. high; stamens shorter than the corolla. Mountains: Colo. *Mont.* Jl.

11. ***P. foliosissimum*** A. Gray. Stems solitary or few, short-pilose throughout, glandular above, 3–9 dm. high; leaflets 11–21, oval or lanceolate; calyx about 7 mm. long, densely glandular; corolla 9–12 mm. long, funnelform-campanulate,

blue or rose-colored, rarely white; stamens usually shorter than the corolla. Mountains: Colo.—N.M.—Utah. *Submont.*—*Subalp.* Je—Au.

12. *P. occidentale* Greene. Stems leafy, solitary and rather simple, glabrous below, glandular-puberulent above, 3–9 dm. high; leaves glabrous or sparingly pubescent; leaflets 15–27, ovate-oblong or lanceolate, rounded, oblique at the base, acute at the apex, 1–4 cm. long; calyx glandular-puberulent, 7–8 mm. long; lobes oval, obtusish; corolla blue or violet, 10–12 mm. long, campanulate; stamens about as long as or longer than the corolla. Valleys and open woods: Sask.—Colo.—Calif.—Alaska. *Submont.*—*Mont.* Je—Au.

13. *P. intermedium* (A. Brand) Rydb. Stem solitary, 5–7 dm. high, puberulent throughout and glandular above; leaflets 11–27, ovate-lanceolate to linear-lanceolate, often somewhat falcate, 3–5 cm. long; calyx 6–7 mm. long; lobes lanceolate; corolla blue, campanulate, 12–14 mm. long; lobes acutish; stamens shorter than the corolla. *P. occidentale intermedium* A. Brand. Along streams: Ida.—Wash.—B.C. Jl—Au.

14. *P. speciosum* Rydb. Stem 1–2 dm. high, with 2–3 leaves; basal leaves numerous, 8–15 cm. long, with wing-margined rachis; leaflets 13–25, ovate, 6–12 mm. long, acute; inflorescence capitate; calyx viscid-villous and glandular, 15–20 mm. long; lobes lanceolate, acute; corolla pale blue, deeply campanulate-funnel-form, 2–2.5 cm. long; limb about 1.5 cm. broad. Mountains: Colo. *Alp.* Jl—Au.

15. *P. viscosum* Nutt. Stems several, viscid-pubescent, 5–10 cm. high, erect; leaflets verticillate, 30–41, orbicular or nearly so, 1–4 mm. long; flowers subcapitate; calyx campanulate, densely glandular, 8–10 mm. long; lobes lanceolate; corolla blue or violet, 15–20 mm. long; lobes rounded; filaments sparingly barbed. SKUNK-WEED. Mountains: Alta.—Wyo.—Utah—Ida. *Mont.*—*Subalp.* Je—Au.

16. *P. Grayanum* Rydb. Stems about 1 dm. high, glandular-villous; leaflets verticillate, obovate or spatulate, 2–6 mm. long, obtuse; calyx about 18 mm. long, villous with white hairs; lobes linear-lanceolate; corolla about 2 cm. long, campanulate-funnel-form, with a wide tube; lobes rounded. High mountains: Colo. *Mont.*—*Alp.* Jl—Au.

17. *P. confertum* A. Gray. Stems erect, 1–2 dm. high; leaflets verticillate, 30–40, orbicular to oblong, more or less viscid, 3–10 mm. long; flowers capitate or spicate; calyx oblong-campanulate, fully 1 cm. long, densely glandular; lobes lanceolate, acute; corolla blue or violet, 2–3 cm. long, funnel-form. SKUNK-WEED. Mountains: Wyo.—N.M.—e Utah. *Mont.*—*Alp.* Jl—Au.

18. *P. mellitum* (A. Gray) A. Nels. Stem 1–2.5 dm. high, leafy; leaflets verticillate, 30–60, oval to almost linear, 5–10 mm. long; flowers racemose or spicate; calyx glandular-puberulent, about 12 mm. long; lobes linear-lanceolate; corolla white or cream-colored, about 3 cm. long. *P. confertum mellitum* A. Gray. Mountains: Wyo.—Colo. *Mont.*—*Subalp.* Je—Au.

19. *P. Brandegei* (A. Gray) Greene. Stem 1–3 dm. high, sparingly leafy, glandular-puberulent; leaflets verticillate, 30–40, elliptic, 5–8 mm. long; flowers racemose or spicate; calyx about 1 cm. long, glandular-puberulent; lobes linear-lanceolate; corolla 2.5–3 cm. long, yellow or greenish-yellow. *Gilia Brandegei* A. Gray. Mountains: Colo.—Utah. *Mont.*—*Subalp.* Je—Au.

2. COLLÒMIA Nutt.

Simple or branched, caulescent annuals. Leaves alternate, entire or pinnatifid. Flowers perfect, in subcapitate clusters, at the end of the stem or axillary. Calyx obpyramidal, 5-cleft, scarious in the sinuses, not ruptured by the capsule. Corolla funnel-form or salverform, 5-lobed. Stamens 5, unequally adnate to the tube of the corolla. Ovules solitary or rarely few in each cell. Seeds developing both mucilage and spiracles when wetted.

Annuals.

Leaves entire, rarely denticulate.

Floral leaves dilated, much broader than the rest; stamens inserted at different heights.

Corolla 2 cm. or more long; calyx-lobes broadly triangular-lanceolate, obtusish.

- | | |
|--|----------------------------|
| Corolla about 1 cm. long; calyx-lobes lanceolate, acute. | 1. <i>C. grandiflora</i> . |
| Floral leaves like the stem-leaves, linear; stamens inserted at the same height. | 2. <i>C. linearis</i> . |
| Calyx-lobes triangular, merely acute. | 3. <i>C. tenella</i> . |
| Calyx-lobes lanceolate, aristate-tipped. | 4. <i>C. aristella</i> . |

Leaves, at least the lower, pinnately divided; divisions again toothed.

Perennials with a caespitose rootstock.

| 5. <i>C. heterophylla</i> . |
| 6. <i>C. debilis</i> . |

1. **C. grandiflora** Dougl. Stem at first simple, later on decidedly branched, 1.5-7 dm. high, hirsute above; leaves linear-lanceolate, 4-10 cm. long, 5-15 mm. broad, puberulent, those of the inflorescence ovate and shorter, decidedly viscid; flowers in dense head-like leafy spikes ending the stem and its branches, those of the branches often smaller and with smaller flowers; corolla trumpet-shaped, yellowish, turning reddish, 2-3 cm. long; limb 12-15 mm. broad; lobes oblong. *Gilia grandiflora* A. Gray. In sandy or gravelly soil: B.C.—Mont.—Utah—Calif. *Son.*—*Submont.* My—Au.

2. **C. linearis** Nutt. Stems simple or in age sometimes branched, 1-4 dm. high, hirsutulous; leaves linear-lanceolate, 1.5-5 cm. long, 2-8 mm. wide, puberulent, the floral ones ovate or lance-ovate, often paler at the base and sometimes tinged with red; flowers in terminal head-like spike; corolla trumpet-shaped, 10-15 mm. long; lobes oval; limb 4-5 mm. broad. *C. lanceolata* Greene. Dry and sandy soil: Minn.—Neb.—Colo.—Calif.—B.C.; adv. in Que., N. B., and N. Y. *Plain*—*Mont.* My—Au.

3. **C. tenella** A. Gray. Stem slender, 1 dm. high or less, dichotomously branched, glandular-puberulent; leaves narrowly linear-obtuse, 2-5 cm. long, 1-3 mm. wide; flowers axillary, subsessile; calyx in fruit 5 mm. long; corolla purplish, trumpet-shaped, 7-8 mm. long; limb about 3 mm. wide; lobes narrowly ovate. *Gilia leptotes* A. Gray. Dry hills: B.C.—Wyo.—Utah—Calif. *Submont.* Je—Jl.

4. **C. aristella** (A. Gray) Rydb. Stem mostly simple, about 1 dm. high, filiform, glandular above; leaves lance-linear, 1-3 cm. long, 1-3 mm. wide, tapering at both ends; flowers in the upper axils; calyx in fruit 5 mm. long; corolla trumpet-shaped, about 1 cm. long; limb about 2 mm. wide. *Gilia aristella* A. Gray. Bare hillsides: Wash.—Mont.—n Calif. *Son.*—*Submont.* Je.

5. **C. heterophylla** Hook. Stem at first simple, soon branched from the base, puberulent, 1-4 dm. high; leaves hirsute, the lower pinnatifid or bipinnatifid, with lanceolate, acuminate or acute divisions, the upper lanceolate or oblanceolate, toothed or entire, the floral ones ovate and about 1 cm. long; flowers in head-like clusters at the end of the branches; calyx in fruit 7-8 mm. long; teeth ovate-lanceolate, acuminate; corolla rose-colored, 12-15 mm. long; limb 5-6 mm. broad. *G. heterophylla* Dougl. Open ground: B.C.—Ida.—Calif. *Submont.* Ap—Au.

6. **C. debilis** (S. Wats.) Greene. Stems 5-15 cm. high, decumbent, viscid-pubescent above; leaves thick, petioled, puberulent, obovate-spatulate to oblanceolate in outline, the earlier entire, the later often 3-5-lobed at the apex; floral leaves like the others, but sessile and crowded; calyx-lobes lance-subulate; corolla violet, 15 mm. long, funnelform; lobes oblong; stamens exserted. *Gilia debilis* S. Wats. *G. Howardii* M. E. Jones. Among loose rocks: Wash.—Mont.—Wyo.—Utah—Ore. *Mont.*—*Alp.* Jl—Au.

3. PHLOX L. PHLOX.

Perennial (all ours), or annual herbs, often shrubby at the base. Leaves opposite or sometimes alternate above, entire. Flowers in terminal corymbiform or paniculate cymes. Calyx of 5 sepals, united into a 5-ribbed tube; lobes often pungent. Corolla salverform, white, blue, purple, or red, with a slender tube; lobes spreading, obovate, orbicular, or obcordate. Stamens 5, included; filaments equally adnate to the tube of the corolla. Capsule included in the tube of the calyx, which is ruptured at maturity. Seeds not emitting spiral threads when wetted.

Intercostal portion of the calyx not replicate.

Plants conspicuously caespitose, less than 1.5 dm. high.

Leaves beset with cobwebby hairs; plants densely pulvinate-caespitose.

I. CANESCENTES.

Leaves not cobwebby, except sometimes slightly so at the base.

Leaves glabrous, or merely cobwebby at the base, not glandular.

II. MULTIFLORAE.

Leaves hispid-ciliate on the margin, usually with more or less glandular hairs.

Leaves linear to subulate, not with thickened margins.

III. CAESPITOSAE.

Leaves oblong or broadly linear, with more or less thickened and cartilaginous margins.

IV. ALBOMARGINATAE.

Plants suffrutescent at the base, 3-10 dm. high.

VI. SPECIOSAE.

Intercostal portion of the calyx replicate.

V. LONGIFLORAE.

I. CANESCENTES.

Leaves ovate to lanceolate, densely arachnoid-lanate, mucronate-tipped, but scarcely acerose.

Leaves ovate, distinctly 4-ranked, imbricate; corolla-tube twice as long as the calyx.

1. *P. bryoides*.

Leaves appressed, not conspicuously 4-ranked; corolla-tube slightly if at all exceeding the calyx.

2. *P. muscoides*.

Leaves subulate, acerose, sparsely arachnoid.

Corolla small; its limb 8-10 mm. wide.

3. *P. canescens*.

Corolla-tube about twice as long as the calyx.

4. *P. Hoodii*.

Corolla-tube slightly if at all exceeding the calyx.

5. *P. andicola*.

Corolla middle-sized, its limb 10-15 mm. wide.

II. MULTIFLORAE.

Plant not glandular.

Calyx more than 8 mm. long, its teeth longer than the tube.

Calyx and the bases of the leaves arachnoid-hairy.

5. *P. andicola*.

Calyx and stem finely villous or glabrous; leaves not arachnoid.

Calyx more than 1 cm. long; leaves flat, the margins not revolute; stem 5-10 cm. high.

6. *P. multiflora*.

Calyx less than 1 cm. long; leaves very narrow, with revolute margins.

7. *P. depressa*.

Stem and calyx glabrous or nearly so.

8. *P. costata*.

Stem and calyx decidedly villous.

Calyx less than 8 mm. long, its lobes much shorter than the tube.

Corolla-lobes 6-8 mm. long.

Leaves all subulate-filiform.

9. *P. scleranthifolia*.

Leaves of the stem broader, inclined to be linear-oblanate, those of the

10. *P. diffusa*.

fascicles or branches subulate.

11. *P. glabrata*.

Corolla-lobes 4-5 mm. long.

12. *P. Douglasii*.

Plant more or less glandular.

III. CAESPITOSAE.

Leaves less than 1 cm. long; plant densely pulvinate-caespitose; limb of corolla seldom over 1 cm. broad.

Leaves almost erect, appressed; corolla-limb about 8 mm. wide.

13. *P. condensata*.

Leaves ascending-spreading; corolla-limb about 10 mm. wide.

Leaves linear, flat; margins only slightly revolute.

14. *P. caespitosa*.

Leaves acerose-subulate; margins strongly revolute.

15. *P. rigida*.

Leaves more than 1 cm. long; plant caespitose, but not pulvinate; corolla-limb 12-20 mm. wide.

Leaves acerose-subulate; margins strongly revolute; corolla white.

12. *P. Douglasii*.

Leaves linear; margins scarcely revolute; corolla usually pinkish or purplish.

16. *P. Kelseyi*.

IV. ALBOMARGINATAE.

Plant caespitose, but not densely pulvinate, more than 3 cm. high; leaves oblong to broadly linear, 7-20 mm. long.

Leaves linear, 1-2 cm. long; margins not very thick; corolla-tube twice as long as the calyx; young stems white-angled.

16. *P. Kelseyi*.

Leaves oblong with very thick margins, 7-12 mm. long; corolla-tube not twice as long as the calyx; young stems not white-angled.

17. *P. alysifolia*.

Plants densely pulvinate, less than 3 cm. high; leaves ovate-oblong, less than 5 mm. long, with very thick margins.

Flowers peduncled; corolla-tube over 1 cm. long, more than twice as long as the densely glandular calyx.

18. *P. albomarginata*.

Flowers sessile; corolla-tube less than 1 cm. long, not twice as long as the calyx.

19. *P. diapensioides*.

V. LONGIFOLIAE.

Plant glabrous or only the upper portion, peduncles, and calyces pubescent.

Plant glabrous throughout, or rarely with a few scattered hairs on the calyces and peduncles; calyx-teeth longer than the tube; leaves less than 2 mm. wide.

20. *P. linearifolia*.

Plant usually pubescent above, in one variety even glandular; calyx-teeth shorter than the tube; leaves over 2 mm. wide.

21. *P. longifolia*.

Plant pubescent throughout.

Plant densely grayish pubescent, not at all glandular, densely caespitose, with a thick woody caudex. 22. *P. austromontana*.

Plant glandular or viscid.

Corolla-tube glabrous.

Leaves 2-4 mm. wide.

Leaves long-attenuate, not thick; only upper portion glandular; corolla scarcely twice as long as the calyx. 21. *P. longifolia*.

Leaves obtusish or abruptly acute, thick and firm; corolla-tube fully twice as long as the calyx. 23. *P. Stansburyi*.

Leaves 1 mm. wide; corolla not twice as long as the calyx.

Corolla-tube pubescent.

24. *P. viridis*.

25. *P. gladiiformis*.

VI. SPECIOSAE.

One species.

26. *P. speciosa*.

1. ***P. bryoides*** Nutt. Plant less than 1 dm. high; leaves densely imbricate, ovate or triangular-lanceolate, 2-3 mm. long, densely cobwebby, with inflexed margins; flowers solitary at the end of the branches, sessile; calyx-teeth subulate, shorter than the tube; corolla about 1 cm. long; lobes obovate, about 3 mm. long. Dry hills: Neb.—Colo.—Utah—Wyo. *Plain—Submont.* My—Je.

2. ***P. muscoides*** Nutt. Plant rarely more than 5 cm. high; leaves imbricate, but not 4-ranked, subulate, with revolute margins, 5-8 mm. long, decidedly cobwebby; flowers sessile and solitary at the ends of the branches; calyx-teeth subulate, equalling the tube; corolla 6-8 mm. long; lobes obovate, 3 mm. long. Dry hills: Mont. *Submont.* My—Jl.

3. ***P. canescens*** T. & G. Leaves subulate, pungent, at length spreading, 6-10 mm. long, lanate-canescens, at least when young; flowers sessile, solitary at the ends of the branches; calyx arachnoid-hairy; teeth subulate; corolla white, about 1 cm. long; lobes broadly obovate, 4-5 mm. long. Dry hills: w Colo.—N.M.—Calif.—Ida. *Submont.* My.

4. ***P. Hoodii*** Richards. Leaves subulate, sparingly lanate, 4-10 mm. long, apiculate; flowers sessile, solitary at the ends of the branches; calyx 5-7 mm. long, arachnoid; teeth similar to the leaves; corolla white, 8-10 mm. long; lobes obovate, entire or mucronate, 5 mm. long. Moss PINK, Moss PHLOX. Hills and plains: Mack.—Neb.—Wyo.—Ida.—Yukon. *Plain.* Ap—My.

5. ***P. andicola*** (Britton) E. Nels. Stem erect, branched at the ground, white, 5-10 cm. high, sparingly arachnoid at the nodes; leaves subulate, 1-2 cm. long, with strong midrib; flowers on short pedicels; calyx-teeth as long as the tube, subulate, pungent; corolla white, half longer than the calyx; lobes obovate, 5-7 mm. long. Plains and hills and sandy soil: S.D.—Colo.—Ida. *Plain.* Je—Jl.

6. ***P. multiflora*** A. Nels. Caespitose perennial, with a suffruticose base; branches erect, finely pubescent, not arachnoid; leaves broadly linear, glabrous, apiculate, 1-2 cm. long; flowers solitary; peduncles 1-3 cm. long; calyx glabrous or nearly so, about 1 cm. long; lobes linear, with a strong midrib; corolla light blue or white, nearly 2 cm. long; tube longer than the calyx; lobes obovate, about 1 cm. long. *P. dasyphylla* A. Brand, a small-flowered and narrow-leaved form. Mountains and hills: Mont.—Colo. *Submont.—Mont.* My—Jl.

7. ***P. depressa*** (E. Nels.) Rydb. Densely caespitose perennial, less than 1 dm. high; leaves narrowly linear, 1 cm., rarely 2 cm. long, with strong midrib; flowers subsessile or with very short pedicels; calyx about 8 mm. long, glabrous; teeth subulate; corolla mostly white, 15-18 mm. long; lobes broadly obovate, 6-7 mm. long. Open hills: Mont.—Colo.—Utah—Ida. *Submont.—Mont.* Je—Au.

8. ***P. costata*** Rydb. Stems less than 5 cm. high; leaves about 1 cm. long, linear-subulate, acrosc; midrib prominent and margins slightly revolute; flowers solitary; pedicels less than 1 cm. long; calyx strongly ribbed, villous between the ribs; teeth subulate, equalling the tube, more or less spreading; corolla bluish, turning white; tube twice as long as the calyx; lobes almost orbicular, 7-8 mm. long. Dry ridges: Mont.—(? Utah). *Mont.* Jl.

9. ***P. scleranthifolia*** Rydb. Branches depressed, glabrous or nearly so; leaves very narrow, about 1 cm. long, less than 0.5 mm. wide, spinulose-tipped,

somewhat divergent, with prominent midrib; flowers sessile or nearly so; calyx about 5 mm. long; teeth lanceolate, bristle-pointed; corolla white; tube exceeding the calyx; lobes oblong. Dry hills: Black Hills, S.D. *Submont.* Je.

10. *P. diffusa* Benth. Loosely caespitose-spreading perennial; branches 2-3 cm. long, glabrous; leaves 6-12 mm. long, oblong-linear, 1-2 mm. wide, spreading, apiculate, with strong midrib; flowers sessile or subsessile; calyx sparsely lanate-ciliate, 5-7 mm. long; teeth lance-subulate, somewhat spreading; corolla white, about 15 mm. long; lobes entire, obovate. Hills and mountains: B.C.—Wyo.—Calif. *Submont.* Je—Au.

11. *P. glabrata* (E. Nels.) A. Brand. Branches numerous, 5 cm. long or less; leaves glabrous or slightly arachnoid at the nodes, densely imbricate, appressed, linear, flat, 5-10 mm. long; flowers sessile, solitary; calyx 4-5 mm. long, glabrous or slightly arachnoid between the ribs; teeth subulate; corolla 8-10 mm. long; lobes broadly ovate. Open plains and hills: Wyo. *Submont.* My.

12. *P. Douglasii* Hook. Stem much branched from a woody root; leaves acerose, pungent, 5-15 mm. long, ciliate and usually conspicuously glandular, rarely glabrate; flowers sessile; calyx ciliate and glandular; teeth subulate; corolla 18-20 mm. long, white; tube exerted; lobes obovate or rounded, 6-7 mm. long. Hills and mountains: Wash.—Mont.—Nev.—n Calif. *Submont.*—Mont. My—Jl.

13. *P. condensata* (A. Gray) E. Nels. Leaves imbricate, rigid, linear, apiculate, 5-6 mm. long, strongly ascending, straight, with a strong midrib, hispid-ciliate on the margins; calyx glandular and ciliate; lobes similar to the leaves; corolla white, 8-10 mm. long; tube much exceeding the calyx; lobes rounded, about 4 mm. long. *P. caespitosa condensata* A. Gray. High mountain ridges: Colo. *Subalp.*—Alp. Je—Jl.

14. *P. caespitosa* Nutt. Leaves linear or oblong-linear, apiculate, 8-14 mm. long, 1-2 mm. wide, usually flat, hispid-ciliate on the margins; flowers sessile or subsessile, solitary at the ends of the branches; calyx hispid-ciliate and glandular; lobes as long as the tube, lanceolate, pungent; corolla white or light blue, fully twice as long as the calyx; lobes obovate, 5-7 mm. long. Mountains: Mont.—N.M.—Utah—Ore.—B.C. *Submont.*—*Subalp.* Je—Au.

15. *P. rigida* Benth. Leaves subulate-acerose, at last recurved-spreading, 5-10 mm. long, hispid-ciliate and somewhat glandular; flowers solitary, subsessile; calyx hispid-ciliate, more or less glandular; lobes acerose; corolla 10-12 mm. long; tube much longer than the calyx; lobes obovate, about 5 mm. long. Dry hills and mountains: Mont.—Utah—Ore.—Wash. *Submont.* My—Jl.

16. *P. Kelseyi* Britton. Branches 1-2 dm. long; leaves flat, lanceolate or linear, 1-1.5 cm. long, narrowly white-margined, usually ciliate, sometimes glandular, sometimes glabrate; flowers solitary, short-pedicelled; calyx nearly 1 cm. long, ciliate and often glandular; teeth subulate; corolla blue, lilac, or pink, rarely white, fully 2 cm. long; lobes broadly obovate, 7-8 mm. long. Valleys: N.D.—Colo.—Mont. *Plain*—*Subalp.*

17. *P. alyssifolia* Greene. Branches short, with white shreddy bark; leaves oblong or linear, or the earlier ones ovate, 5-15 mm. long, 2-4 mm. wide, usually ciliate on the margins and sometimes a little glandular, cuspidate; flowers sessile or nearly so; calyx ciliate, strongly ribbed, often considerably glandular; calyx 7-8 mm. long; teeth oblong, acerose-cuspidate, rather shorter than the tube; corolla bluish, rarely white, 15-18 mm. long; lobes obovate, 7-8 mm. long. *P. collina* Rydb. *P. variabilis* A. Brand. Mountains and dry benches: Sask.—S.D.—Colo.—Utah—Mont. *Submont.*—Mont. My—Au.

18. *P. albomarginata* M. E. Jones. Floral stems 2-7 cm. high, 1-3 flowered; leaves 4-6 mm. long, 2-3 mm. wide, spreading, ovate or lanceolate, hispid-ciliate at the base, and pubescent beneath; pedicels 2-8 mm. long; calyx 7-8 mm. long; teeth 2-3 mm. long, subulate, acerose, scarcely spreading; corolla purplish or lilac, 12-15 mm. long; lobes about 4 mm. long, obovate. Mountain sides and hills: Mont. *Submont.* My—Je.

19. *P. diapiensoides* Rydb. Branches about 2 cm. high; leaves crowded, numerous, 4-5 mm. long, ovate, sharply acerose-cuspidate, thick, with a strong

midrib, ciliate and more or less glandular beneath; calyx about 5 mm. long, somewhat glandular; lobes lanceolate, in fruit divergent; corolla pink-purple; lobes obovate, 4-5 mm. long. *P. albomarginata minor* M. E. Jones. Dry hills: Mont.—Utah. *Submont.* Jl-S.

20. *P. linearifolia* (Hook.) A. Gray. Suffrutescent perennial; herbaceous branches 1.5-3 dm. long, with straw-colored bark; leaves narrowly linear, about 2-5 cm. long, 1-2 mm. wide; flowers long-pedicelled; calyx glabrous, about 1 cm. long; corolla 2-2.5 cm. long; lobes obovate or oblanceolate, 7-12 mm. long. Plains: B.C.—Wyo.—Utah—Ore. *Plain—Submont.* Ap-Jl.

21. *P. longifolia* Nutt. Perennial, with a woody base; stems 1-2 dm. high, erect, glabrous below, usually puberulent above or more puberulent throughout (var. *puberula* E. Nels.); leaves linear, with strong midrib, 3-7 cm. long, 2-3 mm. wide; calyx usually more or less pubescent, sometimes glandular, about 1 cm. long; corolla 18-20 mm. long; lobes obovate, 8-10 mm. long. *P. cernua* E. Nels., a young form with nodding flowers. SWEET WILLIAM. Plains and hills: Mont.—N.M.—Utah—Ore.—B.C. *Plain—Submont.* My-Au.

22. *P. austromontana* Coville. Stems 5-10 cm. high, woody at the base, minutely canescent, not glandular; leaves linear-subulate, acerose, 1-1.5 cm. long (rarely 2-2.5 cm. in var. *prostrata*), arcuate-spreading in age, minutely canescent; flowers subsessile; calyx 6-9 mm. long, glabrous or slightly puberulent; teeth acerose; corolla white or rarely purplish, 15-20 mm. long; tube exceeding the calyx; lobes obovate, 5-7 mm. long. *P. densa* A. Brand, a denser more compact form. Dry mountains: se Colo.—Ariz.—Calif.; L. Calif. *Son.—Submont.*

23. *P. Stansburyi* (Torr.) Heller. Stems with a ligneous branched base, 1-2 dm. high, pubescent and more or less glandular throughout; leaves thick, spreading, linear or linear-lanceolate, 2-2.5 cm. long, 2-3 mm. wide, or in the var. *brevifolia* ovate-lanceolate or oblong, 0.5-2 cm. long, 3-4 mm. wide; calyx 1 cm. long, glandular; teeth subulate-acerose, as long as the tube; corolla pink or rose-colored; lobes cuneate-obovate, erose or emarginate, 7-8 mm. long. *P. viscida* E. Nels., a low, more viscid form. SWEET WILLIAM. Dry regions: Colo.—N.M.—Calif.—Wash. *Son.—Submont.* Ap-Je.

24. *P. viridis* E. Nels. Stems several from a ligneous base, 0.5-1.5 dm. high, glabrous below, glandular-pubescent above; leaves linear-acerose, 2-3 cm. long, 1 mm. wide; pedicels short, glandular-pubescent; calyx glandular-pubescent, about 1 cm. long; teeth acerose, as long as the tube; corolla light blue; lobes 6-7 mm. long, obovate-cuneate, emarginate. *P. aculeata* A. Nels. Tablelands: Wash.—Ida. My-Je.

25. *P. gladiformis* (M. E. Jones) E. Nels. Stems softly pubescent and slightly glandular throughout, prostrate at the base; leaves thick, with prominent midrib, narrowly lance-linear, 1.5-2 cm. long, about 2 mm. wide; flowers subsessile; calyx nearly 1 cm. long, sparingly glandular, ciliate; teeth acerose, slightly longer than the tube; corolla white; tube twice as long as the calyx; lobes cuneate-obovate, entire, 7 mm. long. *P. longifolia gladiformis* M. E. Jones. Dry regions: Utah. *Submont.* My.

26. *P. speciosa* Pursh. Shrubby perennial, 5-10 dm. high; annual branches 2-3 dm. long, glandular-viscid above; leaves linear or the upper lance-linear, 4-7 cm. long, 2-4 mm. wide, more or less pubescent; flowers in lax corymbiform cymes; calyx fully 1 cm. long, glandular-pubescent; lobes subulate; corolla 2-2.5 cm. long; lobes 8-14 mm. long, obcordate or obovate, from deeply emarginate to entire. *P. Sabini* Dougl. Copses and hillsides: Wash.—Wyo.—Calif. *Son.—Submont.* My-Je.

4. MICRÓSTERIS Greene.

Small branched annuals. Leaves all except the floral ones opposite, narrow and entire. Flowers small, perfect, axillary. Calyx tubular, 5-cleft, ruptured by the fruit; lobes scarious-margined. Corolla salver-shaped, with a narrow tube; throat funnelform. Stamens unequally adnate to the corolla-tube. Capsule 3-celled; seeds few, large, the coat, when wetted, mucilaginous but without spiracles.

Calyx-lobes much exceeding the tube in length; plant usually erect, simple below; corolla tube 1 mm. wide or more; limb 3-4 mm. wide. 1. *M. gracilis*.

Calyx-lobes not longer than the tube; plant low, diffusely branched from near the base; corolla-tube less than 1 mm. wide; limb 1-2.5 mm. wide.

Plant 1.5-2 dm. high; leaves except the lower ones lanceolate or linear-lanceolate, mostly acute; corolla-tube longer than the calyx. 2. *M. humilis*.

Plant less than 1 dm. high; leaves, except the basal ones, oblong or linear, obtuse, the basal ones spatulate; corolla-tube scarcely exceeding the calyx. 3. *M. micrantha*.

1. *M. gracilis* (Dougl.) Greene. Stem erect or rarely decumbent (*M. diffusa* Heller), puberulent and glandular above, 1-4 dm. high; basal leaves spatulate, the upper stem-leaves linear or linear-lanceolate, acute, 2-6 cm. long; calyx tubular, glandular-pubescent, 7-10 mm. long; corolla 10-14 mm. long; tube yellowish; limb purplish or violet. *G. gracilis* Hook. Hills and valleys: B.C.—Mont.—Wyo.—Calif. *Plain—Submont.* My-Jl.

2. *M. humilis* (Dougl.) Greene. Stem puberulent and more or less glandular; lower leaves oblanceolate or spatulate; calyx tubular, 7-9 mm. long; lobes subulate; corolla 8-10 mm. long; tube white; limb purplish or violet, sometimes white. *Collomia humilis* Dougl. Dry plains and sandy soil: B.C.—Mont.—Colo.—Calif. *Plain—Submont.* My-Jl.

3. *M. micrantha* (Kellogg) Greene. Stem glandular and puberulent; lower leaves 1-2 cm. long, puberulent; calyx tubular, 4-5 mm. long, puberulent; teeth subulate; corolla 5-7 mm. long; tube white; limb white, rose-colored, or violet. *Collomia micrantha* Kellogg. Dry or sandy soil: Neb.—Colo.—Ariz.—e Calif. *Son.—Mont.* Ap-Je.

5. WELWITSCHIA Reichenb.

Annual herbs, with alternate entire or pinnatifid floccose leaves. Flowers perfect in dense heads; bracts conspicuously long-villous. Calyx densely woolly; lobes acerose-tipped; tube ruptured by the fruit. Corolla salver-shaped, with a funnelliform open throat. Stamens 5; filaments adnate to the whole tube of the corolla, exerted; anthers deeply sagittate. Seed usually mucilaginous and with spiracles when wetted. [*Huegelia* Benth., not Reichenb.]

Corolla-lobes much shorter than the tube.

Plant erect; heads acute at the base; bracts ascending.

Bracts not dilated at the base.

Bracts somewhat dilated at the base.

Plant diffuse; heads rounded at the base; bracts spreading.

Corolla-lobes scarcely shorter than the tube.

1. *W. Wilcoxii*.

2. *W. filifolia*.

3. *W. diffusa*.

4. *W. floccosa*.

1. *W. Wilcoxii* (A. Nels.) Rydb. Stem erect, with erect or ascending branches, lanate, 1-2 dm. high; leaves 3-parted with linear, pungently-tipped lobes, floccose; bracts 5-parted; calyx-lobes unequal, subulate; corolla about 1 cm. long, tubular-funnelform, white; tube scarcely exceeding the calyx. *Gilia Wilcoxii* A. Nels. Dry soil: Ida.—Ore. *Son.* Jl.

2. *W. filifolia* (Nutt.) Rydb. Stem 1-2 dm. high, sparingly floccose; leaves filiform, simple, or 3-parted into filiform divisions, cuspidate; bracts 2-5-cleft, with a hyaline base, somewhat arcuate; calyx-lobes subulate, unequal, shorter than the tube; corolla light blue, scarcely longer than the calyx. *G. filifolia* Nutt. Plains: Wash.—Utah—N.M.—Calif. Ap-Jl.

3. *W. diffusa* (A. Gray) Rydb. Stem 1-10 cm. high, diffusely branched near the base, sparingly floccose; leaves spreading, 3-parted into spreading filiform lobes, or some entire; bracts 5-parted; calyx-lobes subulate, unequal; corolla about 12 mm. long; lobes about half as long as the tube. *G. filifolia diffusa* A. Gray. Plains and dry places: Tex.—s Utah—Calif. *Son.* Ap-Je.

4. *W. floccosa* (A. Gray) Rydb. Stem 1-3 dm. high, branched, more or less floccose or glabrate in age; leaves 3-parted or entire, filiform or with filiform lobes, floccose; bracts much longer than the heads, divergent; calyx-teeth subulate; corolla violet blue to white, about 15 mm. long; limb nearly 1 cm. wide. *G. floccosa* A. Gray. Plains: Wash.—Utah—Ariz.—Calif. *Son.* My-Au.

6. NAVARRËTIA R. & P.

Glabrous or viscid-puberulent, branched annuals. Leaves all alternate, setaceous or spinulose pinnatifid, or the lowest subentire. Flowers perfect, in crowded, bracted, head-like clusters at the ends of the branches. Calyx-tube short, scarious in the sinuses; lobes unequal, costate, pungently tipped, some of them at least spinulose toothed or cleft. Corolla salverform, with a funnelliform throat. Stamens adnate up to or nearly to the throat of the corolla. Seeds one to many in each cell, commonly mucilaginous and producing spiracles, when wetted. Capsule 1-3-celled,, partially dehiscent or indehiscent.

Corolla white; pericarp hyaline and indehiscent or irregularly bursting, closely adherent to the mucilaginous seeds.

Calyx and the bases of the floral leaves long-hairy; flowers nearly 1 cm. long.

Glabrate or strigose, long-hairy only in the sinuses of the calyx; flowers about 7 mm. long.

Corolla yellow; pericarp of the capsule firm, dehiscent.

1. *N. intertexta*.

2. *N. minima*.

3. *N. Breweri*.

1. **N. intertexta** (Benth.) Hook. Stems erect, 1-2 dm. high, simple or widely branched, reflexed-strigose; leaves glabrate or sparingly hairy, pinnatifid or bipinnatifid, with filiform, spinescent divisions; bases of bracts and calyx densely arachnoid-villous with white hairs; some of the calyx-teeth dentate; corolla white, 9-10 mm. long; limb 2.5-3 mm. broad; stamens equally inserted, exserted. *Gilia intertexta* Steud. Plains and sandy places: Wash.—Mont.—Ida.—Calif. *Submont.* My—Au.

2. **N. minima** Nutt. Stem erect, simple, or branched near the base, 1-5 cm. high, glabrate or nearly so; leaves glabrous, pinnatifid, with filiform-subulate, acerose divisions; bracts glabrous; calyx slightly hairy in the sinuses; corolla white, about 7 mm. long; limb 1-1.5 mm. broad; tube shorter than the calyx; stamens equally inserted in the throat. *G. minima* A. Gray. Bottom lands and sandy places: Wash.—Sask.—Neb.—Calif. *Plain—Submont.* My—Jl.

3. **N. Breweri** (A. Gray) Greene. Stem simple or branched below, 1-10 cm. high, glandular-puberulent; leaves pinnatifid, glandular-puberulent, with subulate-acerose divisions; bracts and calyx not villous, merely puberulent; corolla 6-7 mm. long, shorter than the calyx; limb 1.5 mm. wide; stamens equally inserted in the throat, exserted. *G. Breweri* A. Gray. Foot-hills and sandy places: Wash.—Wyo.—Colo.—Calif. My—Au.

7. LEPTODÁCTYLON Nutt.

Much branched undershrubs or some species herbaceous except the base. Leaves alternate, or rarely opposite, with smaller ones fascicled in the axils, numerous, palmately 3-5-parted, usually acerose-subulate, pungent. Flowers showy, solitary or in small clusters, sessile. Calyx tubular or campanulate, with subulate teeth, ruptured by the fruit. Corolla trumpet-shaped, with a funnel-form throat, yellow or reddish or lilac. Filaments equally adnate to the throat of the corolla; anthers included in the throat of the corolla. Capsule many- or few-seeded. Seeds neither mucilaginous, nor with spiracles.

Leaves alternate; stem woody throughout.

Plant pulvinate-cespitose; corolla 4-merous.

Plant suffruticose, with erect branches; corolla 5-merous.

Leaves and their divisions ascending, straight.

Leaves 6-15 mm. long.

Leaves thick, 2-5 mm. long.

Leaves and their divisions spreading-recurved, stout.

Leaves opposite; stem woody only at the base.

Leaves decidedly pungent; ovules numerous.

Leaves scarcely pungent; ovules 2-3 in each cell.

1. *L. caespitosum*.

2. *L. pungens*.

3. *L. brevifolium*.

4. *L. patens*.

5. *L. Watsonii*.

6. *L. Nuttallii*.

1. **L. caespitosum** Nutt. Densely pulvinate-cespitose perennial, with woody caudex; leaves densely crowded, slightly ciliate below, about 5 mm. long, usually 3-parted, with subulate straight pungent divisions; calyx 6-8 mm. long; teeth subulate; corolla light yellow, trumpet-shaped, 12-15 mm. long; lobes 4 mm. long. *Gilia pungens caespitosa* A. Gray. Dry hills: w Neb.—Wyo.—Utah. *Plain—Submont.* My—Jl.

2. *L. pungens* (Torr.) Nutt. Suffrutescent perennial, 1-3 dm. high; leaves 5-8 mm. long, puberulent, but not glandular, or glabrate, digitately 3-7-divided, with linear-subulate, straight, ascending divisions; flowers axillary, solitary; calyx tubular, 5-ridged, about 1 cm. long, glabrate; teeth subulate, pungent, much shorter than the tube; corolla yellow or yellowish, 15-20 mm. long; lobes about 5 mm. long, oblong. *Gilia pungens* (Torr.) Benth. Sandy valleys and hill-sides: Mont.—Colo.—Calif.—B.C. *Plain*—Mont. Je—Jl.

3. *L. brevifolium* Rydb. Suffrutescent, branched perennial, 1-2 dm. high; stems puberulent and slightly glandular above; leaves 3-5 mm. long, glandular-puberulent or glabrate, 3-5-divided into subulate, acerose ascending divisions; calyx about 8 mm. long, glandular-puberulent; teeth subulate-acerose, much shorter than the tube; corolla about 15 mm. long. Dry hills: Utah—Wash.—(? Colo.). *Son.* Je.

4. *L. patens* Heller. Suffrutescent perennial, 1-3 dm. high; branches puberulent; leaves 5-7 mm. long, curved, 3-7-divided into subulate divisions, puberulent or glabrate, somewhat glandular; calyx 7-8 mm. long, glandular-puberulent; teeth subulate, erect, shorter than the tube; corolla about 15 mm. long, trumpet-shaped; lobes oblong, about 6 mm. long; stamens inserted in the throat. *Gilia pungens squarrosa* A. Gray. Arid regions: Utah—Ariz.—Nev. *Son.* Je—Jl.

5. *L. Watsonii* (A. Gray) Rydb. Suffrutescent perennial; stems erect, 5-15 cm. high; branches glandular-pubescent; leaves opposite, palmately 3-7-divided, with narrowly linear acerose divisions, glandular-pubescent; calyx tubular, glandular-ciliate; teeth subulate, much shorter than the tube; corolla white, with a purplish throat, 18-25 mm. long; lobes oval, nearly as long as the tube. *G. Watsonii* A. Gray. Cliffs and rocky hills: Utah—Colo. *Son.*—*Submont.* My—Jl.

6. *L. Nuttallii* (A. Gray) Rydb. Perennial, with a woody base; stems numerous, erect, 1-3 dm. high, crisp-puberulent; leaves palmately 3-7-divided into linear or linear-filiform divisions, or the lower ones entire; flowers axillary, clustered at the ends of the stems; calyx tubular, villous; teeth lance-subulate; corolla 1-2 cm. long, salver-shaped, white with a yellow throat; lobes oval. *Gilia Nuttallii* A. Gray. Mountains: Wash.—Wyo.—N.M.—Calif. *Mont.*—*Subalp.* My—Au.

8. *GILIA* R. & P.

Annual, biennial, or perennial herbs. Leaves all or at least the upper ones alternate, entire to pinnatifid. Flowers perfect, mostly cymose. Calyx campanulate; tube more or less hyaline in the sinuses and burst by the fruit; lobes subequal. Corolla trumpet-shaped or salverform, with an open salverform throat. Stamens 5, usually equally high inserted. Capsule usually many seeded; seeds changed when wetted, mucilaginous and usually spirilliferous.

Flowers capitate or spicately glomerate.

Plant strigose or short-villous (nearly glabrous in *G. nuda*); flowers leafy-bracted.

Perennials; flowers in dense heads or spikes.

I. CONGESTAE.

Annuals, repeatedly branched, with small clusters of flowers in the axils of the leaves, more capitate at the ends of the branches.

II. PUMILAE.

Plants glabrous; flowers in long-peduncled heads, not leafy-bracted.

III. CAPITATAE.

Flowers openly paniculate or thyrsoid-paniculate.

Leaves pinnately divided.

Corolla-tube over 1 cm. long; calyx-lobes lanceolate, attenuate and spine-tipped; biennials.

IV. AGGREGATAE.

Inflorescence thyrsoid, narrow.

V. LONGIFLORAE.

Inflorescence open and inclined to be flat-topped.

Corolla-tube less than 1 cm. long.

Stamens conspicuously exserted; corolla nearly salverform; biennials.

VI. PINNATIFIDAE.

Stamens not exserted, or barely so; corolla with a more or less funneliform

VII. INCONSPICUAE.

Leaves entire or the lower ones toothed or lobed.

VIII. LEPTOMERIAE.

Leaves not filiform.

IX. MINUTIFLORAE.

Leaves or their divisions filiform; annuals.

I. CONGESTAE.

Leaves entire.

Plant 3-4 dm. high, suffrutescent.

1. *G. frutescens*.

- Plant 1–2 dm. high, cespitose.
 Leaves filiform, not very fleshy; flowering stems slender, sparingly leafy.
 Leaves short, fleshy, falcate; flowering stems very short and very leafy.
- Leaves, at least some of them, pinnatifid.
 Plant branched only at the base, or simple; stem or branches strict, with a single head-like or spike-like inflorescence.
 Stamens inserted in the throat of the corolla.
 Inflorescence spike-like, more or less interrupted; corolla greenish white, its lobes acute.
 Inflorescence head-like; corolla white, its lobes obtuse.
 Corolla-lobes 3–4 mm. long.
 Corolla-tube scarcely exerted.
 Corolla-tube decidedly exerted, about half longer than the calyx.
 Corolla-lobes 2–2.5 mm. long.
 Stamens inserted in the middle of the corolla-tube.
- Plant branched above as well as at the base; inflorescence of several heads more or less corymbosely arranged.
 Leaves glabrous; inflorescence glandular.
 Leaves and inflorescence crisp-hairy.
 Corolla-lobes about 2 mm. long; calyx-teeth and bracts green, with very short spine-tips; branches straw-colored.
 Segments of the leaves short, oblong, crowded, the leaves therefore apparently subdigitate.
 Segments of the leaves linear, not crowded, the leaves therefore distinctly pinnatifid.
 Branches erect, 1.5–3 dm. high; plant sparingly pubescent.
 Branches ascending, 0.5–1.5 dm. high; plant densely pubescent.
- Corolla-lobes 4–5 mm. long; calyx-teeth and bract rose-tinged, with long spine-tips; stem tinged with purple.

II. PUMILAE.

- Leaves entire or merely toothed.
 Leaves linear-filiform, entire.
 Leaves oblanceolate, some of them toothed.
- Leaves pinnatifid.
 Divisions of the leaves linear-filiform; floral leaves similar; corolla twice as long as the calyx.
 Divisions of the leaves very short, oblong; floral leaves broader and shorter, more entire; tube of the corolla slightly exceeding the calyx.

III. CAPITATAE.

- One species.

IV. AGGREGATAE.

- Corolla-lobes acute or acuminate; corolla usually scarlet or pink.
 Calyx only slightly scarious at the angles; its lobes lanceolate-attenuate, longer than the tube.
 Calyx and inflorescence glandular-puberulent, not long-hairy.
 Stamens included.
 Corolla-lobes ovate-lanceolate, acute; tube about 2 cm. long.
 Corolla-lobes narrowly lanceolate, attenuate; tube nearly 3 cm. long.
 Stamens exerted; corolla-lobes attenuate.
 Calyx and usually also the inflorescence with long white flat hairs, as well as glandular-puberulent.
 Calyx very scarious at the angles; its teeth shorter than the tube; corolla-lobes acute.
- Corolla-lobes rounded or obtuse at the apex; corolla white.

V. LONGIFLORAE.

- Corolla-tube 3–4 cm. long; its lobes obtuse.
 Corolla-tube 1.5–2.5 cm. long; its lobes acute.

VI. PINNATIFIDAE.

- Divisions of the leaves all linear-filiform, not wider than the rachis; corolla about 1 cm. long.
 Divisions, at least of the lower leaves, obovate or oblong, much broader than the rachis.
 Corolla-tube 4–6 mm. long; calyx-lobes acuminate.
 Corolla-tube 8–10 mm. long; calyx-lobes acute.

VII. INCONSPICUAE.

- Corolla 7–14 mm. long.
 Calyx about one-fourth as long as the corolla.
 Calyx one-third to two-thirds as long as the corolla.

Corolla-tube distinctly exserted from the calyx; leaves mostly basal or the stem-leaves reduced.

Plants branched near the base; the few stem-leaves pinnatifid.

Limb of the corolla 5-6 mm. wide; calyx glandular-puberulent.

Limb of the corolla 3-4 mm. wide; calyx glabrous or nearly so.

Plants simple below, branched above; stem-leaves several, lanceolate, sharply toothed or rarely entire.

Corolla-tube scarcely exserted from the calyx; plant more leafy.

Corolla 4-6 mm. long.

Plant leafy only at the base; divisions short and broad; corolla about twice as long as the calyx.

Plants leafy throughout; divisions of the leaves narrow; corolla only slightly exceeding the calyx.

Leaves pinnatifid, with linear or oblong divisions.

Lower leaves sometimes pinnatifid, with filiform divisions, otherwise the leaves filiform and entire.

VIII. LEPTOMERIAE.

Stamens exserted; inflorescence narrow and spike-like; leaves pinnately lobed.

Stamens not exserted; inflorescence an open panicle.

Basal leaves toothed or lobed; annuals, biennials, or short-lived perennials.

Flowers 1 cm. long or more.

Plant densely glandular; stem-leaves oblanceolate, usually toothed; corolla scarlet or orange.

Plant nearly glabrous; upper stem-leaves lanceolate-subulate, entire; corolla rose-colored.

Calyx 5 mm. long; corolla 15 mm. long.

Calyx 3 mm. long; corolla 10 mm. long.

Flowers less than 1 cm. long; annuals.

Leaf-blades lanceolate, sinuately lobed; lobes scarcely spinulose-tipped.

Leaf-blades orbicular or obovate, spinescent-toothed.

Basal leaves oblanceolate, entire; perennials.

Basal leaves 4-5 cm. long.

Basal leaves 1 cm. long.

Corolla about 5 mm. long; plant simple.

Corolla about 10 mm. long; plant caespitose.

IX. MINUTIFLORAE.

Tall plants with strict branches and erect pedicels.

Pedicels longer than the fruiting calyces; branches ascending; capsule with 2 seeds in each cell; corolla 5 mm. long.

Pedicels usually shorter than the fruiting calyces; branches nearly erect; capsule 1-seeded; corolla 3-4 mm. long.

Low delicate plants with spreading branches; pedicels in fruit reflexed.

1. *G. frutescens* Rydb. Stems woody below, branched above, 3-5 dm. high; leaves linear, glabrous or nearly so, simple, 2-5 cm. long, 1-2 mm. wide, callous-tipped; flowers capitate at the ends of the branches; calyx-teeth lanceolate, cuspidate, shorter than the tube; corolla white, 5-6 mm. long; tube barely exserted; lobes about 2.5 mm. long, oval, acute. Utah. *Son.* My.

2. *G. spergulifolia* Rydb. Stem low, more or less woody at the base, 5-10 cm. high, more or less pubescent with white crisp hairs, or puberulent; leaves linear-filiform, entire, or the upper rarely with 1-2 similar lobes, tipped with a pungent point; flowers in capitate clusters; calyx villous, with short subulate pungent teeth; corolla 4-5 mm. long, white; tube not exserted; lobes oblong, obtuse, a little over 1 mm. long. Stony slopes: Colo.—Wyo.—Mont.—Utah. *Son.* Je-Jl.

3. *G. crebrifolia* Nutt. Stems several, from a branched woody caudex, erect or ascending, sparingly villous, 5-15 cm. long; leaves simple, fleshy, crowded, glabrous or nearly so, cuspidate, 1-2 cm. long; flowers capitate; calyx sparingly villous; teeth subulate, shorter than the tube; corolla 4-6 mm. long, exserted; lobes oval, about 2 mm. long. *G. Merrillii* A. Nels. Dry soil: Wyo. *Submont.* Je.

4. *G. spicata* Nutt. Biennial or perennial, with a taproot; stem simple, erect, or branched at the base, arachnoid-villous, 1-3.5 dm. high; leaves linear, entire, or with few linear lobes, 2-5 cm. long, 1-2 mm. wide, sparingly arachnoid;

calyx-lobes lanceolate, cuspidate; corolla 9–11 mm. long, greenish white; tube one-third longer than the calyx; lobes 3–4 mm. long, oval. Dry hills: Neb.—Colo.—Utah—Wyo. *Plain—Mont. My-Je.*

5. *G. globularis* A. Brand. Perennial, with a taproot, simple or with a branched caudex; stems 1–1.5 dm. high, densely arachnoid-lanate; leaves numerous, 3–6 cm. long, the basal ones usually entire, linear, the cauline ones often pinnately divided; calyx densely lanate-villous; lobes lanceolate, shorter than the tube, cuspidate; corolla about 9 mm. long; lobes broadly oval. *G. congesta capitata* A. Gray. High mountains: Colo. *Subalp. Jl.*

6. *G. cephaloidea* Rydb. Biennial or perennial, with a taproot; stems 1–3 dm. high; leaves pinnatifid into few linear lobes, or some entire, 2–6 cm. long, floccose; calyx densely arachnoid; teeth lanceolate, subulate-tipped, shorter than the tube; corolla about 12 mm. long; lobes oval. Hills and mountains: Mont.—Wyo. *Mont.—Subalp. Je—Au.*

7. *G. congesta* Hook. Perennial, with a branched caudex; stems simple, 1–1.5 dm. high, arachnoid-villous; basal leaves simple, linear, or 3-cleft, 2–4 cm. long; stem-leaves pinnately 3–5-cleft; calyx densely arachnoid; teeth lanceolate, cuspidate, shorter than the tube; corolla white, 7–8 mm. long. *G. cephaloidea* A. Brand, not Rydb. Hills and sandy plains: Sask.—S.D.—Wyo.—(? B.C.) *Je—Jl.*

8. *G. tridactyla* Rydb. Perennial, with a branched caudex; stems several, arachnoid-lanate, 1–1.5 dm. high; leaves 1–2 cm. long, lanate, 3-cleft at the apex or the lower entire; flowers in a short spiciform inflorescence; calyx moderately pubescent; teeth lanceolate, shorter than the tube; corolla about 1 cm. long; tube longer than the calyx-lobes, elliptic, 3 mm. long. *G. trifida* A. Brand, not Nutt. Mountains: Utah. *Subalp. Au.*

9. *G. nuda* (Eastw.) Rydb. Perennial, suffruticose at the base, with ascending branches, glabrous; leaves simple, linear, or 3-cleft, with linear lobes, pungent-pointed, 2–3 cm. long; flowers capitate at the ends of the branches; calyx glandular, 6–7 mm. long; teeth subulate, acerose; corolla white, about 1 cm. long; lobes about 3 mm. long. Cañons: se Utah. *Son. Au.*

10. *G. montana* Nels. & Kenn. Suffruticose perennial, branched at the base; stem erect or ascending, 1–2 dm. high, arachnoid-villous; leaves almost palmately divided into short divisions, arachnoid-villous; calyx turbinate, arachnoid; lobes lance-subulate, cuspidate; corolla white, 5–7 mm. long; tube barely exerted; lobes 2 mm. long, elliptic. *G. palmifrons* (A. Brand) Rydb. Sand hills and mountains: Ore.—Ida.—Utah—Calif. *Son. Je—Au.*

11. *G. Burleyana* A. Nels. Perennial, with a suffruticose branched caudex; branches erect, 15–30 cm. high; pubescence crisp, but scant, except in the inflorescence; leaves alternate, some entire and linear, others pinnatifid, with linear divisions, cuspidate-tipped; corolla white; tube less than 5 mm. long; lobes oblong, reflexed, about 2 mm. long. Clay banks: Ida. *Son. Jl.*

12. *G. iberidifolia* Benth. Suffruticose perennial; stems several from the woody caudex, erect or ascending, floccose, 1–2 dm. high, branched above; leaves pinnately divided into 3–7 linear lobes, 2–5 cm. long, or the lower entire; calyx-teeth lance-subulate, cuspidate, shorter than the tube; corolla white; tube a little exerted; lobes oval, 2 mm. long or less, obtuse. Dry hills, plains, and badlands: S.D.—Neb.—Colo.—Utah. *Plain—Submont. Je—Au.*

13. *G. roseata* Rydb. Perennial, with a woody base, cespitose; flowering branches about 1 dm. high, purple-tinged, more or less villous or crisp-hairy; leaves pinnatifid, with linear pungent-pointed lobes, about 2 cm. long; calyx also very pubescent and rose-tinged; lobes subulate and spinulose-pointed; corolla about 8 mm. long; its lobes 4–5 mm. long, elliptic, obtuse. Dry hills: Colo.—(? Ida.). *Submont. My.*

14. *G. Gunnisonii* Torr. Stem erect, divaricately branched, 1–2.5 dm. high; leaves glabrous, 1–4 cm. long; flowers in small terminal heads; calyx campanulate, crisp-hairy and somewhat glandular; teeth lanceolate, shorter than

the tube; corolla 5-6 mm. long, white; lobes oval, 2 mm. long. Sandy places: e Colo.—Utah—Ariz. *Son.* My-Je.

15. *G. depressa* M. E. Jones. Stem erect, divaricately branched, 5-10 cm. high, crisp-pubescent; leaves entire or with a few teeth above the middle; flowers cymose, more or less clustered towards the ends; bracts oblanceolate, acute; calyx campanulate; teeth subulate, equalling the tube; corolla 6 mm. long, white; lobes 1.5 mm. long, oval, acute. Desert regions: Utah—Ariz.—Calif. *Son.* My-Je.

16. *G. pumila* Nutt. Stem erect, branched, 1-2 dm. high, crisp-hairy; leaves pinnatifid, with few linear divisions, cuspidate, sparingly crisp-hairy; flowers in small terminal heads; calyx-lobes subulate, shorter than the tube, cuspidate; corolla 9-10 mm. long; tube twice as long as the calyx; lobes oval, 2 mm. long. Dry hills: w Tex.—Wyo.—Utah—Ariz. *Son.*—*Submont.* My-Au.

17. *G. polycladon* Torr. Stems ascending or erect, branched at the base, 5-10 cm. high; leaves mostly basal, rosulate, pinnatifid, crisp-hairy, with oblong divisions, cuspidate; stem-leaves few or none; flowers in small terminal heads; bracts 3-cleft at the apex; calyx glandular-puberulent; sepals lanceolate, cuspidate, shorter than the tube; corolla white, 4-5 mm. long, exserted; lobes scarcely 1 mm. long. Desert regions: w Tex.—Colo.—Nev.—Ariz. *Son.* Ap-Je.

18. *G. capitata* Dougl. Stem erect, simple, or virgately branched, glabrate or nearly so, 1.5-6 dm. high; leaves glabrous or arachnoid at their bases, bi- or tri-pinnatifid, with linear segments; flowers capitate at the ends of the branches; calyx glabrous or slightly puberulent; teeth subulate, equalling the tube; corolla light blue or white, short-trumpet-shaped, nearly funnelform; lobes linear or oblong, equalling the tube. Hills and plains: Alaska—Ida.—Calif. *Son.*—*Submont.* My-Jl.

19. *G. arizonica* (Greene) Rydb. Stem 2-4 dm. high, more or less crisp-hairy and glandular-puberulent; leaves crisp-hairy, pinnatifid, with rather approximate linear lobes, obovate in outline; calyx-teeth deltoid-lanceolate, gradually cuspidate; corolla 2.5-3 cm. long. *Callisteris arizonica* Greene. Dry regions: Ariz.—s Utah. *Son.* Je.

20. *G. tenuituba* Rydb. Stem about 3 dm. high, glandular-puberulent; leaves pinnatifid into linear, puberulent, cuspidate divisions; calyx glandular-puberulent, scarious in the sinuses; corolla flesh-colored, 4 cm. long; tube 1 mm. thick below, 2 mm. at the throat; lobes 1 cm. long. Dry soil: s Utah. *Son.*

21. *G. aggregata* (Pursh) Spreng. Stem erect, 3-5 dm. high, more or less puberulent, simple up to the inflorescence; leaves pinnatifid into narrowly linear divisions, more or less crisp-hairy; calyx-lobes lanceolate, attenuate, spinulose-tipped; corolla 3-4 cm. long, crimson to white; lobes 7-9 mm. long, lanceolate. *Callisteris aggregata* and *C. flavida* Greene. SKYROCKET. Hills, glades, and meadows: Mont.—N.M.—Calif.—B.C. *Submont.*—*Mont.* My-Au.

22. *G. pulchella* Dougl. Stem erect, simple up to the inflorescence, more or less crisp-hairy as well as glandular-puberulent, 3-6 dm. high; leaves pinnatifid into linear divisions, crisp-hairy; calyx-lobes narrowly lanceolate, attenuate, with spinulose spreading tips; corolla crimson to white, 3-4 cm. long; lobes lanceolate, attenuate-acuminate. *G. aggregata attenuata* A. Gray. *G. attenuata* A. Nels. and *Callisteris attenuata* Greene, the white-flowered form. SKYROCKET. Open hills and plains: Mont.—Colo.—Nev.—Wash. *Submont.*—*Mont.* My-Au.

23. *G. scariosa* Rydb. Stems simple, strict, 3-6 dm. high, glandular-puberulent throughout; leaves pinnatifid into linear-filiform spinulose-tipped divisions, more or less white-villous when young, glandular-puberulent; calyx-tube about 6 mm. long, puberulent; teeth short, broadly rounded-ovate, abruptly subulate-acuminate; corolla pink, 3-4 cm. long; lobes acute, about 8 mm. long. *Callisteris collina* Greene. Open hills: Colo.—Utah. *Submont.*—*Mont.* Jl-S.

24. *G. candida* Rydb. Biennial or perennial; stems ascending or erect, simple, 4-6 dm. high, leafy; leaves rather fleshy, divided into linear-filiform, spinulose-tipped segments; calyx glandular-pubescent, about 8 mm. long; lobes

lanceolate, bristle-tipped; corolla white, or rarely pale pink, 2-3 cm. long, its lobes oval or obovate, obtuse. *Callisteris leucantha* Greene. Open valleys: Colo. *Mont.* Je—Au.

25. *G. longiflora* (Torr.) G. Don. Stem erect, glabrous, branched above, 2-5 dm. high; leaves deeply pinnatifid, with few filiform divisions, or often entire and filiform; calyx glabrous; teeth subulate, much shorter than the tube; corolla white; lobes about 1 cm. long. Sandy plains: Neb.—Tex.—Ariz.—Utah. *Plain*—*Submont.* Je—Au.

26. *G. laxiflora* (Coul.) Osterhout. Stem glabrous or glandular-puberulent above, about 3 dm. high; leaves pinnatifid, with filiform divisions, the upper few-lobed or entire; calyx-teeth subulate; corolla white or tinged with blue; lobes 4-5 mm. long. *Gilia Macombii laxiflora* Coul. Plains and table lands: Colo.—Tex.—N.M.—Utah. *Plain*—*Submont.* Je—S.

27. *G. polyantha* Rydb. Stems several, 3-4 dm. high, simple up to the inflorescence, glandular-puberulent; leaves 3-4 cm. long, pinnatifid; lobes linear-filiform, pungent-pointed; flowers numerous in a narrow thyrsus; calyx about 5 mm. long; lobes broadly ovate-triangular, abruptly cuspidate-pungent; corolla white, about 1 cm. long; lobes about 5 mm. long, lance-oblong, obtusish. *G. exserta* A. Nels. Dry places: Colo. *Submont.* Jl.

28. *G. calcarea* M. E. Jones. Stem erect, usually branched, glandular-pilose, 0.5-5 dm. high; leaves pinnatifid, glandular; flowers paniculate; calyx densely glandular; teeth triangular-lanceolate, acuminate; corolla-tube yellowish, twice as long as the calyx; lobes violet, rounded-ovate. *G. pinnatifida* Nutt., not Moc. & Sess. *G. viscida* Woot. & Standl. Sandy soil: Neb.—N.M.—Wyo. *Plain*—*Mont.* Je—S.

29. *G. MacVickeræ* M. E. Jones. Stem erect, glabrous, branched, 3-4.5 dm. high; basal leaves rosulate, as well as the lower stem-leaves pinnatifid, with obovate-mucronate divisions; leaves of the upper stem and branches linear, entire; calyx glandular-puberulent; teeth triangular, acute; corolla 12-14 mm. long; lobes oval. Sandy soil: Utah. *Submont.* My.

30. *G. scopulorum* M. E. Jones. Stem 1-2 dm. high, glandular-pubescent; lower leaves oblanceolate in outline, pinnatifid, 1-2.5 cm. long, glandular-pubescent; lobes obovate or oblong, aristate-tipped, the upper stem-leaves comparatively broader and shorter, the uppermost much reduced and few-toothed; calyx-tube about 2 mm. long, glandular; teeth subulate, 1 mm. long; corolla 10-14 mm. long, purple, with a yellow throat. Dry regions: s Utah—Nev.—s Calif. *L. Son.* Ap—My.

31. *G. hutchinsifolia* Rydb. Stem 1-2.5 dm. high, glandular-pubescent; leaves mostly crowded near the base, pinnatifid, with oblong, more or less lobed divisions, glandular-pubescent; leaves of the inflorescence often linear; calyx-tube glandular, 1.5-2 mm. long; lobes subulate; corolla 10-14 mm. long; lobes broadly ovate, acute. *G. arenaria rubella* Brand. Dry regions: s Utah—Ariz. *L. Son.* Ap—My.

32. *G. sinuata* Benth. Stem 1-3 dm. high, usually branched, glabrate or more or less glandular-puberulent; leaves oblanceolate in outline, pinnatifid, somewhat floccose when young, in age glabrate; lobes oblong to ovate, usually short; leaves of the branches lanceolate, entire or toothed; calyx-tube 2 mm. long; teeth subulate, about 1 mm. long; corolla 8-10 mm. long, purple, with yellowish tube. Sandy soil: N.M.—Colo.—Nev.—Calif. *Son.*—*Submont.* Ap—Jl.

33. *G. straminea* Rydb. Stem 2-3 dm. high, glabrous, or rarely slightly glandular-puberulent above, straw-colored; basal leaves glabrous, firm, 1-2 cm. long, pinnately lobed, with lanceolate cuspidate-tipped lobes; stem-leaves sessile and partly clasping, lanceolate, sharply dentate with cuspidate teeth, or entire; calyx-tube 2 mm. long; teeth subulate, 1 mm. long; corolla 7-8 mm. long. Dry regions: s Utah. *L. Son.*

34. *G. inconspicua* (Smith) Dougl. Stem 2-4 dm. high, glandular-puberulent; leaves mostly near the base, pinnatifid, more or less crisp-pubescent or glabrate; lobes mostly oblong, cuspidate; calyx-tube about 2 mm. long, glabrous

or glandular-puberulent; teeth subulate, about 1.5 mm. long; corolla 7-8 mm. long; limb purplish; lobes oval, 2 mm. long, obtuse. Hillsides: N.M.—Wyo.—Wash.—Calif. *Submont.*—*Mont.* F—Au.

35. *G. subacaulis* Rydb. Stem less than 1 dm. high, glandular-puberulent; leaves 1.5-3 cm. long, pinnatifid, with triangular to oblong divisions, glandular-puberulent, or slightly white-villous when young; calyx 2-2.5 mm. long, puberulent; lobes lanceolate, about half as long as the tube, acute. Sandy valleys and cañons: Wyo.—N.M.—Ariz.—Ida. *Son.*—*Submont.* My—Jl.

36. *G. Tweedyi* Rydb. Stem 2-4 dm. high, glandular-puberulent, especially the upper part; leaves 2-3 cm. long, pinnatifid, with lanceolate cuspidate lobes; calyx about 3 mm. long; lobes lanceolate; corolla about 4 mm. long, bluish. River bottoms and sandy plains: Wyo.—Ida.—Colo. *Plain*—*Submont.* My—Je.

37. *G. stenothyrsa* A. Gray. Biennial; stem erect, strict, about 3 dm. high, glandular-puberulent; basal leaves merely toothed, 1-2 cm. long, thick, obovate, puberulent; stem-leaves pinnately lobed, with oblong divisions; calyx campanulate; teeth triangular, shorter than the tube; corolla white, about 12 mm. long. Among cedars: Utah. *Son.* Je.

38. *G. subnuda* Torr. Stem 1-5 dm. high, glandular-puberulent; leaves mostly basal, thick, spatulate or elliptic, 1-4 cm. long, dentate, densely glandular-puberulent; stem-leaves smaller, dentate or entire, glandular-pubescent, 4 mm. long; teeth subulate, equalling the tube; corolla 12-15 mm. long, glandular-puberulent; lobes ovate, acute. *G. superba* Eastw. Cañons: Ariz.—Nev.—Utah—N.M. *Son.*—*Submont.* My—Au.

39. *G. Crandallii* Rydb. Stem 3-5 dm. high, sparingly puberulent, glandular above, rather stout, much branched; basal leaves 3-10 cm. long, spatulate or oblanceolate, serrate or pinnately lobed; calyx glandular; teeth lanceolate; corolla-lobes oblong-spatulate. Sage plains: Colo.—N.M. *Submont.*

40. *G. Haydeni* A. Gray. Stem 1-3 dm. high; basal leaves pinnately lobed or toothed, slightly pubescent, 2-3 cm. long, spatulate; calyx-tube 2 mm. long; teeth triangular-subulate, scarcely 1 mm. long; corolla-lobes obovate. Plains: sw Colo. *Plain.* Jl.

41. *G. leptomeria* A. Gray. Stem 1-2 dm. high, branched, glandular-pubescent; leaves mostly basal, oblong to linear in outline, 1-5 cm. long, pinnately lobed or toothed, with mucronate teeth or lobes; calyx sparingly glandular or glabrous; teeth triangular-subulate, slightly shorter than the tube; corolla white or pale rose-colored, 4-5 mm. long; lobes 1-1.5 mm. long, acute or apiculate. *G. triodon* Eastw., *Aliciella triodon* A. Brand, a form with 3-cleft corolla-lobes. Dry soil: N.M.—Colo.—Ore.—Calif. *Son.*—*Submont.* My—Je.

42. *G. latifolia* S. Wats. Stem 1-2.5 dm. high, viscid-villous, with crisp hairs and glandular on the upper portion; leaves petioled or the upper sessile; blades coarsely dentate, with cuspidate triangular teeth; calyx sparingly glandular; tube about 2.5 mm. long teeth lance-subulate, spinulose-cuspidate, 3 mm. long; corolla light rose, 6-8 mm. long, the broad tube equalling the calyx; lobes oval, acute. Desert regions: s Utah—Ariz.—se Calif. *L. Son.* Ap—My.

43. *G. pentstemonoides* M. E. Jones. Cespitose perennial, glandular above, about 1 dm. high; basal leaves densely crowded, linear-oblanceolate, 4-5 cm. long, petioled, entire, thick, glabrous; stem-leaves 3-4, smaller; flowers in axillary racemes; calyx-teeth subulate, equalling the tube; corolla blue, 1 cm. long, fully twice as long as the calyx; lobes ovate or oval. Rocks: Colo. S.

44. *G. sedifolia* A. Brand. Perennial; stem simple, fleshy, 2-4 cm. high; leaves basal, imbricate, fleshy, obovate-spatulate, obtuse, 5 mm. long; cauline leaves linear-spatulate, 1 cm. long or less; flowers congested in a short inflorescence; calyx campanulate; lobes ovate, obtuse; corolla violet, 5 mm. long; a little longer than the calyx. Cliffs: Colo. *Alp.* Jl.

45. *G. caespitosa* A. Gray. Perennial, with a cespitose woody caudex; leaves basal, crowded, spatulate, thick, entire, viscid-puberulent, 8-12 mm. long;

flowering stems 3-7 cm. long, 1-5-flowered; leaves much reduced; calyx about 4 mm. long; lobes subulate; corolla trumpet-shaped, fully 1 cm. long. *G. Grayi* A. Nels. Valleys: Utah. *Submont.*

46. *G. sinistra* M. E. Jones. Stem with ascending branches, 2-3 dm. high, glandular-puberulent; leaves entire, linear or lance-linear, 1-3 cm. long, 2-4 mm. wide; calyx in flower, about 2 mm. long, somewhat enlarging in fruit, at last burst by the capsule; lobes subulate; corolla light blue, 5 mm. long. *Collomia sinistra* Brand. Gumbo soil: Ida. *Son.* Jl.

47. *G. minutiflora* Benth. Stem much branched and leafy, 2-5 dm. high, minutely glandular-puberulent or glabrate; leaves linear-filiform, entire or some of the lower 3-cleft, those of the inflorescence reduced and subulate; calyx 1.5-2 mm. long; teeth subulate, about 1 mm. long; corolla white. *C. linoides* Nutt. Plains and sandy places: B.C.—Mont.—Colo.—Ore. *Plain—Submont.* Jl—Au.

48. *G. tenerrima* A. Gray. Stem erect, filiform, diffusely branched, glandular-puberulent, 5-15 cm. high; leaves linear, 1-5 cm. long, entire, the upper bract-like; flowers axillary; calyx short-campanulate; tube about 1 mm. long; teeth triangular, shorter; corolla white, about 3 mm. long; lobes oblong, equalling the tube; ovules solitary in each cell. Sandy soil: Mont.—Wyo.—Utah—Ore. *Plain—Submont.* My—Jl.

9. LANGLOÏSIA Greene.

Low annuals. Leaves alternate, pinnatifid, the lower segments modified into bristles, the upper bristle-tipped. Flowers perfect, in terminal involucrate heads; bracts with bristle-tipped lobes. Calyx campanulate or tubular, 5-cleft; lobes equal, bristle-tipped; tube in fruit cleft to the base. Corolla with a cylindric tube and funnellform limb, regularly 5-lobed or more or less 2-lipped. Stamens inserted in the throat, often more or less declined. Ovary 3-celled, with 3-8 ovules in each cell. Capsule loculicidal; seed submucilaginous when wetted.

Corolla almost regular and stamens nearly straight.
Corolla bilabiate and the stamens declined, curved.

1. *L. setosissima*.
2. *L. Schottii*.

1. *L. setosissima* (A. Gray) Greene. Annual; stem branched from the base, 3-8 cm. high, crisp-hairy; leaves glabrous, pinnatifid, the upper divisions deltoid, setaceously tipped; calyx-teeth terminated by a long bristle; corolla white, about 15 mm. long; lobes oval. *Gilia setosissima* A. Gray. Desert regions: Ariz.—Ida.—Nev.—Calif. *Son.* Mr—My.

2. *L. Schottii* (Torr.) Greene. Annual; stem branched from the base, villous or glabrate, 2-10 cm. high; leaves pinnatifid; upper lobes lanceolate, bristle-tipped; calyx tubular; teeth subulate, villous, longer than the tube, with long bristle-points; corolla white, half longer than the calyx; lobes oblong. *G. Schottii* S. Wats. Desert regions: Ariz.—s Utah—Calif.—Sonora. *L. Son.* Ap—Je.

10. LINÁNTHUS Benth.

Erect, glabrous slender annuals. Leaves all opposite, 3-5-divided into filiform divisions or the lower entire and filiform. Flowers regular, axillary. Calyx-tube white-scarious, ruptured by the fruit; lobes acerose. Corolla short-salver-shaped or with a short tube and a funnellform throat; lobes broadly cuneate, minutely erose or denticulate, convolute in bud. Stamens included in the tube of the corolla. Capsule cylindric or oblong. Seed-coat not producing spiracles when wetted.

Corolla short salver-shaped or campanulate.

Calyx 7-8 mm. long; corolla 10-15 mm. long; stamens inserted in the middle of the tube.

Calyx 4 mm. long; corolla 6-7 mm. long; stamens inserted near the base of the tube.

Corolla with a funnellform throat and short tube.

Corolla more than twice as long as the hirsute or strigose calyx.

Corolla about half longer than the glabrous calyx.

1. *L. Bigelovii*.
2. *L. Dactylophyllum*.
3. *L. pharnaceoides*.
4. *L. Harknessii*.

1. **L. Bigelovii** (A. Gray) Greene. Annual; stem glabrous, 1-3 dm. high, dichotomously branched; lower leaves entire, narrowly linear, the upper 3-divided into similar divisions, glabrous; flowers sessile; calyx glabrous, tubular, 7-8 mm. long, scarious except the ribs; teeth subulate, somewhat recurved-spreading; corolla 10-15 mm. long, white; lobes convolute, obovate. *Gilia Bigelovii* A. Gray. Desert regions: Tex.—s Utah—Ariz. *L. Son.* Ap—My.

2. **L. Dactylophyllum** (Torr.) Rydb. Low annual; stem hirsutulous, 2-6 cm. long, branched; leaves 3-cleft, with linear divisions, or some entire, acerose-cuspidate, alternate or the upper sub-opposite; flowers short-pedicelled or subsessile; calyx about 4 mm. long, puberulent; sepals distinct to near the base, scarious-margined; corolla white, 6-7 mm. long; lobes ovate. *G. Dactylophyllum* Torr. *G. demissa* A. Gray. *Linanthus demissus* Greene. Desert regions: Ariz.—s Utah—Calif. *L. Son.* Ap—My.

3. **L. pharnaceoides** (Benth.) Greene. Annual; stem 1.5-4.5 dm. high, often diffusely branched, dichotomous, glabrous or minutely puberulent above; leaves 3-7-cleft, with filiform, acerose divisions; flowers with filiform pedicels; calyx 3 mm. long; teeth lance-subulate; corolla white or rose-colored, 7-8 mm. long; filaments bearded at the base. *G. pharnaceoides* Benth. Prairies and plains: Wash.—Ida.—Utah—Calif. *L. Son.* Ap—Jl.

4. **L. Harknessii** (Curran) Greene. Annual; stem glabrous, 0.5-3 dm. high, dichotomously branched; leaves opposite, 3-5-cleft into filiform divisions, or the upper simple; flowers with filiform pedicels; calyx 2-2.5 mm. long; teeth lanceolate; corolla white, 3-4 mm. long. *G. Harknessii* Curran. Sandy and waste places: Mont.—Colo.—Calif.—B.C. *L. Son.*—Mont. Je—Au.

11. GYMNÓSTERIS Greene.

Diminutive annuals, with simple stems. Leaves proper wanting, the foliage represented by the persistent cotyledons, and the bracts, which are scarious at the base and herbaceous above. Flowers subumbellate. Calyx of 5 united sepals; tube campanulate, scarious, ruptured by the fruiting capsule; lobes unequal, partly herbaceous. Corolla salverform, with slender tube. Stamens 5; filaments adnate to the corolla-tube; anthers borne in the throat of the corolla. Seeds membranous-margined or winged; testa thin, mucilaginous when wetted, but not developing spiracles.

Lobes of the corolla 3-4 mm. long, truncate, undulate at the apex.

Lobes of the corolla 1-1.5 mm. long, acutish.

1. *G. nudicaulis*.

2. *G. parvula*.

1. **G. nudicaulis** (H. & A.) Greene. Annual, glabrous; stem 5-10 cm. high; bracts lanceolate, 8-20 mm. long; calyx about 3 mm. long; teeth subulate; corolla 10-15 mm. long, white or yellowish; lobes obovate; capsule 4 mm. long or more. *Gilia nudicaulis* A. Gray. *G. pulchella* Greene. Sandy places: Ore.—Ida.—Nev. *L. Son.* Ap—My.

2. **G. parvula** (Rydb.) Heller. Annual; stem 2-3 cm. high, glabrous; flowers capitate; bracts ovate-lanceolate, 5-15 mm. long, often tinged with red; calyx 3 mm. long; teeth ovate, acute; corolla white or pinkish, 6-8 mm. long; capsule 3-4 mm. long, ovoid. *G. nudicaulis* Greene, in part, and Rydb. (Fl. Colo.) Sandy places: Wyo.—Colo.—Utah—Ida. *Submont.*—Mont. Je—Jl.

12. TINTINÁBULUM Rydb.

Low slender annuals. Leaves alternate, narrow. Flowers perfect, solitary in the axils, on long reflexed pedicels. Calyx campanulate; lobes subulate, hyaline-margined. Corolla campanulate, deeply cleft. Ovary 3-celled. Seeds few, often mucilaginous when wetted, but not spirilliferous.

1. **T. filiforme** (Parry) Rydb. Stem filiform, 5-20 cm. long, glabrous, branched; leaves all filiform, entire, 2-4 cm. long; pedicels 0.5-2 cm. long; calyx glabrous, 2 mm. long; corolla white, whitish, or yellowish, 4-5 mm. long, cleft nearly to the base; lobes oblong. *Gilia filiformis* Parry. Arid regions: Ariz.—s Utah—Calif. Ap—My.

13. GILIÁSTRUM (A. Brand) Rydb.

Perennial or annual herbs. Leaves alternate, from toothed to pinnatifid. Flowers perfect, cymose. Calyx campanulate, 5-lobed or 5-cleft; tube scarious in the sinuses and bursted by the fruit; corolla rotate-funnelform, deeply 5-cleft. Stamens inserted near the base of the corolla. Seeds several in each cell, mucilaginous when wetted. [*Gilia* § *Giliastrum* A. Brand.]

1. *G. acerosum* (A. Gray) Rydb. Suffrutescent perennial, 1-3 dm. high, very leafy, glandular-puberulent; leaves pinnatifid, with linear-subulate, acerose divisions, glandular-puberulent; calyx glandular-puberulent, 5-6 mm. long; teeth lanceolate, acuminate; corolla blue, nearly rotate, about 1 cm. long; lobes broadly ovate, much longer than the united portion. *Gilia rigidula acerosa* A. Gray. *G. acerosa* Britton. Sandy plains and hills: Tex.—Kans.—Colo.—Ariz. *Son.* Ap-Jl.

FAMILY 110. HYDROPHYLLACEAE. WATERLEAF FAMILY.

Perennial or annual, mostly caulescent herbs, with watery sap. Leaves alternate, or rarely opposite or in basal rosettes, without stipules. Flowers perfect, regular or nearly so, in scorpioid racemes or cymes, or solitary and axillary. Calyx of 5 more or less united sepals, often appendaged in the sinuses. Corolla 5-lobed, mostly campanulate or funnellform, often appendaged inside, the lobes convolute or imbricate in aestivation. Stamens 5, alternate with the corolla-lobes; filaments adnate to the base of the corolla, distinct, often bearded; anthers introrse, versatile. Ovary of 2 united carpels, 1-celled or 2-celled, with parietal placentae; styles more or less united; stigmas often capitate; ovules numerous, or few. Fruit a capsule. Seeds amphitropous; endosperm cartilaginous. [*Hydroleaceae*.]

Corolla-lobes convolute in bud; placentae dilated.

Stamens exserted; calyx without appendages; leaves alternate. **1. HYDROPHYLLUM.**
Stamens included.

Calyx without appendages; leaves opposite.

Seeds inserted only on the inner face of the placentae, globose, alveolate; calyx enlarged in fruit. **2. MACROCALYX.**

Seeds inserted on both faces of the placentae, oblong or vermiform, rugose; calyx not enlarged in fruit. **3. EUCRYPTA.**

Calyx with appendages in the sinuses, not much enlarged in fruit; leaves alternate or opposite. **4. NEMOPHILA.**

Corolla-lobes imbricate in bud; placentae not dilated.

Styles more or less united; stamens mostly equal.

Styles free at the apex.

Flowers in circinate racemes, or solitary in the axils of the stem-leaves.

Calyx-lobes in two series, the outer 3 large and cordate.

13. TRICARDIA.

Calyx-lobes in one series, similar or nearly so.

Corolla deciduous, mostly purplish, bluish, or white.

Flowers in circinate racemes.

Flowers solitary in the axils of stem-leaves.

Corolla persistent, marcescent, yellowish.

Capsule ovoid, turgid; flowers not drooping.

Capsule compressed; flowers drooping.

Flowers solitary, from the axils of basal leaves.

Styles united to the apex; flowers racemose, but hardly circinate.

9. ROMANZOFFIA.

Styles free to the base; stamens unequal.

Capsule coriaceous; shrubs.

10. ERIODICTYON.

Capsule membranous; herbs.

11. MARILAUNIDIUM.

1. HYDROPHÝLLUM (Tourn.) L. **WATER-LEAF.**

Perennial (all ours) or biennial, caulescent herbs. Leaves alternate, pubescent, lobed, or (in all ours) pinnately divided. Flowers in more or less scorpioid cymes. Calyx-tube short; lobes 5, narrow, with naked sinuses. Corolla white, blue, or purple; tube short; lobes 5, convolute, each with a linear appendage within. Stamens 5, exserted; filaments partly pubescent. Ovary 1-celled, pubescent; styles 2-cleft; ovules 4, enclosed by the fleshy placentae, which is attached at the bottom and top of the ovary. Capsule 2-valved; seeds 1-4, thick.

Peduncles shorter than the petioles and mostly shorter than the flower-cluster; anthers oblong.

Flowers capitate-cymose; corolla 7-8 mm. high.

Flowers distinctly pediceled; corolla 5-6 mm. high.

Peduncles longer than the petioles; anthers oblong-linear.

Leaf-segments 7-19.

Divisions of the leaves acuminate.

Stem and leaves sparingly hirsute or glabrous; sepals about equalling the corolla.

Upper part of the stem and lower surface of the leaves densely pubescent; sepals much shorter than the corolla.

Divisions of the leaves acute, mucronate.

Leaves hispid beneath; inflorescence dense, subcapitate.

Leaves canescent beneath; inflorescence more open.

Leaf-segments 3-5.

1. *H. capitatum*.

2. *H. alpestre*.

3. *H. Fendleri*.

4. *H. albifrons*.

5. *H. occidentale*.

6. *H. Watsoni*.

7. *H. virginianum*.

1. ***H. capitatum*** Dougl. Stem 1-2 dm. (rarely 3 dm.) high, more or less grayish puberulent; leaves pinnately divided into 5-7 obovate divisions, which are 2-5 cm. long, 2- or 3-cleft and sometimes again lobed, grayish strigose or softly hirsute, paler beneath; lobes ovate; calyx very hispid, its lobes linear-lanceolate. Hillsides: Mont.—Colo.—Calif.—B.C. *Submont.*—*Mont.* Ap-Jl.

2. ***H. alpestre*** Nels. & Kenn. Stem 1-2 dm. high, sometimes nearly acaulescent; leaves pinnately divided, grayish, short-hirsute, paler beneath; divisions 5-7, obovate, cleft and lobed, with oblong mucronate lobes; calyx short-hispid; stamens long-exserted. *H. capitatum alpinum* S. Wats. Mountains: (? Utah)—Nev.—Calif. *Submont.*—*Mont.* My-Je.

3. ***H. Fendleri*** (A. Gray) Heller. Stem 3-7 dm. high, sparingly hirsute, leafy; leaves 2-3 dm. long, sparingly short-hairy or glabrate, paler beneath; segments 9-19, lanceolate or ovate-lanceolate, 2-10 cm. long, coarsely serrate, the upper 3-cleft; teeth ovate-lanceolate; cyme small; sepals linear, hispid; corolla about 8 mm. long. *H. occidentale Fendleri* A. Gray. Along streams and among bushes: Wyo.—N.M.—Utah. *Submont.*—*Mont.* My-Jl.

4. ***H. albifrons*** Heller. Stem 4-6 dm. high, usually very hirsute; leaves rather densely short-hairy on both sides, paler beneath; segments ovate to lanceolate, coarsely serrate, 2-10 cm. long; sepals linear-lanceolate; corolla cream-colored, or tinged with purple, nearly 1 cm. long. Near streams: Ida.—Wash.—B.C. My-Jl.

5. ***H. occidentale*** A. Gray. Stem 2-4 dm. high, more or less hirsute; leaves densely hirsute on both sides; segments 7-13, the upper more or less confluent, broadly ovate, more or less lobed, the lobes ovate; sepals linear-lanceolate, scarcely half as long as the corolla, hirsute on the back and hispid-ciliate; corolla nearly 1 cm. high. Mountains: s Utah—Calif.—Ore. *Submont.* Ap-Jl.

6. ***H. Watsoni*** (A. Gray) Rydb. Stem 1-3 dm. high, canescent-pilose; leaf-segments 7-13, 1-6 cm. long, ovate, acute, usually deeply cleft into ovate or lance-oblong divisions; sepals hirsute and hispid-ciliate, lanceolate, fully half as long as the corolla, which is 7-8 mm. long. Mountains: Utah—Calif. *Son.*—*Submont.* My-Au.

7. ***H. virginianum*** L. Stem 1-6 dm. high, glabrous or sparingly pilose; leaves oval in outline, 1-3 dm. long; segments 3-5, the lateral one 2-cleft, the terminal 3-cleft, sharply and deeply serrate; cyme short-peduncled; sepals linear-lanceolate, hispid; corolla fully 1 cm. long. Damp woods: Que.—Ga.—Ark.—Minn.; Colo. (fide Osterhout). *Boreal.*—*Submont.* My-Au.

2. MACROCÆLYX Trew.

Annual caulescent herbs. Leaves alternate or opposite, pubescent, from once to thrice pinnatifid. Flowers perfect, solitary in the axils. Calyx enlarging in fruit, 5-lobed, appendaged in the sinuses. Corolla campanulate, usually with 5 appendages within; lobes convolute. Stamens 5, included. Ovary 1-celled; styles 2-cleft; ovules 2-4 on each fleshy placenta, which is attached to the top and bottom of the ovary. Seeds pitted. [*Ellisia* L.]

1. ***M. Nyctelea*** (L.) Kuntze. Stem erect, 0.5-3 dm. high, diffusely branched; leaf-segments spreading, entire, toothed or incised; calyx-lobes triangular-lance-

olate, becoming 7-8 mm. long, acute, pubescent; corolla bluish white, 7-8 mm. broad. *Ellisia Nycleia* L. Alluvial soil and shady places: N.J.—N.C.—Colo.—Ida.—Alta. *Plain—Mont.*

3. EUCRÝPTA Nutt.

Low annual herbs. Leaves membranous, pinnately parted. Flowers perfect, regular, in geminate or panicle racemes. Calyx deeply 5-cleft. Corolla almost rotate, bright blue with yellow center, with two plicate, transverse appendages, much higher up than the stamens. Capsule globose, loculicidal. Seeds few or many, cylindraceous or oblong, incurved, transversely rugose and tuberculate, or deeply flavose.

Seeds cylindric, transversely rugose and tubercled.
Seeds oblong or oval, deeply favose.

1. *E. micrantha*.
2. *E. pinetorum*.

1. ***E. micrantha*** (Torr.) Heller. Weak annual; stem branched, 1-2 dm. long, minutely glandular-pilose; leaves thin, pinnately parted into 5-9 obovate or oblong, obtuse lobes; racemes loose; calyx-lobes obovate or broadly spatulate, 2.5-3 mm. long; corolla bright blue, with yellowish tube, according to Heller creamy, a little exceeding the sepals; capsule globular, 20-24-seeded. *Phacelia micrantha* Torr. Dry places: N.M.—Utah—Calif. *Son.* Mr—My.

2. ***E. pinetorum*** (M. E. Jones) Rydb. Weak annual; stem erect, branched, 5-20 cm. high, glandular-puberulent; lower leaves pinnatifid, with oblong divisions, the upper entire or 3-lobed; racemes few-flowered; calyx-lobes lanceolate or ovate, acutish, longer than the white or blue corolla. *Phacelia pinetorum* M. E. Jones. Pine woods: Utah. *Submont.* Je.

3. NEMÓPHILA Nutt. BABY-BLUE-EYES.

Diffuse annual herbs. Leaves alternate or opposite, pinnately lobed or pinnatifid. Flowers perfect, solitary on axillary or terminal pedicels. Calyx not accrescent, 5-lobed, with a spreading or reflexed linear appendage in each sinus. Corolla campanulate to nearly rotate, with 10 appendages within; lobes convolute. Stamens 5, included, with short filaments. Ovary 1-celled; styles 2-cleft; ovules 2-12 on each fleshy placenta, which is attached to the top and bottom of the ovary. Capsule two-valved. Seeds usually 1-4.

Corolla 12-18 mm. long.

Corolla 2-3 mm. long.

1. *N. Kirtleyi*.

Appendages of the corolla present.

Appendages of the corolla narrow, acuminate; seeds deeply pitted.

Appendages of the corolla broad, cuneate; seeds smooth.

Appendages of the corolla wanting.

2. *N. inconspicua*.
3. *N. breviflora*.
4. *N. explicata*.

1. ***N. Kirtleyi*** Henders. Stem 5-20 cm. high, short-hispid; lower leaves opposite, the upper alternate; blades ovate in outline, irregularly 5-parted; lobes oblong, 3-lobed or strongly dentate; appendages of the calyx ovate, less than one-third the length of the lobes; calyx-lobes lanceolate, in fruit nearly as long as the corolla; corolla with violet border and white center, greenish-spotted; internal appendages half fan-shaped, lobed and fimbriate; seeds deeply pitted. Loose soil: Ida.—Ore. *Son.* Jl.

2. ***N. inconspicua*** Henders. Leaves pinnately 5-lobed or 5-parted; blades rounded to ovate in outline; lobes rounded or obtusely triangular; appendages of the calyx ovate, one-fourth as long as the sepals; corolla equalling the calyx or slightly shorter, white, 2.5 mm. long; appendages narrow, acuminate or lacinate. Loose moist soil: Ida. *Son.* Jl.

3. ***N. breviflora*** A. Gray. Stem branched, diffuse, 1-3 dm. high; leaves often all alternate, pinnately 3-5-parted; divisions oblong-lanceolate, acute, entire, 6-18 mm. long; appendages of the calyx nearly half as long as the sepals; corolla whitish or tinged with violet, shorter than the calyx; internal appendages cuneate, broad, fimbriate. Rich soil, hillsides, and cañons: Mont.—Colo.—Ore.—B.C. *Submont.* My—Jl.

4. ***N. explicata*** Nels. & Macbr. Stem branching from the base, 7-15 cm. long, spreading; leaves obovate or orbicular in outline, crenately 3-5-lobed, 1-2

cm. long; appendages of the calyx small, oblong; lobes ovate, short-ciliate; corolla barely exceeding the calyx; lobes oval; seeds obscurely pitted. Perhaps the same as *N. Austinae* Eastw. Cañons: Ida. Son. Jl.

5. PHACĒLIA Juss. SCORPION WEED.

Perennial or annual caulescent herbs. Leaves alternate or opposite below. Flowers perfect, in scorpioid racemes or cymes. Calyx slightly enlarging in fruit, 5-lobed, without appendages. Corolla white, purple, or blue; tube appendaged within; lobes 5, imbricate. Stamens 5; filaments adnate to the tube of the corolla. Ovary 1-celled, with two narrow placentae attached to the walls of the ovary; styles 2-cleft; ovules two to many on each placenta. Capsule 1-celled or falsely 2-celled, 2-valved. Seeds reticulate or roughened.

Stamens equalling or usually much exceeding the corolla.

Leaves all simple and entire, or some of the lower pinnately 3-5-divided, with entire divisions; capsule acute; ovules 4. I. HETEROPHYLLAE.

Leaves from sinuate-crenate to twice pinnatifid.

Plant annual or in one species perhaps perennial, but not caespitose.

Capsule globular-ovoid, obtuse; ovules 4; stamens in most species long-exserted.

Calyx-lobes oblong-spatulate to linear-oblancoate, scarcely exceeding the capsule. II. GLANDULOSAE.

Calyx-lobes linear to linear-oblancoate, much exceeding the capsule. III. RAMOSISSIMAE.

Capsules ovoid, acute; ovules 12-40; stamens slightly if at all exceeding the corolla. IV. LINEARES.

Plant perennial, caespitose; inflorescence spicate-thyriform. V. SERICEAE.

Stamens shorter than the corolla; plant low and diffuse; annuals.

Seeds reticulate or favose-pitted, not transversely rugose; leaves long-petioled, entire or crenately lobed. VI. PULCHELLAE.

Seeds strongly corrugated transversely; leaves pinnately divided. VII. BICOLORES.

I. HETEROPHYLLAE.

Plant perennial, or at least biennial.

Plant densely caescent.

Calyx-lobes linear or linear-oblong; midveins inconspicuous; corolla pink or pale lilac, about 6 mm. long. 1. *P. leucophylla*.

Calyx-lobes narrowly linear; midveins, at least in fruit, very strong; corolla white, 4-5 mm. long. 2. *P. Burkei*.

Plant not densely caescent.

Pubescence of the leaves of two kinds, long hirsute hairs and a fine pilose or tomentose pubescence.

Calyx almost as long as the white corolla, its lobes narrowly linear, acute, with a strong midrib. 3. *P. nervosa*.

Calyx much shorter than the corolla; midveins faint.

Stem erect; calyx from two-thirds to three-fourths as long as the corolla.

Plant biennial or short-lived perennial; corolla pink or lilac. 4. *P. biennis*.

Plant a caespitose perennial; corolla usually white. 5. *P. heterophylla*.

Stem ascending, slender; inflorescence open; calyx about half as long as the pilose purplish corolla. 6. *P. alpina*.

Pubescence of the leaves hirsute only; calyx-lobes narrowly linear; midrib weak; corolla white. 7. *P. leptosepala*.

Plant annual.

Corolla 5-6 mm. long; ovules 4. 8. *P. humilis*.

Corolla 8-10 mm. long; ovules 12-16. 24. *P. linearis*.

II. GLANDULOSAE.

Corolla-lobes entire or merely sinuate-crenate.

Leaves sinuate-crenate to lobed halfway to the midrib.

Corolla narrowly campanulate; plant simple, strict, densely hirsute. 9. *P. Palmeri*.

Corolla open-campanulate; plant branched, scarcely at all hirsute, very glandular. 10. *P. orbicularis*.

Stem-leaves suborbicular, subcordate at the base.

Stem-leaves not suborbicular.

Stem-leaves ovate, oval, or elliptic in outline. 11. *P. integrifolia*.

Stem-leaves oblong in outline. 12. *P. corrugata*.

Leaves pinnately divided to the midrib.

Leaves densely hirsute or pilose, only slightly glandular; plant low, 1-2.5 dm. high, often naked above.

Leaves oblanceolate or spatulate in outline; calyx decidedly hirsute-hispid; stem and petioles glandular. 13. *P. crenulata*.

Leaves oblong or linear in outline; calyx scarcely hispid, but densely glandular; stem and petioles white-villous. 14. *P. deserti*.

Leaves hirsute only on the veins, short-pubescent and very viscid; plant stouter, 2-4 dm. high, branched.

Terminal divisions of the leaves large and obovate in outline.

Terminal divisions of the leaves not much enlarged, ovate, lanceolate or oblong in outline.

Corolla-lobes distinctly dentate or erose.

Corolla white; stamens about twice as long as the corolla.

Corolla purplish or pink.

Stamens slightly exceeding the corolla; corolla-lobes erose.

Stamens included; corolla-lobes dentate.

15. *P. splendens*.

16. *P. glandulosa*.

17. *P. alba*.

18. *P. neomexicana*.

19. *P. denticulata*.

III. RAMOSISSIMAE.

Leaves pinnatifid or bipinnatifid.

Calyx-lobes oblanceolate; segments of the leaves broad, obovate or oblong; plant diffusely branched.

Calyx-lobes linear; segments of the leaves small, oblong; plant simple.

20. *P. ramosissima*.

21. *P. hispida*.

22. *P. Rattani*.

Leaves round-lobed and coarsely crenate.

IV. LINEARES.

Leaves pinnately divided with numerous divisions, which are often toothed.

23. *P. Franklinii*.

Leaves entire or with 3-5 entire divisions.

24. *P. linearis*.

V. SERICEAE.

Stamens only slightly exceeding the corolla.

25. *P. idahoensis*.

Stamens at least twice as long as the corolla.

Leaves divided halfway to the midrib; stamens twice as long as the corolla.

26. *P. Lyallii*.

Leaves divided to near the midrib; stamens about three times as long as the corolla.

Plant equally sericeous throughout; segments of the leaves narrowly linear.

27. *P. sericea*.

Plant finely pubescent, hirsute-ciliate on the petioles; segments of the leaves oblong.

28. *P. ciliosa*.

VI. PULCHELLAE.

Flowers almost sessile in small dense sessile spikes; calyx equalling the corolla, or slightly shorter.

Leaves pinnatifid; calyx enlarging in fruit and strongly reticulate.

29. *P. firmomarginata*.

Leaves merely toothed or lobed; calyx neither much accrescent nor reticulate.

Leaf-blades spatulate.

Calyx-lobes subequal.

Calyx-lobes unequal, the longer twice as long as the shorter.

30. *P. cephalotes*.

Leaf-blades orbicular or rounded ovate.

31. *P. minutissima*.

32. *P. Knightii*.

Flowers pedicel in peduncled racemes; calyx much shorter than the corolla.

Leaf-blades entire or nearly so.

Leaf-blades orbicular or subreniform.

33. *P. demissa*.

Leaf-blades ovate, obovate, oval, or oblong.

Corolla about 1 cm. long; plant diffuse.

34. *P. pulchella*.

Corolla about 6 mm. long; plant erect.

Filaments sparsely pilose.

35. *P. curripes*.

Filaments glabrous.

36. *P. incana*.

Leaf-blades round, sinuately toothed or crenate.

Corolla 8-10 mm. long; leaves glandular-puberulent.

37. *P. glechomaefolia*.

Corolla 3-5 mm. long; leaves hirsutulous.

38. *P. rotundifolia*.

VII. BICOLORES.

Corolla white or pale purple, not much, if at all, exceeding the calyx.

Plant not glandular or scarcely so; leaves pinnatifid.

Corolla shorter than the calyx.

39. *P. campestris*.

Corolla usually slightly exceeding the calyx.

40. *P. Ivesiana*.

Plant decidedly glandular; leaves more or less bipinnatifid.

Calyx-lobes linear or nearly so, twice as long as the capsule.

41. *P. glandulifera*.

Calyx-lobes spatulate, scarcely half longer than the capsule.

42. *P. affinis*.

Corolla about twice as long as the calyx; throat yellow; limb purple.

Corolla broadly funnelform; leaves once pinnate.

43. *P. Fremontii*.

Corolla narrowly funnelform, nearly tubular; leaves twice pinnatifid.

44. *P. bicolor*.

1. *P. leucophylla* Torr. Stem 1-3 dm. high, densely canescent and only slightly hirsute; basal leaves petioled, 5-15 cm. long, oblanceolate or elliptic; calyx-lobes linear or linear-oblong, obtuse, about two-thirds as long as the corolla; filaments villous-bearded. Dry hills: Neb.—Colo.—Ida.—B.C. *Plain—Submont.* Je—Au.

2. **P. Burkei** Rydb. Stems 2-3 dm. high, canescent; basal leaves 3-10 cm. long, petioled, lanceolate, entire, strongly veined, densely white-canescenscent on both sides; calyx canescent and hispid-ciliate; lobes obtuse, two-thirds as long as the corolla; corolla pubescent; stamens about twice as long as the corolla, villous-bearded. Dry hills: Ida.—Wash. *Submont.*

3. **P. nervosa** Rydb. Stems decumbent at the base, 1-3 dm. high, more or less hirsute; lower leaves 2-7 cm. long, simple or with a pair of smaller lobes on the petioles, lanceolate, 2-5 cm. long, acute, hirsute on both sides; inflorescence soon open; calyx more or less tinged with purple, about as long as the corolla; corolla white or nearly so, pubescent, about 5 mm. long; filaments about twice as long as the corolla, slightly bearded. *P. alpina* Rydb. (Fl. Colo.) Mountains: Colo. *Subalp.*—*Alp.* Je—Au.

4. **P. biennis** A. Nels. Stem strict, usually purplish, 3-4 dm. long, sparingly and closely canescent and slightly hirsute; basal leaves simple or often with a pair of divergent lobes on the petioles, appressed-hirsute and with finer pubescence intermixed, oblong, acute, 5-10 cm. long; calyx-lobes oblong-linear or linear, about three-fourths as long as the corolla, obtuse; corolla 5 mm. long; filaments distinctly villous-bearded. Mountain valleys: Mont.—Colo.—Ida. *Submont.* My—Jl.

5. **P. heterophylla** Pursh. Stem 3-6 dm. high, strict, hirsute and tomentulose; leaves entire, or with one or two pairs of lanceolate segments or lobes below; blade or terminal segment lanceolate, 5-10 cm. long; calyx hirsute, ciliate and tomentose, three-fourths as long as the corolla or nearly equalling it; lobes narrowly linear, usually acute; corolla 5-6 mm. long; filaments villous-bearded. *P. hastata* Dougl. Hills and mountains: Alta.—Colo.—Utah—Wash.—B.C. *Submont.* My—Jl.

6. **P. alpina** Rydb. Stem about 2 dm. high, sparingly grayish strigose and hirsute; basal leaves short-petioled, about 5 cm. long, oblong-lanceolate or oblanceolate, entire, grayish strigose; calyx hispid; lobes linear, obtuse or acutish; corolla 5-6 mm. long, lilac; filaments bearded. Mountains: Mont.—Wyo.—Utah—B.C. *Mont.* Je—Jl.

7. **P. leptosepala** Rydb. Stems ascending, hirsute, 1-3 dm. high; leaves usually simple, hirsute on both sides, 5-10 cm. long, oblanceolate or elliptic; calyx hirsute; lobes narrowly linear, hirsute, nearly as long as the corolla, acute; corolla glabrous or nearly so, 5 mm. long; filaments about twice as long, sparingly villous-bearded. Mountains: B.C.—Mont. *Submont.* Je—Au.

8. **P. humilis** T. & G. Diffusely branched annual; stem 1-2 dm. high, pilose or somewhat hirsute; leaves elliptic, spatulate, or oblanceolate, more or less hirsute, 2-5 cm. long, usually simple; calyx-lobes narrowly linear, hirsute, nearly two-thirds as long as the blue or purple corolla, which is 5-6 mm. long; filaments slightly exserted, glabrous or nearly so. Dry gravelly soil: Calif.—Utah. *Son.* My—Jl.

9. **P. Palmeri** Torr. Stem simple, 2-4 dm. high, usually decidedly viscid-glandular; leaves short-petioled or subsessile, numerous and crowded, 2-8 cm. long, coarsely dentate, or more or less lobed, lanceolate or oblong; inflorescence dense and spike-like; calyx-lobes narrowly linear-oblanceolate, hirsute-glandular; corolla 6-7 mm. long; filaments glabrous. *P. foetida* Goodding. Arid soil: s Utah. *Son.*

10. **P. orbicularis** Rydb. Stem 1-2 dm. high, glandular-villous, often tinged with red, branched; leaf-blades petioled, suborbicular in outline, crenately lobed, 1.5-2.5 cm. long, hirsute as well as glandular; calyx-lobes oblong or oblanceolate, obtuse, 3 mm. long; corolla purplish, 6 mm. long; lobes crenulate; filaments about twice as long as the corolla. Arid places: Utah. *Son.*

11. **P. integrifolia** Torr. Stem 2-6 dm. high, branched, glandular-puberulent, only slightly hirsute; leaves short-petioled or the upper sessile; blades 2-10 cm. long, round-lobed and crenate; inflorescence open, 5-10 cm. long; calyx-lobes elliptic or oblong; corolla bluish or whitish, 5-6 mm. long; filaments glabrous. In gypsum soil: Kans.—w Tex.—Ariz.—Utah; n Mex. *Son.* Ap—Jl.

12. *P. corrugata* A. Nels. Stem 3-5 dm. high, glandular-puberulent, more or less branched; leaves short-petioled or the upper sessile; blades sinuately round-lobed and crenate; branches of the inflorescence long, dense, 5-15 cm. long; sepals linear-oblong, sparingly hirsute; corolla blue or purple, about 1 cm. long; filaments glabrous, twice as long as the corolla. Dry soil: Colo.—Tex.—N.M.—Utah. *Son.* Ap-Je.

13. *P. crenulata* Torr. Stem erect, branched, 2-4 dm. high, hispid and somewhat glandular; leaves distinctly petioled, pinnatifid; segments 8-12, oblong to orbicular, the upper confluent, coarsely crenate, densely hirsute; calyx-lobes linear-oblong, obtuse; corolla deep violet, 6-8 mm. long, its lobes crenulate; filaments glabrous, nearly twice as long as the corolla. Mountains: Ariz.—Utah—Calif.—L. Calif. *Son.*—*Submont.* Ap-Je.

14. *P. deserta* A. Nels. Stem simple, erect, 1-2 dm. high, densely leafy, white-villous with short hairs; leaves petioled, pinnatifid, densely pilose; segments oval, crenate; inflorescence short and dense; sepals lanceolate-oblong; corolla blue, 7 mm. long, with rounded entire lobes; filaments glabrous, about twice as long as the corolla. Dry bluffs: Wyo. *Submont.* My.

15. *P. splendens* Eastw. Stem erect, 2-4 dm. high, branched, purplish, glandular-puberulent or glabrous; leaves petioled, pinnatifid; divisions often alternate, 7-9, obovate or orbicular, oblique at the base, crenate or round-lobed, glandular-puberulent or nearly glabrous; inflorescence dense, on a long peduncle; calyx white-hirsute and somewhat glandular; lobes linear-lanceolate; corolla bright blue, rarely white, about 1 cm. long; filaments glabrous. Desert or dry soil: Colo.—Utah. *Submont.* My-S.

16. *P. glandulosa* Nutt. Stem stout, 3-6 dm. high, leafy, glandular-puberulent; leaves densely glandular-puberulent, pinnatifid, with many oblong to oval divisions, which are coarsely crenate, lobed, or incised; inflorescence compound, of many short branches; sepals glandular, linear or oblanceolate; corolla deep blue or violet, 6-8 mm. long; filaments glabrous. *P. Bakeri* F. Macbr., in part. Gravelly soil: Mont.—w Tex.—Ariz. *Son.*—*Mont.* Je-S.

17. *P. alba* Rydb. Stem leafy, 2-4 dm. high, strict and simple, viscid-villous and glandular above; leaves twice interruptedly pinnatifid, about 1 dm. long, glandular-puberulent; ultimate segments ovate or oblong, 3-6 mm. long; inflorescence branched, dense; calyx glandular, cleft to near the base; lobes broadly linear, obtuse; stamens and style much exserted. Valleys: Wyo.—N.M.—Ariz.—Utah. *Submont.*—*Mont.* Jl-Au.

18. *P. neomexicana* Thurb. Stem 2-6 dm. high, strict, leafy, glandular-pubescent; leaves interruptedly twice pinnatifid; lobes ovate, short; inflorescence dense; calyx-lobes oblong or oblanceolate, glandular-puberulent and hirsute-ciliate; corolla bluish or purplish; stamens slightly exserted. Plains: Colo.—N.M. *Son.*—*Submont.* Je-O.

19. *P. denticulata* Osterhout. Stem 1-3 dm. high, pubescent and glandular-viscid; leaves 5-6 cm. long, petioled, oblong in outline, hispid-pubescent on both sides, pinnatifid; inflorescence branched; calyx-lobes linear, obtuse; corolla blue or bluish, 5 mm. long. Glades: Colo. *Submont.* Je.

20. *P. ramosissima* Dougl. Stem often decumbent at the base, 3-6 dm. high, diffusely branched, glandular-puberulent, slightly hirsute above; leaves pinnatifid, densely puberulent; segments 5-9, ovate to oblong, dentate or incised; calyx-lobes spatulate, obovate or oblong, at least twice as long as the capsule, densely pilose and hispid-ciliate; corolla 6-8 mm. long; filaments glabrous. Hills and dry places: Wash.—Ida.—Ariz.—Calif. *Son.* Je-Jl.

21. *P. hispida* A. Gray. Stem at last diffusely branched, 3-6 dm. high, hispid with long white hairs; leaves pinnatifid, conspicuously hispid; segments 7-11, lanceolate or oblong, sharply serrate to incised; calyx-lobes about 5 mm. long, in fruit often 10 mm. long, narrowly linear, hispid-ciliate; corolla 7-10 mm. long, open-campanulate; filaments glabrous. Hills and rocky places: Calif.—Utah—Ariz. *Son.* Ap-Je.

22. *P. Rattani* A. Gray. Stem 1-4 dm. high; leaves oval or ovate in outline, thin, hirsute; inflorescence lax and few-flowered; sepals spatulate, long-hispid, twice as long as the fruit; corolla sky-blue or white, campanulate; lobes short. Shady places: Ore.—Ida.—n Calif. Je—Jl.

23. *P. Franklinii* R. Br. Stem 2-4 dm. high, softly hirsute, erect, rather simple; leaves pinnatifid, densely pilose or hirsute; divisions many, oblanceolate or oblong, deeply cleft or pinnatifid into lanceolate divisions; inflorescence dense; calyx-lobes linear, about 5 mm. long; corolla pale blue or almost white, about 8 mm. long; stamens slightly exserted. Hillsides and banks: Hudson Bay—Mich.—Wyo.—Ida.—Mack. Submont.—Boreal. My—Jl.

24. *P. linearis* (Pursh) Holz. Stem 1-4 dm. high, at last branched, grayish puberulent; leaves 2-5 cm. long, simple, linear, or cleft into 3-7 linear divisions; inflorescence thyrsoid-paniculate; sepals narrowly linear, hispid-ciliate; corolla bright blue, rarely white, about 1 cm. long; filaments glabrous, scarcely exserted. *P. Menziesii* (R. Br.) S. Wats. Valleys and hillsides, especially in sandy soil: Alta.—Wyo.—Utah—Calif.—B.C. Plain—Submont. Ap—Jl.

25. *P. idahoensis* Henders. Stem simple, 3-6 dm. high, glabrous below, somewhat hirsute above; leaves pinnatifid, the lower petioled, 1-2 dm. long, sparingly pilose; divisions oblong or lanceolate, entire or cleft, pale beneath; inflorescence an elongate spike-like thyrsus; calyx-lobes narrowly linear, ciliate; corolla light blue, puberulent, 5 mm. long. Moist meadows: Ida. Submont. Je.

26. *P. Lyallii* (A. Gray) Rydb. Stem 1-2 dm. high, sparingly hirsute; leaves oblanceolate in outline, 5-10 cm. long, green, sparingly strigose; lobes broadly oblong; inflorescence short and dense; calyx-lobes linear, hirsute, 5 mm. long; corolla dark blue, 8 mm. long. High mountains: Mont.—Ida.—B.C. Subalp.—Alp.

27. *P. sericea* (Graham) A. Gray. Stem 1-3 dm. high, strigose-canescens; leaves 3-10 cm. long, silvery-silky; divisions cleft into linear or linear-oblong divisions; inflorescence spike-like; calyx-lobes linear, silky-villous; corolla violet-blue, open-campanulate, 5-6 mm. long. High mountains: Alta.—Colo.—Nev.—Wash.—B.C. Mont.—Alp. Je—Au.

28. *P. ciliosa* Rydb. Stem 2-5 dm. high, more or less strigose; leaves 5-15 cm. long; segments entire or 2- or 3-cleft, with oblong divisions, green, but more or less strigose; petioles and rachis often hispid-ciliate; inflorescence spike-like, 1-2 dm. long; sepals linear, hirsute; corolla violet-blue, 5-6 mm. long; filaments glabrous. Mountains: Alta.—Colo.—Nev.—B.C. Submont.—Subalp. Je—Au.

29. *P. firmomarginata* A. Nels. Stem branched from the base, 1-2 dm. high, puberulent and slightly glandular and hispid; leaves alternate, 1-4 cm. long, pinnatifid, with oblong or obovate crenulate divisions, puberulent and hispidulous; inflorescence spike-like, in fruit 3-6 cm. long; corolla pale or white, shorter than the calyx; folds obsolete. Desert regions: Ida. Son. Je.

30. *P. cephalotes* A. Gray. Stem divaricately branched, nearly prostrate, less than 1 dm. long, glandular-hirsute; leaves petioled; blades somewhat fleshy, oblong or spatulate, 1-2 cm. long; calyx-lobes linear-spatulate or linear, hispid; corolla white or yellowish, with blue or purplish limb, 4 mm. long, almost cylindrical. River banks and cañons: s Utah. L. Son. Ap—Je.

31. *P. minutissima* Henders. Stem branched at the base, 2.5-6.5 cm. high; leaves lanceolate or linear, 7-9 mm. long; inflorescence few-flowered; flowers subsessile; sepals oblong-spatulate, 2-4 mm. long; corolla subcylindric, 2 mm. long. *P. foliosepala* A. Nels. Rocky places: Ida. Mont.

32. *P. Knightii* A. Nels. Stem 2-5 cm. high, minutely puberulent, simple or branched; leaves few, petioled; blades somewhat fleshy, orbicular to ovate, entire or nearly so, 5-10 mm. long; calyx-lobes linear-spatulate, shorter than the corolla; corolla narrowly campanulate, about 5 mm. long, with a yellowish tube and purple limb. Barren clayey slopes: Wyo. Submont. Je.

33. *P. demissa* A. Gray. Stem diffusely branched, less than 1 dm. high, viscid-puberulent; leaves petioled; blades orbicular or sub-reniform, entire or

rarely somewhat repand, 1-2 cm. broad, glandular-puberulent; calyx-lobes linear, glandular-puberulent; corolla white, 4-6 mm. long. *P. nudicaulis* Eastw. Arid places: N.M.—s Utah—Nev. *Son.*

34. *P. pulchella* A. Gray. Stem diffusely branched, glandular-puberulent, 5-20 cm. high; leaves petioled, puberulent; blades 1-3 cm. long, ovate, oval, or obovate, obtuse, entire or somewhat repand; pedicels shorter than the calyx; calyx-lobes linear-spatulate, 4-5 mm. long; corolla deep purple, with a yellowish base, about 1 cm. long. Gypsum hills: s Utah. *Son.*

35. *P. curvipes* Torr. Low annual; stem pubescent, branched at the base; leaves lanceolate or oblong, entire; sepals oblanceolate, 6-7 mm. long, hirsute; corolla light blue or white; stamens sparsely bearded. Arid regions: Calif.—s Utah—Ariz. *Son.*

36. *P. incana* A. Brand. Stem branched, with erect branches, 8-15 cm. high, glandular-pilose; leaves petioled, densely pilose; blades oval or oblong, entire, obtuse, 0.5-2 cm. long; sepals linear or linear-spatulate, 3-4 mm. long; corolla white, about 4 mm. long. Dry places, sage plains, &c.: Utah. *Son.* My.

37. *P. glechomaefolia* A. Gray. Stem 1-3 dm. high, paniculately branched, glandular-puberulent; leaves petioled, glandular-puberulent; blades orbicular or cordate-orbicular, 1.5-3 cm. broad, coarsely crenate; calyx-lobes spatulate or oblong, 4-5 mm. long; corolla lilac-purple. Arid regions: Ariz.—s Utah. *L.* *Son.* My-Je.

38. *P. rotundifolia* Torr. Stem diffusely branched, 0.5-2 dm. long, glandular-hirsute; leaves petioled, densely hirsutulous; blades orbicular, with a cordate base, crenate, 0.5-2 cm. broad; sepals linear-spatulate, 2-3 mm. long; corolla white. Arid regions: s Utah—Ariz.—s Calif. *L.* *Son.*

39. *P. campestris* A. Nels. Stem minutely puberulent, branched from the base, 8-12 cm. high; leaves petioled, oblong in outline, 1.5-3 cm. long, deeply pinnatifid, with oblong obtuse divisions; sepals oblong or linear-spatulate, hirsute-ciliate, 3-4 mm. long; corolla 2-3 mm. long, white, short-cylindric. Sandy sage-plains and rocky hills: Wyo. My-Je.

40. *P. Ivesiana* Torr. Stem diffusely branched, 5-15 cm. long; leaves petioled, pinnatifid, finely pilose, 1-4 cm. long; divisions oblong or linear, entire or few-toothed; calyx-lobes linear-spatulate, 2-3 mm. long; corolla white, 3-4 mm. long. Arid places: Utah—Ariz.—Calif.—Wash. *Son.*—*Submont.* Ap-Je.

41. *P. glandulifera* Piper. Stem branched from the base, 5-30 cm. high, glandular-hispid; leaves mostly bipinnatifid, with oblong lobes; calyx-lobes spatulate or oblanceolate, hispid-glandular, 5-6 mm. long; corolla pale violet or yellowish, with purplish limb, about 6 mm. long, barely exceeding the calyx. *P. luteo-purpurea* A. Nels. Sage plains and dry places: Wash.—Ida.—Ore. *Son.* My-Je.

42. *P. affinis* A. Gray. Stem branched from the base, 1-2 dm. high, glandular-hispid; leaves pinnatifid; divisions oblong, more or less lobed or toothed, hirsute and glandular-pubescent; calyx hirsute and glandular; corolla light blue or yellowish, about equalling the calyx. Arid regions: L. Calif.—s Calif.—Utah. *Son.* My-Jl.

43. *P. Fremontii* Torr. Stem 1-3 dm. high, branched at the base, puberulent; leaves pinnatifid, with 7-15 oblong or obovate, entire or rarely 2-3-lobed divisions; calyx-lobes spatulate, 4 mm. long; corolla open-funnelform, 8-12 mm. long; capsule oblong; seeds 20-30, strongly corrugated. Dry regions: s Utah—Ariz.—Calif. *Son.*—*Submont.* Mr-Je.

44. *P. bicolor* Torr. Stem diffuse, 1-2 dm. high, puberulent; leaves pinnatifid and the divisions again parted into linear or oblong divisions; calyx-lobes linear or linear-spatulate, 3 mm. long; corolla narrowly funnelform, fully 1 cm. long. Hills and desert slopes: Utah—Calif. *Son.*—*Submont.* My-Jl.

6. MILTITZIA A.DC.

Diffuse or depressed annuals. Leaves alternate, pinnatifid. Flowers perfect, regular or nearly so, in more or less leafy-bracted scorpioid racemes. Calyx

5-cleft; lobes similar or nearly so. Corolla yellow or yellowish, campanulate or funnelform. Stamens equally inserted low down in the corolla-tube. Ovary more or less 2-celled by the intrusion of the placentae; style 2-cleft at the apex. Capsule loculicidal; seeds minutely reticulate.

Leaf-blades lanceolate to oblong, obtuse, lacinate-dentate.

1. *M. foliosa*.

Leaf-blades obovate, spatulate or oval, coarsely round-toothed.

2. *M. scopulina*.

Peduncles usually longer than the leaves; corolla and capsule equalling the calyx.

Peduncles shorter than the leaves; corolla and capsule shorter than the calyx.

3. *M. salina*.

1. ***M. foliosa*** (M. E. Jones) A. Brand. Stem minutely glandular-puberulent, branched, 2-5 cm. high; leaf-blades 1-2 cm. long; calyx 2 mm. long in flower, 4 mm. in fruit; lobes linear or linear-spatulate; corolla almost equalling the calyx, barely lobed. *Emmenanthe foliosa* M. E. Jones. Alkaline soil: Utah. *Submont.* Je.

2. ***M. scopulina*** (A. Nels.) Rydb. Stem branched near the base, ascending, 1-3 cm. long, pilose; leaf-blades crenately lobed to entire, 5-12 mm. long; sepals linear, obtuse, less than 3 mm. long in flower, 4 mm. in fruit. *Emmenanthe scopulina* A. Nels. Dry sandy shales: Colo.—Mont. *Submont.* My.

3. ***M. salina*** (A. Nels.) Rydb. Stem short and thick, 2 cm. high or less; leaf-blades entire, dentate, or round-lobed, 7-15 mm. long; calyx about 3 mm. long; lobes linear. *Emmenanthe salina* A. Nels. *E. dispar* M. E. Jones. River flats: Wyo. Je.

7. EMMENANTHE Benth. WHISPERING BELLS.

Erect caulescent annuals. Leaves alternate, pinnatifid, with toothed segments. Flowers perfect, regular, in short paniculate leafy-bracted racemes, on drooping pedicels. Calyx 5-cleft, with broad ovate lobes. Corolla broadly campanulate, cream-colored, persistent. Stamens slightly adnate to the base of the corolla. Style 2-cleft above, deciduous; placenta conspicuously dilated in the axis. Capsule loculicidal; seeds somewhat rugosely alveolate-reticulate.

1. ***E. pendulaeflora*** Benth. Erect annual; stem 1-3 dm. high, villous-glandular; leaves pinnately parted or divided, with numerous oblong, sometimes toothed lobes; calyx-lobes ovate-lanceolate, acute, 6-7 mm. long; corolla nearly 1 cm. long; seeds oblong-oval, rugosely alveolate-reticulate. Dry sandy soil: Calif.—s Utah—Ariz.—L. Calif. *L. Son.* Mr—Au.

8. CAPNOREA Raf.

Dwarf stemless perennials. Leaves basal, oblong or spatulate, entire. Flowers singly on elongated pedicels from the axils of the leaves. Calyx 5-7-parted; lobes linear-lanceolate, often unequal. Corolla from campanulate or funnelform to saucer-shaped, deciduous, without appendages within. Stamens inserted in the base of the corolla, more or less hairy at the base. Ovary 1-celled, with 2 more or less intruding placentae; ovules 20 or more on each placenta; style 2-cleft at the apex. Capsule loculicidal, many-seeded. Seeds minutely reticulate. [*Hesperochiron* S. Wats.]

Corolla saucer-shaped or rotate.

Calyx almost glabrous, except the ciliate margins; leaves not distinctly venulose.

1. *C. pumila*.

Calyx long-villous at the base; leaves distinctly venulose.

2. *C. nervosa*.

Corolla campanulate or funnelform.

Calyx-lobes oblong or lanceolate, obtuse.

Corolla 12-15 mm. long; pubescence of the plant short.

3. *C. Watsoniana*.

Corolla 7-10 mm. long; pubescence longer on the peduncle; calyx densely villous.

4. *C. incana*.

Calyx-lobes linear or linear-lanceolate, acute.

5. *C. nana*.

1. ***C. pumila*** (Dougl.) Greene. Leaves oblanceolate or elliptic, tapering into short petioles, 4-7 cm. long, glabrous except on the margins; scape 3-7 cm. long; calyx-lobes equal, lanceolate, 5-7 mm. long; corolla 10-15 mm. high. Hill-sides: Wash.—Ida.—Utah—n Calif. *Submont.* Je—Jl.

2. *C. nervosa* Greene. Leaves thin, petioled; blades elliptic, glabrous on both sides, sparingly silky-ciliate on the margin; calyx-tube densely villous; lobes lanceolate, long-ciliate on the margins; corolla fully 1 cm. high. Wet meadows: Ida. *Submont.* My.

3. *C. Watsoniana* Greene. Leaf-blades oblong or oblanceolate, obtuse, 3-7 cm. long, grayish pubescent, with short hairs; scape 2-5 cm. long; sepals oblong or elliptic, short-hairy; corolla lilac-purple, 12-15 mm. long. Gravelly soil: e Calif.—w Wyo. *Submont.* Ap-Je.

4. *C. incana* Greene. Leaf-blades elliptic or spatulate, 1-3 cm. long, canescent on both sides; scape 1-3 cm. long; calyx-lobes oblong or lanceolate, obtuse; corolla 7-10 mm. long; lobes rounded. Wet benches and flats: Mont.—Ida.—Wash. *Submont.* My-Je.

5. *C. nana* (Lindl.) Raf. Leaf-blades ovate-oblong or oval, strigose-pubescent, 2-5 cm. long; scape 4-7 cm. long; calyx-lobes 5-8 mm. long; corolla 10-17 mm. long; lobes ovate, acute. *C. lasiantha* Greene. *C. macilentia* Greene. Wet places and creek banks: Wash.—Ida.—Ore. *Submont.* Ap-Au.

9. ROMANZÓFFIA Cham.

Low, delicate, scapose perennial herbs, with bulbiferous rootstocks, resembling some saxifrages in habit. Leaves mainly basal, but alternate, with long petioles and reniform lobed blades. Flowers perfect, regular, racemose or paniculate. Calyx-lobes 5, oblong-linear or lanceolate. Corolla pink or purple, funnellform or nearly campanulate. Stamens inserted in the base of the corolla-tube, unequal. Ovary 2-celled or nearly so by the intrusion of the placentae; style entire, filiform; stigma simple, small; ovules many. Capsule loculicidal. Seeds alveolate-reticulate.

Leaves 1.5-4.5 cm. broad.

Leaves 5-9-lobed; capsule longer than the calyx.

Leaves 3-5-lobed; capsule not exceeding the calyx.

Leaves less than 0.5 cm. broad.

1. *R. sitchensis*.

2. *R. Leibergii*.

3. *R. minima*.

1. *R. sitchensis* Bong. Stem slender, 1-3 dm. high, glabrous or nearly so; leaf-blades thin, glabrous or nearly so, reniform, 1-3 cm. broad, with rounded-ovate, mucronate lobes; calyx-lobes linear-lanceolate, 3-5 mm. long; corolla 7-10 mm. long. Wet rocks: Alaska—Alta.—Mont.—n Calif. Ap-Au.

2. *R. Leibergii* Greene. Stem 7-12 cm. high, glabrous; leaf-blades light green, glabrous; lobes extending to the middle, broadly ovate, acute; calyx-lobes oblong-linear; corolla small, open-funnelform. Ledges of slate: n Ida. *Mont.* Au.

3. *R. minima* A. Brand. Stem scarcely exceeding the leaves, rarely more than 2.5 cm. long; leaf-blades 3-5-lobed; calyx-lobes 2-2.5 mm. long, oblong; corolla campanulate, 6 mm. long. High mountains: B.C. *Alp.* Jl.

10. ERIODÍCTYON Benth. MOUNTAIN BALM, YERBA SANTA.

Low shrubs or undershrubs. Leaves alternate, pinnately veined and reticulate, more or less coriaceous and rigidly toothed. Flowers perfect, regular, scorpioid-cymose. Sepals nearly distinct, 5, narrow. Corolla violet or purple, rarely white, funnellform or campanulate, without appendages; its lobes imbricate in the bud. Stamens included; filaments variously adnate to the corolla-tube, more or less hairy. Ovary more or less completely 2-celled. Styles distinct to the base; stigmas capitate. Capsule 4-valved, first loculicidal, then septicidal; placentae very broad. Seeds few, pendulous.

1. *E. angustifolium* Nutt. Low shrub; stem glabrous, glandular-pruinose above; leaves 3-10 cm. long, 2-6 mm. wide, linear or narrowly linear-lanceolate, green above, white beneath, strongly reticulate; margin sinuate-denticulate, revolute; calyx-lobes hirsute-ciliate, 3 mm. long, linear; corolla funnellform, 6-7 mm. long. Dry hills: N.M.—s Utah—Nev.—Calif. *L. Son.* Ap-Je.

11. MARILAUNÍDIUM Kuntze.

Annual or perennial herbs. Leaves alternate, entire, sometimes decurrent. Flowers perfect, regular, solitary, axillary. Calyx with 5 narrow lobes. Corolla

funnellform or salver-shaped, blue; lobes 5, imbricate. Stamens 5, included; filaments irregularly inserted in the corolla-tube. Ovary 1-celled, or sometimes imperfectly 2-celled; styles distinct; ovules numerous on each placenta. Capsule subglobose or oblong, 2-valved. Seeds rugose. [*Nama* L., in part.]

Diffuse; corolla more than twice as long as the calyx.

1. *M. demissum*.

Erect; corolla shorter than the calyx.

2. *M. angustifolium*.

1. ***M. demissum*** (A. Gray) Kuntze. Diffuse annual; stem branched at the base, 5–10 cm. high, hirsutulous; leaf-blades linear-spatulate, more or less tapering into a petiole; flowers subsessile in the axils; sepals narrowly linear, 5–7 mm. long; corolla 8–10 mm. long, purple. *Nama demissum* A. Gray. Desert regions: Wash.—Utah—Ariz.—Calif. *Son.* Ap–Jl.

2. ***M. angustifolium*** (A. Gray) Kuntze. Annual; stem erect, minutely glandular-puberulent, 1–3 dm. high; leaves narrow, linear or nearly so, 1–3 cm. long; flowers subsessile in the forks; calyx-lobes narrowly linear or linear-spatulate, 4–5 mm. long, in fruit even 10 mm. long; corolla about 2 mm. long. *Nama dichotomum angustifolium* A. Gray. Plains and prairies: Tex.—Colo.—N.M.; Mex. *Son.* Je–O.

12. CONÁNTHUS S. Wats.

Small dichotomously branched winter annuals. Leaves alternate, linear-spatulate, entire. Flowers solitary in the forks. Calyx-lobes 5, narrow, similar. Corolla funnellform, deciduous, not appendaged. Stamens unequally inserted in the tube of the corolla. Styles united to near the apex; stigmas capitate; ovules about 10 on each placenta. Capsule loculicidal. Seeds smooth.

1. ***C. aretioides*** (Hook.) S. Wats. Depressed winter annual; stem 5–10 cm. long, repeatedly forked, hirsute-hispid; leaves spatulate-linear; flowers sessile in the forks; calyx-lobes filiform-linear, hispid with long white hairs; corolla 10–15 mm. long, purple, funnellform. Sandy or dry plains: Ore.—Wyo.—N.M.—Calif. *Son.* My–Je.

13. TRICÂRDIA Torr.

Perennial caulescent herbs, branched from the base. Leaves alternate, entire. Flowers perfect, regular, racemose. Sepals only slightly united, very dissimilar; the three outer much larger, and cordate, becoming scarious and finely reticulate-veiny, the inner two linear. Corolla broadly campanulate, deciduous, the 10 internal appendages free and rather distant from the filaments. Stamens equally inserted on the base of the corolla. Ovary 2-celled by the intrusion of the placentae. Style 2-cleft; ovules 4 on each placenta. Capsule loculicidal. Seeds roughened.

1. ***T. Watsoni*** Torr. Perennial; stem branched from the base, 1–2 dm. high, villous with long hairs or more glabrate in age; leaf-blades spatulate or oblanceolate, 3–5 cm. long; larger sepals cordate in fruit, becoming 1.5 cm. or more broad and long; corolla purplish, about 6 mm. wide, moderately 5-lobed; stamens included. Arid regions: Nev.—s Utah—Calif. Ap–Je.

FAMILY 111. EHRETIACEAE. EHRETIA FAMILY.

Undershrubs, shrubs, or trees, rarely herbs. Leaves mainly alternate, without stipules; blades simple and entire. Flowers perfect, regular, in compound cymes. Calyx of 5 or fewer, partially united sepals. Corolla of 5, rarely 4 or 6, more or less united petals, deciduous, with spreading lobes. Stamens 4–6, adnate to the base of the corolla-tube; filaments often united at the base; anthers introrse. Gynoecium of 2–4 united carpels; ovary 2–4-celled, or 1-celled, some of the partitions being imperfect; styles 2, distinct or partially united, or 4, united in pairs; ovules 1 or 2 in each cavity. Fruit drupaceous, with a 4-celled, but 1-seeded stone, or 2 two-seeded or 4 one-seeded stones.

Corolla not appendaged; stamens unequally inserted; nutlets rough-granulate, ventrally united.

1. EDDYA.

Corolla appendaged; stamens equally inserted; nutlets smooth and shining, united only at the center.

2. TRIQUILIOPSIS.

1. EDDYA Torr.

Low suffruticose plants. Leaves alternate, fascicled, rigid, in age strongly revolute. Flowers perfect, regular, solitary in the forks. Calyx-lobes narrow, linear. Corolla not appendaged. Stamens unequally inserted. Fruit deeply 4-lobed, the mature nutlets rounded, ventrally united, thin-walled, rough-granulate. Embryo straight.

1. *E. hispidissima* Torr. Stem diffusely branched, procumbent, 1-3 dm. high; leaves fascicled, rigid, lanceolate or linear, hispid, 5-10 mm. long, margins at last strongly revolute; flowers scattered; calyx-lobes linear, resembling the leaves; corolla 5-6 mm. long. *Coldenia hispidissima* A. Gray. Dry hills: w Tex.—s Utah—Nev.—Ariz. Son. Je-Jl.

2. TRIQUILIOPSIS (A. Gray) Heller.

Annual or perennial herbs, dichotomously branched. Leaves alternate, petioled, veiny. Flowers perfect, regular, clustered in the forks. Calyx-lobes linear, hispid. Corolla salver-shaped, appendaged within; stamens equally inserted. Fruit deeply 4-lobed; nutlets rounded, smooth and shining, united only at the center. Cotyledons 4-parted around the cotyledons.

Annual, canescent and hirsute; leaf-blades rhombic or rotund; corolla pink or white.

1. *T. Nuttallii*.

Perennial, often suffruticose at the base, merely canescent; leaf-blades obovate or ovate; corolla bluish.

2. *T. Palmeri*.

1. *T. Nuttallii* (Hook.) Heller. Prostrate annual; stem divergently dichotomously branched, canescent; leaves petioled; blades rhombic or rounded, 4-8 mm. long, with 5-7 strong veins below, canescent on both sides, revolute-margined; flowers clustered in the axils; corolla white or pink, 3-4 mm. long. *Coldenia Nuttallii* Hook. Arid plains: Wash.—Wyo.—Ariz.—Calif. My—Au.

2. *T. Palmeri* (A. Gray) Rydb. Perennial, suffruticose at the base, 1-3 dm. high, diffusely branched; leaf-blades obovate or ovate, with 6 pairs of strong veins, impressed on the upper surface, canescent, about 5 mm. long; calyx-lobes lanceolate, half as long as the bluish corolla; nutlets globose, only one or two maturing. *Coldenia Palmeri* A. Gray. Sandhills: Ariz.—s Utah—s Calif. L. Son. Ja—My.

FAMILY 112. HELIOTROPACEAE. HELIOTROPE FAMILY.

Herbs, shrubs, or vines. Leaves alternate, without stipules, usually entire-margined. Flowers perfect, regular, mainly in scorpioid racemes or spikes, rarely axillary. Calyx of 5 slightly united sepals. Corolla of 5 united petals, funnelform, salver-shaped, or campanulate. Stamens 5, wholly adnate or nearly so to the corolla-tube. Gynoecium of 2-4 united carpels; ovary 2-4-celled, often 4-lobed; styles united; stigmas annular, surpassed by a 2-lobed appendage; ovules pendulous. Fruit dry, separating into 2 or 4 one-seeded nutlets, drupaceous.

Cone of the stigma not setose; flowers in terminal scorpioid spikes or racemes.

1. HELIOTROPIMUM.

Cone of the stigma penicillate-setose; flowers axillary to leaf-like bracts.

2. EUPLOCA.

1. HELIOTROPIMUM L. HELIOTROPE.

Annual or perennial herbs, or in warmer climates shrubs. Leaves alternate, or rarely opposite, pubescent. Flowers perfect, regular, usually in terminal scorpioid racemes or spikes. Calyx-lobes 5, narrow. Corolla salver-shaped; tube cylindric, usually naked in the throat; lobes 5, induplicate or imbricate. Stamens 5, included; filaments short; anther-sacs sometimes appendaged at the

tip. Ovary 4-celled or 2-celled, with 2 more or less intruding placentae; ovules pendulous. Fruit 4-lobed or 4-grooved, sometimes didymous, but separating into 4 nutlets.

1. *H. spathulatum* Rydb. A glabrous, more or less glaucous, fleshy perennial, 3-5 dm. high; leaves spatulate, fleshy, indistinctly nerved, 2-5 cm. long, obtuse or rounded at the apex; inflorescence branched into 2-5 racemes, these often starting from one point at the end of the common peduncle; corolla white or slightly tinged with blue, 6-8 mm. long; nutlets 2.5-3 mm. long, scarcely rugose. *H. curassavicum* Hook., not L. *H. curassavicum obovatum* DC., not *H. obovatum* D. Don. River valleys: Sask.—N.M.—Calif.—Wash. *Plain*.

2. *EUPLOCA* Nutt.

Annual caulescent herbs. Leaves alternate, broad, entire, petioled, pubescent. Flowers perfect, regular, solitary in the axils of leaf-like bracts. Calyx-lobes 5, narrow. Corolla salver-shaped; tube cylindric, naked in the throat; limb 5-angled, strongly plicate in aestivation. Stamens 5, included; anthers subsessile, with a beard at their base; ovary 4-celled; style elongate; cone of stigma penicillate-setose; ovules pendulous. Fruit didymous, the two halves separating into 2 hemispheric, 1-seeded nutlets.

1. *E. convolvulacea* Nutt. Diffusely branched annual; stem 1-4 dm. high, hispid-strigose; leaf-blades lanceolate or ovate, 2-4 cm. long, hirsute-strigose; flowers usually supra-axillary; calyx-lobes linear-subulate; corolla white, salver-shaped to funnelform, 10-15 mm. long; nutlets almost hemispheric, 3 mm. broad, more or less strigose. *Heliotropium convolvulaceum* A. Gray. Sandy plains: Tex.—Neb.—Wyo.—Calif.; Mex. *Plain*—*Son.* My—Au.

FAMILY 113. BORAGINACEAE. BORAGE FAMILY.

Herbs (all ours), or shrubby plants. Leaves alternate, without stipules, simple, entire, bristly. Flowers perfect, regular, or sometimes irregular, in scorpioid racemes or spikes. Calyx of 5, rarely 4, more or less united sepals, persistent. Corolla salver-shaped or campanulate, rarely nearly rotate, deciduous; throat often with a crown of 5 small scales (fornices); lobes 5, convolute, plicate or induplicate, usually equal. Stamens 5, adnate to the corolla-tube; filaments often appendaged; anthers introrse. Gynoecium of 2 united carpels; styles united, rising between the four lobes of the ovary; stigma simple or 2-lobed; ovules anatropous, solitary in each cell of the ovary. Fruit usually of 4 nutlets.

Nutlets with hooked prickles, at least on the margins.

Nutlets spreading or divergent on the low receptacle.

Nutlets elongate, flat, wing-margined, attached underneath the edge of the receptacle; prickles only on the margins; slender annuals.

Nutlets divergent in pairs; margin lacinate or undulate. 1. PECTOCARYA.

Nutlets equally radiately divergent, entire-margined. 2. GRUVELIA.

Nutlets short, not wing-margined, prickly all over, attached horizontally or obliquely on the receptacle; stout biennials or perennials. 3. CYNOGLOSSUM.

Nutlets erect on the elevated receptacle, prickly on the margin, rarely along the back. 4. LAPPULA.

Nutlets unarmed, or if prickly the prickles not hooked.

Receptacle conic or elongate; nutlets attached laterally.

Calyx in fruit much enlarged, veiny-reticulate and folded. 5. ASPERUGO.

Calyx in fruit neither much enlarged, nor conspicuously veiny.

Corolla blue or white (yellowish only in a few species of *Oreocarya*), with fornicules in the throat (except in *Greeneocharis*, and obscurely so in *Eremocarya*); cotyledons entire.

Nutlets attached below the middle, with an oblique truncate back, which is surrounded by an entire or toothed margin; low pulvinate-cespitose perennials. 6. ERITRICHUM.

Nutlets attached at the middle or with an elongated scar reaching from the base to above the middle, not with a truncate, margined back; plants rarely pulvinate-cespitose.

Pedicels and calyx persistent in fruit.

Calyx circumsessile; plants dichotomously branched.

7. GREENEOCHARIS.

Calyx not circumscissile.

Nutlets oblique or incurved, attached by a median false caruncle.
8. *PLAGIOBOTHRYA*.

Nutlets erect, the groove or scar of attachment naked.

Plants dichotomously branched; racemes biserial; calyx cleft to the base.
9. *EREMOCARYA*.

Plants not dichotomously branched; inflorescence racemiform or thyrsoid; its branches uniserial; calyx not cleft to the base.

Calyx-lobes spreading in fruit; leaves alternate.

Perennials, with bracted racemose or thyrsoid inflorescence.
10. *OREOCARYA*.

Annuals, mostly with bractless racemose inflorescence.
12. *CRYPTANTHA*.

Calyx nearly closed in fruit; leaves proper opposite, with connate bases; annuals.
11. *ALLOCARYA*.

Pedicels in fruit falling off with the calyx; the latter closed; branched but not dichotomous annuals.
12. *CRYPTANTHA*.

Corolla yellow or orange, often with naked throat; cotyledons 2-cleft.
13. *AMSINCIA*.

Receptacle flat or merely convex.

Scar of the nutlets small and marginless.

Nutlets obliquely attached; flowers mostly bractless; corolla blue or white, with funnelliform throat.
14. *MERTENSIA*.

Nutlets attached by the very base.

Corolla salverform or funnelliform, its lobes rounded and spreading.

Racemes not bracted; corolla in ours blue, its lobes convolute in the bud.
15. *MYOSOTIS*.

Racemes bracted; corolla yellow or yellowish, its lobes imbricated in the bud.
16. *LITHOSPERMUM*.

Corolla tubular, its lobes erect, acute, otherwise as in *Lithospermum*.
17. *ONOSMODIUM*.

Scar of the nutlets large and excavated, bordered by a prominent margin.

Fornices in the throat of the corolla short, blunt.
18. *ANCHUSA*.

Fornices long, linear or lanceolate.
19. *SYMPHYTUM*.

1. *PECTOCARYA* DC.

Small dichotomously branched annuals. Leaves alternate, narrowly linear. Flowers perfect, regular, minute, scattered. Calyx deeply 5-cleft; lobes spreading or reflexed in fruit. Corolla salverform, with a crown nearly closing the throat. Stamens included. Style short; stigma capitate. Nutlets spreading, in pairs, thin, with laciniate or at least undulate wings, attached at the inner end to the depressed receptacle.

Nutlets linear or linear-oblong, their wings pectinately or laciniately toothed, each tooth ending in an uncinat prickle.
1. *P. linearis*.

Nutlets oblong, their wings not laciniate, sinuately lobed, uncinat-prickly usually only at the apex, sometimes with a few prickles on the sides.
2. *P. penicillata*.

1. *P. linearis* (R. & P.) DC. Stem strigose, branched at the base, 5–20 cm. high; leaves narrowly linear, 1–4 cm. long; corolla nearly 2 mm. long, longer than the linear calyx-lobes; nutlets 3–4 mm. long. Gravelly soil: Calif.—s Utah—Ariz.; Mex. and S. Am. *L. Son.* F—My.

2. *P. penicillata* (H. & A.) A. DC. Stem branched at the base, strigose, 3–20 cm. long; leaves linear, 0.5–2 cm. long, strigose; corolla white, 1–1.5 mm. long; nutlets oblong or somewhat fiddle-shaped, 2–2.5 mm. long. *P. miser* A. Nels. Sandy soil: B.C.—Wyo.—Ariz.—Calif.; L. Calif. *Son.* Mr—Je.

2. *GRUVÈLIA* A. DC.

Small branched annuals. Leaves alternate, narrowly linear. Flowers perfect, regular, minute, scattered, irregularly opposite the leaves. Calyx deeply 5-cleft; lobes reflexed in fruit. Corolla salverform, with a crown of small fornicies, nearly closing the throat. Stamens included. Nutlets radiately divergent, flat, depressed, thin, attached at the inner end to the depressed receptacle, prickly on the back, the rim or wing-margin entire.

1. *G. setosa* (A. Gray) Rydb. Diffusely branched annual; stem more or less hirsute as well as strigose; leaves linear-oblong or linear, 1–3 cm. long; corolla white, not exceeding the linear-oblong obtuse sepals; nutlets broadly obovate, 2–2.5 mm. long, surrounded by a thin wing-margin, prickly on the back

as well as on the margins. *Pectocarya setosa* A. Gray. Sandy hills and cañons: Ore.—Ida.—Ariz.—Calif. Son. My—Je.

3. CYNOLÓSSUM (Tourn.) L. HOUND'S TONGUE.

Annual, biennial, or perennial caulescent herbs. Leaves alternate, entire, mostly decurrent, pubescent. Flowers perfect, regular, in scorpioid racemes. Calyx with 5 spreading or reflexed lobes, slightly accrescent in age. Corolla white, blue, or purple, salverform or funnelform; tube short; throat closed by 5 scales; lobes 5, imbricate. Stamens 5, included. Nutlets 4, flat, distinct, equally divergent, armed with short barbed prickles, attached by an oval or rounded scar at the upper end to a flat or low-pyramidal receptacle.

Soft pubescent; lower leaf-blades oblong or spatulate; stem-leaves lanceolate; inflorescence many-flowered and leafy.

Hispidulous; lower leaf-blades oval; stem-leaves oblong-ovate, clasping; inflorescence few-flowered and naked.

1. *C. officinale*.

2. *C. boreale*.

1. *C. officinale* L. Biennial; stem 6-8 dm. long, softly pilose, somewhat canescent; basal leaves petioled; blades 1-3 dm. long, velvety-pilose; racemes panicled; calyx-lobes oval or oblong; corolla dull red, rarely white, 7-10 mm. broad; nutlets depressed on the back, margined, about 7 mm. long; prickles in 4-5 rows on the margins and scattered on the back. Pastures and waste places: Que.—N.C.—Kans.—Utah—Mont.; nat. from Eu. My—Jl.

2. *C. boreale* Fernald. Perennial; stem 4-8 dm. high, hirsute and the inflorescence strigose; basal leaves long-petioled; blades 1-3 dm. long, hispid; racemes geminate; fruiting pedicels spreading, recurved; calyx strigose, 2-2.5 mm. long; lobes ovate; corolla blue, 6-8 mm. wide; nutlets ovoid-pyriform, 4-5 mm. long, glochidiate-prickly all over. Woods: N.B.—Mass.—n Mich.—B.C. Je—Jl.

4. LÁPPULA (Riv.) Moench. STICKSEED, BURSEED, STICK-TIGHTS, BEGGAR TICKS.

Annual, biennial, or perennial caulescent herbs. Leaves alternate, entire, narrow, pubescent. Flowers perfect, regular, in terminal scorpioid racemes. Calyx with 5 narrow lobes, slightly if at all accrescent. Corolla salverform, blue or white; tube very short; throat closed by 5 scales; lobes 5, imbricate, obtuse. Stamens 5, included; filaments very short. Fruit of 4, finally distinct nutlets, these with barbed prickles along the edge, and sometimes with smaller ones on the dorsal faces, muricate on the sides, obliquely attached by the inner angle to a conical receptacle. [*Echinosperrum* Sw.]

Inflorescence leafy-bracted only at the base; bracts minute above; gynobase short-pyramidal; scar of the nutlets ovate or triangular; perennials or biennials.

Marginal prickles free to the base or nearly so.

Corolla 1.5-3 mm. wide.

Leaves thin; stem-leaves lanceolate.

Fruit about 3 mm. wide; nutlets usually with a few prickles on the back.

1. *L. americana*.

Fruit about 5 mm. wide; nutlets merely muricate on the back.

2. *L. leptophylla*.

Leaves firmer; stem-leaves oblanceolate to linear; fruit about 3 mm. wide, not prickly on the back.

3. *L. Besseyi*.

Corolla 4-12 mm. wide; leaves firmer.

Fornices of the corolla glabrous or papillose.

Fornices broader than long; corolla blue.

Foliage rather softly pubescent; stem leafy throughout.

Corolla 4-6 mm. broad; nutlets without prickles on the back.

4. *L. floribunda*.

Corolla 8-10 mm. broad; nutlets with a few prickles on the back.

5. *L. diffusa*.

Foliage hirsute; hairs with pustulate bases; stem very leafy at the base, few-leaved above.

6. *L. gracilentia*.

Fornices as long as broad; corolla white; foliage harshly papillose-scabrous.

7. *L. trachyphylla*.

Fornices of the corolla pubescent; nutlets with about 10 prickles on the back.

Corolla tinged with blue; appendages long-hirsute.

8. *L. coerulescens*.

Corolla white; appendages pilose.

9. *L. subdecumbens*.

Marginal prickles united for one-third to one-half their length into a distinct wing.

Back of the nutlets strongly muricate and with prickles.

Corolla blue; pubescence fine, appressed.

10. *L. ciliata*.

Corolla white; pubescence hirsute.

11. *L. cinerea*.

Back of the nutlets without prickles, almost smooth.

Stem-leaves linear-lanceolate, densely strigose.

Stem-leaves oblong-lanceolate, hispidulous, the hairs with papillose bases.

12. *L. angustata*.

13. *L. scaberrima*.

Inflorescence leafy, the floral leaves, although smaller, resembling those of the stem; annuals.

The annular margin connecting the bases of the prickles inconspicuous in all four nutlets.

Marginal prickles in two rows.

Corolla almost 3 mm. wide; prickles shorter than the length of the fruit.

14. *L. erecta*.

Corolla less than 2 mm. wide; prickles nearly as long as the fruit.

Fruit 4-5 mm. long; sepals ovate-lanceolate, obtuse; floral leaves ample, ovate or oblong.

15. *L. cenchrusoides*.

Fruit 3-4 mm. long; sepals lanceolate or linear-lanceolate, acute; floral leaves much reduced, lanceolate.

16. *L. Fremontii*.

Marginal prickles in one row.

Calyx-lobes more than twice as long as the fruit, reflexed-spreading; floral leaves broadly lanceolate.

17. *L. calycosa*.

Calyx-lobes less than twice as long as the fruit; floral leaves linear or linear-lanceolate.

Dorsal faces of the nutlets inside the annular margin small; lower prickles inserted about one-third the distance from the base; stem strigose.

18. *L. montana*.

Dorsal faces of the nutlets inside the ring large; lower prickles inserted near the base of the nutlets; stem hirsute.

Prickles terete; plant green; corolla blue.

19. *L. occidentalis*.

Prickles flattened and dilated at the base; plant whitish long-hairy below; corolla white.

20. *L. leucotricha*.

The annular margin connecting the bases of the prickles at least in three of the nutlets broadened and forming a cup.

Plant at flowering time with a large basal rosette of spatulate leaves; stems simple up to the inflorescence, softly pilose.

Stems several from the rosette, low, 1-2 dm. high; cup deep and much inflated.

21. *L. collina*.

Stems solitary, 3-4 dm. high; cup rather shallow and slightly gibbous.

22. *L. cupulata*.

Plant at flowering time without a basal rosette, diffusely branched, hirsute, green.

Cup deep, more or less saccate.

23. *L. heterosperma*.

Cup shallow, with revolute margins.

24. *L. foliosa*.

1. *L. americana* (A. Gray) Rydb. Biennial; stem 3-10 dm. high, retrorsely hirsute; lower leaves petioled; blades oblanceolate, acute, 5-10 cm. long, sparingly hirsute, thin; upper leaves sessile, lanceolate, acute or acuminate; corolla pale blue, 1.5-2 mm. wide; back of the fruit convex, but not keeled, muricate. *E. deflexum americanum* A. Gray. Copses: Man.—Neb.—Ida.—B.C. Plain—Submont. Je—Jl.

2. *L. leptophylla* Rydb. Biennial or perhaps perennial; stem 6-8 dm. high, finely retrorsely hirsutulous; basal leaf-blades oblanceolate, very thin, finely pubescent, somewhat scabrous; corolla blue, 2-3 mm. in diameter; back of the fruit finely puberulent, slightly muricate, not prickly. Shaded lowlands: Mont.—Wyo. Submont.

3. *L. Besseyi* Rydb. Biennial; stem 5-10 dm. high, hirsute, branched above; lower leaf-blades spatulate or oblanceolate, obtuse, hispidulous and hirsute on the veins; corolla dark blue, scarcely over 1.5 mm. wide; back of the fruit flat, prickless, but minutely hispidulous. Cañons: Colo. Submont.—Mont.

4. *L. floribunda* (Lehm.) Greene. Biennial or perhaps perennial; stem 3-15 dm. high, strigose or pilose; lower leaf-blades narrowly oblanceolate, 5-15 cm. long, strigose; upper leaves linear or linear-lanceolate, sessile; nutlets 5-6 mm. broad; back slightly ridged, glabrous or scabrous, muricate. *E. floribundum* Lehm. Hillsides and among bushes: Man.—N.M.—Calif.—B.C. Plain—Mont. Je—Au.

5. *L. diffusa* (Lehm.) Greene. Perennial; stem erect, pilose or softly hirsute, 5-10 dm. high; basal leaf-blades narrowly oblanceolate, 5-15 cm. long, pilose; fruit 6-7 mm. wide; back flat, hispidulous, somewhat muricate and with a few central prickles. *Echinosperrum diffusum* Lehm. Brook banks: Alta.—Wyo.—Utah—Calif.—B.C. Submont.—Mont. My—Jl.

6. *L. gracilentia* Eastw. Biennial; stem 4-6 dm. high, hispid throughout; basal leaf-blades spatulate or oblanceolate, 2-8 cm. long, hirsute; stem-leaves

lanceolate, 6 cm. long; corolla blue, 6-8 mm. wide; fornicies each of 3 wart-like crests; fruit 4-5 mm. wide; backs pubescent. Cañons: s Colo. *Sen.* Je.

7. *L. trachyphylla* Piper. Perennial; stem about 6 dm. high, hispid; upper leaves lanceolate, attenuate-acuminate, 4-5 cm. long, harshly scabrous-hispid on both sides; hairs with pustulate bases; corolla white, 10-12 mm. broad; fornicies as broad as long, papillose; fruit about 6 mm. wide; back plane, muriculate, bearing several prickles. Dry places: Mont. *Submont.*

8. *L. coerulescens* Rydb. Perennial; stems several, ascending, 4-6 dm. high, grayish strigose; basal leaf-blades oblanceolate or spatulate, obtuse, grayish strigose, ciliate-margined; stem-leaves linear-oblong, sessile; corolla 6-10 mm. broad, sky-blue, veined with blue; fruit about 7 mm. broad; back keeled, finely muricate, with a few prickles. Hillsides: Alta.—Wyo.—Utah—Nev. *Submont.*

9. *L. subdecumbens* (Parry) A. Nels. Perennial; stem diffusely soft-hirsute, spreading at the base, 3-7 dm. high; lower leaf-blades oblanceolate, 7-15 cm. long, soft hirsute, the upper ones oblong, sessile; corolla white, 8-12 mm. broad; back of the fruit with few short prickles. *E. subdecumbens* Parry. Dry hillsides: Utah—I da. *Submont.*

10. *L. ciliata* (Dougl.) Greene. Perennial; stem 3-7 dm. high, cinereous-strigose, with some hispid hairs; lower leaf-blades narrowly linear-oblanceolate, acute, cinereous-strigose and hispid-ciliate; upper leaves sessile, linear; corolla blue, 7-9 mm. broad; fruit 7-8 mm. broad; back flat, with a faint dorsal keel, roughly muricate and with a few short prickles. *E. ciliatum* A. Gray. Dry hillsides: Wash.—I da. *Submont.* My-Jl.

11. *L. cinerea* Piper. Perennial; stem 4-6 dm. high, cinereous-strigose, and somewhat hispid; basal leaf-blades linear or linear-oblanceolate, 6-10 cm. long; the upper linear, sessile, densely hispid, the hairs with pustulate bases; corolla white, 8-10 mm. broad; fornicies short-pilose; fruit 7-8 mm. broad; back with a faint dorsal ridge, muricate and with a few prickles. Mountains: Mont.—n Utah—I da. *Submont.* Je-Au.

12. *L. angustata* Rydb. Short-lived perennial; stem strict, hirsute, 6-8 dm. high; lower leaves petioled, 9-15 cm. long, strigose or hirsute on the petioles; blades narrow, linear-oblanceolate, mostly acute; corolla blue, about 4 mm. wide; fruit 4-5 mm. wide; back slightly keeled, minutely hispidulous or glabrous. Mountain valleys: Black Hills, S.D.—Colo. *Submont.* Je-Jl.

13. *L. scaberrima* Piper. Perennial; stem softly hirsute below; basal leaf-blades spatulate, obtuse, harshly hispid-strigose; stem-leaves oblong-lanceolate; corolla blue, 5 mm. broad; fornicies broader than long, papillose; fruit 6 mm. wide; back smooth, with prominent keel. Hills and mountains: w Neb.—Colo. *Plain—Submont.* Jl.

14. *L. erecta* A. Nels. Stem 2-4 dm. high, strigose; basal leaves numerous, rosulate, oblanceolate, 1-3 cm. long; stem-leaves linear or linear-oblong, sessile, 1-4 cm. long, strigose; corolla blue; fruit about 5 mm. broad; back muricate. Foot-hills and sandy places: Alta.—Wyo.—Yukon. *Submont.—Mont.* Je-S.

15. *L. cenchrusoides* A. Nels. Stem intricately branched, 2-4 dm. high, strigose; leaves and bracts numerous, small, oblong or ovate, obtuse, 1-2 cm. long, strigose above, hispid below; back of fruit papillose-tuberculate. Hills: Wyo. *Submont.* S.

16. *L. Fremontii* (Torr.) Greene. Stem erect, strigose, with erect or ascending branches, 2-4 dm. high; leaves 1-3 cm. long, oblong or oblanceolate, strigose above, hispid beneath; bracts smaller, lanceolate, acute; back of the fruit strongly muricate. *E. Fremontii* Torr. Cañons and river banks: Sask.—Wyo.—Calif. *Submont.* Ap-S.

17. *L. calycosa* Rydb. Stem hirsute, 3-4 dm. high, simple below, branched above, with long virgate branches; leaves oblong, obtuse, 3-4 cm. long, 7-8 mm. wide; corolla pale blue, about 1 mm. broad; calyx-lobes enlarged in fruit, foliaceous, 4-6 mm. long; fruit about 4 mm. in diameter; back strongly muricate. Deserted fields and waste places: Colo. *Submont.* Je-Jl.

18. *L. montana* Greene. Stem slender, 2-4 dm. high, branched above, strigose; branches ascending; basal leaves spatulate, 1-2 cm. long; stem-leaves oblanceolate, 2-4 cm. long, cinereous-strigose; corolla about 2 mm. broad; fruit about 3 mm. wide. Dry hills: Mont.—Wyo.—Wash.—B.C. *Submont.* Je-Jl.

19. *L. occidentalis* (S. Wats.) Greene. Stem 2-6 dm. high, usually branched above, with ascending branches, more or less hirsute, with spreading hairs; basal leaves spatulate, 2-4 cm. long; stem-leaves linear or oblong, more or less hirsute; corolla blue, 1.5-2 mm. wide; fruit about 3 mm. wide. *E. Redowskii occidentalis* S. Wats. Sandy places and dry plains: Sask.—Mo.—N.M.—Wash. My—Au.

20. *L. leucatricha* Rydb. Stem 2-4 dm. high, slender, branched above, densely pilose; basal leaves oblanceolate, 2-4 cm. long, softly pilose on both sides; stem-leaves linear or oblong, numerous; corolla 3 mm. broad; fruit about 5 mm. wide; nutlets about 2.5 mm. long, light, almost straw-colored; back strongly muricate. Dry regions: Ariz.—s Colo.—s Utah. *Son.* Ap-Jl.

21. *L. collina* Greene. Stem usually branched at the base, 1-2 dm. high, rather simple, canescent-pilose; basal leaves numerous, spatulate, 1-3 cm. long, canescent-pilose; stem-leaves oblong or linear; corolla usually whitish; back of the nutlets white-tubercled. Dry places: w Tex.—s Colo.—Utah—Ariz. *Son.* My-Je.

22. *L. cupulata* (A. Gray) Rydb. Stem simple below, branched above, 3-5 dm. high, softly pilose; basal leaves numerous, short-petioled; blades spatulate, 1-3 cm. long, softly pilose; stem-leaves linear, obtuse; corolla light blue or whitish, about 3 mm. wide; fruit 5-6 mm. broad; nutlets 2.5 mm. long; back muricate, with about 3 rows of tubercles along the mid-ridge. *E. Redowskii cupulata* A. Gray. *L. columbiana* A. Nels. River bottoms and sandy soil: Nev.—Ida.—Wash.—Ore. *Submont.* Ap-My.

23. *L. heterosperma* Greene. Stem much branched, 1-3 dm. high, hirsute, green; basal leaves 1-2 cm. long, oblanceolate; stem-leaves lanceolate or oblong, hirsute on both sides; bracts lanceolate, longer than the fruit; corolla blue, 1.5-2 mm. wide; fruit about 5 mm. wide. *L. heterosperma homosperma* A. Nels., a form with all four nutlets cupulate. River valleys: S.D.—Kans.—Tex.—Ariz.—Mont. *Submont.* My—Au.

24. *L. foliosa* A. Nels. Stem diffusely and profusely branched from the base, 1-2 dm. high; leaves broadly linear, 1-3 cm. long; bracts oblong-lanceolate, longer than the fruit; corolla blue; nutlets nearly alike, papillose-scabrous and distinctly ridged on the face. *L. desertorum foliosa* A. Nels. Gravelly slopes: Wyo.—Colo. Je-Jl.

5. **ASPERÙGO** (Tourn.) L. CATCHWEED, GERMAN MADWORT.

Low annuals, with hispid foliage and few axillary flowers on recurved pedicels. Calyx foliaceous, strongly reticulate-veiny, enlarged in fruit; lobes 5, flat, with 5 smaller ones intervening. Corolla with a short tube, enlarged throat, and spreading 5-lobed limb. Stamens 5, included. Nutlets ovoid, granular-tubercled, keeled, laterally attached above the middle to an elongate-conic receptacle.

1. *A. procumbens* L. Stem slender, 2-4.5 dm. long; leaves oblong or the lower spatulate, 1-4 cm. long; corolla about 2 mm. broad; fruiting calyx 8-12 mm. broad. Waste places: N.Y.—D.C.—Utah—Alta.; adv. from Eu. My—Au.

6. **ERITRÍCHIUM** Schrader.

Depressed pulvinate-caespitose perennials. Leaves short, entire, clustered on the short branches. Flowers perfect, regular, in few-flowered racemes, or subsolitary. Calyx 5-parted; lobes ascending in fruit. Corolla blue, rarely white, funnelform; tube short. Nutlets 4, obliquely attached by their inner angle to a conic receptacle, smooth, but with an obliquely truncate apex, the truncate portion surrounded by an entire or toothed margin. [*Omphalodes* A. Gray, in part, not Tourn.]

Dorsal surface of the nutlets margined with a ridge-like ring, but not toothed.

Plant strigose; dorsal surface of the nutlets papillose-hispid; corolla 7-9 mm. wide.

1. *E. Howardii*.

Basal leaves with long loose pubescence; dorsal surface of the nutlets smooth; corolla 5-6 mm. wide. 2. *E. elongatum*.
Dorsal surface of the nutlets with a toothed border; corolla 4-6 mm. wide. 3. *E. argenteum*.

1. ***E. Howardi*** (A. Gray) Rydb. Floral branches 1-10 cm. long, canescent-strigose; leaves linear-oblanceolate, canescent or yellowish strigose; corolla dark blue; nutlets broadly obconic, oblique, 2 mm. long and broad; dorsal surface oval, almost flat. *Cynoglossum* and *Omphalodes Howardii* A. Gray. Dry hills: Mont.—Wyo.—Wash. Submont. My—Jl.

2. ***E. elongatum*** (Rydb.) Wight. Floral branches 1-10 cm. long; leaves of the caudex closely overlapping, 5-8 mm. long, oblong or oblanceolate, those of the flowering branches linear or linear-oblong, loosely silky-villous; corolla light blue; nutlets about 2 mm. long, oblique; dorsal surface ovate, smooth and shining. *E. aretioides elongatum* Rydb. Hills and mountains: Mont.—N.M.—Ore. Mont.—Alp. Je—Jl.

3. ***E. argenteum*** Wight. Floral branches 1-5 cm. high, loosely silky; leaves of the caudex closely overlapping, oblanceolate or oblong, 5-10 mm. long; those of the flowering branches linear-lanceolate, silky villous; corolla bright blue, rarely white, 4-6 mm. broad; nutlets about 2 mm. long. *Eritrichium nanum aretioides* A. Gray, not Herder. *Omphalodes nana aretioides* A. Gray. *Oreocarya pulvinata* A. Nels., white-flowered form. High mountains: Colo.—Utah—(? Wyo.) Jl—Au.

7. GREENEOCHARIS Guerke & Harms.

Depressed, spreading annuals. Leaves alternate, linear, hirsute. Flowers perfect, regular, sessile, leafy-bracted. Calyx 5-cleft, the upper portion deciduous, the lower persistent around the fruit. Corolla salver-shaped; tube short; throat open, naked; limb 5-lobed. Nutlets oblong-ovate, attached by a narrow groove bifurcate at the base for nearly their whole length to a pyramidal-subulate receptacle. [*Piptocalyx* Torr.]

1. ***G. circumscissa*** (H. & A.) Rydb. Stem depressed, divaricately branched and spreading, 3-10 cm. high, hispid; leaves linear, 5-15 mm. long, hispid; flowers crowded at the ends of the branches, leafy-bracted; corolla white, 1 mm. long; nutlets oblong-ovate, smooth or minutely scabrous. *P. circumscissus* Torr. Desert plains: Wash.—Wyo.—Ariz.—Calif. Son.—Plain. My.

8. PLAGIOBÓTHRYS Fisch. & Mey. POPCORN FLOWER.

Low, commonly diffuse annuals. Leaves alternate, narrow, entire. Flowers perfect, regular, in scorpioid racemes. Calyx 5-lobed, persistent. Corolla salverform, white; tube very short. Nutlets attached at or near the middle, to a globular or depressed receptacle, ventrally carinate above the insertion, rugose or rough, rarely smooth, only one or two maturing, succumbent horizontally and tardily detached, leaving a caruncle at the insertion.

Receptacle subglobose or depressed, not 4-sulcate; nutlets only 1 or 2 maturing, horizontally incumbent; plants with tufted basal leaves.

Nutlets cruciform; basal leaves rosulate; cauline few and small.

Nutlets broadly ovate; stems leafy throughout.

Receptacle deeply 4-sulcate, after the falling of the nutlets; nutlets all 4 maturing, incurved.

1. *P. tenellus*.

2. *P. arizonicus*.

3. *P. Kingii*.

1. ***P. tenellus*** A. Gray. Stem branched at the base, hirsute; basal leaves numerous, rosulate, oblanceolate, 1-2 cm. long, hirsute; stem-leaves few and small, linear-lanceolate; calyx hirsute, with yellowish or brownish hairs; corolla white, 1.5 mm. broad; nutlets contracted both at the base and the apex, with transverse wrinkles. Sandy soil: B.C.—Ida.—Calif. Son. Ap—Je.

2. ***P. arizonicus*** (A. Gray) Greene. Stem branched from the base, hirsute; branches ascending or decumbent at the base, 2-3 dm. high; basal leaves oblanceolate to linear, 2-5 cm. long, hirsute; stem-leaves lanceolate or linear-lanceolate; calyx hispid; corolla white, nearly 2 mm. wide; nutlets ovate, somewhat cross-wrinkled and with a few tubercles on the ridges. Sandy soil: Ariz.—s Utah—s Calif. L. Son. Ap—My.

3. *P. Kingii* A. Gray. Stem 2-3 dm. high, canescent-hirsute; basal leaves spatulate, densely hirsute, the cauline oblong or lanceolate; inflorescence branched; corolla white, 6-8 mm. broad; fruiting calyx 4-6 mm. long; lobes lance-linear; nutlets roughened with scattered acute papillae. *Sonnea Kingii* Greene. Arid valleys: Nev.—Ida.—(? Utah). *Son.*

9. EREMOCARYA Greene.

Dichotomously branched annuals. Leaves alternate, linear, entire, hirsute-canescenscent. Flowers perfect, regular, biserial in dense leafy racemes. Calyx wholly persistent, 5-cleft; lobes linear-oblong, obtuse, short-hirsute, not hispid. Corolla minute, salver-shaped, white; throat obscurely appendaged. Style thickened. Nutlets attached by a simple groove for their whole length to the columnar receptacle.

Nutlets smooth and shining.
Nutlets finely muricate, dull.

1. *E. micrantha*.
2. *E. muricata*.

1. *E. micrantha* (Torr.) Greene. Stem slender, branched from the base, diffuse, 5-15 cm. high, strigose; leaves linear, 4-8 mm. long, hispid; corolla white, barely 2 mm. long; nutlets oblong-ovate, acute. *Eritrichium micranthum* Torr. Dry plains: w Tex.—s Utah—s Calif. *L. Son.* *Je.*

2. *E. muricata* Rydb. Stem slender, branched throughout, with ascending branches, strigose; leaves linear, 2-5 mm. long, hispidulous; corolla white, 1 mm. long; limb scarcely 0.5 mm. wide; nutlets lanceolate in outline. Dry plains and hills: s Utah—Ariz. *L. Son.* *Ap—My.*

10. OREOCARYA Greene.

Perennial or at least biennials, with taproots or short rootstocks. Leaves alternate, the earlier in basal rosettes, more or less hispid. Calyx wholly persistent, 5-cleft; the lobes ascending or spreading in fruit. Corolla salverform, white or yellowish; tube often elongate, annulate within near the base; throat closed by conspicuous fornicies; limb 5-lobed. Inflorescence thyrsoid or paniculate, leafy-bracted. Nutlets triangular, sometimes somewhat wing-margined, attached for the larger part of their length by a slender scar on the inner angle to a subulate or columnar receptacle.

Corolla-tube not exerted.

Fruit depressed; nutlets smooth, at the margins separated by an open space; caulescent caespitose perennials.

Leaves canescent.

Nutlets all maturing.

Leaves appressed-canescenscent, not hispid; corolla 5-7 mm. wide.

1. *O. cinerea*.

Leaves with the fine pubescence intermixed with hispid hairs on the lower surface; corolla less than 5 mm. wide.

Plant low, grayish, not yellowish hispid above; racemes short, 2-ranked.

2. *O. suffruticosa*.

Plant tall, yellowish hispid above; racemes in fruit elongate, 1-ranked.

3. *O. multicaulis*.

Nutlets only one maturing, three abortive.

4. *O. disticha*.

Leaves grass, having scattered short hairs with pustulate bases above, glabrous beneath.

5. *O. pustulosa*.

Fruit conical or ovoid; nutlets touching each other.

Floral leaves long, many times longer than the flower-clusters; inflorescence spike-like; biennials or short-lived perennials.

Nutlets transversely rugose.

6. *O. virgata*.

Nutlets smooth.

7. *O. spicata*.

Floral leaves comparatively short, little if at all surpassing the flower-clusters.

Nutlets rough.

Nutlets decidedly wing-margined.

Branches of the inflorescence appressed, erect, in fruit elongate; nutlets merely muricate on the back.

8. *O. setosissima*.

Branches of the inflorescence spreading; nutlets rugose as well as muricate on the back.

11. *O. virginensis*.

Nutlets acute-margined, not winged.

Calyx-lobes ovate-lanceolate, only slightly exceeding the mature nutlets; inflorescence paniculate, with rather few branches; caulescent perennials, often caespitose.

Corolla 7-8 mm. broad; nutlets muricate and cross-ribbed, but not honeycomb-crested.

9. *O. elata*.

Corolla 4–5 mm. broad; nutlets honeycomb-crested.

10. *O. Bakeri*.

Calyx-lobes lanceolate to linear, much exceeding the nutlets; inflorescence thyrsoid.

Inflorescence a broad, open, round-topped thyrus; branches usually again branched.

Plant tall, 2 dm. high or more; nutlets with acute backs and sharply acute margins; tubercles united into more or less distinct cross-ridges; biennials, with taproots.

Nutlets wing-margined, with the strong, rather regular cross-ridges uniting on the back.

11. *O. virginensis*.

Nutlets merely acute-angled, weakly irregularly cross-ridged.

12. *O. thyrsoflora*.

Plant low, caespitose perennials, 1–2 dm. high; nutlets with rounded backs; murications united into star-shaped tubercles.

13. *O. aperta*.

Inflorescence, at least in flowers, narrow, almost spike-like, if more open, the branches simple.

Plants green, very hispid, only the basal leaves canescent; bristles with conspicuous pustulate bases, much longer than the short strigose or tomentose pubescence.

Leaves linear or narrowly linear-lanceolate; plant 1–2 dm. high, very slender.

14. *O. Macounii*.

Leaves, at least the basal ones, broadly oblanceolate or spatulate.

Corolla 7–10 mm. broad; nutlets ovate, more than half as broad as long.

Leaves obtuse; inflorescence dense.

Basal leaves broadly spatulate, usually canescent; stem 1–3 dm. high.

15. *O. glomerata*.

Basal leaves oblanceolate, greener; stem usually 3–4 dm. high.

16. *O. affinis*.

Leaves acute, strongly hirsute-ciliate; inflorescence not very dense.

17. *O. spiculifera*.

Corolla 5–7 mm. broad; nutlets lanceolate, less than half as broad as long; basal leaves oblanceolate, somewhat canescent; plant 1–3 dm. high.

18. *O. perennis*.

Plant canescent; at least the basal leaves with inconspicuous bristles scarcely longer than the other pubescence.

Plant stout, 2–4 dm. high, rather simple; corolla 7–10 mm. broad.

19. *O. argentea*.

Plant low, less than 2 dm. high, densely caespitose.

Basal leaves narrowly linear-oblanceolate, glossy, closely appressed-canescant; nutlets mammillate-papillose.

20. *O. cana*.

Basal leaves spatulate, white or yellow, scarcely glossy, at least when mature.

Nutlets 1 or 2, acuminate with a blunt apex; calyx-lobes linear-subulate.

21. *O. nana*.

Nutlets 4, merely acute; calyx-lobes lanceolate.

Nutlets more or less rugulose; tubercles more or less confluent.

Inflorescence in fruit rather open; corolla-tube slightly exserted.

22. *O. echinoides*.

Inflorescence congested; corolla-tube not exserted.

Corolla 7–9 mm. broad.

23. *O. sericea*.

Corolla 4–6 mm. broad.

Leaves tomentose and hispid; nutlets tuberculose-rugulose.

24. *O. depressa*.

Leaves strigillose and hispid; nutlets sinuately and finely rugulose.

25. *O. caespitosa*.

Nutlets muricate.

Inflorescence narrow; plant not more than 1 dm. high.

Leaves strigillose and hispid.

26. *O. Shantzii*.

Leaves subtomentose and hispid.

27. *O. dolosa*.

Inflorescence open; plant 1–2 dm. high.

28. *O. commixta*.

29. *O. salmonensis*.

Nutlets smooth.

Corolla-tube long-exserted; caespitose perennial, rarely biennial.

Corolla white.

Nutlets rough.

Nutlets more or less distinctly rugose, with irregular cross-ridges, as well as muricate.

Fruit depressed-globose; nutlets incurved on the margins and separated by open spaces. 30. *O. paradoxa*.

Fruit ovoid-conic; nutlets touching.

Ridges of the nutlets honeycomb-crested; inflorescence narrow; leaves canescent and hispid. 31. *O. culophus*.

Ridges of the nutlets neither much interlacing nor crested.

Inflorescence, at least in fruit, open, with elongate branches.

Corolla 15–18 mm. long; calyx enlarging and becoming 15–18 mm. long in fruit. 32. *O. longiflora*.

Corolla 12–15 mm. long; calyx scarcely enlarging in fruit less than 1 cm. long. 33. *O. Wetherillii*.

Inflorescence narrow; stem slender.

Basal leaves spatulate.

Corolla 12–14 mm. long, much exceeding the calyx.

Corolla slightly exceeding the calyx. 34. *O. cristata*.

Basal leaves linear-ob lanceolate; corolla slightly exceeding the

calyx. 35. *O. tenuis*.

Nutlets finely muricate; at least the inflorescence with yellowish hairs.

Plant low, 1–2 dm. high; basal leaves 2–3 cm. long, 3–7 mm. wide.

Corolla about 1 cm. long, pure white; nutlets muricate on the back.

Corolla 12–15 mm. long, often with a yellow eye; nutlets roughly papil-

lose. 36. *O. fulvocanescens*.

Plant 2–3 dm. high; basal leaves 4–10 cm. long, 7–15 mm. wide.

Corolla 12–15 mm. long, often with a yellow eye; nutlets roughly papil-

lose. 37. *O. nitida*.

Nutlets smooth.

Fruit not depressed; stem-leaves linear or linear-lanceolate.

Stem-leaves linear; nutlets brownish, obtuse, slightly ridged on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

Stem-leaves linear-lanceolate; nutlets ivory-white, acute, flat on the back.

1. *O. cinerea* Greene. Stems 1–3 dm. high, cinereous-strigose; leaves elongate, linear-ob lanceolate or linear, silvery-cinereous, with appressed hairs; calyx-lobes broadly lanceolate; corolla 8–9 mm. long, 5–7 mm. broad; nutlets light gray, smooth. Arid plains: Colo.—N.M. *Submont.* My–Jl.

2. *O. suffruticosa* (Torr.) Greene. Stems 1–3 dm. high, decumbent or ascending at the base, cinereous and hirsute; leaves linear-ob lanceolate or linear, 3–10 cm. long; calyx-lobes ovate-lanceolate; corolla 5–6 mm. long; nutlets more or less tubercled and white-spotted. *E. Jamesii* Torr. *Krynitzkia Jamesii* A. Gray. Plains and foot-hills: S.D.—Tex.—N.M.—Utah—Wyo. *Plain—Submont.* My–Jl.

3. *O. multicaulis* (Torr.) Greene. Stems stout, 2–4 dm. high; leaves linear-ob lanceolate or lanceolate, 3–10 cm. long; corolla 5–6 mm. long; nutlets smooth and shining. *Eritrichum multicaulis* Torr. Dry plains: Tex.—s Colo.—Ariz. *Son.—Submont.* My–Au.

4. *O. disticha* Eastw. Stems about 3 dm. high, canescent as well as hispid; leaves ob lanceolate, 2–4 cm. long, finely canescent-strigose above, appressed-hirsute beneath; racemes few, distichous; calyx-lobes ovate-lanceolate, obtuse, 4 mm. long; corolla white, 5 mm. long, and about as wide; nutlets solitary, rounded and arched on the dorsal side, mottled with brown, and slightly papillose. Mesas: Utah. *Son.* Jl.

5. *O. pustulosa* Rydb. Stems 3–5 dm. high, glabrous or nearly so throughout; lower leaves linear-ob lanceolate, the upper linear or linear-lanceolate, 3–10 cm. long, green; flowers paniculate; sepals triangular-lanceolate, acute; corolla white; tube not exceeding the calyx; limb 5–6 mm. broad; lobes orbicular; fruit depressed-globose; nutlets mottled with light brown. Cañons: se Utah. *Son.* Jl–Au.

6. *O. virgata* (Porter) Greene. Stem 3–6 dm. high, hispid with yellowish hairs; basal leaves ob lanceolate, hirsute and hispid, 3–8 cm. long; stem-leaves linear; corolla 6–7 mm. long and fully as broad; nutlets in age brown or gray;

margins sharp, almost winged. *K. virgata* A. Gray. Dry hills and mountains: Colo.—Wyo. *Submont.*—Mont. My—Jl.

7. *O. spicata* Rydb. Stem solitary and simple, virgate, hispid throughout; basal leaves numerous, spatulate, 2–5 cm. long, hispid on both sides; stem-leaves linear-ob lanceolate or linear, 4–9 cm. long; corolla 6 mm. long, 4 mm. broad; nutlets 4 mm. long, ovate in outline, scarcely keeled on the back, white and shining, the margins merely acute. Hills: Colo. *Submont.* Jl—Au.

8. *O. setosissima* (A. Gray) Greene. Biennial or perennial, with a taproot; stem 6–8 dm. high, very hispid; basal leaves oblanceolate or linear-ob lanceolate, 1–2 dm. long, hirsute; corolla about 5 mm. long, 4 mm. wide; nutlets nearly 6 mm. long, broadly ovate, dull, scabrous-muricate on the back, distinctly winged. Dry hills: Utah—Ariz. *Son.* Je—Au.

9. *O. elata* Eastw. Stems 3–4 dm. high, virgate, white-strigose and somewhat hirsute; basal leaves clustered, spatulate, 2–3 cm. long, densely white-strigose; upper stem-leaves linear, more hirsute; inflorescence with very short branches; corolla white, 6–7 mm. long; nutlets ovate, acutely margined. Dry clay-hills: w Colo. *Submont.* My—Je.

10. *O. Bakeri* Greene. Stem 1–2 dm. high, hirsute; leaves oblanceolate, strigose-hispid; inflorescence with few short branches; calyx hispid; corolla white, 4–5 mm. long; nutlets ovate. Sage plains: s Colo. Je—Jl.

11. *O. virginensis* (M. E. Jones) F. Macbr. Stem 2–3 dm. high, hirsute; basal leaves oblanceolate, 6–10 cm. long, canescent and hispid; inflorescence rather open-paniculate, 1–2 dm. long, yellowish hispid; corolla white, 4 mm. long; nutlets broadly ovate, narrowly winged and strongly ridged. *K. glomerata virginensis* M. E. Jones. Hillsides: s Utah. *Son.* My—Je.

12. *O. thyrsiflora* Greene. Stem branched above, very hispid, 2–4 dm. high; basal leaves numerous, spatulate or oblanceolate, very hispid, 4–10 cm. long; inflorescence 1–2 dm. long, 5–8 cm. wide, often yellowish hispid; corolla about 5 mm. long, 3 mm. wide; nutlets 3 mm. long. *O. hispidissima* (Torr.) Rydb. Hillsides and river valleys: Neb.—N.M.—Utah. *Plain*—Mont. Je—Au.

13. *O. aperta* Eastw. Stem 1–2 dm. high, branching, hirsute; basal leaves spatulate or oblanceolate, 2–4 cm. long, strigose as well as hirsute; stem-leaves oblanceolate; inflorescence a closely branched thyrsus; corolla white, 6 mm. long; nutlets 2.5 mm. long. Dry hills: Colo.—Mont. *Submont.* Je—S.

14. *O. Macounii* Eastw. Biennial or perennial, with a slender taproot; stem sparingly hirsute; leaves sparingly hirsute; corolla white, 5 mm. long, 4 mm. wide; nutlets ovate, obtuse, 2 mm. long, acutely margined, rounded on the back and coarsely muricate. Plains: Sask. *Plain.* Jl.

15. *O. glomerata* (Pursh.) Greene. Perennial or biennial; stem erect, 1–3 dm. high; basal leaf-blades 2–6 cm.; stem-leaves oblanceolate; corolla white, 7–8 mm. long, 7–10 mm. wide; nutlets ovate, 3 mm. long, acute-margined, obtuse, transversely rugose and muricate on the back. *K. glomerata* A. Gray. Dry hills: Sask.—Neb.—(? Colo.)—Utah.—B.C. *Plain*—*Submont.* My—Jl.

16. *O. affinis* Greene. Biennial; stems 2–4 dm. high, hispid; leaves oblanceolate, somewhat grayish strigose and hirsute, 3–10 cm. long; stem-leaves linear or linear-ob lanceolate, greener and more hirsute; corolla 7–9 mm. long, 7–10 mm. wide; nutlets ovate, rounded on the back, coarsely tuberculate on the back (rarely somewhat rugose), finely so towards the margin. *Krynitzkia pustulata* Blankinship. Dry hills: S.D.—Colo.—Ida.—Mont. *Plain*—*Submont.* Je—Jl.

17. *O. spiculifera* Piper. Perennial, with a tufted caudex; stem erect, 2–3 dm. high, finely strigose and hispid; basal leaves spatulate-ob lanceolate, densely strigose and sparingly hispid; blades 1.5–2 cm. long; inflorescence of 8–12 false racemes; corolla white; tube 5 mm. long; limb 8 mm. broad; nutlets ovate, obtuse, 3 mm. long, the back bluntly tuberculate. *O. ciliotricha* Nels. & Macbr. Hills: Wash.—Ida. *Submont.* Je.

18. *O. perennis* (A. Nels.) Rydb. Perennial, with a taproot; stem hispid; basal leaves grayish strigose and hirsute; corolla 5–7 mm. long; nutlets about 3

mm. long, rounded and muricate on the back, not at all cross-ridged. *O. affinis perennis* A. Nels. Dry hills: N.D.—Colo.—Ida. *Submont.* Je—Jl.

19. *O. argentea* Rydb. Cespitose perennial; stems 3–4 dm. high, hispid; basal leaves spatulate or oblanceolate, obtuse, 5–6 cm. long, densely white or yellowish pubescent; stem-leaves oblanceolate, with the bristles more spreading; corolla white, less than 5 mm. long; nutlets about 3.5 mm. long, papillose and with more or less distinct cross-ridges. Hills: Colo.—Utah. *Son.* Je.

20. *O. cana* A. Nels. Stem 1 dm. high or less, silvery-strigose; leaves 1–3 cm. long; corolla about 4 mm. long and 3 mm. wide; nutlets broadly ovate, 2 mm. long. *Krynitzkia sericea* Nutt.; A. Gray, in part. Dry hills: w Neb. *Submont.* Je—Au.

21. *O. nana* Eastw. Densely cespitose perennial; stems 5–10 cm. high, hispid; basal leaves crowded on the caudex, densely white-strigose, oblanceolate, 1–2 cm. long; corolla white, 6–7 mm. long; nutlets 1 or 2, ovate, muriculate and somewhat rugose. Mesas: Colo. *Son.* My.

22. *O. echinoides* (M. E. Jones) F. Macbr. Cespitose perennial; stems about 1.5 dm. high, fulvous-hispid; basal leaves spatulate, 4–5 cm. long, densely canescent and strigose; stem-leaves narrowly oblanceolate; corolla nearly 1 cm. long, 5–6 mm. wide; nutlets sharply angled, muricate-papillose and short-setose on the sides. *Eritrichum glomeratum humile* A. Gray. *Krynitzkia echinoides* M. E. Jones. *O. humile* Greene. *O. hispida* Nels. & Kenn. Dry hills: Utah—Calif. *Submont.* Ap—Je.

23. *O. sericea* (A. Gray) Greene. Cespitose perennial; stem 1–2.5 dm. high, hirsute above with yellow hairs; basal leaves spatulate, 3–5 cm. long, with long petioles, silky canescent; stem-leaves linear or linear-oblanceolate; corolla 7–8 mm. long; nutlets ovate, ridged on the back, rugose. *O. humilis* Greene. *K. sericea* A. Gray. Dry arid hills: Utah—w Wyo.—Mont. My—Jl.

24. *O. depressa* (M. E. Jones) F. Macbr. Densely cespitose perennial; basal leaves many, tomentose and strigose, spatulate, 2–5 cm. long; petioles long-hairy; spike barely surpassing the leaves; calyx about 4 mm. long, densely pubescent; lobes triangular; corolla 4 mm. long and as broad, white; nutlets deltoid-ovate, with sharp edges, closely tuberculate on the back. *K. depressa* M. E. Jones. Dry slopes: Nev.—Utah. *Submont.*—Mont. Je.

25. *O. caespitosa* A. Nels. Densely cespitose perennial; stems 5–10 cm. high, numerous, densely hirsute below; basal leaves crowded, very numerous, spatulate or oblanceolate, 1–3 cm. long, densely silky-canescens or sometimes yellowish; corolla white, 4–5 mm. long; nutlets narrowly ovate. Dry arid hills: Wyo. *Submont.* My—Je.

26. *O. Shantzii* Tidestr. Cespitose perennial; stems about 1 dm. high, strigose and white-hispid; leaves linear-spatulate, 2 cm. long, 4 mm. broad, densely strigose; calyx densely hirsute; lobes 4 mm. long; corolla-tube slightly longer than the calyx; nutlets elongate-ovate, obtuse, white-punctate on the back. Dry saline soil: Utah. *Son.* Je—Au.

27. *O. dolosa* F. Macbr. Cespitose perennial; stem 7–10 cm. high, strigose and softly hirsute; basal leaves about 3 cm. long and 4 mm. wide, canescent and strigose-hispid; inflorescence spike-like, 3–5 cm. long; calyx hispid; lobes in fruit 6 mm. long; corolla 5 mm. long, not exserted; nutlets ovate, 3 mm. long, densely muricate. Bench lands: Utah. *Son.* My—Je.

28. *O. commixta* F. Macbr. Stem 1.5–2 dm. high, strigillose and softly hirsute; basal leaves spatulate, 4–5 cm. long, 5–8 mm. wide, appressed strigillose and hispid; stem-leaves few, oblanceolate; inflorescence 1–1.5 dm. long, yellowish hispid; corolla 5 mm. long; tube not exserted; nutlets ovate, about 3 mm. long; tube not exserted; nutlets ovate, about 3 mm. long, densely muricate. Sandy slides and stony benches: Utah—Nev. Je—Jl.

29. *O. salmonensis* Nels. & Macbr. Stem 1.5–2 dm. high, white-hispid and finely strigose; stem-leaves 3–8 cm. long, oblanceolate or spatulate, hispid-ciliate, canescent and pustulate-hispid; inflorescence thyrsoid-glomerate, dense;

calyx-lobes linear-lanceolate, 5-7 mm. long in fruit; corolla white; tube shorter than the calyx; nutlet 3 mm. long, ovate, acutely margined, gray, with a lighter indistinct keel. Loose soil: Ida. *Plain.* Je.

30. *O. paradoxa* A. Nels. Stems 8-15 dm. high, decumbent at the base, hirsute; leaves spatulate-ob lanceolate, 1.5-3 cm. long, hispid-strigose; inflorescence subcapitate at first; calyx-lobes linear-lanceolate, 4-5 mm. long; corolla-tube nearly three times as long as the calyx; nutlets ovoid, transversely rugose and muricate. *O. gypsophila* Payson. Gypsum hills: w Colo. *Submont.* Je.

31. *O. eulophus* Rydb. Stem about 2 dm. high, hispid with yellowish hairs; basal leaves numerous, spatulate, 4-5 cm. long, finely cinereous and appressed-hispid; stem-leaves oblanceolate, often yellowish; corolla white, 10-12 mm. long; limb about 5 mm. wide; nutlets 4-5 mm. long. Gravelly hills: Colo.—Utah. *Submont.* Je-Jl.

32. *O. longiflora* A. Nels. Stem 1-2 dm. high, hispid; basal leaves crowded, spatulate, 3-7 cm. long, cinereous-strigose and more or less hispid; stem-leaves few, linear; inflorescence thyrsoid, yellowish hispid; corolla 7-8 mm. wide; nutlets ovate, 3-4 mm. long, acutely margined, obscurely transversely rugose on the back and papillose towards the margins. Table-lands and plains: Colo.—Utah. *Son.—Submont.* My-Je.

33. *O. Wetherillii* Eastw. Biennial, with a taproot; stems 1-3 dm. high, hirsute; leaves mostly basal, spatulate, 1-3 cm. long; inflorescence of numerous unilateral or distichous spikes; corolla 8-9 mm. wide; nutlets ovate-oblong, 3-5 mm. long, acute-margined, densely and irregularly rugose on the back. Cañons: Utah. *Son.* My.

34. *O. cristata* Eastw. Stems slender, about 2 dm. high, pubescent and hispid; leaves oblanceolate, 1.5-5 cm. long, cinereous-strigose and hispid; inflorescence grayish or tawny hispid; calyx-lobes lanceolate, 6 mm. long; corolla-limb 7 mm. broad; nutlets ovate, acute-margined, transversely rugose and papillose. Arid hills: w Colo.—N.M. *Submont.* My.

35. *O. tenuis* Eastw. Stem branched at the base, 1-2 dm. high, brown, strigose and hispid; leaves oblanceolate or linear-spatulate, 1-3 cm. long, acute, strigose on both sides, and hispid beneath and on the margins; calyx-lobes in fruit 6 mm. long, linear, white-hispid; corolla white, about 1 cm. long; limb 8 mm. wide; nutlets ovate, 3 mm. long, acute-margined, keeled and corrugate-l-rugose on the back. Cañons: Utah. *Son.* My.

36. *O. fulvocanescens* (A. Gray) Greene. Stems 5-15 cm. high, densely silvery-strigose; basal leaves linear-spatulate or oblanceolate, 2-3 cm. long, thick, densely silvery-canescens, sometimes yellowish; stem-leaves yellow and more or less hispid; inflorescence narrow, yellow-hispid; corolla white, about 1 cm. long; limb 6-7 mm. wide; nutlets broadly ovate. *K. fulvocanescens* A. Gray. Hills: Wyo.—N.M. *Submont.* My-Au.

37. *O. nitida* Greene. Stem cinereous-strigose; basal leaves numerous, broadly oblanceolate, silvery silky-strigose; inflorescence an open thyrsus, yellowish hispid; corolla white, about 15 mm. long; limb 6 mm. wide; nutlets mostly solitary, finely muriculate. Dry hills and stony ground: Colo.—Utah. *Son.—Submont.* My-Je.

38. *O. flavoculata* A. Nels. Stems 1-2 dm. high, strigose and hispid-ciliate; basal leaves numerous, spatulate or oblanceolate, canescent-strigose and somewhat hirsute; inflorescence narrow, yellowish hispid; corolla 12-15 mm. long; limb 7-8 mm. wide; nutlets ovate. Dry hills: Wyo.—w Colo.—Utah. *Submont.* My-Je.

39. *O. flava* A. Nels. Stems 1-3 dm. high, white-strigose below, yellowish hirsute above; leaves numerous, linear or linear-ob lanceolate, silky-strigose, 1-5 cm. long; inflorescence narrow, yellow-hispid; corolla yellow, about 15 mm. long; limb 7-8 mm. wide; nutlets broadly ovate, obtuse. *O. lutescens* Greene. Hills: Wyo.—N.M.—Ariz. *Submont.* My-Jl.

40. *O. leucophaea* (Dougl.) Greene. Stems 2-5 dm. high, silky-strigose; leaves silky-strigose and silvery, linear or linear-lanceolate, 5-10 cm. long;

corolla cream-colored, about 12 mm. long. *K. leucophaea* A. Gray. Dry plains: B.C.—Calif.—Ida. *Son.* My-Jl.

41. *O. alata* (Jones) A. Nels. Stems 3-4 dm. high; basal leaves oblanceolate, 5-10 cm. long, silky-strigose, canescent; upper leaves linear-lanceolate; inflorescence narrow; corolla white, 15-18 mm. long; limb 7-8 mm. wide; nutlets sharply ovate-trigonus. *K. leucophaea alata* M. E. Jones. Mountain sides and dry hills: s Utah. *Submont.* Je.

11. *ALLOCARYA* Greene.

Diffusely branched annuals. Lower leaves opposite, the upper alternate, narrow, more or less hirsute. Flowers in scorpioid racemes, some leafy-bracted, others not, perfect, regular. Calyx wholly persistent, 5-parted; lobes connivent and enclosing the fruit. Corolla salver-shaped, white; tube usually short; throat furnished with more or less conspicuous scales (fornices); limb 5-cleft. Nutlets ovoid or oblong, or somewhat trigonous, obliquely attached by an oblong or rounded scar to the low-conical receptacle. Seeds anphitropous, ascending.

Racemes loose and leafy-bracted; corolla small, less than 2 mm. wide; nutlets more or less rugose.

Plant glabrous or nearly so.

Plant decidedly hairy.

Plant hirsute.

Plant strigose.

Calyx erect in fruit.

Bracts oblong, scarcely more than twice as long as the flowers; nutlets uncinately-bristly on the back.

Bracts (often lacking under some of the flowers) linear and resembling the leaves; nutlets merely rugose on the back.

Calyx spreading in fruit; nutlets irregularly wrinkled on the back.

Racemes bractless; flowers 7-8 mm. broad; nutlets not rugose.

1. *A. orthocarpa*.

2. *A. hispidula*.

3. *A. Nelsonii*.

4. *A. scopulorum*.

5. *A. cognata*.

6. *A. Hendersoni*.

1. *A. orthocarpa* Greene. Stem somewhat succulent, 7-20 cm. high; leaves elongate-linear, 2-5 cm. long; spike long, strict; sepals erect, linear, twice as long as the fruit; nutlets lanceolate in outline, transversely rugose and minutely tuberculate. Wet places: Utah—Wyo. *Son.*—*Submont.* My-Je.

2. *A. hispidula* Greene. Stem diffusely branched, 1-2 dm. high, hispid with ascending hairs; leaves linear or narrowly linear-ob lanceolate, hispid; bracts small, scarcely exceeding the densely hispid calyces; nutlets 1.2 mm. long, muriculate and rugose, with few transverse ridges. Valleys: Wash.—Ida.—Nev.—s Calif. *Son.* Je-Jl.

3. *A. Nelsonii* Greene. Stem diffuse, branched, strigose, 1-2 dm. high; leaves linear or linear-ob lanceolate, obtuse, strigose, 1-3 cm. long; nutlets 1.5 mm. long, transversely rugose, somewhat muriculate. Saline flats and river banks: S.D.—Wyo.—Ida. Jl—Au.

4. *A. scopulorum* Greene. Stem ascending or spreading, branched, strigose, 5-20 cm. high; leaves linear, strigose, 3-5 cm. long; nutlets ovate-lanceolate in outline, muricate and transversely rugose. Sandy soil: Sask.—Neb.—Colo.—Utah—Nev.—Wash. *Son.*—*Mont.* Je—Au.

5. *A. cognata* Greene. Annual; stem slender, reclining, strigose-pubescent, especially above; leaves linear; raceme loose; fruiting calyces spreading; nutlets minute, broadly ovate, acuminate. Wet places: Utah. *Son.* Je.

6. *A. Hendersoni* A. Nels. Stem simple at the base, but soon branched, erect, 2-4 dm. high, sparsely hirsute; leaves broadly linear, 4-6 cm. long, 3-6 mm. wide, hirsute; racemes elongate, the terminal ones geminate; nutlets ovate, 2-3 mm. long, finely muricate, with a few larger papillae intermixed. Sandy soil: Ida.—Wash. *Son.* Ap-Je.

12. *CRYPTANTHA* Lehm.

Annual caulescent, branched herbs. Leaves alternate, narrow, entire. Flowers perfect, regular, in scorpioid spikes or racemes. Calyx usually deciduous with the fruit, 5-cleft; the lobes in fruit connivent around the nutlets. Cor-

olla salver-shaped or funnelform, white; tube short; throat closed by 5 scales (fornices); lobes 5, imbricate. Stamens 5, included; filaments short. Nutlets ovoid, attached for at least the lower half by a narrow, simple or bifurcate groove to the pyramidal receptacle. Seeds more or less amphitropous, pendulous. [*Krynitzkia* Fisch. & Mey.]

Nutlets not winged.

Nutlets all or some of them tuberculate or muricate.

Nutlets usually solitary.

Nutlets usually 4.

Nutlets dissimilar, 3 of them tubercled or muricate, the fourth smooth or nearly so.

Nutlets all alike and tubercled.

Nutlets all smooth.

Groove of the nutlets simple, continuous to the base.

Groove two-forked at the base.

No open areola between the forks of the groove; nutlets acute.

A distinct open areola between the forks of the groove; nutlets lanceolate.

acuminate.

Nutlets winged.

I. RECURVATAE.

Calyx-lobes recurved.

Calyx-lobes not recurved.

II. HETEROCARYAE.

Sepals in fruit strongly thickened on the back.

Sepals in fruit not strongly thickened on the back.

Plant 1-2 dm. high; calyx in fruit 6-8 mm. long.

Plant a few cm. high; calyx in fruit less than 5 mm. long.

III. MURICULATAE.

Pubescence of the stem at least in part consisting of spreading hairs.

Leaves broadly linear or oblanceolate; calyx in fruit over 5 mm. long.

Calyx densely pubescent with long white silky hairs and bristly on the midribs; nutlets tubercled even on the ventral side; groove open.

Calyx with appressed or ascending yellowish hairs, and with spreading bristles on the veins.

Nutlets smooth on the ventral side; groove closed.

Nutlets narrowly conical with an open narrow groove, finely spinulose-muricate.

Leaves narrowly linear; calyx in fruit about 4 mm. long.

Pubescence on the stem appressed; leaves very narrowly linear; calyx white-silky.

IV. LEOCARPAE.

Mature nutlets solitary, subterete; stem strigose; leaves narrowly linear, almost filiform.

Mature nutlets usually 4, angled on the ventral side; plants more or less hispid; leaves linear to oblanceolate.

Leaves narrowly linear or linear-lanceolate.

Fruiting calyx about 6 mm. long; nutlets attached only to the middle.

Fruiting calyx 3-4 mm. long; nutlets attached their whole length.

Leaves wider, oblanceolate or oblong.

V. TORREYANA.

Mature nutlet solitary.

Mature nutlets usually 4.

Nutlets broadly ovoid, attached by their lower half; fruiting calyx 4-7 mm. long.

Corolla-limb 5-6 mm. wide.

Corolla-limb less than 2 mm. wide.

Calyx 4-5 mm. long; lobes not much thickened on the back.

Calyx 6-7 mm. long; lobes much thickened on the back, usually spreading.

Nutlets lanceolate in outline, attached by their whole length.

VI. RAMULOSISSIMAE.

Leaves spatulate or oblanceolate, or the upper sometimes linear.

Leaves narrowly linear.

Branches ascending; flowers not conspicuously unilateral.

Branches divaricate, arcuate, and flowers conspicuously unilateral.

VII. PTEROCARYAE.

Fruiting calyx 4-5 mm. long; nutlets broadly ovate, with a broad erose or toothed wing.

Fruiting calyx, 2-3 mm. long; nutlets lance-ovate, with a narrow, entire wing.

I. RECURVATAE.

II. HETEROCARYAE.

III. MURICULATAE.

IV. LEOCARPAE.

V. TORREYANA.

1. *C. recurvata* Coville. Stem 5–15 cm. high, erect, branching, strigose, or in age hirsute; leaves linear-lanceolate or linear, 8–15 mm. long; racemes secund; sepals linear-filiform, 2 mm. long, in fruit 3–4 mm., recurved; corolla 2 mm. long; nutlet single, 1.5–1.8 mm. long, muricate, ovate-lanceolate, acuminate; groove 2-forked at the base. Bluffs and mountains: s Calif.—Nev.—w Colo.—s Utah. *Son.—Submont.* Ap–Je.

2. *C. crassisejala* (T. & G.) Greene. Stem diffusely branched, 1–2 dm. high, hispid; leaves oblanceolate or linear-spatulate, 1–3 cm. long; calyx-lobes linear, 5 mm. long, in fruit 8–10 mm. long; corolla 5 mm. long; limb 1 mm. wide; groove of the nutlets open, forming an open lance-ovate areola below. *Krynitzkia crassisejala* A. Gray. Loose soil, "prairie-dog towns," and waste places: Sask.—Tex.—Utah—Alta.; n Mex. *Plain—Submont.* My–Jl.

3. *C. Kelseyana* Greene. Stem branched, 1–2 dm. high, hispid; leaves linear-oblanceolate, obtuse, 3–5 cm. long, hispid; calyx-lobes subulate, 3–4 mm. long, in fruit 6–8 mm.; corolla 4 mm. long; limb scarcely 1 mm. wide; nutlets lanceolate; groove narrow, opening only at the base into a small areola. Dry sandy soil: Sask.—Colo.—Mont. *Plain—Submont.* Je–Jl.

4. *C. minima* Rydb. Dwarf, beginning to bloom when only 1 cm. high; stems several, erect; leaves spatulate or oblanceolate, obtuse, hirsute on both sides, 5–15 mm. long and 2–3 mm. wide; corolla 2.5–3 mm. long; limb a little over 1 mm. broad; nutlets whitish, about 1 mm. long; groove triangular-dilated at the base. River valleys: Colo. *Submont.* My–Je.

5. *C. barbiger*a (A. Gray) Greene. Stem hispid, branched, 1–3 dm. high; leaves broadly linear, hispid, 3–8 cm. long; calyx-lobes linear, in fruit 6–8 mm. long, bristly; corolla 5 mm. long, limb 1–3 mm. wide; nutlet 2 mm. long or more, ovate, acuminate, strongly muricate-papillose; groove narrow, widening into a small areola at the base. *Krynitzkia barbiger*a A. Gray. *K. mixta* M. E. Jones. Arid hills and mountains: s Utah—Ariz.—Calif. *Son.* Ap–My.

6. *C. multicaulis* A. Nels. Stem branched at the base, 1.5–3 dm. high, hirsute; leaves numerous, 2–3 cm. long, white-hispid; sepals about 5 mm. long; nutlets ovate, less than 2 mm. long, sparingly and minutely muricate; groove narrow, forked at the base, but without open areola. Dry and sandy places: Nev.—Colo.—Mont.—Wash. *Plain—Submont.* Je–Au.

7. *C. scoparia* A. Nels. Stem about 1.5 dm. high, fastigiately branched from the base, with erect branches, sparingly hispid; leaves linear, hispid, the hairs with pustulate bases; racemes numerous; calyx-lobes very narrow, thick, 4–5 mm. long in fruit; nutlets 4, about 2 mm. long, muricate, brown, with the murications silvery-gray; groove scarcely forked at the base. Sage-brush plains: Ida. *Plain.* Jl.

8. *C. ambigua* (A. Gray) Greene. Stem slender, branched, 2–4 dm. high, more or less hirsute; leaves 1–4 cm. long, hirsute; nutlets muricate; groove barely open at the two-forked base. *C. muriculata montana* A. Nels. (?) *C. depressa* A. Nels. *K. ambigua* A. Gray. River banks and dry places: B.C.—Mont.—Wyo.—Utah—Calif. *Son.—Submont.* Je–Jl.

9. *C. leptophylla* Rydb. Stem 1.5–3 dm. high; leaves narrowly linear, 1–3 cm. long, strigose; inflorescence cymose, short; calyx-lobes linear-filiform, 3–4 mm. long, white-silky, with long spreading hairs; corolla minute, shorter than the calyx; limb hardly 0.5 mm. wide; nutlets 3 mm. long, narrowly lanceolate, long-acuminate, strongly muricate; groove closed, 2-forked at the base. Arid regions: s Utah. *Son.*

10. *C. flaccida* (A. Gray) Greene. Stem with ascending branches, 1–5 dm. high; leaves 2–5 cm. long, grayish strigose; spikes many-flowered, in age slender; calyx-lobes about 3 mm. long, in fruit only slightly elongate, hispidulous; corolla 4 mm. long; limb about 2 mm. wide; nutlet ovate-lanceolate, long-acuminate, 3 mm. long. *K. oxycarpa* A. Gray. Banks, hills, and dry prairies: Wash.—Ida.—Calif. *Son.—Plain.* Ap–Je.

11. *C. affinis* (A. Gray) Greene. Stem 2–3 dm. high, strict, with erect branches, pilose; leaves 2–3 dm. long, grayish hirsute; flower-clusters at first

almost sub-capitate; calyx-lobes subulate, pilose-hirsute with yellowish hairs; corolla 4 mm. long, about 1 mm. wide; nutlets ovate, thin-walled, whitish. *K. affinis* A. Gray. Dry places: Wash.—Mont.—Wyo.—Utah—Calif. Son.—Submont. My—Jl.

12. *C. leiocarpa* (Fisch. & Mey.) Greene. Annual; stem branched, hispid with ascending hairs, 2–4 dm. high; leaves 2–5 cm. long, hirsute; flower-clusters short and dense; corolla 3 mm. long, about 1 mm. wide; nutlets ovate, glossy, brown, 2 mm. long. *K. leiocarpa* Fisch. & Mey. Hills and sandy places: B.C.—Sask.—Utah—Calif. Mr—Au.

13. *C. confusa* Rydb. Stem rather stout, hispid, branched; leaves 2–5 cm. long, 3–8 mm. wide, coarsely hirsute; calyx-lobes 2 mm. long, lance-subulate, hispid, in fruit 3–4 mm. long; corolla about 3 mm. long; limb scarcely 1 mm. wide; nutlets ovate, 2 mm. long, light-colored, thin-walled, attached by the lower half or two-thirds. River valleys and open woods: B.C.—Mont.—Wyo.—Utah. Plain—Submont. Je—Au.

14. *C. gracilis* Osterh. Stem slender, erect, branched, 1–1.5 dm. high, hirsute; leaves few, remote, linear-ob lanceolate, obtuse, 1–2 cm. long, hispid on both sides; spikes rather slender; calyx-lobes 2 mm. long, in fruit 3 mm., hispid with whitish or yellowish hairs; corolla white, 3 mm. long; limb less than 1 mm. wide; nutlet lance-ovate, acuminate, smooth, 2 mm. long. *C. Hilmanii* Nels. & Kenn. Dry places: Colo.—Utah—Ida. Submont. Je.

15. *C. grandiflora* Rydb. Stem branched, 2–4 dm. high, hirsute with white hairs; leaves broadly linear, lanceolate or oblong, 3–5 cm. long, 5–10 mm. wide, hirsute; calyx-lobes 3 mm. long, in fruit 5 mm.; corolla 4–5 mm. long; nutlets 2.5 mm. long, shining, smooth, rather thin-walled. River valleys: Wash.—Ida.—Ore. Son. Ap—Jl.

16. *C. Torreyana* (A. Gray) Greene. Stem with ascending branches, hirsute; leaves linear, 2–4 cm. long, 2–5 mm. wide, hirsute; calyx 3 mm. long, in fruit 4–5 mm. long, hispid; corolla 4 mm. long; limb 1–2 mm. wide; nutlets about 2 mm. long. *Krynitzkia Torreyana* A. Gray. Dry places: B.C.—Alta.—Colo.—Utah—Calif. Plain—Mont. Je—Au.

17. *C. calycosa* (Torr.) Rydb. Stem branched, 2–4 dm. high, hispid; leaves oblong or oblanceolate, 2–4 cm. long, 4–8 mm. wide, hispid; racemes short, but elongating in fruit; calyx-lobes about 3 mm. long, in fruit 6–7 mm., subulate, hispid; corolla 3–4 mm. long, about 1 mm. broad; nutlets 2.5 mm. long. *C. flexuosa* A. Nels. *K. Torreyana calycosa* A. Gray. Stony and sandy places: Mont.—Wyo.—Nev.—Wash. Submont. Jl—Au.

18. *C. Watsoni* (A. Gray) Greene. Stem hispidulous, 2–3 dm. high; leaves linear, 2–5 cm. long, hispid; calyx-lobes linear, hispid, 3 mm. long; corolla white, about 4 mm. long; limb 1.5 mm. wide. *K. Watsoni* A. Gray. Hills and mountain slopes: Utah—Wyo.—Colo. Submont. Je—Au.

19. *C. Pattersoni* (A. Gray) Greene. Stem branched at the base, 1–2 dm. high, hirsute; leaves 2–5 cm. long, 3–5 mm. wide, hispid; calyx-lobes 2.5 mm. long, in age 4 mm. long; corolla 4 mm. long, 1–1.5 mm. wide; nutlets lanceolate, more or less mottled, attached by its lower half. *K. Pattersoni* A. Gray. Hill-sides and dry places: S.D.—Colo.—Wyo.—Ida. Submont.—Mont. My—Jl.

20. *C. Fendleri* (A. Gray) Greene. Stem erect, hirsute with ascending hairs; calyx-lobes linear, 2–3 mm. long, very hispid; corolla 3 mm. long; limb scarcely 1 mm. wide; nutlets ovate, acuminate, mottled, attached by their whole length. *K. Fendleri* A. Gray. River valleys and sandy places: Sask.—Neb.—N.M.—Ariz.—Mont. Plain—Submont. Je—Au.

21. *C. ramulosissima* A. Nels. Stem densely and intricately branched, 2–3 dm. high, densely hispid; leaves small, 1–3 cm. long; sepals linear-subulate, 2–2.5 mm. long, in fruit 5–6 mm. long, densely hispid; corolla minute; nutlets lanceolate, acuminate, 2 mm. long. Sandy plains: Wyo. Plain. Jl—S.

22. *C. pterocarya* (Torr.) Greene. Stem slender, branched, hirsute, 2–3 dm. high; leaves linear or the lower linear-spatulate, hispid; corolla 4 mm.

long; limb about 1 mm. wide; nutlets ovate, granulate-tubercled on the back, affixed by nearly their whole length; groove narrow, forked at the base with an open areola. *K. pterocarya* A. Gray. Plains and dry places: Wash.—Ida.—w Colo.—N.M.—Calif. *Son.* My.—Jl.

23. *C. utahensis* (A. Gray) Greene. Stem branched, 2-3 dm. high, strigose or hirsute below; leaves linear, hispidulous; corolla 3 mm. long; limb 1.5-2 mm. wide; nutlets lance-ovate, minutely papillate on the back; groove gradually opening below into an open areola. *K. utahensis* A. Gray. *Eritrichium holopterum submolle* A. Gray. Dry places: s Utah—s Calif. *Son.* My.

13. **AMSINCKIA** Lehm. FIDDLE NECK, BUCKTHORN-WEED.

Rough-hispid biennials. Leaves alternate, linear or oblong to ovate, entire. Flowers perfect, regular, in scorpioid spikes, leafy-bracted. Calyx persistent, 5-lobed, or some of the lobes united to near the apex. Corolla salver-shaped, yellow; tube mostly rather elongate; throat in some flowers with and in others without fornicies, in the latter the stamens inserted high up, in the former low down in the tube; limb often plicate in the sinuses. Nutlets bony, more or less triangular, attached below the middle to the pyramidal receptacle.

Leaves all narrowly linear.

Stem-leaves at least lanceolate to ovate.

Corolla about 5 mm. long.

Corolla 8-10 mm. long.

Nutlets with tubercles in more or less distinct rows, but not with tessellate ridges.

Fruiting calyx about 12 mm. long.

Fruiting calyx about 8 mm. long.

Stem-leaves narrowly lanceolate; tubercles distinctly in rows.

Stem-leaves broadly lanceolate; tubercles scarcely arranged in rows.

Nutlets rugose, with tessellate ridges, interposed with smaller tubercles.

Stem-leaves narrowly lanceolate; inflorescence not leafy; sepals linear-lanceolate, free.

Stem-leaves broadly lanceolate or oblong; inflorescence leafy; sepals lanceolate, some often united.

1. *A. retrorsa*.

2. *A. micrantha*.

3. *A. idahoensis*.

4. *A. hispidissima*.

5. *A. Menziesii*.

6. *A. rugosa*.

7. *A. tessellata*.

1. *A. retrorsa* Suksd. Stem strict, 3-6 dm. high, hispid with spreading or retrorse hairs; leaves linear, 5-10 cm. long, densely hirsute; sepals linear, 5 mm. long, in fruit 8 mm. long, not covering the nutlets; corolla with indistinct orange spots, 7-8 mm. long; nutlets transversely rugose and with intermediate small tubercles. Dry ground and river valleys: Wash.—Ida. *Son.* Ap.—My.

2. *A. micrantha* Suksd. Stem 3-4 dm. high, sparingly and finely hispid; basal leaves oblanceolate or oblong, 3-6 dm. long, sparingly hispid; upper stem-leaves lanceolate; calyx-lobes linear, 4 mm. long, in fruit 4-8 mm. long; corolla light yellow, unspotted; nutlets only faintly rugose, but rather strongly tubercled. Waste places and among bushes: Wash.—Ida.—B.C. My.—Je.

3. *A. idahoensis* M. E. Jones. Stem about 6 dm. high, sparsely setose-hispid; basal leaves oblanceolate, very hispid; stem-leaves ovate-oblong, 3-5 cm. long; inflorescence broad and short; bracts leafy, 12-15 mm. long; nutlets obliquely ovoid, 3 mm. long, sharply tubercled, distinctly keeled on the back. Dry ground: Ida.—Mont. *Son.*

4. *A. hispidissima* Suksd. Stem very densely hispid, especially below, 3-7 dm. high; basal leaves oblanceolate, 5-8 cm. long, densely hispid; stem-leaves linear-lanceolate; sepals linear-subulate, densely hispid; corolla 8 mm. long, with orange spots in the throat. Dry and waste places: Ore.—Ida.—Utah. *Son.*—*Submont.* My.—Je.

5. *A. Menziesii* (Lehm.) Nels. & Macbr. Stem hispid, 4-7 dm. high; basal leaves oblanceolate; stem-leaves broadly lanceolate, hispid; calyx-lobes linear; corolla light yellow, spotless, 8 mm. long; nutlets not at all rugose, densely covered with small tubercles not arranged in rows. *A. intermedia* A. Gray, in part. Hills: Ida.—B.C. *Son.* My.—Jl.

6. *A. rugosa* Rydb. Stem 3-5 dm. high, densely hispid; basal leaves linear-oblanceolate, 5-8 cm. long, hispid; stem-leaves narrowly lanceolate; racemes

elongate, not leafy-bracted; sepals linear-lanceolate; corolla about 8 mm. long. *A. parviflora* Macbr., in part, not Bernh., nor Heller. Dry places: Ida.—Wash.—Nev. Son. Ap—My.

7. *A. tessellata* A. Gray. Stem branched, 3–8 dm. high, sparingly hispid; basal leaves oblanceolate, 8–15 cm. long, strongly but rather sparingly hirsute; stem-leaves lanceolate, often somewhat clasping; calyx-lobes broadly lanceolate, 5–6 mm. long, in fruit often 1 cm. long; corolla orange, about 1 cm. long. Dry and waste places: Wash.—Ida.—Utah—Calif. Son.—Submont. My—Jl.

14. **MERTENSIA** Roth. LUNGWORT, BLUEBELLS, LANGUID LADY.

Perennial caulescent herbs. Leaves alternate, entire. Flowers perfect, regular, in racemes or panicles. Calyx deeply 5-cleft, persistent, essentially unchanged in age. Corolla tubular-funnelform or trumpet-shaped, blue or purple, rarely white; throat rarely appendaged; lobes 5, imbricate. Stamens included or barely exserted; filaments often flattened. Nutlets obliquely attached by a small scar near the base to the convex receptacle, wrinkled at maturity. Style filiform; stigma entire.

Filaments equalling or exceeding, and usually broader than the anthers.

Calyx-lobes longer than the short tube, rarely slightly shorter.

Calyx-lobes linear or oblong, obtuse.

Stem 3–10 dm. high.

Stem 2–3 dm. high.

Calyx-lobes triangular-lanceolate to linear-lanceolate, acute.

Tube of the corolla at least twice as long as the throat and limb.

Tube of the corolla only slightly if at all longer than the throat and limb.

Plant tall, usually more than 4 dm. high; leaves distinctly veined, in most feather-veined, but in a few triple-veined with anastomosing veins. Stem, calyx-tube and lower surface of the leaves long-hairy.

Stem glabrous; calyx strigose or merely ciliate on the margins.

Plant low, usually less than 4 dm. high; leaves with a strong midrib, without distinct lateral veins (except sometimes the basal leaves, which then however are thick and firm).

Calyx-lobes rounded-ovate, much shorter than the ample, campanulate tube.

Anthers subsessile or on very short narrow filaments inserted in the tube or the throat of the corolla; low plants, 1–3 dm. high, of the habit of the LANCEOLATAE group.

I. CILIATAE.

Lower surface of the leaves decidedly pubescent.

Lower surface of the leaves glabrous, except the ciliate margins.

Calyx-lobes oblong, 1.5–2 mm. long.

Stem-leaves, at least the upper ones, narrowly lanceolate; plant very pale; pedicels usually strigillose.

Stem-leaves all ovate or broadly lanceolate; pedicels usually pustulate-muricate.

Calyx-lobes linear, 3 mm. long, ciliate.

II. LONGIFLORAE.

Plant with a tuberous-thickened root and mostly a single stem.

Leaves densely pubescent on both sides.

Leaves glabrous at least beneath.

Calyx-lobes linear-lanceolate, long-ciliate; pedicels strigose; leaves linear-oblong to oblong-lanceolate.

Calyx-lobes short-ciliate; pedicels glabrous or muricate; leaves broader.

Corolla-tube twice as long as the limb and throat; leaves setulose-scabrous above.

Corolla-tube almost three times as long as the limb and throat; leaves merely papillose above.

Plant not tuberous-rooted, more or less caespitose.

Floral leaves oblong.

Floral leaves ovate.

Pedicels scabrous-muricate; corolla-tube about three times as long as the limb and throat.

Pedicels glabrous or minutely pustulate; corolla-tube about twice as long as the limb and throat.

III. PANICULATAE.

Corolla about 1.5 cm. long; stem densely pubescent.

Corolla about 1 cm. long; stem sparingly pubescent.

Calyx-lobes lance-linear to lanceolate, acuminate.

Calyx-lobes oblong-lanceolate, acutish.

I. CILIATAE.

VIII. INCONGRUENTES.

II. LONGIFLORAE.

III. PANICULATAE.

IV. MEMBRANACEAE.

V. LANCEOLATAE.

VI. BRACHYLOBAE.

IV. MEMBRANACEAE.

Pedicels hairy.

Corolla 1 cm. or less long.

Fruiting pedicels strongly reflexed.

Fruiting pedicels ascending or nodding.

Corolla-tube over 4 mm. wide; calyx bristly-ciliate.

Corolla-tube 2-3 mm. wide.

Calyx strigose; stem-leaves ovate.

Calyx only ciliate on the margins; leaves oblong-lanceolate or only the uppermost ovate.

Hairs of the pedicels not with pustulate bases.

Plant stout; pedicels bristly-hispid with spreading hairs.

Plant slender; pedicels strigose.

Hairs of the pedicels very short, and with pustulate bases.

Corolla about 1.5 cm. long.

Pedicels muricate-scabrous or smooth.

Calyx-lobes not longer than the fruit; leaves broadly ovate.

Calyx much exceeding the fruit; leaves oblong or lanceolate, or ovate in no. 23.

Calyx-lobes shorter than the calyx-tube, bristly ciliate.

Calyx-lobes longer than the calyx-tube.

Corolla about 15 mm. long; pedicels smooth or sparingly callous-pustulate.

Corolla-tube not shorter than the limb and throat.

Upper leaves at least three times as long as wide.

Upper leaves not more than twice as long as wide.

Corolla-tube shorter than the limb and throat.

Corolla 10 mm. long; pedicels with small hispidulous hairs with pustulate bases.

V. LANCEOLATAE.

Pedicels decidedly strigose or hirsute.

Stem from a fusiform root; leaves glabrous beneath.

Stem from a more or less woody caudex or rootstock.

Leaves pubescent on both sides; calyx usually densely pubescent all over.

Leaves linear or only the uppermost lanceolate.

Blades of the lower leaves ovate or spatulate.

Plant more or less grayish and densely strigose throughout.

Plant green.

Pubescence short, on the stem sparse.

Calyx conspicuously pubescent.

Calyx glabrous except the ciliate margins.

Pubescence longer and looser.

Calyx less than half as long as the corolla-tube.

Calyx fully half as long as the corolla-tube.

Leaves glabrous beneath; calyx usually glabrous, except the ciliate margins and sometimes the midrib.

Calyx-lobes ovate-lanceolate; inflorescence open.

Calyx-lobes narrowly lanceolate; inflorescence dense.

Leaves narrowly linear.

Leaves oblong-lanceolate to ovate.

Stem-leaves ovate to lance-ovate, finely strigose above; corolla-limb and throat decidedly shorter than the tube.

Stem-leaves oblong-lanceolate; corolla-limb and throat nearly equalling the tube.

Leaf-blades scabrous-hispidulous or merely pustulate above; stem 2-4 dm. high.

Leaf-blades hispidulous-strigose above; stem rarely more than 2 dm. high.

Pedicels and calyx glabrous, except the ciliate lobes of the latter.

Calyx-lobes ovate-lanceolate; upper stem-leaves ovate.

Calyx-lobes narrowly lanceolate; stem-leaves linear or oblong.

Upper surface of the leaves short-pubescent.

Upper surface of the leaves not hairy.

VI. BRACHYLOBAE.

Calyx-lobes ciliate on the margins.

Calyx-lobes not ciliate on the margins.

VII. ALPINAE.

Calyx ciliate on the margins; inflorescence narrow.

Leaves short-strigose above, glabrous beneath.

Corolla 7-9 mm. long; plant depressed, decumbent or ascending, 1-2 dm. high.

Calyx-lobes obtuse.

Calyx-lobes acute.

Corolla more than 10 mm. long; stem about 3 dm. high.

Leaves merely pustulate-punctate above.

15. *M. refracta*.16. *M. cynoglossoides*.17. *M. membranacea*.18. *M. muriculata*.19. *M. pratensis*.20. *M. brachycalyx*.21. *M. arizonica*.22. *M. intermedia*.23. *M. praecox*.24. *M. Calyx villous all over.

Leaves oblong or oblanceolate, glabrous beneath; inflorescence open.

46. *M. brevistyla*.

Leaves linear, densely hairy on both sides; inflorescence narrow.

47. *M. cana*.

VIII. INCONGRUENTES.

One species.

48. *M. incongruens*.

1. *M. subpubescens* Rydb. Stem simple, stout, 6–10 dm. high, glabrous throughout; leaf-blades broadly lanceolate, 5–10 cm. long, tapering at both ends, thin, glabrous or nearly so above, short-pubescent beneath, and ciliate on the margins; pedicels slightly strigose; calyx-lobes ciliate on the margins, 2–2.5 mm. long; corolla about 12 mm. long, the tube only slightly longer than the limb and throat. Along streams: Mont. *Mont.* Je–Jl.

2. *M. pallida* Rydb. Stem glabrous, very pale, 5–8 dm. high, leafy; lower leaves oblanceolate, the upper narrow-lanceolate, 5–8 cm. long, glabrous or minutely muriculate; calyx-lobes about 1 mm. long, obtuse, ciliate on the margins; corolla about 1 cm. long. River banks: Mont. *Submont.*—*Mont.* Je–Jl.

3. *M. ciliata* (Torr.) Don. Stem 3–5 dm. high, pale and somewhat bluish below; lower leaves petioled; blades oval or elliptic-ovate, 5–9 cm. long, obtuse or acutish, sometimes finely pustulate; upper leaves lanceolate or ovate-lanceolate and subsessile; pedicels and calyx more or less pustulate; calyx-lobes in fruit nearly 2 mm. long; corolla blue, 12–15 μ m. long. *M. picta* Rydb. *M. polyphylla* Greene. *M. punctata* Greene. Along streams: Wyo.—Colo.—Utah—Nev. *Submont.*—*Mont.* Je–Au.

4. *M. platensis* Rydb. Stem 3–4 dm. high, simple, pale; basal leaf-blades ovate or subcordate; stem-leaves lanceolate, pale and somewhat glaucous beneath, 5–6 cm. long, glabrous on both sides or somewhat pustulate beneath, ciliate on the margins; pedicels pustulate-muricate, about 12 mm. long; tube shorter than the throat and limb. Along streams: Colo. *Mont.*—*Subalp.* Je.

5. *M. epicata* F. Macbr. Stem 2–3 dm. high, pubescent; leaves subvillous on both sides; basal leaves 1.5–2.5 dm. long; blades ovate; stem-leaves oblong or oblong-lanceolate; calyx villous; lobes lanceolate, 4–5 mm. long; corolla-tube 10 mm. long, not plicate; throat and limb 4–5 mm. long. Open moist slopes: Ida. *Submont.* My.

6. *M. oblongifolia* (Nutt.) Don. Stems 1–2 dm. high, glabrous; basal leaves oblanceolate or spatulate; stem-leaves linear or linear-oblong, 2–5 cm. long, glabrous or nearly so below, strigillose above; calyx-lobes 4 mm. long; corolla-tube 10–14 mm. long; limb* 4.5–5 mm. long. Hills: Wash.—Nev.—Mont.—B.C. *Submont.* Je–Jl.

7. *M. longiflora* Greene. Stem 1–2 dm. high, glabrous; lowest leaves petioled; blades elliptic-spatulate or obovate; cauline leaves sessile, obovate or oval, 3–6 cm. long; calyx-lobes lanceolate, 4–5 mm. long; tube of corolla 12–15 mm. long; limb 7–8 mm. Mountains: Mont.—Ida.—Wash.—B.C. *Submont.*—*Mont.* My–Jl.

8. *M. pulchella* Piper. Stems erect, 1–2 cm. high; lower leaves obovate, petioled, 2–6 cm. long, the upper ovate and sessile; calyx-lobes broadly lanceolate, ciliolate-denticulate on the margins; corolla-tube about 15 mm. long; limb 6 mm. long. Slopes: Ida. *Submont.* Mr–Je.

9. *M. nutans* Howell. Stem 1–2 dm. high, glabrous; lower leaves oblanceolate or spatulate, the upper oblong or lanceolate, 3–6 cm. long, glabrous below, pustulate-papillose above; pedicels short, glabrous; calyx-lobes 4 mm. long, obscurely ciliate; corolla-tube about 1 cm. long; limb 5 mm. long. Hills: Wash.—Ore.—Nev.—Mont. *Submont.* Ap–My.

10. *M. tubiflora* Rydb. Stem 2–3 dm. high, glabrous; basal leaves oblanceolate, short-petioled; stem-leaves sessile, lanceolate to ovate, about 4 cm. long, glabrous beneath, pustulate above, ciliate on the margins; calyx slightly

* In this species as in many of the following the throat is included with the limb, even if not specially mentioned.

strigillose; lobes lanceolate; corolla 13–15 mm. long. Mountains: Wyo. *Mont.* Jl.

11. *M. foliosa* A. Nels. Stem erect, glabrous, 2–4 dm. high; leaves thick, glabrous or slightly pustulate above, the lower ones oblong or spatulate, 4–7 cm. long, petioled; stem-leaves lanceolate or the upper ones ovate; calyx-lobes lanceolate, ciliate; corolla 15–18 mm. long. Hills and cañons: Wyo.—Utah. *Submont.* My-Je.

12. *M. pilosa* (Cham.) DC. Stem simple, 3–4 dm. high, villous; leaves lanceolate, 5–8 cm. long, acuminate at each end, villous-hirsute beneath, strigose above; pedicels and calyx canescent-strigose; lobes linear-lanceolate, 5 mm. long, strigose; corolla-tube equalling the limb. *Pulmonaria pilosa* Cham. *Lithospermum corymbosum* Hook. Wet places: Hudson Bay—Canadian Rockies—Alaska. *Boreal.*

13. *M. paniculata* (Ait.) Don. Stem more or less hirsute, 3–6 dm. high; leaves lanceolate, acuminate at each end, 5–10 cm. long, hirsute on both sides; pedicels and calyx strigose; lobes of the latter 4 mm. long; corolla-tube 4–5 mm. long, about equalling the throat and limb. *Pulmonaria paniculata* Ait. Along streams and shady banks: Hudson Bay—w Ont.—Ia.—Ida.—Wash.—Alaska. *Boreal—Mont.* My-Jl.

14. *M. toyabensis* F. Macbr. Stem 4–5 dm. high, subvillous; basal leaves oblong-lanceolate, 10–15 cm. long; stem-leaves lanceolate or ovate-lanceolate, 10 cm. long; pedicels hirsute; calyx-lobes hirsute, 3–4 mm. long, in fruit 5–6 mm. long; corolla-tube 6 mm. long, equalling the throat and limb. Mountains: Nev.—Utah. *Mont.* Jl.

15. *M. refracta* A. Nels. Stems tufted, 2–4 dm. high; stem-leaves oblong to ovate, 3–5 cm. long, minutely strigose; pedicels minutely strigose, in fruit reflexed; calyx-lobes linear, softly hirsute, 2–3 mm. long; corolla 1 cm. long; tube equalling the throat and limb. Mountains: Colo. *Mont.* Jl.

16. *M. cynoglossoides* Greene. Stem 4–6 dm. high, glabrous; basal leaves long-petioled; blades elliptic, 1–1.5 dm. long; stem-leaves ovate, acutish, somewhat cordate-clasping, 7–10 cm. long, thin, glabrous beneath, scabrous-hispidulous above and on the margins; pedicels sparingly hispidulous; calyx-lobes lanceolate, 4 mm.; corolla-tube about 6 mm. long, 4 mm. thick, about equalling the throat and limb. Cañons, along streams: Colo. *Submont.* Je.

17. *M. membranacea* Rydb. Stem glabrous or sparingly hirsute above, 6–8 dm. high; leaf-blades ovate, acute or more often short acuminate, 4–8 cm. long, very thin, hispid-strigillose on both sides; pedicels hispidulous; calyx-lobes 2–3 mm. long, hispidulous, lanceolate; corolla about 1 cm. long; tube longer than the dark blue limb and throat. Wet places: Mont.—Utah.—Wash. *Submont.* Je-Au.

18. *M. muriculata* Greene. Stem decumbent at the base, 3–5 dm. high; leaves thin, glabrous beneath, pustulate-scabrous above; basal leaf-blades elliptic-lanceolate, 7–10 cm. long; stem-leaves lanceolate or ovate, sessile or clasping; calyx-lobes lance-ovate, hispid-ciliate; corolla 5 mm. long, about equalling the throat and limb. Along streams: Colo. *Submont.* Je.

19. *M. pratensis* Heller. Stem pale, 6–8 dm. high; lower leaves petioled, upper sessile; basal leaf-blades oval-lanceolate or elliptic-lanceolate, glabrous beneath, hispidulous-strigose above and on the margins; pedicels and calyx strigose; lobes linear-lanceolate, acute; corolla-tube about 8 mm. long, and 4 mm. wide; limb of about the same length, 8–10 mm. wide. *M. alba* Rydb., an albino form. Wet meadows and along streams: Colo.—N.M.—Ariz. *Submont.—Subalp.*

20. *M. brachycalyx* Piper. Stem glabrous, erect, 5–10 dm. high, leafy; leaves bright green, lance-ovate, acuminate, smooth beneath, minutely pustulate above, 5–10 cm. long; pedicels smooth or nearly so; calyx-lobes triangular-ovate, acute, glabrous, minutely ciliate on the margins; corolla 10–12 mm. long, the tube about as long as the throat and limb. Creek banks: Wash.—Ida. *Submont.* Jl-Au.

21. *M. arizonica* Greene. Stem 3-5 dm. high; leaves thin, glabrous, smooth or minutely pustulate above, ciliate on the margins, the lower petioled, with oblanceolate blades, the upper sessile, lanceolate or ovate, 5-10 cm. long; calyx-lobes ovate, ciliate-margined, 3-4 mm. long; corolla 12-15 mm. long. Cañons: Utah—Ariz. *Submont.* Je-Jl.

22. *M. intermedia* Rydb. Stem 3-4 dm. high, glabrous, strict; lower leaves about 1 dm. long; blades oblanceolate, obtuse, minutely pustulate and scabrous-ciliate on the margins; upper leaves sessile, oblong or lanceolate; sepals lanceolate, hispid-ciliate, 3-4 mm., in fruit often 8 mm. long; corolla-tube 8-10 mm. long; limb 5-7 mm. long. (?) *M. umbratilis* Greenm. *M. stenoloba* Greene. Hills and banks: Mont.—Wyo.—Ida. *Submont.*—*Mont.* My-Jl.

23. *M. praecox* Smiley. Stem 4-5 dm. high, glabrous; cauline leaves ovate-elliptic to suborbicular, 6-9 cm. long, 3-4.5 cm. wide; calyx-lobes glabrous or slightly ciliate, 2-4 mm. long; corolla-tube slender, 2.5 mm. thick; throat and limb 5 mm. long. Cañons: Utah. My.

24. *M. Leonardi* Rydb. Stem erect, glabrous, 5-10 dm. high; leaves thin, glabrous and smooth beneath, more or less pustulate-muricate above, and ciliate on the margins, the lower short-petioled; blades oblanceolate, 4-7 cm. long; stem-leaves lanceolate or ovate, 5-15 cm. long; pedicels sparingly pustulate; calyx-lobes lanceolate, 4 mm. long, ciliate; corolla-tube 6-7 mm. long; limb 8-10 mm. long, 7-8 mm. wide. Cañons: Utah. *Submont.*—*Mont.* Jl.

25. *M. fusiformis* Greene. Stem 1-3 dm. high, glabrous; leaves thick, strigose above, glabrous beneath, the lower petioled, 5-8 cm. long, with spatulate blades; stem-leaves oblong or lanceolate; pedicels strigose; calyx villous-ciliate on the margins and often with a few scattered hairs on the back; corolla 8-10 mm. long; tube equalling the limb. *M. congesta* Greene. Hillsides: Colo. *Submont.*—*Mont.* My-Je.

26. *M. lateriflora* Greene. Stems 2-3 dm. high, canescent-strigose; leaves crowded, linear or lance-linear, 3-5 cm. long, canescent-strigose on both sides; inflorescence leafy; pedicels and calyx strigose; calyx-lobes lanceolate, more villous; corolla 6-8 mm. long; throat and limb only slightly shorter than the tube. *M. secundorum* Cockerell. Mountains and hillsides: Colo. *Submont.*—*Subalp.* My-Jl.

27. *M. Bakeri* Greene. Stems 1-3 dm. high, densely strigose-canescant; lower leaves spatulate or oblanceolate, the upper oblong or lanceolate, 3-5 cm. long, canescent; pedicels densely strigose; calyx pilose; lobes linear; tube of the corolla 6-7 mm. long; throat and limb 5-6 mm. long. Mountains: Colo. *Mont.*—*Alp.* Je-Jl.

28. *M. nivalis* (S. Wats.) Rydb. Stem 1-2 dm. high, sparingly strigose or almost glabrous; basal leaves petioled, 3-5 cm. long; blades spatulate or oblanceolate; stem-leaves lanceolate or ovate, 1-3 cm. long, sparingly strigose on both sides; pedicels short, strigose; calyx-lobes lanceolate, 2 mm. long, silky-strigose; corolla 10-12 mm. long, tube about equalling the limb. *M. paniculata nivalis* S. Wats. High mountains: Utah. *Subalp.* Au.

29. *M. media* Osterhout. Stem slender, 2-3 dm. high, glabrous or sparingly pubescent; leaves all linear, 3-6 cm. long, the upper shorter, appressed short-hirsute on both sides, the upper often with pustulate-based hairs; pedicels hirsute; calyx 3-3.5 mm. long; lobes narrowly linear; corolla about 1 cm. long, the tube equalling the throat and limb. Hills: Colo. *Submont.* My.

30. *M. myosotifolia* Heller. Stem 1-2 dm. high, densely pilose; leaves rather thick, densely pilose on both sides, the lower petioled, 5-8 cm. long, with ovate or lance-elliptic blades; stem-leaves sessile, lanceolate or ovate, 3-5 cm. long; pedicels and calyx pilose, the latter 3 mm. long, with lance-ovate lobes; corolla-tube 5-7 mm. long, throat and limb 4-6 mm. long. *M. micrantha* A. Nels. Mountains: Colo. *Mont.* Je.

31. *M. amoena* A. Nels. Stem 1-3 dm. high, pilose with short spreading hairs; leaves pilose, the lower 4-7 cm. long, petioled, with oblong-oblanceolate to

oval blades, the upper broadly linear or narrowly oblanceolate, 3-6 cm. long; pedicels pilose-strigose; calyx-lobes lanceolate, ciliate-hirsute on the margins and sometimes on the back; corolla 10-15 mm. long; tube scarcely longer than the limb. Hills and mountains: Mont.—Wyo.—Colo.—Ida. *Submont.*—*Mont. Je.*

32. *M. viridis* A. Nels. Stems slender, 2-4 dm. high, glabrous; leaves glabrous beneath, hispid-strigose above, the lower petioled, the upper sessile; blades of the basal ones spatulate, obtuse, those of the stem-leaves acute, elliptic, or lanceolate; pedicels strigose; calyx glabrous, except the base and the margins of the lobes; tube about 4 mm. long; limb of about the same length. *M. viridula* Rydb. Mountains: Colo.—Wyo. *Mont.*—*Alp.* My-Jl.

33. *M. lineariloba* Rydb. Stem glabrous, simple, 2-3 dm. high; basal leaves 5-15 cm. long, long-petioled; blades oblanceolate, obtuse; stem-leaves subsessile, linear or linear-lanceolate, acute, 3-6 cm. long, 4-9 mm. wide, strigose above; pedicels very slender, strigose; calyx-lobes linear, acute, 3-4 mm. long, almost equalling the tube of the corolla, glabrous on the back, but hispid-ciliate on the margins; corolla blue, 7-8 mm. long; tube nearly of the same length as the throat and limb. Hillsides: Colo. *Mont.* Je-Jl.

34. *M. ovata* Rydb. Stem 1-1.5 dm. high, glabrous; leaves 2-5 cm. long, minutely strigose above, glabrous beneath, the lower obovate and short-petioled, the upper broadly ovate and sessile; pedicels very short; calyx-lobes lanceolate, ciliate on the margin, about 4 mm. long; corolla 10-12 mm. long. High mountains among rocks: Colo.—e Utah. *Mont.* Jl.

35. *M. coronata* A. Nels. Stem glabrous, shining, adsurgent, 2-4 dm. high; leaves scabrous-hispidulous, or merely pustulate above, the basal ones petioled; blades oblong, obtuse, 5-10 cm. long; upper stem-leaves ovate-lanceolate; calyx-lobes lanceolate, ciliate-margined; corolla-tube 5 mm. long, a little longer than the limb. Rocky hills: Ida.—Wyo.—(Black Hills) S.D. *Submont.* Je.

36. *M. Parryi* Rydb. Stem about 2 dm. high, glabrous; leaves hispidulous-strigose above, only the basal ones petioled and spatulate; stem-leaves sessile, lanceolate or oblanceolate, about 5 cm. long; pedicels strigose; calyx glabrous except the very base and the ciliate margins of the lobes, these narrowly linear-lanceolate, about 3 mm. long; tube of the blue corolla about 5 mm. long and about equalling the length of the throat and limb. Alpine ridges: Colo. *Subalp.*—*Alp.* Jl.

37. *M. Drummondii* (Lehm.) Don. Stem 1-2 dm. high, decumbent at the base, glabrous; leaves hispidulous above, oblong or lance-oblong, or the upper ovate, 3-4 cm. long; pedicels very short, pustulate; calyx-lobes ovate-lanceolate, ciliate on the margins; corolla about 1 cm. long, the tube equalling the throat and limb. Arctic seacoast—Canadian Rockies. *Subarctic.*

38. *M. linearis* Greene. Stems 2-4 dm. high, leafy, glabrous; leaves narrowly linear, 2-7 cm. long, roughly strigillose above, glabrous beneath; pedicels glabrous or pustulate; calyx-lobes lanceolate, ciliate on the margins, otherwise glabrous; corolla about 1 cm. long; tube about equalling the throat and limb. Dry hillsides: Sask.—Neb.—Colo.—Alta. *Plain*—*Mont.* My-Jl.

39. *M. lanceolata* (Pursh) DC. Stem 2-4 dm. high, glabrous; leaves glabrous on both sides or merely pustulate above, the lower petioled, 3-10 cm. long; stem-leaves oblong or lanceolate; pedicels pustulate-muricate; calyx-lobes lanceolate, ciliate on the margins, otherwise glabrous; corolla about 1 cm. long; tube equalling the limb. *M. coriacea* A. Nels. *M. papillosa* Greene. Hills: Sask.—N.D.—Colo.—B.C. *Submont.*—*Subalp.* Ap-Au.

40. *M. brachyloba* Greene. Stem 3-4 dm. high, glabrous and glaucous; lower leaves oblanceolate, the upper lanceolate or oblong-ovate, 4-6 cm. long, glabrous or slightly papillose; calyx-lobes ciliate on the margins; corolla-tube 6-7 mm. long, slightly shorter than the limb and throat. Foot-hills: Colo. *Submont.* My-Je.

41. *M. campanulata* A. Nels. Stem pale, 3 dm. high or more, glabrous; basal leaves long-petioled; blades glabrous, 8-12 cm. long, oblong, tapering at both ends; stem-leaves oblanceolate; pedicels and calyx glabrous; calyx-lobes broadly triangular, one-fourth as long as the tube; corolla 18-20 mm. long; tube equalling the throat and limb. Meadows: Ida. Jl.

42. *M. alpina* (Torr.) Don. Stems ascending, glabrous, 1-2 dm. high; lower leaves spatulate or oblanceolate, obtuse, tapering into a winged petiole, dark green, 3-5 cm. long, the upper broadly lanceolate, sessile; pedicels very short, often sparingly strigillose; calyx-lobes oblong, obtuse, 2-3 mm. long; corolla dark blue, about 7 mm. long; tube nearly equalling the throat and limb. *M. obtusiloba* Rydb. High mountains: Colo.—N.M. *Subalp.*—Alp.

43. *M. Tweedyi* Rydb. Stems decumbent or rarely ascending, often less than 1 dm. high; basal leaves petioled, somewhat fleshy, 2-5 cm. long, with oblanceolate blades; stem-leaves 1-2 cm. long, oblong-lanceolate; calyx-lobes linear-lanceolate, ciliate on the margins; corolla 8-10 mm. long; limb and throat fully as long as the tube. High mountains: Colo.—Wyo. *Mont.*—Alp. My—Au.

44. *M. perplexa* Rydb. Stem about 3 dm. high, glabrous; basal leaves spatulate, 4-10 cm. long, petioled; stem-leaves sessile, the lower oblanceolate, the upper ovate; pedicels minutely hispid-strigose, the hairs with pustulate bases; corolla blue, about 12 mm. long; tube equalling the throat and limb, the latter 7-8 mm. wide. High mountains: Colo. *Alp.* Jl.

45. *M. humilis* Rydb. Stem 1-2 dm. high, ascending or decumbent, glabrous; basal leaves petioled, 3-8 cm. long; blades thick, elliptic to ovate; stem-leaves sessile, elliptic or ovate, rarely oblong, 2-4 cm. long; pedicels with scattered large pustules; corolla 7-8 mm. long; tube slightly shorter than the limb and throat. Stony slopes: Wyo. *Subalp.* My—Je.

46. *M. brevistyla* S. Wats. Stem 1-3 dm. high, glabrous or slightly strigose; leaves firm, strigose above, oblong, or the lower oblanceolate; pedicels strigose; calyx-lobes lanceolate, hirsute; corolla 7-8 mm. long; tube shorter than the limb and throat. High mountains: Utah. *Submont.*—*Subalp.* Ap—Je.

47. *M. cana* Rydb. Stems about 1 dm. high, strigose; leaves linear or linear-oblanceolate, grayish strigose on both sides; pedicels and calyx strigose; calyx-lobes linear-lanceolate, acute, about 2 mm. long, ciliate on the margins; corolla blue, about 8 mm. long; tube as long as the throat and the limb, the latter about 3 mm. wide. *M. canescens* Rydb., not Kaulf. High mountains: Colo. *Subalp.*—Alp. Jl.

15. MYOSÖTIS (Rupp.) L. FORGET-ME-NOT.

Annual, biennial, or perennial caulescent herbs. Leaves alternate, entire, narrow. Flowers perfect, regular, in 1-sided racemes. Calyx persistent, 5-lobed; lobes erect or spreading. Corolla salverform, blue, pink, or white, often with an eye; tube short; throat with transverse crests; lobes rounded, convolute. Stamens included. Nutlets small, ovoid, smooth, attached by the very base to the flat receptacle.

Perennials, tufted; corolla 4-6 mm. wide.

Annuals; corolla less than 2 mm. wide.

Stem tall, 3-5 dm. high; calyx nodding in fruit, 5-7 mm. long; nutlets about 2 mm. long.

Stem lower, 1.5-3 dm. high; calyx not nodding in fruiting, less than 5 mm. long; nutlets about 1.5 mm. long.

1. *M. alpestris*.

2. *M. macrosperma*.

3. *M. virginica*.

1. *M. alpestris* Schmidt. Stem 1-3 dm. high, hirsute; basal leaves spatulate or oblanceolate, 3-7 cm. long, hirsute; stem-leaves linear-lanceolate; calyx lobes lanceolate, erect in fruit; corolla bright blue, 4-6 mm. wide. Wet places in the mountains: Alta.—Colo.—Alaska; Eurasia. *Mont.*—*Subalp.* My—Au.

2. *M. macrosperma* Engelm. Stem 3-5 dm. high, hirsute with ascending hairs, leafy; basal leaves oblanceolate, 2-8 cm. long, sparingly hirsute; stem-leaves lanceolate or oblong; racemes 1-2 dm. long; calyx-lobes 2.5 mm., in fruit 6-7 mm. long; corolla light blue or white, 3 mm. long. River banks and open woods: D.C.—Fla.—Tex.—Calif.—B.C.—Ida. *Plain*—*Submont.* Ap—Je.

3. *M. virginica* (L.) B.S.P. Stem branched from the base, 0.5–3 dm. high, hirsute; basal leaves spatulate, 1–3 cm. long; stem-leaves linear-oblong; corolla white, very small. Dry banks and rocky woods: Me.—Ga.—Tex.—Ore.—B.C. Ap–Je.

16. LITHOSPÉRMUM (Tourn.) L. GROMWELL, PUCCOON,
INDIAN PAINT.

Annual or perennial caulescent herbs. Leaves alternate, entire, narrow, hirsute. Flowers perfect, regular, in bracted spikes or racemes. Calyx persistent, 5-lobed. Corolla salverform or funnelform, white or yellow; tube often elongate; throat either appendaged or pubescent; lobes 5, entire, erose, or toothed. Stamens included. Stigma capitate or 2-lobed. Nutlets white, shining and smooth, or brown and wrinkled, attached by their very bases to the flat receptacle.

- Annuals; nutlets dull, brownish, coarsely wrinkled and pitted. 1. *L. arvense*.
Perennials, with thick taproots; nutlets white and shining.
Corolla-lobes neither fimbriate nor toothed; flowers all well developed.
Corolla greenish or pale yellow, 1 cm. or less long; crest in the throat obsolete; plant very leafy, with the flowers mostly on the short branches.
Corolla-limb 3–5 mm. wide; tube not longer than the calyx; stem grayish strigose, but scarcely hispid. 2. *L. Torreyi*.
Corolla-limb 5–8 mm. wide; tube longer than the calyx.
Leaves linear or narrowly linear-lanceolate; stem very hispid; plant canescent. 3. *L. ruderale*.
Leaves lanceolate, long-attenuate; stem scarcely hispid; plant green. 4. *L. lanceolatum*.
Corolla bright yellow or orange, more than 1 cm. long; crest in the throat prominent. 5. *L. multiflorum*.
Floral leaves of the later flowers small, shorter than the flowers; limb of the corolla 6–8 mm. wide.
Floral leaves of the later flowers not reduced; limb of the corolla 8–20 mm. wide.
Hispid-pubescent; corolla-tube bearded at the base within.
Canescent; corolla-tube not bearded at the base within. 6. *L. Gmelini*.
Corolla-lobes of the early flowers fimbriate or dentate; later flowers cleistogamous. 7. *L. canescens*.
Corolla of the early flowers 2.5–3 cm. (rarely only 2 cm.) long; lobes distinctly fimbriate.
Plant hirsute. 8. *L. asperum*.
Plant appressed-canescent.
Leaves narrowly linear. 9. *L. linearifolium*.
Leaves spatulate to linear-oblong. 10. *L. oblongum*.
Corolla of the early flowers 2 cm. or less long; lobes dentate.
Corolla 15–20 mm. long; limb 8–10 mm. wide; stem low, ascending or decumbent. 11. *L. mandanense*.
Corolla 10 mm. or less long; limb 6–8 mm. wide; stem strict, 2–4 dm. high, mostly simple, or with erect branches. 12. *L. breviflorum*.

1. *L. arvense* L. Stem 2–5 dm. high, strigose, simple or branched at the base; leaves lanceolate, linear, or oblong, sessile or the lower short-petioled, canescent-strigose; corolla white, about 6 mm. long; calyx equalling or exceeding the corolla-tube; nutlets 2 mm. long. Waste places and fields: Que.—Ga.—Kans.—Minn.; Utah; Mont.; nat. from Eu. *Plain—Son.* My–Au.

2. *L. Torreyi* Nutt. Stem erect, 2–4 dm. high; leaves linear or linear-lanceolate, 3–8 cm. long, strigose; corolla 6–8 mm. long; nutlets 5 mm. long, ovoid. Hills and cañons: Mont.—Colo.—Utah—Ida. *Plain—Submont.* Je–Au.

3. *L. ruderale* Lehm. Stem 3–5 dm. high; leaves 3–8 cm. long, canescent, pilose, or strigose; corolla 10–12 mm. long; nutlets slightly wrinkled, 5 mm. long. *L. pilosum* Nutt. Hills: Alta.—Colo.—Nev.—B.C. *Plain—Submont.* Ap–Jl.

4. *L. lanceolatum* Rydb. Stem 3–6 dm. high, strigose; lower leaves linear-lanceolate, the upper lanceolate, 4–10 cm. long, finely strigose; corolla yellowish, 8–10 mm. long; nutlets 5–6 mm. long. Hills, cañons, and plains: Mont.—Utah—Calif.—Wash. *Plain—Submont.* My–Jl.

5. *L. multiflorum* Torr. Stem strigose or somewhat hirsute, 3–6 dm. high, virgately branched above; leaves linear or linear-lanceolate, appressed-strigose

above, more hirsute beneath; corolla 10–12 mm. long; nutlets 3 mm. long. Hills, mountain sides, cañons: Wyo.—N.M.—Ariz.—Utah; Mex. *Submont.*—*Mont.* My—Jl.

6. **L. Gmelini** (Michx.) Hitchc. Stem hispid, 3–6 dm. high; leaves lanceolate, or oblong, hispid, 4–8 cm. long; corolla 15–20 mm. long; limb 15–20 mm. wide; nutlets 4 mm. long. *L. hirtum* Lehm. Sandy places, dry plains, and open woods: N.Y.—Fla.—N.M.—*Mont.* *Plain*—*Submont.* Ap—Jl.

7. **L. canescens** (Michx.) Lehm. Stem 2–4 dm. high, hirsute or pilose; leaves oblong to linear, 1–4 cm. long, canescent-strigose; corolla 10–12 mm. long; limb about 1 cm. wide; nutlets 3 mm. long. Plains and prairies: Ont.—Ala.—Tex.—Colo.—Sask. *Plain.* Ap—Jl.

8. **L. asperum** A. Nels. Stems 1.5–3 dm. high, hirsute, with white divaricate hairs; leaves oblong to linear, 2–4 cm. long, rough-hirsute; corolla 2–3 cm. long; limb 1–1.5 cm. broad; lobes crenulate-erose. *L. ciliolatum* Greene. Sandstone slopes: Wyo. *Submont.* Je.

9. **L. linearifolium** Goldie. Stems strict, 1–5 dm. high, canescent-strigose; leaves all linear, 1–5 cm. long, strigose; corolla of the earlier flowers 2.5–3 cm. long; limb 10–18 mm. wide, erose-fimbriate; cleistogamous flowers 1 cm. long or less; nutlets more or less pitted. *L. angustifolium* Michx. Dry soil: Man.—Ill.—Tex.—Ariz.—B.C. *Plain*—*Submont.* Ap—Jl.

10. **L. oblongum** Greene. Stems numerous, 1–2 dm. high, strigose; leaves short, 2–3 cm. long, strigose; corolla of the early flowers about 3 cm. long; limb about 1 cm. wide; nutlets pitted along the margins. Dry plains: N.M.—Wyo. *Son.*—*Plain.* Ap—Je.

11. **L. mandanese** Spreng. Stems many, 1–2 dm. high; leaves linear, 3–4 cm. long, mostly strigose; corolla of the early flowers 1.5–2 cm. long; nutlets sparingly pitted. Dry plains: N.D.—Tex.—Ariz.—Alta. *Plain*—*Submont.* Ap—Je.

12. **L. breviflorum** Engelm. & Gray. Stems several, erect, 2–4 dm. high, finely strigose; leaves narrowly linear, 3–5 cm. long, ascending; corollas of the early flowers 1 cm. long or less, deep yellow; nutlets scarcely pitted except near the margins. *L. albicans* Greene. Dry plains: Ark.—Tex.—N.M.—Colo. *Son.* My—Je.

17. **ONOSMÔDIUM** Michx. FALSE GROMWELL.

Coarse perennial caulescent herbs. Leaves alternate, entire, usually broad, strongly nerved, pubescent. Flowers perfect, regular, in terminal scorpioid racemes or spikes. Calyx persistent, with 5 narrow lobes. Corolla tubular, yellow, white, or greenish; tube elongate; throat without appendages; lobes erect. Stamens included; anthers often sessile. Nutlets white, shiny, smooth or sparingly pitted, attached by their very base to the flat receptacle, often only one or two maturing.

1. **O. occidentale** Mackenzie. Stem 3–6 dm. (rarely 6–12 dm.) high, branched above, white-hispid; leaves about 5 cm. long, prominently 5–7-ribbed, coarsely hirsute-strigose; corolla 12–20 mm. long, canescent, its lobes broadly triangular, acute, 3–4 mm. long; nutlets 3.5–4 mm. long, ovoid, not constricted at the base, dull, little if at all pitted. Plains and prairies: Man.—Ill.—Mo.—Tex.—N.M.—Utah—Alta. *Plain*—*Submont.*

18. **ANCHÛSA** L. ALKANET.

Annual or perennial herbs, with hispid or villous foliage. Flowers bracteate, in scorpioid cymes. Calyx 5-cleft. Corolla blue or purple; tube straight; throat closed by fornicies or hairs. Nutlets rugose or granulate, inserted by a broad concave base on the flat receptacle.

1. **A. officinalis** L. Perennial, with a taproot; stem hispid, 3–8 dm. high; basal leaves oblanceolate, 1–2 dm. long, very hispid; stem-leaves lanceolate; corolla dark blue, fully 1 cm. long. Waste places and roadsides: N.Y.—Utah; sparingly introduced from Eu. *Plain*—*Submont.* Jl—S.

19. SYMPHYTUM (Tourn.) L. COMFREY.

Large hairy perennials. Leaves alternate, entire, or the uppermost opposite; the lower long-petioled. Flowers in terminal scorpioid racemes. Calyx deeply 5-cleft. Corolla blue, purple, or yellow, campanulate, with short lobes; fornicies in the throat lanceolate or linear, papillose-margined. Nutlets obliquely ovoid; scar large, concave, bordered by a prominent denticulate ring-margin.

1. S. officinale L. Stem 6-10 dm. high; leaves lanceolate to ovate, the lower petioled, the upper decurrent on the stem; calyx-lobes lance-linear; corolla purplish or yellowish, 1-2 cm. long. Waste places: Newf.—Md.—Mont.; adv. or escaped from cultivation; native of Eu. Je—Au.

FAMILY 114. **VERBENACEAE.** Vervain Family.

Annual or perennial herbs, or in warmer climates sometimes shrubs or trees. Leaves usually alternate, rarely opposite or whorled, usually simple. Flowers perfect, more or less irregular, zygomorphic, in ours spicate. Calyx of 4 or 5, more or less united sepals, usually bracteolate. Corolla of 4 or 5, partially united petals, usually 2-lipped. Stamens 2, or 4, and then didynamous; filaments more or less adnate to the corolla; anthers erect or incumbent. Gynoecium of 2 or 4 carpels; styles united; stigma entire or 2- or 4-lobed; ovules 1 or 2 in each cavity, anatropous. Fruit separating into 2 or 4 nutlets, or drupes, or berry-like. Seeds commonly solitary in each cavity; endosperm scant or wanting; embryo straight.

Corolla-limb 5-lobed; nutlets 4; flowers in terminal spikes.

Corolla 4-lobed; nutlets 2; flowers in short dense axillary spikes.

1. **VERBENA.**

2. **PHYLA.**

1. VERBENA (Tourn.) L. Vervain, Verbena.

Annual or perennial herbs. Leaves opposite, entire, toothed, or dissected. Flowers in terminal spikes. Calyx-tube funnelform. Corolla more or less bilabiate; tube narrow, straight or curved. Limb 5-lobed. Stamens 4, didynamous, rarely only 2; connective of the anthers often bearing a gland. Ovary 4-celled; stigma 2-lobed, only one lobe stigmatose; ovules solitary in each cell. Fruit of 4 nutlets, enclosed in the calyx.

Anthers not appendaged; flowers in elongate spikes, less than 8 mm. long.

Leaves not pinnatifid, sometimes merely lobed at the base in the first species; plant tall, erect, strict.

Bracts shorter than the calyx, or barely equalling it.

Spike peduncled; corolla-limb 3-6 mm. broad; pubescence sparse, coarse.

1. *V. hastata*.

Spike sessile; corolla-limb 8-9 mm. broad; pubescence dense, soft.

2. *V. stricta*.

Bracts one-third longer than the calyx; pubescence dense, soft.

3. *V. MacDougalii*.

Leaves more or less pinnatifid, at least incised; bracts much longer than the calyx.

Spike dense; nutlets muriculate on the commissural faces.

4. *V. bracteosa*.

Spike lax; nutlets nearly smooth on the commissural faces.

5. *V. remota*.

Anthers of the longer stamens appendaged by a gland on the connective; corolla 8 mm. long or more.

Calyx-lobes subulate or lance-subulate.

Leaves twice 3-parted into linear-oblong or lanceolate divisions.

6. *V. ciliata*.

Leaves once 3-parted, with toothed or slightly lobed divisions.

7. *V. Gooddingii*.

Calyx-lobes setaceous.

Bracts narrowly lanceolate, shorter than the calyx; leaf-segments oblanceolate.

8. *V. ambrosifolia*.

Bracts setaceous, longer than the calyx; leaf-segments linear.

9. *V. bipinnatifida*.

1. V. hastata L. Perennial; stem 4-15 dm. high, hispidulous, branched above, 4-angled; leaf-blades scabrous-hispidulous, lanceolate or ovate-lanceolate, 4-12 cm. long, sharply and doubly serrate, often hastate at the base; spikes erect, narrow, 5-15 cm. long; calyx 2.5 mm. long, pubescent; corolla purplish

blue; nutlets smooth. River valleys, thickets and waste places: N.S.—Fla.—N.M.—Calif.—B.C. *Plain—Submont.* My—Au.

V. hastata × **stricta**. In habit resembling *V. hastata*, but the leaves more veinly-reticulate and softer pubescent and the corolla larger. Mo.—Colo.

2. V. stricta Vent. Perennial; stem stout, 3–12 dm. high, simple or branched above, densely pilose, almost velutinous, terete or nearly so; leaf-blades oblong, oval, 3–10 cm. long, doubly serrate or incised, rugose, nearly sessile, densely soft-pubescent; spike stout, strict; calyx hirsute, 5 mm. long; corolla dark blue; nutlets strongly reticulate. Dry soils, pastures, and river valleys: Minn.—Ky.—Tex.—N.M.—Wash.; introduced eastward to Conn. Je—Au.

3. V. MacDougalii Heller. Perennial; stem stout, simple, obtusely 4-angled, 3–7 dm. high, densely pilose; leaf-blades oblong-lanceolate, densely soft-pubescent, short-petioled, thick, rugose and reticulate beneath, incised-serrate, 7–9 cm. long; spikes often solitary or few, stout, dense; corolla blue; limb 4 mm. broad; nutlets striate, with a few cross-reticulations above. River valleys: N.M.—Colo.—Ariz. *Plain—Submont.* Jl—Au.

4. V. bracteosa Michx. Annual or perennial; stem branched at the base, prostrate or procumbent, 1–5 dm. long, diffusely branched, angled, more or less hirsute; leaf-blades spatulate in outline, pinnately lobed and incised or doubly-toothed, 1–6 cm. long, prominently veined beneath, hirsute; bracts lanceolate or linear-lanceolate; calyx bristly, 3 mm. long; corolla purple or bluish; limb 2 mm. broad; nutlets strongly reticulate on the back. *V. rudis* Greene. Waste places, prairies and plains: Man.—Ill.—Fla.—Tex.—Calif.—B.C. *Plain—Submont.*

V. bracteosa × **hastata**. Resembling most *V. bracteosa* in habit, but stouter, more erect, with broad, laciniate rather than dissected leaves and shorter bracts. Neb.—Colo.

V. bracteosa × **stricta**. Resembling *V. bracteosa* in habit, but stouter, with broad, laciniate, strongly reticulate leaves and larger flowers. Mo.—Kans.—Neb.

5. V. remota Benth. Annual or perennial; stem mostly erect, sparingly branched, 2–4 dm. high, round-angled, hirsute; leaf-blades obovate in outline, mostly bipinnatifid, with lanceolate divisions, 2–8 cm. long, hirsute; bracts linear or linear-subulate; calyx 2–2.5 mm. long, hirsute; teeth subulate, short; corolla lilac, 4–5 mm. long; nutlets reticulate on the back. Plains and waste places: Utah—c Mex. *Son.* Ap—N.

6. V. ciliata Benth. Perennial; stem branched at the base, 0.5–2 dm. high, decumbent, hirsute, leafy; leaf-blades 2–4 cm. long, obovate in outline; calyx becoming 7–8 mm. long; corolla 1–1.5 cm. long; limb 7–8 mm. wide; nutlets strongly wrinkled. Dry plains and hills: Tex.—Colo.—Ariz.; Mex. *Son.—Submont.* Ap—Au.

7. V. Gooddingii Briq. Perennial; stem 2–5 dm. high, robust, hirsute, branched; leaves spatulate or obovate in outline, densely hirsute; spikes very short; bracts lanceolate, acuminate, shorter than the calyx; corolla 12–15 mm. long; limb 8 mm. broad. Sandy bottom lands: Nev.—s Utah—Ariz. *Son.* Mr—My.

8. V. ambrosifolia Rydb. Perennial; stem branched and decumbent at the base, sparingly hirsute, 2–4 dm. long; leaf-blades obovate in outline, bipinnatifid or biternately divided, with oblanceolate divisions, sparingly hirsute; calyx becoming 8–9 mm. long; corolla-limb 6–8 mm. wide; nutlets coarsely wrinkled all over the back. Plains and stony soil: S.D.—Tex.—Ariz. *Son.—Plain—Submont.* Je—Au.

9. V. bipinnatifida Nutt. Perennial; stems often branched at the base, 1–4 dm. high, decumbent at the base; leaf-blades 2–5 cm. long, bipinnatifid; segments linear; calyx becoming 9–10 mm. long; corolla-limb 7–9 mm. wide; nutlets 3 mm. long, prominently wrinkled above. Plains and dry ground: S.D.—La.—Tex. *Son.—Plain.* My—Jl.

2. PHŶLA Lour.

Perennial, caulescent, prostrate or creeping herbs. Leaves opposite, petioled, toothed or lobed. Flowers perfect, in dense, sometimes head-like, peduncled axillary spikes, conspicuously bracted. Calyx-tube flattened and 2-

keeled. Corolla 2-lipped; tube curved; limb 4-lobed, oblique. Stamens 4, didymous; connective of the anthers not appendaged. Ovary 2-celled; stigma oblique; ovules solitary in each cell. Fruit tardily separating into two nutlets. [*Lippia* in part.]

Leaves from linear-oblancheolate to cuneate, 2-8-toothed above; peduncles slightly if any exceeding the leaves.

Leaves lanceolate, oblong, or oval, sharply serrate; peduncles much exceeding the leaves.

1. *P. cuneifolia*.
2. *P. lanceolata*.

1. ***P. cuneifolia*** (Torr.) Greene. Stems branched at the base, procumbent or creeping, 2-10 dm. long; leaves opposite and more or less fascicled in the axils; blades 1-3 cm. long; midvein prominent, the lateral ones obsolete; corolla purplish or whitish, 4 mm. long. *Lippia cuneifolia* (Torr.) Steud. Plains and prairies: S.D.—Tex.—Ariz.—Wyo. Plain—Submont. Je—Au.

2. ***P. lanceolata*** (Michx.) Greene. Stem branched from the base, procumbent, 1-4 dm. long; leaves opposite, rarely fasciculate; blades elliptic-lanceolate, 1.5-5 cm. long, acute, with about 4 pairs of lateral veins; corolla pale blue, 2-2.5 mm. long. Valleys: Ont.—Fla.—Tex.—Neb. Plain—Son. Je—O.

FAMILY 115. LAMIACEAE. MINT FAMILY.

Aromatic herbs or shrubs, with 4-angled stems. Leaves opposite or whorled, simple, usually toothed or lobed, glandular-punctate. Flowers perfect, irregular, zygomorphic, or nearly regular, pseudo-vericillate, *i. e.*, in congested axillary reduced cymes. Calyx of 5 united sepals, sometimes regular, sometimes irregular, and then usually 2-lipped. Corolla bilabiate, or nearly regular. Stamens 4, didynamous, or one of the pairs abortive; anthers 2-celled. Gynoecium of united carpels; ovary 4-lobed and 4-celled; styles united, arising between the lobes; stigma terminal; ovules solitary in each cell. Fruit of 4 nutlets, included in the persistent calyx. Endosperm fleshy or wanting.

Ovary of 4 united nutlets; style not basal; nutlets laterally attached.

Corolla strongly bilateral, the upper lip very small, the lower large.

Flowers in small congested cymes, axillary to small bracts, and forming a raceme-like panicle; calyx-lobes shorter than the tube; leaves toothed.

Flowers solitary in the axils of bracts similar to the leaves; calyx-lobes longer than the tube; leaves lacinate.

Corolla almost regularly 5-lobed, but lobes declined; stamens long-exserted and coiled.

Ovary of 4 distinct or nearly distinct nutlets; styles basal; nutlets basally attached.

Corolla bilabiate.

Calyx 2-lipped; both lips entire; stamens 4.

Calyx not inflated, the upper lip with a crest on the upper side.

Calyx inflated, without a crest.

Calyx either 2-lipped and at least one of the lips toothed, or regularly 4-5-toothed.

Stamens included in the corolla-tube.

Stamens exserted from the tube.

Upper lip of the corolla concave.

Anther-bearing stamens 4.

Upper stamens longer than the lower.

Calyx 5-toothed.

Anther-sacs parallel or nearly so; stamens divergent.

Anther-sacs divaricate; anther approximate in pairs.

Flowers in terminal spikes; floral leaves reduced; plant erect.

Flowers in axillary verticils; floral leaves like the rest; plant spreading.

Calyx distinctly 2-lipped.

Upper stamens shorter than the lower.

Calyx distinctly 2-lipped, closed in fruit.

Calyx 5-toothed, not 2-lipped, open in fruit.

Calyx membranous, inflated in fruit, faintly nerved.

Calyx not membranous, not inflated in fruit, strongly 5-10-nerved.

1. *TEUCRUM*.
2. *MELOSOMON*.
3. *TRICHOSTEMA*.
4. *SCUTELLARIA*.
5. *SALAZARIA*.
6. *MARRUBIUM*.
7. *AGASTACHE*.
8. *NEPETA*.
9. *GLECOMA*.
10. *MOLDAVICA*.
11. *PRUNELLA*.
12. *DRACOEPHALUM*.

Anther-sacs not transversely 2-valved.

Nutlets 3-sided, truncate above.

Calyx-teeth awn-pointed, spreading.

13. *LEONURUS*.

Calyx-teeth not awn-pointed.

14. *LAMIMUM*.

Nutlets ovoid, nearly terete, rounded above.

15. *STACHYS*.

Anther-sacs transversely 2-valved.

16. *GALEOPSIS*.

Anther-bearing stamens 2.

Connective of the anthers very long, articulated to the filaments, bearing a perfect anther at the ascending end and a reduced one or none at the other; calyx 2-lipped.

Upper lip of the corolla erect, entire or emarginate; lower portion of the connective either dilated and naked or with a small anther.

Inflorescence head-like; calyx-teeth aristate; lower portion of the connective anther-bearing.

17. *PYCNOSPHERE*.

Inflorescence raceme or spike-like; calyx-teeth not aristate; lower portion of the connective not anther-bearing.

18. *SALVIA*.

Upper lip of the corolla spreading, 2-lobed; lower portion of the connective a mere tooth or lacking; flowers verticillate-glomerate.

19. *AUDIBERTELLA*.

Connective of the anther short; anther-cells confluent; calyx equally 5-toothed.

20. *MONARDA*.

Upper lip of the corolla flat.

Stamens curved, often converging.

Calyx regularly 5-toothed.

Anther-bearing stamens 2.

21. *POLIOMINTHA*.

Anther-bearing stamens 4.

25. *MICROMERIA*.

Calyx 2-lipped or irregularly 5-toothed.

Anther-bearing stamens 2.

22. *HEDEOMA*.

Anther-bearing stamens 4.

23. *CLINOPODIUM*.

Stamens straight, distant and diverging; calyx almost regularly 5-toothed; anther-bearing stamens 4.

24. *MADRONELLA*.

Corolla nearly regular, 4-5-toothed.

Anther-bearing stamens 2.

26. *LYCOPUS*.

Anther-bearing stamens 4.

27. *MENTHA*.

1. *TEUCRIUM* (Tourn.) L. GERMANDER, WOOD SAGE.

Perennial caulescent herbs, rarely shrubs. Leaves toothed. Flowers perfect, in raceme-like inflorescence. Calyx campanulate, 10-ribbed; lobes 5, unequal. Corolla purplish, pink, or white; upper lip very short; lower lip 3-lobed, the middle lobe elongate. Stamens 4, inserted between the lobes of the upper lip, the anterior pair the longer; anther-sacs divergent, confluent at the base.

1. *T. occidentale* A. Gray. Perennial, with a rootstock; stem 3-8 dm. high, villous-hirsute; leaf-blades ovate-oblong, oblong, or lanceolate, 4-9 cm. long, sharply serrate, strigose above, paler and softly villous beneath; calyx 5-6 mm. long, viscid-villous, often purplish; corolla purplish, 8-10 mm. long. Thickets and wet grounds: Ont.—Pa.—N.M.—Calif.—B.C. Plain—Submont. Je—Au.

2. *MELÓSMON* Raf.

Perennial or annual herbs. Leaves opposite, incised or parted. Flowers solitary in the axils of the leaves. Calyx-tube very short, 10-ribbed; lobes 5, equal or nearly so. Corolla blue, lilac, or white; upper lip small; lower lip 3-lobed, with the middle lobe the longer. Stamens 4, as in *Teucrium*.

1. *M. laciniatum* (Torr.) Small. Perennial, with a woody root and short caespitose caudex; stems 1-2 dm. high, glabrous or nearly so; leaf-blades pinnately 3-7-parted, into linear divisions, which are sometimes again lobed; calyx 10-12 mm. long; lobes linear-subulate, acuminate; corolla pale blue or lilac, 1.5-2 cm. long. Plains: Kans.—Tex.—Ariz.—Colo. Son. My—Au.

3. *TRICHOSTEMA* L. BLUE CURLS.

Annual or perennial herbs, rarely shrubby. Leaves rather narrow, entire or merely repand. Flowers perfect, in axillary cymes or panicles. Calyx campanulate, with short tube; lobes 5, unequal. Corolla blue, purple, pink, or white, slightly irregular. Stamens 4, didymous, conspicuously exerted; filaments curved, the anterior pair the longer and spirally curled in bud; anther-sacs divergent. Nutlets reticulate.

1. **T. oblongum** Benth. Annual; stem branched, 1-3 dm. high, soft-villous; leaves short-petioled; blades oblong to oval, membranous, 1-4 cm. long, soft-pubescent on both sides; flower-clusters axillary, much shorter than the leaves; calyx-lobes subulate, longer than the tube and nearly equalling the corolla; corolla about 6 mm. long; filaments 8-10 mm. long. Moist places: Wash.—Ida.—Calif. *Submont.* Je-Jl.

4. SCUTELLARIA L. SKULLCAP.

Annual or perennial herbs, sometimes shrubby. Leaves opposite, entire or toothed. Flowers perfect, in terminal racemes or panicles, often leafy-bracted. Calyx campanulate, 2-lipped; lips entire, the upper with a crest. Corolla blue, violet, or white; throat dilated; limb 2-lipped, the upper lip arched, the lower 3-lobed; lateral lobes small, the middle one large and spreading. Stamens 4, didymous; anthers ciliate, those of the upper pair 2-celled, those of the lower 1-celled. Nutlets papillose or tubercled.

Flowers in axillary and terminal racemes.

Flowers solitary in the axils of the leaves.

Perennials, with horizontal rootstock.

Leaf-blades lanceolate or ovate, more or less distinctly toothed, at least the lower ones.

Leaf-blades lanceolate, acute.

Leaf-blades ovate, obtuse.

Leaf-blades entire or nearly so, ovate, oblong or linear.

Corolla blue or violet; nutlets not raised on a gynobase.

Pedicels shorter than the calyx; calyx and corolla villous outside; lower lip of the latter glabrous within.

Pedicels not shorter than the calyx; calyx and corolla densely short-pubescent; lower lip of the latter bearded within.

Corolla 12-18 mm. long; leaves elliptic, usually entire.

Corolla 18-30 mm. long.

Leaves linear or oblong, entire; corolla-tube slender, gradually widening upward.

Lower leaves ovate, usually toothed; corolla-tube ample, abruptly widening upwards.

Corolla yellow; nutlets raised on a gynobase.

Perennials, with a woody caudex.

1. *S. lateriflora*.

2. *S. galericulata*.

6. *S. veronicifolia*.

3. *S. Brittoni*.

4. *S. antirrhinoides*.

5. *S. angustifolia*.

6. *S. veronicifolia*.

7. *S. Footiana*.

8. *S. resinosa*.

1. **S. lateriflora** L. Perennial, with a creeping rootstock; stem 2-10 dm. high, glabrous or sparingly puberulent above, branched; leaves slender-petioled; leaf-blades thin, ovate or ovate-lanceolate, 2-6 cm. long, coarsely serrate, rounded or cordate at the base; calyx 2-4 mm. long; corolla blue, 6-7 mm. long. Along streams and swamps: Newf.—Fla.—Ida.—B.C. *Plain—Submont.* Je-S.

2. **S. galericulata** L. Stem strigose, at least on the angles, 2-9 dm. high; leaf-blades oblong or oblong-lanceolate, acute, crenate, truncate or cordate at the base, more or less densely strigose and often glandular-granuliferous beneath; calyx 3.5-5 mm. long, minutely pubescent; corolla blue, or rarely pink or white, 15-18 mm. long, pubescent. River banks and swamps: Newf.—N.C.—Ariz.—Alaska; Eurasia. *Plain—Submont.* Je-Au.

3. **S. Brittoni** Porter. Stem puberulent, 1-3 dm. high; leaves entire, nervose, finely puberulent, oblong to oval, 1-3 cm. long; calyx puberulent, 5-6 mm. long; corolla about 2 cm. long, gradually dilated upwards. *S. resinosa* A. Gray, not Torr. *S. virgulata* Nels. Hillsides and valleys: Wyo.—Colo. *Submont.—Mont.* My-Jl.

4. **S. antirrhinoides** Benth. Stem branched, diffuse or ascending, 1-3 dm. high, puberulent; leaves elliptic, grayish puberulent, 1-2 cm. long, obtuse; calyx 4 mm. long, finely puberulent. Moist shady places: Ore.—Ida.—Nev.—Calif. *Submont.* Je-Jl.

5. **S. angustifolia** Pursh. Stem 1-3 dm. high, minutely puberulent; lower leaves oblong or oval, the upper linear to oblong, usually entire, 1-2.5 cm. long, the radical ones often orbicular or cordate; calyx about 4 mm. long, puberulent. Moist ground: B.C.—Mont.—Utah—Calif. *Submont.* My-Jl.

6. **S. veronicifolia** Rydb. Stem 2-4 dm. high, finely puberulent, more or less purplish; leaves ovate, obtuse, coarsely crenate, 1-4 cm. long, minutely

puberulent or glabrate, short-petioled; those of the inflorescence and branches oblong and entire or nearly so; calyx finely pubescent, 6 mm. long. Hillsides: Ida.—Calif. *Submont.* My—Je.

7. *S. Footeana* Mulford. Stem 6–10 cm. high, much branched and spreading, purplish, puberulent; leaves 1.5–2.5 cm. long, entire, oblanceolate or obovate, finely and densely pubescent; calyx about 6 mm. long; corolla 12–18 mm. long, amplate-dilated, lemon-yellow to dull brownish yellow at the base, somewhat hairy within. Cañons: Ida. Je.

8. *S. resinosa* Torr. Stems many, diffusely branched, 1–3 dm. high, grayish puberulent; leaf-blades ovate, oval, elliptic, or oblong-spatulate, 1–1.5 cm. long, grayish puberulent, strongly veined beneath; calyx 3–5 mm. long, merely resinous; corolla blue or purplish, minutely pilose, 1 cm. long. *S. Wrightii* A. Gray. Plains and hills: Kans.—Tex.—Ariz.—Colo. *Son.*

5. **SALAZÀRIA** Torr. BLADDER SKULLCAP, BLADDER BUSH.

Scraggly desert shrubs. Leaves small, entire. Flowers perfect, racemose. Calyx at first oblong, in age enlarging, becoming inflated and globular, barely repand-bilabiate. Corolla bilabiate; upper lip arched; lower lip 3-lobed, but the lateral lobes small. Stamens 4, didymous, parallel; anthers ciliate, those of the upper pair 2-celled, those of the lower 1-celled. Nutlets tubercled.

1. *S. mexicana* Torr. Shrub 6–10 dm. high; branches divaricate, often recurving, finely canescent-strigose; leaves glabrate, oblong or broadly lanceolate, about 1 cm. long; racemes terminal, short; calyx about 5 mm. long, in fruit inflated and 2 cm. in diameter; corolla about 2 cm. long. Ravines: s Utah—Ariz.—s Calif.—Nev. *L. Son.* My—Je.

6. **MARRÛBIUM** (Tourn.) L. HOREHOUND.

Perennial caulescent herbs. Leaves toothed, woolly. Flowers perfect, in axillary clusters. Calyx tubular, 5–10-ribbed; lobes 10, equal, or alternately longer and shorter, recurved at maturity. Corolla white or purplish, 2-lipped; upper lip erect, entire or notched; lower lip 3-lobed, the lateral lobes small, the middle one large and broad. Stamens 4, included, didymous, the anterior pair the longer; anthers 2-celled, with divergent sacs. Nutlets smooth or granular.

1. *M. vulgare* L. Stem white-woolly, 2–10 dm. high, usually strict; leaf-blades suborbicular, oval or ovate, 1–4 cm. long, crenate, strongly rugose; bracts subulate, with hooked ends; calyx 4–5 mm. long, 10-ribbed; lobes ridged, hooked; corolla white, 5–6 mm. long, puberulent. Waste places: Me.—N.C.—Calif.—B.C. *Plain—Son.*

7. **AGÁSTACHE** Clayton. GIANT HYSSOP.

Tall perennial herbs, with rootstocks. Leaves petioled, broad, toothed. Flowers perfect, in dense terminal spike-like panicles. Calyx narrowly campanulate or tubular, slightly 2-lipped; lobes nearly equal or the upper somewhat longer. Corolla purplish, rose, or yellowish, 2-lipped; upper lip erect, notched; lower lip 3-lobed, the middle lobe toothed or undulate. Stamens 4, exserted, didymous; anthers 2-celled, sacs almost parallel. Nutlets smooth. [*Lopanthus* Benth. *Vleckia* Raf.]

Calyx-lobes ovate-lanceolate, acute.

Leaves glaucous beneath; calyx tinged with blue; stem glabrous. **1. *A. anethiodora*.**
Leaves not glaucous beneath; calyx green, yellowish, or rarely pinkish; stem puberulent. **2. *A. pallidiflora*.**

Calyx-lobes elongate-lanceolate, acuminate, rose-tinged. **3. *A. urticifolia*.**

1. *A. anethiodora* (Nutt.) Britton. Stem glabrous or nearly so, 6–15 dm. high; leaf-blades ovate or deltoid-ovate, acute or acuminate, serrate, green above, pale beneath, 5–8 cm. long, anise-scented; spike dense, 4–10 cm. long, scarcely 2 cm. thick; corolla blue, 8–10 mm. long. *L. anisatus* Benth. *A. Foeniculum* (Pursh) Kuntze. Among bushes: Ont.—Ill.—Colo.—Alta.—Mack. *Plain—Submont.* Jl—S.

2. **A. pallidiflora** Heller. Stem 6–10 dm. high, cinereous-puberulent; leaf-blades ovate or cordate, crenate, puberulent, 3–5 cm. long, acute; spikes 4–8 cm. long, about 2 cm. thick; corolla about 14 mm. long, pale pink. *Brittonastrum pallidiflorum* Heller. *A. montana* Greene. Mountains: Colo.—N.M.—Ariz. Submont.—Mont. JI–S.

3. **A. urticifolia** (Benth.) Rydb. Stem stout, 5–10 dm. high, glabrous or minutely puberulent; leaf-blades cordate, coarsely dentate, 3–10 cm. long; spike very dense, 2–10 cm. long, 2.5–3 cm. thick; corolla rose or violet, about 15 mm. long. *L. urticifolius* Benth. Hillsides and valleys: Mont.—Colo.—Calif.—B.C. Submont.—Mont. My–Au.

8. **NĚPETA** L. CATNIP, CAT MINT.

Perennial or annual caulescent herbs. Leaves broad, toothed or incised, pubescent. Flowers perfect, in axillary cymes, clustered. Calyx inflated in age, 15-ribbed, incurved; lobes 5, the upper slightly longer than the lower. Corolla white or blue; throat enlarged; upper lip erect, entire or notched; lower lip 3-lobed, with large middle lobe. Stamens 4, didymous, exserted; anthers with 2 diverging sacs. Nutlets flattened, smooth.

1. **N. Cataria** L. Perennial; stem densely tomentulose, 6–10 dm. high; leaf-blades ovate or cordate, coarsely crenate, 2–8 cm. long, green above, densely white-tomentose beneath; flower-clusters spicate at the end of the branches; calyx densely puberulent, its lobes subulate; corolla white or pale purple, dark-dotted, 10–12 mm. long. Waste places and around dwellings: N.B.—Va.—Utah—Ore.; nat. from Eu. Plain—Submont. JI–N.

9. **GLECŌMA** L. GROUND IVY, GILL-OVER-THE-GROUND.

Low creeping perennial herbs. Leaves opposite, long-petioled. Flowers perfect, in axillary verticils. Calyx-tube short-tubular, 15-nerved, oblique, unequally 5-toothed. Corolla 2-lipped; tube exserted, enlarged above; upper lip erect, 2-lobed or emarginate; lower lip spreading, 3-lobed, the middle lobe broad, emarginate. Stamens 4; anther-sacs divergent. Nutlets ovoid, smooth.

1. **G. hederacea** L. Stem pubescent, 3–5 dm. long; leaf-blades orbicular or reniform, crenate, 1–4 cm. broad; calyx-teeth lanceolate, acuminate; corolla 1.5–2 cm. long, light blue, three times as long as the calyx. Waste places, roadsides, and thickets: Newf.—Ga.—Colo.—Mont.; nat. from Eurasia. Plain—Submont. Mr–My.

10. **MOLDĀVICA** (Tourn.) Adans. DRAGON'S HEAD.

Herbs, with blue or purple flowers, in axillary and terminal bracted clusters. Leaves mostly toothed or dissected. Calyx tubular, 15-nerved, 5-toothed, or 2-lipped, with the upper 3 teeth more or less united. Corolla enlarged above, 2-lipped; upper lip erect, emarginate; lower lip spreading, 3-lobed. Stamens 4, the upper the longer, all fertile; anthers more or less approximate in pairs; sacs divergent. Nutlets ovoid, smooth. [*Dracocephalum* L., in part.]

1. **M. parviflora** (Nutt.) Britton. Annual or biennial; stem finely puberulent, 2–6 dm. high; leaf-blades lanceolate, ovate, or oblong, coarsely serrate, the upper with spinulose-tipped teeth; bracts pectinate, with awn-pointed teeth; upper tooth of the calyx longer than the rest; corolla light blue, scarcely longer than the calyx. *D. parviflorum* Nutt. Hillsides and valleys: N.Y.—Neb.—N.M.—Ariz.—Alaska. Submont.—Mont. Je–Au.

11. **PRUNĚLLA** L. SELF-HEAL, HEAL-ALL, CARPENTER WEED.

Perennial caulescent herbs, with rootstocks. Leaves opposite, petioled, toothed, pubescent. Flowers perfect, irregular, in axillary clusters, toward the end of the stem forming a leafy spike-like inflorescence. Calyx 2-lipped, closed at maturity; tube 10-ribbed; upper lip truncate, slightly 2-lobed, the lower with 3 narrow lobes. Corolla purple or white, 2-lipped; upper lip arched; lower lip

3-lobed, with broad middle lobe. Stamens 4, but 2 sterile; fertile stamens with forked filaments, one prong bearing the 2-celled anthers. Nutlets smooth.

1. *P. vulgaris* L. Stem procumbent or ascending or erect, 0.5-5 dm. high; leaf-blades ovate, oblong, or lanceolate, entire or crenate, 2-10 cm. long; spike terminal, very dense, 1-3 cm. long in flower, or 5-10 cm. in fruit; bracts broadly ovate-orbicular, cuspidate; corolla violet or purple, 8-12 mm. long. Woods and wet places among bushes: Newf.—Fla.—Calif.—B.C.; nat. from Eurasia. *Plain—Mont.* My-O.

12. DRACOCÉPHALUM (Tourn.) L. FALSE DRAGON-HEAD.

Perennial herbs, with mostly simple stems. Leaves opposite, glabrous, rather narrow, usually toothed. Calyx campanulate, 5-ribbed, more or less inflated; lobes 5, nearly equal. Corolla purple, pink, or white, 2-lipped; tube dilated upwards; upper lip entire; lower lip 3-lobed, with the middle lobe emarginate. Stamens 4, all fertile; anthers 2-celled; sacs parallel. Nutlets smooth, 3-angled. [*Physostegia* Benth.]

1. *D. Nuttallii* Britton. Stem simple, 3-10 dm. high, glabrous; leaves lanceolate, oblong, or linear, dentate, the upper sessile, 7-10 cm. long; spike 2-10 cm. long; calyx campanulate, with ovate, obtuse teeth; corolla purple, about 1 cm. long. *Physostegia parviflora* Nutt. Banks of streams and among bushes: Sask.—Minn.—Colo.—Ore.—B.C. *Plain—Submont.* Jl—Au.

13. LEONÛRUS L. MOTHERWORT.

Annual or perennial caulescent herbs. Leaves opposite, toothed, or palmately cleft or parted. Flowers perfect, irregular, in dense axillary clusters. Calyx tubular-campanulate, 5-ribbed; lobes 5, nearly equal, subulate or awn-tipped. Corolla white or pink, 2-lipped; upper lip erect, nearly flat; lower lip spreading, 3-lobed; middle lobe broad, truncate, or notched. Stamens 4, all fertile; anthers 2-celled; sacs mostly parallel. Nutlets smooth, 3-angled.

1. *L. Cardiaca* L. Perennial; stem erect, 3-10 dm. high, strigose-puberulent; leaf-blades 2-10 cm. long, palmately 3-5-cleft, with lanceolate, more or less acuminate, entire or toothed lobes; calyx 5-angled; lobes spinulose; corolla pale purple or white, villous without, 9-10 mm. long. Waste places: N.S.—N.C.—Tex.—Utah.—Mont. *Plain—Submont.* Je—Au.

14. LAMIUM L. DEAD NETTLE, HENBIT.

Annual or perennial caulescent herbs, with branched stems. Leaves opposite, petioled, usually broad, toothed or incised. Flowers perfect, irregular, in remote axillary clusters. Calyx campanulate, 5-nerved; lobes 5, equal or the upper somewhat longer. Corolla purple, blue, or white, 2-lipped; upper lip erect, concave, entire; lower lip 3-lobed; lateral lobes narrow, the middle one dilated and notched. Stamens 4, all fertile; anthers 2-celled; sacs divergent. Nutlets smooth or tuberculate.

1. *L. amplexicaule* L. Annual or biennial; stem slender, weak, branched from the base and lower axils, usually decumbent, 1-5 dm. long, glabrous; leaf-blades orbicular, cordate, or reniform, 1-4 cm. broad, crenate, the upper sessile and more or less clasping; flowers axillary; corolla purplish or red, 12-16 mm. long; middle lobe of the lower lip spotted. Waste places and cultivated ground: N.B.—Fla.—Utah—Calif.—B.C.; adv. from Eu.

15. STACHYS (Tourn.) L. HEDGE NETTLE.

Annual or perennial herbs, ours with rootstocks. Leaves opposite, in ours petioled and toothed. Flowers perfect, in axillary clusters, sometimes approximate, forming leafy spikes. Calyx mostly campanulate, 5-10-ribbed, 5-lobed. Corolla purple, pink, or white, 2-lipped; upper lip erect, entire or notched; lower lip spreading, 3-lobed; middle lobe largest, often 2-lobed. Stamens 4; anthers all fertile, 2-celled; anther-sacs divergent or parallel; filaments naked. Nutlets obtuse, not truncate at the apex, smooth.

Leaves and the angles of the stem coarsely hispid.

Leaves and stem softly pubescent.

Lateral lobes of the lower corolla-lip large, half as broad and three-fourths as long as the middle one.

Lateral lobes of the lower corolla-lip small, scarcely half as long as the middle one.

Stem glabrous below; leaves short-pubescent or glabrate.

Stem pubescent throughout; leaves loosely villous.

Leaves oblong-ovate or cordate; corolla 12-15 mm. long; calyx lobes almost equalling the calyx-tube.

Leaves oblong-lanceolate; corolla 10-12 mm. long; calyx-lobes decidedly shorter than the calyx-tube.

1. *S. asperrima*.

2. *S. ampla*.

3. *S. Leibergii*.

4. *S. teucriformis*.

5. *S. scopulorum*.

1. *S. asperrima* Rydb. Stem stout, 4-6 dm. high, coarsely hispid on the angles, with spreading or reflexed hairs; leaves nearly sessile, oblong, elliptic, or oblong-lanceolate, 5-8 cm. long, coarsely crenate, hispid above, hispid on the veins and also puberulent beneath; corolla purplish, 10-12 mm. long, puberulent, and more or less hirsute on the lips outside. Valleys: Utah. *Son.* Jl.

2. *S. ampla* Rydb. Stem 5-7 dm. high, softly hirsute and more or less viscid; leaves ovate to lanceolate, 5-10 cm. long, sessile or nearly so, crenate-serrate, softly pubescent on both sides; corolla rose-colored or pink, about 15 mm. long, somewhat puberulent without. Meadows: Black Hills, S.D. *Submont.* Au.

3. *S. Leibergii* Rydb. Stem 3-6 dm. high, sharply angled, glabrous below, softly hirsute above; leaves sessile, lanceolate, 4-8 cm. long, crenate-dentate, pubescent on both sides with short appressed hairs or in age glabrate; corolla about 12 mm. long, rose-colored, glabrous. Low meadows: Ida.—B.C. *Submont.* Jl—Au.

4. *S. teucriformis* Rydb. Stem 4-6 dm. high, glandular-villous; lower leaves short-petioled, the upper sessile; blades 5-10 cm. long, crenate, pubescent on both sides; corolla light rose, with reddish-purple veins and blotches. Wet meadows: Colo.—Wyo. *Submont.* Jl—Au.

5. *S. scopulorum* Greene. Stem 3-6 dm. high, softly hirsute with spreading hairs and more or less glandular; leaf-blades serrate, 5-10 cm. long, softly pubescent on both sides; corolla rose, lilac, or purplish, blotched. Wet meadows: Minn.—N.M.—Utah—Wash.—Mack. *Plain—Submont.* Jl—S.

16. GALEOPSIS L. HEMP NETTLE.

Annual herbs. Leaves opposite, petioled. Flowers perfect, in several axillary verticils. Calyx 5-ribbed, with 5 subequal lobes. Corolla dilated at the throat; upper lip ovate, arched, entire; lower lip 3-cleft, with an obcordate middle lobe; palate with 2 teeth at the sinuses. Stamens 4; anthers all 2-celled. Nutlets ovoid, slightly flattened, smooth.

1. *G. Tetrahit* L. Stem 3-10 dm. high, swollen below the nodes; leaf-blades ovate, coarsely serrate, 5-15 cm. long; corolla purple or pink, variegated with white, 15-25 mm. long, twice as long as the calyx. Waste places: Newf.—N.C.—(Black Hills) S.D.—Alaska; nat. or adv. from Eu. Je—S.

17. PYCNOSPHERE (Benth.) Rydb. THISTLE SAGE, CHIA.

Annual herbs. Leaves opposite, mainly basal, pinnately lobed. Flowers perfect, capitate-verticillate, with persistent, spinulose-toothed bract-like floral leaves. Calyx 2-lipped; upper lip incurved, 3-toothed; lower lip 2-parted; teeth spinulose-aristate. Corolla open; tube pilose-annulate inside; limb 2-lipped; upper lip 2-lobed. Stamens separate, remote from the upper lip; lower branch of the long filiform appendaged connective carrying a pollen-bearing anther-cell. Nutlets smooth.

1. *P. Columbariae* (Benth.) Rydb. Winter annual; stem 1-5 dm. high, retrorsely strigose or hispidulous, leafy below; leaves petioled, deeply once or twice pinnatifid into oblong crenate obtuse divisions, rugose, strongly veined beneath, anescent-hirsutulous; floral leaves and bracts broadly ovate, entire, abruptly acuminate, spinulose, puberulent, often purplish; corolla blue, 8-10 mm. long, slightly exceeding the calyx. *Salvia Columbariae* Benth. Hillsides and sandy plains: Calif.—Utah—Ariz. *Son.* Mr—Jl.

18. *SÁLVIA* (Tourn.) L. SAGE.

Annual or perennial herbs (ours), or rarely shrubby plants. Leaves opposite, sometimes mostly basal, entire, toothed, or lobed. Flowers perfect, in axillary clusters, disposed in spikes, racemes, or panicles. Calyx 2-lipped; upper lip 3-toothed; lower lip with 2 longer and narrower lobes. Corolla strongly 2-lipped, upper lip arched; lower lip longer, spreading, with 3 lobes. Stamens 4, but only 2 anther-bearing, or sometimes only 2; lower branch of the connective deflexed, destitute of an anther-cell. Nutlets smooth.

Corolla 15–30 mm. long; tube exserted.

1. *S. Pitcheri*.

Corolla 8–12 mm. long; tube included in the calyx.

2. *S. lanceolata*.

1. *S. Pitcheri* Torr. Stem 4–12 dm. high, finely retrorsely strigose; leaves short-petioled, linear-lanceolate or linear, 3–12 cm. long, toothed or entire, strigillose; calyx densely canescent, 6–8 mm. long; upper lip barely pointed; corolla blue or white; upper lip densely bearded on the back. Dry plains and prairies: Neb.—Mo.—Tex.—Colo. *Plain*. J1-S.

2. *S. lanceolata* Willd. Perennial; stem puberulent, erect, branched, 1–4 dm. high; leaf-blades oblong-lanceolate to oblong or linear, 2–8 cm. long, remotely serrate or undulate or entire, puberulent or glabrate; calyx 7–8 mm. long, puberulent; upper lip abruptly pointed; corolla purplish; upper lip minutely puberulent. Prairies, plains, and hillsides: S.D.—Tex.—N.M.—Mont.; Mex. *Plain*—*Submont*. My-S.

19. *AUDIBERTÉLLA* Briq. BALL SAGE.

Perennial, mostly suffruticose herbs, usually more or less canescent. Leaves opposite, short-petioled, crenate or crenulate. Flowers perfect, in bracteate axillary verticils. Calyx 2-lipped, deeply cleft in front, sometimes oblique. Corolla 2-lipped; upper lip spreading, 2-lobed or emarginate; lower lip spreading, 3-lobed. Fertile stamens 2; filaments slender, either simple or articulate above, but bearing a single anther-cell. Nutlets smooth. [*Audibertia* Benth.]

Leaf-blades oblong-spatulate; lower lip of the corolla much longer than the upper.

1. *A. incana*.

Leaf-blades rounded obovate-spatulate; lower lip of the corolla slightly longer than the upper.

2. *A. argentea*.

1. *A. incana* (Benth.) Briq. Branches grayish puberulent; leaves short-petioled, 2–4 cm. long; blades oblong-spatulate, scurfy-canescens, obtuse, entire; bracts obovate or oval, canescent and ciliate, about 1 cm. long; corolla about 15 mm. long. *Audibertia incana* Benth. Hillsides: Wash.—Ida.—Ore. *Submont*.

2. *A. argentea* Rydb. Branches cinereous-puberulent; leaves petioled, 1–2 cm. long; blades rounded, obovate-spatulate, scurfy-cinereous, at first silvery white; bracts broadly obovate, membranous, strongly veined, puberulent and ciliate; corolla blue, about 1 cm. long. Dry hills: Utah—Ariz.—Calif.—Nev. *Son*. Ap-Je.

20. *MONÁRDA* L. HORSE MINT, WILD BERGAMOT, LEMON MINT.

Perennial or annual, caulescent herbs. Leaves opposite, petioled, with broad usually toothed blades. Flowers perfect, in dense, remote or contiguous, axillary clusters. Calyx tubular or nearly so, mostly pubescent in the throat, 15-ribbed, nearly regularly 5-lobed. Corolla 2-lipped; throat dilated; upper lip narrow, erect or arched, entire or notched; lower lip spreading, 3-lobed, the middle lobe much the larger. Anther-bearing stamens 2, and with 2 or no rudimentary filaments; anthers narrow, 2-celled, versatile; sacs divergent. Nutlets smooth.

Heads solitary at the ends of the stem and branches; stamens conspicuously exceeding the acute upper lip of the corolla.

Petioles and stem more or less hirsute-villous, the latter especially so under the nodes.

Leaves sparingly pilose; stem and petioles hirsute-ciliate.

1. *M. comata*.

Leaves softly pubescent, especially below; stem, petioles, and the veins of the leaves lanate.

2. *M. Ramaleyi*.

Whole plant finely strigose or puberulent.

Petioles seldom over 5 mm. long.

Leaf-blades ovate-cordate; plant pale, more or less cinereous.

Leaf-blades lanceolate, with rounded or truncate base; plant green.

Petioles 1-3 cm. long.

Heads or verticillate glomerules several in the upper axils of the leaves; stamens scarcely exceeding the emarginate or cleft upper lip of the corolla.

3. *M. menthaefolia*.

4. *M. stricta*.

5. *M. mollis*.

6. *M. pectinata*.

1. **M. comata** Rydb. Stem 4-6 dm. high, simple; lower leaves with petioles, which are about 1 cm. long, the upper subsessile; blades ovate or lance-ovate, more or less cordate at the base, serrate, 4-6 cm. long, sparingly silky-pilose on both sides; corolla red-purple, almost wine-color, densely villose-puberulent. Hillsides: Colo. *Submont.* Jl-Au.

2. **M. Ramaleyi** A. Nels. Stem 3-6 dm. high, glabrate below, softly lanately white-pubescent upwards; leaf-blades lanceolate or ovate-lanceolate, rounded or truncate at the base, sharply serrate; corolla lilac-purple, softly pubescent. Sandy soil: Colo. *Submont.* Je.

3. **M. menthaefolia** Benth. Stem 3-10 dm. high, finely puberulent; leaf-blades short-petioled or the upper subsessile, ovate or ovate-lanceolate, at least the lower cordate at the base, more or less cinereous, with short pubescence; corolla rose or lilac, 2-2.5 cm. long. Hillsides and valleys: Sask.—Man.—Ill.—Tex.—Utah—Ida.—Alta. *Plain—Mont.* Je—Au.

4. **M. stricta** Wooton. Stem 3-6 dm. high, slender, minutely pubescent; leaf-blades ovate or deltoid-lanceolate, 4-6 cm. long, acuminate, sharply serrate, minutely pubescent on both sides or glabrate above; corolla bright purple. Hillsides: Wyo.—N.M.—Ariz. *Submont.* Jl-S.

5. **M. mollis** L. Stem 3-10 dm. high, finely pubescent; leaf-blades elongate deltoid-lanceolate, sharply serrate, 2-5 cm. long, finely puberulent, often paler beneath; corolla lilac, about 2.5 cm. long. Prairies and among bushes: Me.—Ga.—Tex.—B.C. *Plain—Submont.* Je—Au.

6. **M. pectinata** Nutt. Annual or perennial (?), with a taproot; stems simple or branched at the base, 2-4 dm. high, canescent-strigose; leaf-blades lanceolate or oblanceolate, distantly serrulate, minutely strigillose or glabrate, ciliate on the margins, densely punctate, 2-4 cm. long; bracts 12-16 mm. long, green or purplish, lanceolate or oblong, spinulose-cuspidate; corolla yellowish white, 15-18 mm. long, puberulent. *M. citriodora* Coult. *M. Nuttallii* A. Nels. Plains, especially in sandy soil: Neb.—Tex.—Ariz.—Utah. *Plain—Submont.*

21. POLIOMINTHA A. Gray.

Low suffruticose canescent plants. Leaves opposite, entire. Flowers perfect, in small axillary cymes or glomerules, the floral leaves often reduced and bract-like. Calyx cylindric, 13-15 striate, bearded in the throat, equally 5-toothed. Corolla 2-lipped, with two hairy rings in the throat; upper lip erect, emarginate; lower lip spreading, 3-cleft, the middle broad lobe emarginate. Anther-bearing stamens 2; posterior filaments rudimentary, subulate.

1. **P. incana** (Torr.) A. Gray. Low shrub, 3-6 dm. high; branches silvery white, with fine tomentum, erect; leaves linear or oblong, 5-20 mm. long, sessile, white-tomentulose; calyx 15-nerved, white-villous, 6 mm. long; corolla about 1 cm. long, rose or purplish. Sand hills: w Tex.—s Colo.—s Utah—Ariz.; Mex. *Son.* Ap—Au.

22. HEDEOMA Pers. MOCK PENNYROYAL.

Annual or perennial herbs, usually aromatic. Leaves opposite, small, entire or sparingly toothed. Flowers perfect, in remote or contiguous axillary clusters. Calyx 13-ribbed, commonly gibbous at the base, pubescent in the more or less constricted throat, somewhat 2-lipped, the 2 lower calyx-lobes being different and usually longer than the 3 upper ones. Corolla blue or purple, 2-lipped; throat but little enlarged; upper lip erect, entire or 2-lobed; lower lip 3-lobed and spreading. Stamens 4, or usually only 2 fertile, the other with much reduced filaments or wanting. Nutlets smooth.

Calyx-teeth about equal in length; bracts spreading or reflexed, hispid-ciliate.

Calyx-teeth of the lower lip much longer than those of the upper; bracts mostly erect, cinereous-hispidulous.

Corolla 10-12 mm. long, more than half longer than the calyx. 2. *H. camporum*.

Corolla 6-8 mm. long, slightly exceeding the calyx.

Floral leaves longer than the subtended calyces; plant 1.5-4 dm. high.

Floral leaves scarcely exceeding the subtended calyces; plant 1-1.5 dm. high.

Leaf-blades oval or elliptic, distinctly petioled.

Blades of the floral leaves oblong to linear.

3. *H. sancta*.

4. *H. thymoides*.

5. *H. ovata*.

1. *H. hispida* Pursh. Annual; stem 1-2 dm. high, hispidulous; leaves linear, entire, thickish, hispid-ciliate; upper calyx-teeth subulate, the lower more aristiform, equalling the bluish corolla, 6 mm. long. Sandy soil: Sask.—Wis.—Ky.—Colo.—Alta. *Plain*. My-Jl.

2. *H. camporum* Rydb. Perennial, with a slender taproot; stems branched at the base, decumbent or ascending, finely puberulent; leaves spreading, linear-lanceolate, lanceolate, or oblong, 1-2 cm. long, grayish-puberulent, subsessile; calyx 7-8 mm. long, somewhat saccate below; teeth subulate, the lower 2 mm., the upper 1 mm. long; corolla puberulent, with an ample limb. *H. longiflora* Rydb., not Briq. Cañons: S.D.—Kans. *Plain*.

3. *H. sancta* Small. Annual or perennial; stem erect, branched, cinereous-puberulent; leaf-blades oval, oblong, or linear-oblong, 1-1.5 cm. long, entire, slightly revolute, short-petioled; calyx 5-6 mm. long, hispidulous; tube somewhat saccate; lobes subulate, the lower about twice as long as the upper; corolla puberulent. Dry plains: Tex.—Colo.—N.M. *Plain*—*Submont*. Ap-Jl.

4. *H. thymoides* A. Gray. Perennial, with a taproot; stem branched at the base, finely puberulent; leaf-blades ovate or elliptic, 6-10 mm. long, short-petioled, canescent-puberulent; calyx about 5 mm. long, hispidulous; teeth subulate, the lower slightly longer than the upper; corolla 6-7 mm. long. *H. nana* Rydb., in part. Mountain sides: N.M.—Colo.—Utah—Ariz. *Son*.—*Submont*. Ap.

5. *H. ovata* A. Nels. Perennial, with a taproot; stem branched at the base, divaricate, puberulent, 1-2 dm. high; blades of lower leaves oval or elliptic, 7-15 mm. long; floral leaves linear; calyx about 5 mm. long; lower teeth a little longer than the upper; corolla barely exceeding the calyx. *H. Drummondii* Coult., in part. *H. nana* Rydb., in part. Hills: Mont.—Colo.—Utah. *Submont*. Je-Jl.

23. CLINOPÏDIUM L. BASIL.

Annual or perennial herbs or rarely shrubs. Leaves opposite, entire or toothed, narrow or broad. Flowers in ours in dense axillary clusters subtended by linear-filiform bracts. Calyx 13-ribbed, often swollen at the base; upper lip with 3 short lobes; lower lip with 2 longer lobes. Corolla 2-lipped, abruptly ciliated at the throat; upper lip erect; lower lip spreading, 3-lobed. Stamens 4, all anther-bearing; anther 2-celled, awnless. Nutlets smooth.

1. *C. vulgare* L. Perennial, with a rootstock; stem 1-5 dm. high, simple or nearly so, sparingly hairy; leaf-blades oval or ovate, 1-4 cm. long, obtuse, undulate or crenate; calyx 8-9 mm. long, villous-hirsute, ribbed; lobes subulate-aristate; corolla white or purple, 10-12 mm. long. Thickets and waste places: N.S.—N.C.—Colo.—Man.; nat. or adv. from Eu. *Plain*—*Mont*. Je—Au.

24. MADRONÉLLA Greene. FALSE HORSE-MINT, WESTERN PENNYROYAL, MUSTANG MINT.

Aromatic caulescent perennials. Leaves mostly short-petioled, opposite, entire or dentate. Flowers perfect, in dense terminal or axillary verticillate heads, subtended by broad membranous or colored bracts. Calyx tubular, narrow, 15-nerved, with 5 equal teeth. Corolla 2-lipped; upper lip entire, flat, linear or oblong; lower lip 3-cleft, with linear divisions. Stamens 4, anther-bearing, unequal, exserted; anther-sacs 2, divergent. [*Monardella* Benth., in part.]

Bracts thin and pale, oval to orbicular; leaves usually entire.

Leaves tomentulose, especially beneath.

Leaves sparingly and minutely puberulent or glabrous.

Calyces and bracts 8–12 mm. long.

Stem stout; leaves subsessile, ovate.

Stems slender; leaves distinctly petioled, oblong.

Calyces and bracts about 6 mm. long.

Bracts thick, resembling the leaves, lanceolate or ovate-lanceolate, obtuse; leaves usually dentate.

1. *M. odoratissima*.

2. *M. sessilifolia*.

3. *M. oblongifolia*.

4. *M. parvifolia*.

5. *M. dentata*.

1. *M. odoratissima* (Benth.) Greene. Stems decumbent at the base, more or less grayish pilose, with short hairs; leaves oblong or lance-oblong, subsessile or the lower short-petioled, 2–3 cm. long; bracts oval, densely pilose and ciliate on the margins, 8–10 mm. long; calyx-lobes narrowly lanceolate, strongly ciliate; corolla about 12 mm. long. *Monardella odoratissima* Benth. Mountains: Ore.—Wash.—Ida. *Submont.* Jl—Au.

2. *M. sessilifolia* Rydb. Stems stout, about 3 dm. high, finely puberulent; leaves entire, obtuse, rather pale; bracts oval, 10–12 mm. long, puberulent on the back, ciliate on the margins; calyx-lobes lanceolate, about 1 mm. long; corolla 12–13 mm. long, pubescent. Dry hills: s Utah. *Son.*

3. *M. oblongifolia* Rydb. Stems 1–3 dm. high; leaf-blades oblong, 1–3 cm. long, entire, obtuse; bracts pale or tinged with rose, finely puberulent, ciliate on the margins, oval; calyx-teeth lanceolate, and strongly ciliate; corolla white to rose-colored, 12–14 mm. long, puberulent. *M. purpurea* A. Nels., in part. Dry mountain sides: Utah—Nev.—Ida. *Submont.*—*Mont.* Jl—Au.

4. *M. parvifolia* (Greene) Rydb. Stems many, decumbent at the base, puberulent; leaf-blades ovate-lanceolate or oblong-lanceolate, obtuse, entire, 1–1.5 cm. long; bracts slightly rose-tinged, puberulent, ciliate-margined; calyx-lobes lanceolate, not conspicuously ciliate; corolla lilac-purple, scarcely 1 cm. long. *Monardella parvifolia* Greene. Cañons: Colo. *Submont.* Jl—Au.

5. *M. dentata* Rydb. Stems slender, light brown, about 3 dm. high; leaves short-petioled; blades ovate, 1.5–2 cm. long, serrate-dentate, finely pubescent and strongly punctate, obtuse, strongly veined beneath; calyx about 8 mm. long, grayish pubescent; lobes lanceolate; corolla about 12 mm. long. Mountains: Colo. *Submont.*

25. MICROMÈRIA Benth. TEA-VINE, YERBA BUENA.

Perennial herbs or somewhat shrubby plants, often with creeping stems. Leaves opposite, entire or sparingly toothed, petioled. Flowers perfect, either solitary or in small clusters in the axils. Calyx nearly tubular, 13-ribbed, slightly 2-lipped, but the 5 teeth nearly equal. Corolla small, 2-lipped; upper lip erect, usually very small; lower lip 3-lobed, with the middle lobe often notched. Stamens 4, anther-bearing; anthers 2-celled, with divergent sacs. Nutlets smooth.

1. *M. Chamissonis* (Benth.) Greene. Stem decumbent, trailing or creeping, 2–5 dm. long, finely puberulent; leaf-blades broadly ovate or rounded, crenate or entire, 1–3 cm. long, slightly puberulent or glabrate; calyx naked in the throat, 4 mm. long; corolla about 1 cm. long. *M. Douglasii* Benth. Woods: B.C.—Ida.—Calif. *Submont.* My—Au.

24. LYCOPUS (Tourn.) L. WATER HOREHOUND, BUGLE WEED.

Perennial caulescent herbs, mostly odorless, often stoloniferous. Leaves opposite, entire, toothed, or pinnatifid. Flowers perfect, in remote axillary verticils. Calyx regular or nearly so, 4- or 5-toothed. Corolla funnelform or campanulate; lobes 4, nearly equal, or one of them broader. Anther-bearing stamens 2, with or without 2 additional rudimentary filaments. Anther-sacs 2, parallel. Nutlets 3-angled, truncate, smooth.

Calyx-teeth ovate, obtusish, shorter than the nutlets.

Calyx-teeth lanceolate or subulate, acute or acuminate, longer than the nutlets.

Stem and lower surface of the leaves densely and finely pubescent, the former often velvety.

1. *L. communis*.

2. *L. velutinus*.

Stem sparingly and coarsely pubescent or glabrous; leaves glabrous or nearly so.

Leaves merely coarsely serrate.

Leaves tapering at the base, rather thin.

Leaves rounded at the base, thicker.

Leaves sinuately pinnatifid.

3. *L. lucidus*.

4. *L. asper*.

5. *L. americanus*.

1. ***L. communis*** Bickn. Rootstock tuberous-thickened at the base of the stem; stem 1-8 dm. high, acutely angled; leaves 2.5-8 cm. long, lanceolate or oblong-lanceolate, sharply serrate; calyx campanulate; corolla 2-3 mm. long; lobes spreading. Wet places: Newf.—Va.—Neb.—Ore.—B.C. *Plain—Submont.* Au—S.

2. ***L. velutinus*** Rydb. Stem 3-5 dm. high; leaf-blades lance-elliptic, coarsely toothed, 4-10 cm. long, short-petioled; calyx campanulate, copiously pubescent, 2.5 mm. long; lobes lanceolate, acuminate, the upper two recurved; corolla 3.5 mm. long, glandular-punctate. Low ground and swamps: Colo.—Tex.—Miss.—Ark. *Son.* Au.

3. ***L. lucidus*** Turcz. Stem stout, strict, 3-9 dm. high, sparingly pubescent on the angles; leaves oblong-lanceolate, sessile or short-petioled, 5-15 cm. long, sharply serrate; calyx-teeth subulate-lanceolate, nearly as long as the tube; corolla little longer than the calyx. Wet soil, especially in thickets: Neb.—Kans.—Ariz.—Calif.—B.C.; Asia. *Plain—Submont.* Jl—S.

4. ***L. asper*** Greene. Stem 3-6 dm. high, obtusely angled; leaves firm, narrowly lanceolate, acute, sessile, strongly serrate, 4-6 cm. long, very veiny, rough on both sides; calyx-teeth ovate-lanceolate, acuminate. Wet places: w Ont.—Neb.—B.C. *Plain.* Jl—Au.

5. ***L. americanus*** Muhl. Stem sharply angled, puberulent or glabrous, 1-10 dm. high; leaves lanceolate in outline, petioled, acuminate, pinnatifid or incised, 3-10 cm. long; calyx-teeth triangular-subulate, cuspidate, rigid; corolla little exceeding the calyx. *L. sinuatus* Ell. Swamps and wet meadows: Newf.—Fla.—Calif.—B.C. *Plain—Submont.* Je—O.

26. **MÉNTHA** (Tourn.) L. MINT, SPEARMINT, PEPPERMINT.

Aromatic caulescent perennial herbs, with rootstocks. Leaves opposite, punctate, toothed, usually petioled. Flowers perfect, in dense, axillary clusters. Calyx campanulate, 10-ribbed, regular or nearly so, 5-lobed. Corolla funnel-form or campanulate, nearly regular; lobes 4, the upper larger than the rest. Stamens 4, anther-bearing, erect; anther-sacs 2, parallel. Nuts smooth.

Whorls of flowers forming terminal spikes.

1. *M. spicata*.

Whorls of flowers all axillary.

Stem and petioles densely pubescent with long villous hairs; leaves decidedly pubescent.

2. *M. lanata*.

Stem and petioles retrorsely strigose or crisp-hairy with short hairs, or glabrous below; leaves sparingly puberulent or glabrous.

Corolla 5-6 mm. long, open-funnelform; bracts lanceolate or linear-lanceolate, usually exceeding the flower-clusters; leaves dark green, not strongly veined.

3. *M. occidentalis*.

Corolla 4-5 mm. long, salver-shaped-funnelform; bracts linear or subulate, shorter than the flower-clusters.

Leaf-blades thin, dark green, not strongly veined, tapering gradually into slender petioles, which equal or exceed the flower-clusters.

4. *M. glabrior*.

Leaf-blades thick, strongly veined, abruptly contracted into short petioles, which are much shorter than the flower-clusters.

Plant pale green, stout, 4-8 dm. high; calyx-teeth much longer than broad.

5. *M. Penardi*.

Plant usually purplish, low, 2-4 dm. high; calyx-teeth scarcely longer than broad.

6. *M. rubella*.

1. ***M. spicata*** L. Stem erect, 3-5 dm. high, glabrous; leaves lanceolate, sessile or nearly so, sharply serrate, 3-7 cm. long; spikes 5-10 cm. long; bracts subulate-lanceolate, ciliate; calyx-teeth subulate; corolla glabrous. *SPEARMINT.* Fields and waste places: N.S.—Fla.—Kans.—Minn.; Calif.—Utah—B.C.; nat. from Eu. *Plain—Submont.* Jl—S.

2. ***M. lanata*** (Piper) Rydb. Stem 3-6 dm. high; leaves short-petioled, lanceolate or ovate, serrate, 2-7 cm. long, more or less pilose above, villous beneath; bracts subulate, about equalling the flowers; calyx 2.5-3 mm. long,

villous; teeth lanceolate; corolla pink or rose-colored, rarely white, pubescent. Wet places: B.C.—Ida.—Calif. *Submont.* Je—Au.

3. *M. occidentalis* Rydb. Stem 3–6 dm. high; leaf-blades ovate or ovate-lanceolate, short-acuminate, strongly serrate, 4–8 cm. long, minutely pubescent on both sides or in age glabrate; calyx about 3 mm. long, pilose; teeth lanceolate, acute or acuminate, longer than broad; corolla white or pink, its lobes oblong, obtuse. Wet places: Wash.—Alta.—Ida. *Submont.* Jl—Au.

4. *M. glabrior* (Hook.) Rydb. Stem 3–6 dm. high, glabrate or minutely puberulent on the angles; leaf-blades ovate, elliptic or lanceolate, acute, serrate, glabrous or nearly so; calyx 3 mm. long, finely pubescent; lobes triangular-lanceolate, acuminate, slightly longer than broad; corolla narrowly campanulate, 4 mm. long. *M. canadensis glabrata* Benth. Wet places: Me.—Pa.—Colo.—Mont. *Plain—Submont.* Jl—Au.

5. *M. Penardi* (Briq.) Rydb. Stem 2–4 dm. high, short-pubescent especially on the angles; leaf-blades ovate-elliptic or ovate-lanceolate, 2–5 cm. long, serrate, acute; calyx about 3 mm. long, softly pilose; teeth lanceolate, acute; corolla usually pink, 4 mm. long. Wet places, among bushes: Neb.—N.M.—Utah—B.C.—Mack. *Submont.* Je—Au.

6. *M. rubella* Rydb. Stem 1–2 dm. high, more or less purple, finely puberulent, with short retrorse hairs; leaf-blades ovate, 1–3 cm. long, finely puberulent and glandular-punctate, finely serrate; calyx 2–2.5 mm. long, puberulent; teeth triangular-lanceolate, acuminate; corolla 4–5 mm. long, light rose. Wet places, especially around hot springs: B.C.—Alta.—n Wyo. *Submont.—Mont.* Jl—Au.

FAMILY 116. **SOLANACEAE.** POTATO FAMILY.

Herbaceous plants or rarely shrubs, with narcotic or stimulant properties. Leaves alternate, without stipules. Flowers perfect, usually regular. Calyx of 5 (rarely 4 or 6) more or less united sepals, mostly persistent. Corolla hypogynous, rotate, campanulate, funnelform, or salverform; limb mostly lobed. Stamens 5, rarely 4 or 6, fertile; filaments adnate to the tube of the corolla and alternate with its lobes; anthers introrse, opening lengthwise or by pores. Gynoecium usually of 2, rarely 3–5, united carpels; ovary 2- (rarely 3–5-) celled; style terminal; stigma entire. Ovules and seeds numerous, amphitropous. Fruit a berry or capsule. Seeds crustaceous, often tuberculate, flattened; endosperm copious, fleshy.

Fruit a berry.

Corolla plicate; lobes usually induplicate; all our species herbs or vines.

Calyx inflated and bladder-like in fruit.

Corolla open-campanulate, yellow or whitish, often with a darker center; seeds finely pitted; flowers nodding in anthesis. 1. **PHYSALIS.**

Corolla rotate, violet or purple; seeds rugose-tuberculate; flowers erect in anthesis. 2. **QUINCULA.**

Calyx not bladder-like inflated in fruit.

Calyx closely investing the berry.

Stamens alike, not inclined; low unarmed perennials. 3. **CHAMAESARACHA.**

Stamens dissimilar, declined; prickly annuals. 4. **ANDROCERA.**

Calyx not inclosing the berry.

Anthers short, opening by a terminal pore or short slit. 5. **SOLANUM.**

Anthers long, tapering to the summit, opening longitudinally.

6. **LYCOPERSICON.**

7. **LYCIUM.**

Corolla little if at all plicate; its lobes valvate; shrubs.

Fruit a capsule.

Capsule circumscissile near the top, which separates as a lid; corolla irregular.

8. **HYOSCYAMUS.**

Capsule opening by valves; corolla regular.

Capsule prickly; seeds flat.

9. **DATURA.**

Capsule not prickly; seeds scarcely flattened.

10. **NICOTIANA.**

1. PHYSALIS L. GROUND CHERRY, STRAWBERRY TOMATO, TOMATILLO.

Annual or perennial herbs. Leaves alternate, entire or sinuately toothed. Pedicels usually solitary from the axils of the leaves. Calyx campanulate, 5-lobed, accrescent and becoming bladder-like in fruit, 5-angled or prominently

10-ribbed. Corolla yellow or whitish, campanulate or funnelform, often with a darker, brownish or purplish center, plicate in the bud. Stamens adnate to the base of the corolla; anther-sacs opening by longitudinal slits. Stigma minute. Seeds numerous, kidney-shaped, flattened, finely pitted.

Annuals, with branching roots; fruiting calyx cordate-ovoid, acuminate, strongly 5-angled. Leaves very oblique, cordate, sinuate-dentate; fruiting calyx ovoid.

Leaves orbicular or broadly ovate, sinuately crenate, scarcely cordate and scarcely oblique at the base. 1. *P. pruinosa*.
2. *P. neomexicana*.

Perennials, with horizontal rootstocks or rarely with woody caudices.

Pubescence if any not stellate, although in *P. pumila* with some branched hairs.

Leaves and stem glabrous or the veins of the former and the upper part of the latter with scattered appressed hairs.

Leaves ovate, ovate-lanceolate, or oval.

Leaves lanceolate, oblanceolate, or linear.

Leaves and stem more or less pubescent with spreading hairs.

Pubescence sparse, consisting of flat, sometimes jointed hairs, scarcely viscid.

Fruiting calyx ovoid, scarcely angled and scarcely sunken at the base; leaves thick, oblanceolate or spatulate to rhombic, subentire.

Leaves oblanceolate or spatulate; hairs all simple.

Pubescence very short; leaves narrowly oblanceolate.

Pubescence long; leaves spatulate.

Leaves broader, often rhombic; hairs on the lower surface branched.

Fruiting calyx pyramidal-ovoid, obtusely 5-angled and deeply sunken at the base; leaves ovate to lanceolate, generally more or less toothed.

Pubescence dense, viscid, partly of fine and short, partly of long flat, jointed hairs.

Leaves large; blades over 5 cm. long, more or less cordate; long flat hairs numerous.

Leaves smaller; blades less than 5 cm. long; long flat hairs few, mostly confined to the calyx.

Plant erect or ascending.

Leaf-blades reniform or rounded-cordate, coarsely-sinuately toothed.

Leaf-blades rounded-ovate or rhombic.

Plant prostrate, diffuse; leaf-blades nearly orbicular.

Pubescence fine, grayish, at least in part stellate.

1. *P. pruinosa* L. Stem stout, finely villous and somewhat viscid, erect or spreading, 3-6 dm. high; leaf-blades 3-10 cm. long, finely pubescent, sinuately toothed; calyx viscid, in fruit 2-3 cm. long, sunken at the base; corolla 3-8 mm. in diameter; berry yellow or green. Cultivated ground and waste places: Mass.—Fla.—Tenn.—Ia.; adv. in Colo. *Plain*. JI-S.

2. *P. neomexicana* Rydb. Stem stout, obtusely angled, finely pubescent and slightly viscid, 3-6 dm. high, erect; leaf-blades 3-5 cm. long, rounded or truncate, finely pubescent; calyx finely pubescent, sharply angled, deeply sunken at the base; teeth lanceolate, acuminate. Loose soil: N.M.—Colo.—L. Calif. *Son.* Je-Au.

3. *P. subglabrata* Mack. & Bush. Stem 3-9 dm. high; leaf-blades 3-7 cm. long, entire or undulate, glabrous or very sparingly strigose; calyx strigose, in fruit ovoid, reticulate, 2.5-3 cm. long; corolla yellow, with darker center, 1-1.5 cm. broad. River valleys, sandy or cultivated ground: Ont.—Pa.—Ark.—Colo.—Ida. *Plain—Submont.* Je-S.

4. *P. longifolia* Nutt. Stem tall, 5-10 dm. high; leaf-blades entire-margined or somewhat repand; calyx glabrous or nearly so, in fruit ovoid, about 3 cm. long; corolla 1-2 cm. broad, yellow, with brownish center; berry yellow, the lower portion and the stipe glutinous. River valleys and rich soil: Ia.—Ark.—Ariz.—Mont.; Mex. *Plain—Submont.* My-Au.

5. *P. polyphylla* Greene. Stem erect, branched, 1.5-2.5 dm. high, angular, scabrous-puberulent; leaf-blades 2-4 cm. long, entire, scabrous-puberulent on the margins and veins; calyx sparingly puberulent, in fruit 2 cm. thick; corolla greenish yellow, with greenish center. Plains: Colo. *Plain—Submont.* JI.

6. *P. lanceolata* Michx. Stem 3-6 dm. high, erect or spreading, sparingly hirsute; leaf-blades acute or obtuse, entire or rarely wavy, thickish, sparingly short-hirsute; calyx hirsute or strigose; corolla dull-yellow, with brownish center,

about 1.5 cm. broad; berry yellow or greenish. Prairies and plains: Ill.—S.C.—Ariz.—S.D. *Plain—Submont.* Jl—S.

7. *P. pumila* Nutt. Stem 3–10 dm. high, obscurely angled, hirsute; leaf-blades thick, acute at both ends, 5–10 cm. long, entire or sinuate; calyx densely hirsute, 4–5 cm. long; corolla yellow, with brown center, 1.5–2 cm. broad. Prairies and river valleys: Ill.—Ark.—Tex.—Colo. *Plain—Submont.* My—Jl.

8. *P. virginiana* Mill. Stem 3–10 dm. high, erect, angular, more or less hirsute; leaf-blades 3–6 cm. long, hirsutulous; calyx hirsute or puberulent; corolla 1.5–2.5 cm. broad, sulphur-yellow, with purplish center; berry reddish. Prairies, river valleys, and cultivated ground: N.Y.—Fla.—Tex.—Mont. *Plain—Submont.* Ap—O.

9. *P. heterophylla* Nees. Stem 3–10 dm. high, erect or decumbent and spreading, puberulent and villous, viscid; leaf-blades 5–10 cm. long, usually broadly cordate, acute or acuminate, thick, more or less sinuately toothed, densely pubescent and very viscid; calyx viscid-villous, in fruit ovoid, somewhat angled and sunken at the base; corolla 1.5–2 cm. wide, yellow, with purple center; berry yellow. Cultivated ground, sandy or loose soil, etc.: N.B.—Fla.—Tex.—Utah—Sask. *Plain—Submont.* My—S.

10. *P. hederæfolia* A. Gray. Stem erect, rarely decumbent, 3–5 dm. high, finely viscid-pubescent; leaf-blades 3–5-ribbed, 3–5 cm. broad; calyx finely viscid-pubescent, in fruit ovoid, 5–10-angled, 2–3 cm. long, slightly sunken at the base; corolla about 1.5 cm. wide. Rocky hills and dry plains: Tex.—Colo.—Utah—s Calif.; Mex. *Son.* Ap—Au.

11. *P. comata* Rydb. Stem about 5 dm. high, finely short-pubescent and viscid, with a few scattered long hairs on the upper part; leaf-blades 3–5 cm. long, somewhat repand or entire, finely pubescent; calyx finely pubescent and villous, in fruit 3–4 cm. long, rounded-ovoid, scarcely sunken at the base; corolla greenish yellow, with brown center. Hillsides, cliffs, and dry plains: Neb.—Colo.—Tex. *Plain—Submont.* Jl—Au.

12. *P. rotundata* Rydb. Stem diffuse or spreading, dichotomously zigzag-branched, densely and finely viscid-pubescent; leaf-blades with truncate or subcordate base, 2–4 cm. broad, sinuate-dentate; fruiting calyx ovoid, scarcely angled, not sunken at the base; corolla 1.5 cm. broad, greenish yellow, with brownish center. Plains: S.D.—Tex.—N.M.—Colo. *Plain.* Jl—S.

13. *P. Fendleri* A. Gray. Stem 3–6 dm. high, finely puberulent, somewhat stellate, much branched; leaf-blades small, 1–4 cm. long, deltoid, lanceolate, ovate or somewhat cordate, sinuately toothed; calyx somewhat stellate and puberulent, in fruit rounded-ovoid, 2–3 cm. thick; corolla yellow, with brown center; berry yellow. Dry plains and rocky places: N.M.—Colo.—Utah—Ariz.; Mex. *Submont.* My—Au.

2. QUÍNCULA Raf.

Perennial scurfy-granuliferous perennials, with diffuse stems. Leaves alternate, sinuately lobed or pinnatifid, somewhat fleshy. Peduncles commonly in pairs from the axils of the leaves. Flowers perfect, regular, erect during anthesis. Calyx campanulate, accrescent and becoming bladder-like in fruit, 5-angled, reticulate, with 5 converging lobes. Corolla flat, rotate, pentagonal in outline, violet or purple. Anthers opening by longitudinal slits. Seeds comparatively few, flattened, kidney-shaped, rugose-tuberculate.

1. *Q. lobata* (Torr.) Raf. Stem low, spreading or prostrate; leaf-blades oblanceolate or spatulate to oblong, sinuately lobed or more or less pinnatifid, with rounded lobes; calyx in fruit sharply 5-angled, ovoid, sunken at the base; corolla purplish, 2–3 cm. broad. *Physalis lobata* Torr. High plains and bluffs: Kans.—Tex.—Ariz.; Mex. *Son.—Submont.* Ap—Au.

3. CHAMAESARACHA A. Gray.

Scurfy perennial herbs. Leaves alternate, entire or pinnatifid, with winged petioles. Peduncles solitary or 2 or 3 in the axils of the leaves. Calyx campanulate, 5-lobed, only slightly accrescent, not becoming bladder-like in fruit,

close-fitting to the berry. Corolla rotate, white or ochroleucous, often tinged with purple, plicate. Stamens 5; filaments adnate to the base of the corolla; anther opening by longitudinal slits. Seeds reniform, flattened, rugose-favose.

Pubescence dense, hirsute as well as puberulent.

1. *C. conioides*.

Pubescence sparse, puberulent or stellate, hirsute if at all only on the calyx.

2. *C. Coronopus*.

1. **C. conioides** (Moric.) Britton. Stems erect, decumbent, or prostrate, viscid; leaf-blades oblanceolate to obovate-rhombic, acute and tapering into short petioles, usually deeply lobed, varying from subentire to pinnatifid; calyx-lobes triangular, acutish; corolla about 1 cm. broad, white or ochroleucous. *C. sordida* (Dunal) A. Gray. Dry clayey soil: Kans.—Colo.—Ariz.—Tex.; Mex. Son. My-Jl.

2. **C. Coronopus** (Dunal) A. Gray. Stem obtusely angled; leaf-blades linear or lanceolate, sinuately lobed to pinnatifid, pruinose; calyx-lobes triangular, acute; corolla white or ochroleucous. Dry clayey soil: Kans.—Colo.—Ariz.—Tex. Son.—Submont. My-D.

4. ANDRÓSERA Nutt. BUFFALO BUR.

Annual prickly herbs. Leaves alternate, pinnatifid. Flowers perfect, cymose. Calyx campanulate, prickly, somewhat accrescent and enclosing the berry in fruit, 5-lobed. Corolla yellow or purple, 5-lobed, plaited. Stamens 5, dissimilar, declined, adnate to near the throat of the corolla; anthers narrow, opening by terminal pores. Ovary 2-celled. Fruit a berry, enclosed in the prickly calyx. Seeds flattened.

1. **A. rostrata** (Dunal) Rydb. Stem yellowish-hirsute and prickly, 2-7 dm. high, widely branching; leaf-blades 5-12 cm. long, once or twice pinnatifid; segments oval to oblong, obtuse, entire or undulate, yellowish hirsute; calyx bristly; corolla yellow, about 2.5 cm. broad. *Solanum rostratum* Dunal. Waste places, prairies, and river valleys: N.D.—Tex.—N.M.—Wyo.; Mex.; adv. eastward to N.H. and Fla. Plain—Submont. Mr-S.

5. SOLANUM (Tourn.) L. NIGHTSHADE, BITTERSWEET, POTATO, HORSE NETTLE.

Annual or perennial, often prickly, or most of ours unarmed herbs, rarely vines. Leaves alternate, entire, toothed or pinnatifid. Flowers perfect, regular, in cymes, racemes, umbels, or panicles. Calyx from campanulate to rotate; lobes 5. Corolla variously colored, rotate, 5-angled or 5-lobed, plicate. Stamens 5, adnate to near the throat of the corolla. Anthers narrow, converging or united into a cone; sacs opening by terminal pores, rarely lengthwise. Ovary mostly 2-celled. Fruit a berry, seated in the calyx. Seeds flattened.

Annuals.

Leaves pinnatifid.

1. *S. triflorum*.

Leaves sinuately dentate or entire.

Plant strigose or glabrous; berry black.

Leaves glabrous or nearly so; sepals very obtuse.

2. *S. nigrum*.

Leaves decidedly strigose beneath; sepals abruptly acutish.

Corolla-lobes 3-4 mm. long.

3. *S. interius*.

Corolla-lobes 6-8 mm. long.

4. *S. Douglasii*.

Plant more or less viscid-villous; berry greenish or yellowish.

5. *S. villosum*.

Perennials.

Plant green, glabrous or pubescent, but not stellate, never prickly.

Low plants with tuber-bearing rootstocks; leaves pinnately divided into 5-7 divisions.

6. *S. Jamesii*.

Tall plants, more or less woody below, not tuberiferous; leaves simple or pinnately 3-lobed.

Plant climbing; berry ellipsoid.

7. *S. Dulcamara*.

Plant not climbing; berry globose.

4. *S. Douglasii*.

Plant with stellate hairs; stem often prickly.

Leaves silvery-white, oblong to linear.

8. *S. elaeagnifolium*.

Leaves green, ovate, sinuately toothed.

9. *S. carolinense*.

1. **S. triflorum** Nutt. Stem branched at the base, spreading, 2-9 dm. long, sparingly hirsute; leaf-blades oblong or ovate in outline, pinnatifid, 3-9 cm. long; lobes acute, entire or toothed; calyx-lobes oblong or oblong-lanceolate;

corolla white, 8–10 mm. broad; berry globose, 10–15 mm. thick. Prairies, cultivated ground, waste places, "prairie-dog towns": w Ont.—Kans.—N.M.—Ariz.—B.C. *Plain*—*Mont.* Je-S.

2. *S. nigrum* L. Stem erect, branched, 1–12 dm. high; leaf-blades ovate or oblong-ovate, 2–8 cm. long, undulate to sinuately lobed; inflorescence umbelliform; calyx-lobes ovate or oblong-ovate; corolla white or bluish, about 1 cm. broad; lobes oblong or linear; berries subglobose, 5–8 mm. thick, black. Sandy soil, waste places: N.S.—Fla.—Tex.—Wash.; nat. or adv. from Eu. *Plain*. Mr-D.

3. *S. interius* Rydb. Stem 3–6 dm. high, usually with narrow denticulate margins or wings; leaf-blades deltoid or rhombic, 3–7 cm. long, acuminate, usually sinuately lobed or dentate, with acute or acuminate lobes or teeth; inflorescence corymbiform; calyx-lobes ovate, 2 mm. long; corolla yellowish white; lobes ovate, acute, 3–4 mm. long; berry greenish black, nearly 1 cm. in diameter. River valleys among bushes: Neb.—Kans.—N.M.—Ariz.—Utah. *Plain*—*Submont.* Je-Au.

4. *S. Douglasii* Dunal. Annual or perennial, and then more or less shrubby at the base; stem 1–3 m. high, denticulate on the angles, glabrous or strigose; leaf-blades ovate or somewhat hastate, 3–6 cm. long, sinuate-dentate, grayish strigose beneath; inflorescence corymbiform; calyx-lobes oblong, acute, erect in fruit; corolla white or often tinged with blue, puberulent, its lobes 6–8 mm. long; berry globose, black. Valleys: Calif.—Ore.—(? Colo.)—Ariz. Mr-S.

5. *S. villosum* Mill. Stem 3–10 dm. high, viscid-villous; leaves ovate or ovate-rhombic, coarsely sinuate-dentate, villous-hirsute, 2–5 cm. long; calyx-lobes triangular, acute; corolla white or greenish ochroleucous; lobes 2–3 mm. long; berry globose, yellow or greenish. Waste places and sandy soil: Wyo.—Colo.—L. Calif.—B.C.; adv. from the Old World. *Plain*—*Submont.* Jl-S.

6. *S. Jamesii* Torr. Stem 1–3 dm. high, erect, sparingly hairy or glabrous; leaves pinnately divided; divisions 5–7, lanceolate, subentire, 2–4 mm. long, glabrate, or with scattered hairs; inflorescence cymose; corolla white; lobes lanceolate, 7–8 mm. long. WILD POTATO. Mountains: Tex.—Colo.—Utah—Ariz.; Mex. *Son.*—*Submont.* Je-S.

7. *S. Dulcamara* L. Stem climbing or twining, 4–15 dm. long; leaf-blades ovate, 3–10 cm. long, acute or acuminate, undulate, entire or with a lobe or two on one or both sides at the base; calyx glabrous, its lobes triangular; corolla blue or white, about 1.5 cm. wide; lobes oblong-lanceolate, pubescent near the tips. BITTERSWEET. Thickets: N.B.—Fla.—Kans.—Ida.; adv. or nat. from Eu. Je-Au.

8. *S. elaeagnifolium* Cav. Perennial, with a caespitose caudex or rootstock; stem 3–11 dm. high, silvery stellate-canescens, often more or less prickly; leaf-blades oblong to linear, 5–15 cm. long, usually obtuse, undulate to deeply sinuate, silvery-stellate; calyx 5-ribbed; corolla violet or white, 2–2.5 cm. broad; berries globose, 1–1.5 cm. thick, yellow or black. Dry soil: Mo.—Tex.—Calif.; Mex. *Son.* My-O.

9. *S. carolinense* L. Stem erect, 3–6 dm. high, hirsute and prickly; leaf-blades mostly ovate, sinuately toothed or lobed, 1–2 dm. long, green, but rather densely stellate-pubescent, prickly on the petioles, midribs, and the stronger veins beneath; corolla blue, about 2 cm. in diameter; berry 1–1.5 cm. in diameter, globose. HORSE NETTLE. Sandy soil and waste places: Mass.—Fla.—Tex.—Neb.; adv. in Utah and Idaho. Je-S.

6. LYCOPÉRSICON Mill. TOMATO, LOVE APPLE.

Annual herbs, with once or twice pinnately divided leaves. Flowers perfect, in small racemes, opposite the leaves. Calyx mostly 5-parted. Corolla rotate, 5-lobed, plicate. Stamens usually 5; filaments short; anthers elongate, connate or connivent, introrsely longitudinally dehiscent. Ovary 2–3-celled, many-seeded. Fruit a berry.

1. *L. Lycopersicum* (L.) Karst. Viscid-pubescent, much branched; stem 3-10 dm. high; leaves 2-pinnatifid, lobed and dentate; corolla yellow, 10-15 mm. broad; fruit through cultivation very variable, subglobose, ellipsoid, or pear-shaped, red or yellow. *L. esculentum* Mill. Waste places and around dwellings: N.Y.—Fla.—Tex.—Colo.; Calif.; escaped from cultivation.

7. *LŶCIUM* L. MATRIMONY VINE.

Shrubs or woody vines, often spiny. Leaves alternate, thick, entire, often with smaller ones clustered in their axils. Flowers perfect, regular, solitary or clustered in the axils. Calyx enlarged and persistent under the fruit, deeply 5-cleft. Corolla whitish, yellowish, or purplish, funnelform, salverform, or campanulate; lobes 5 or rarely 4, imbricate, obtuse. Stamens 5 or 4; filaments adnate up to the mouth of the corolla-tube; anthers opening lengthwise. Ovary 2-celled. Berry rather dry.

Fruit red, globose; corolla narrowly funnelform, yellow or greenish.

Flowers 2 cm. long.

Flowers about 1 cm. long.

Leaves and calyces puberulent, the latter about half as long as the corollas.

Leaves and calyces glabrous (except the margin), the latter less than one-third as long as the corollas.

Calyx nearly one-third as long as the corolla, its lobes lanceolate or ovate-lanceolate; leaves 1-4 cm. long.

Calyx less than one-fourth as long as the corolla, its lobes broadly triangular; leaves usually less than 1 cm. long.

Fruit orange-red, oval; corolla short-funnelform, greenish purple.

1. *L. pallidum*.

2. *L. Cooperi*.

3. *L. Torreyi*.

4. *L. Andersonii*.

5. *L. vulgare*.

1. *L. pallidum* Miers. Shrub 6-12 dm. high, more or less spiny; leaves pale, spatulate or oblanceolate, 2-4 cm. long, fascicled, glabrous or pruinose; corolla narrowly funnelform, greenish, tinged with purple; filaments exserted, glabrous. Arid hills: w Tex.—Colo.—Utah—Ariz.; Mex. *Son.* Ap—My.

2. *L. Cooperi* A. Gray. Shrub 5-10 dm. high, with very short spines and stout branches; leaves spatulate, minutely viscid-pubescent or puberulent, 1-2.5 cm. long; corolla narrowly funnelform, 10-12 mm. long, white; lobes oblong, obtuse; filaments hairy at the base. Arid hills: s Calif.—s Utah—Ariz. *L. Son.* Ap—Je.

3. *L. Torreyi* A. Gray. Shrub 1-2.5 m. high, more or less spiny; leaves spatulate or oblanceolate, 1-4 cm. long, glabrous; corolla 10-12 mm. long, narrowly funnelform; limb about 8 mm. wide; lobes tomentulose on the margins; filaments very woolly at the base; berry red. Arid hills: w Tex.—s Utah—s Calif. *L. Son.* Mr—Je.

4. *L. Andersonii* A. Gray. Shrub 5-10 dm. high, much branched, with short spines, glabrous; leaves linear-spatulate or oblanceolate, 3-10 mm. long, glabrous; corolla tubular-funnelform, about 1 cm. long; limb 4-5 mm. wide; lobes rounded; filaments slightly hairy at the base; berry bright red. Arid hills: Nev.—Utah—Ariz. *Son.* Ap—Je.

5. *L. vulgare* Dunal. Tall shrub, often climbing or trailing; stems 2-8 m. long, sometimes spiny; leaves lanceolate, oblong, or spatulate, 1-4 cm. long; corolla purplish, changing to greenish, 8-12 mm. wide. Thickets and waste places: Ort.—Conn.—Utah—Alta.; escaped from cultivation, native of Eurasia and n Africa.

8. *HYOSCŶAMUS* (Tourn.) L. HENBANE.

Viscid-pubescent herbs. Leaves alternate, lobed or pinnatifid. Flowers perfect, regular, solitary in the upper axils and in terminal racemes. Calyx urn-shaped, 5-cleft, striate. Corolla funnelform, with slightly oblique 5-lobed limb. Stamens declined, mostly exserted; anthers opening longitudinally. Ovary 2-celled; stigma capitate. Capsule 2-celled, circumscissile above the middle.

1. *H. niger* L. Biennial, with a fusiform root; stem viscid-villous, 3-10 dm. high; leaves oblong to ovate, sinuately toothed or lobed, the upper clasping, viscid-villous; calyx campanulate, strongly veined, in fruit 2-2.5 cm. long; corolla

campanulate, lurid-yellowish, purple-veined, 2 cm. long. Waste places and around dwellings: N.S.—N.Y.—Colo.—Mont.; nat. from Eu. My—S.

9. DATŪRA L. THORN APPLE, JIMSON WEED, JAMESTOWN WEED, STRAMONIUM.

Annual or perennial herbs, or in the tropics shrubs or trees, narcotic. Leaves alternate, mostly lobed. Flowers perfect, regular, solitary in the axils. Calyx prismatic-funnelform, 5-lobed. Corolla funnelform, plaited, 5-lobed; lobes acuminate. Stamens 5, included, adnate to near the middle of the corolla-tube. Ovary 2-celled or falsely 4-celled; stigma 2-lobed. Capsule more or less prickly, 4-valved or splitting irregularly.

Corolla 1.5–2 dm. long; capsule more or less fleshy, bursting irregularly.

Corolla about 1 dm. long; capsule dry, 4-valved.

Capsule erect; plant glabrous.

Corolla white; lower prickles of the capsule shorter.

Corolla violet; prickles all alike.

Capsule nodding; plant more or less cinereous.

1. *D. meteloides*.

2. *D. Stramonium*.

3. *D. Tatula*.

4. *D. discolor*.

1. D. meteloides DC. Annual or perennial; stem erect, 3–10 dm. high, finely grayish puberulent; leaves obliquely ovate, grayish puberulent, repand or nearly entire, 10–15 cm. long; calyx 10–12 cm. long; lobes lanceolate, acuminate; corolla white, often tinged with violet, 15–20 cm. long; lobes with slender tips; capsules subglobose, 4–5 cm., densely short-prickly, reflexed in fruit. Along streams: w Tex.—Colo.—Calif.; Mex. *Son.*—*Submont.* Mr—O.

2. D. Stramonium L. Annual; stems glabrous, 5–15 dm. high, widely branching; leaf-blades ovate to oblong, glabrous, 1–2 dm. long, acute, sinuately or laciniately toothed; calyx 3–5 cm. long; lobes triangular or triangular-lanceolate, 5–7 mm. long; corolla white, 6–10 cm. long; lobes with slender tips; capsule 4–6 cm. long, densely prickly. Waste places and cultivated ground: N.S.—Fla.—Tex.—Colo.—Minn.; W. Ind. and S. Am.; nat. from Asia. My—D.

3. D. Tatula L. Annual; stem 5–15 dm. high, glabrous, purplish, branched; leaf-blades ovate to oblong, sinuately or angulately toothed, glabrous; calyx 3–6 cm. long; lobes triangular-lanceolate, 4–7 mm. long; corolla violet or lavender, 8–11 cm. long; lobes with slender tips; capsule oval or ovoid, 4–6 cm. long, densely prickly. Waste places and fields: Conn.—Fla.—Tex.—Colo.—Calif.—Wash.; W. Ind. and Mex.; nat. from S. Am. Je—O.

4. D. discolor Bernh. Annual; stem puberulent, 3–6 dm. high; leaves sinuately or laciniately toothed, 5–15 cm. long, more or less puberulent; calyx about 5 cm. long; teeth lanceolate; corolla white, tinged with purple, 5–7 cm. long; capsule globose, with rather few, very stout prickles, pubescent. Valleys: N.M.—Colo.—s Calif.; Mex. *Son.* Ja—S.

10. NICOTIÀNA (Tourn.) L. TOBACCO.

Annual or perennial, viscid-pubescent, narcotic herbs. Leaves alternate, entire or repand. Flowers perfect, regular, in terminal racemes or panicles. Calyx campanulate or tubular-ovoid, 5-lobed. Corolla funnelform, salverform, or nearly tubular; lobes 5, spreading. Stamens 5, included; filaments adnate to the base of the corolla-tube or free; anthers opening lengthwise. Ovary 2-celled, rarely 4-celled; stigma capitate. Fruit a 2- or rarely 4-valved capsule. Seeds numerous.

Corolla salverform; capsule 2-celled.

Leaves clasping at the base; flowers diurnal.

Leaves petioled, not clasping at the base; flowers nocturnal.

Corolla funnelform; capsule 4-celled; leaves acute at both ends.

1. *N. trigonophylla*.

2. *N. attenuata*.

3. *N. quadrivalvis*.

1. N. trigonophylla Dunal. Annuals; stem 3–10 dm. high, viscid-pubescent; leaves all sessile or the lower with winged petioles, obovate-oblong, 5–15 cm. long, entire, the upper lanceolate, cordately half-clasping; inflorescence paniculate; calyx-lobes subulate-lanceolate; corolla greenish white or yellowish, 2–2.5 cm. long, somewhat pubescent. Valleys: Tex.—s Colo.—s Utah—Calif.; Mex. *Son.* Ap—S.

2. *N. attenuata* Torr. Annual; stem 3-6 dm. viscid-puberulent; leaves petioled; blades ovate to lanceolate, long-acuminate, 5-10 cm. long; inflorescence paniculate; calyx-teeth triangular-lanceolate; corolla dull white or greenish, glabrous, 2-2.5 cm. long. *N. Torreyana* Nels. & Macbr. Dry or sandy ground: Mont.—N.M.—Calif.—B.C.; Mex. *Son.*—*Submont.* Je-S.

3. *N. quadrivalvis* Pursh. Annual; stem 3-6 dm. high, viscid-pubescent, branched; lower leaves petioled, the upper sessile; blades ovate-lanceolate, lanceolate, or oblong, acute at both ends, viscid-pubescent; flowers few; corolla about 2 cm. long, funnelform. Valleys and cultivated ground: Wash.—Mont.—Ore.

FAMILY 117. SCROPHULARIACEAE. FIGWORT FAMILY.

Annual or perennial herbs, rarely shrubs or trees, with mostly round stems. Leaves usually opposite, sometimes whorled, or alternate, without stipules. Flowers perfect, more or less irregular. Calyx of 5 or 4, more or less imbricate and united sepals. Corolla usually 2-lipped, sometimes almost regular. Stamens usually 4, rarely 5, or only 2 fertile, one pair longer than the rest, the fifth stamen sometimes represented by a sterile filament, all partly adnate to the tube of the corolla. Gynoecium of 2 united carpels; ovary 2-celled; styles usually united, rarely distinct. Fruit a 2-celled, 2-valved capsule, rarely baccate. Seeds numerous; endosperm present, surrounding the embryo, fleshy or cartilaginous. [RHINANTHACEAE.]

Anther-bearing stamens 5.

Corolla rotate.

Corolla funnelform, 2-lipped. (Occasional forms of)

Anther-bearing stamens 4 or 2.

Corolla spurred, saccate or gibbous at the base on the lower side.

Corolla distinctly spurred at the base.

Corolla merely saccate or gibbous at the base.

Corolla neither spurred, nor saccate, nor gibbous on the lower side.

Stamens 5, 4 anther-bearing; the fifth sterile and often rudimentary.

Sterile stamen rudimentary, represented by a scale or gland on the upper inside of the corolla-tube or throat; corolla short.

Corolla gibbous at the base on the upper side; ovules and seeds few or solitary; annuals.

Corolla deeply bilabiate, the middle lobe of the lower lip conduplicate and enclosing the stamens.

Corolla obscurely bilabiate, its five lobes rotately spreading, the lowest not enclosing the stamens.

Corolla not gibbous at the base, but more or less ventricose especially on the lower side; ovules and seeds numerous; 4 upper lobes of the corolla erect, the lower spreading; perennials.

Sterile stamen elongate, filiform to spatulate; corolla-tube elongate, tubular or funnelform.

Inflorescence thyrsoid-paniculate; seeds not with an ariliform cellular-reticulate outer coat; corolla not gibbous at the base above; calyx deeply cleft.

Inflorescence racemose or spiciform; seeds with an ariliform cellular-reticulate outer coat.

Corolla gibbous at the base above; calyx divided to near the base; inflorescence racemose.

Corolla not gibbous at the base above; calyx deeply tubular-funnelform, obtusely 5-lobed; inflorescence spicate.

Stamens 4 or 2.

Upper lip or lobes external in the bud.

Anther-bearing stamens 4.

Corolla more or less bilabiate; sepals united into an angled tube; plants leafy-stemmed.

Style glabrous; stigma divided into 2 oval lobes; placentae remaining united in the middle, rarely separating.

Style glandular above; stigma peltate-funnelform; placentae separating and remaining attached to the valves.

Corolla nearly regular.

Calyx unequally 5-parted; flowers solitary in the axils of the leaves; plant caulescent.

Calyx regularly 5-lobed; flowers solitary on scape-like peduncles from the basal rosette of leaves; plant acaulescent.

1. VERBASCUM.

7. PENTSTEMON.

2. LINARIA.

3. ANTIRRHINUM.

4. COLLINSIA.

5. TONELLA.

6. SCROPHULARIA.

7. PENTSTEMON.

8. PENTSTEMONOPSIS.

9. CHIONOPHILA.

11. EUNANUS.

12. MONIERA.

13. LIMOSELLA.

- Anther-bearing stamens 2; calyx of 5 almost distinct sepals; sterile filaments short or wanting. 14. GRATIOLA.
- Upper lip or lobes internal in the bud.
- Stamens 2.
Corolla almost regularly 4-lobed.
Corolla rotate; leaves opposite or verticillate. 15. VERONICA.
- Corolla campanulate or short-tubular; leaves alternate, mostly basal. 16. SYNTHYRIS.
- Corolla none, or 2-lipped, cleft to near the base; upper lip entire, the lower irregularly cleft or toothed; basal leaves ample; stem-leaves bract-like, reduced and alternate. 17. BESSEYA.
- Stamens 4.
Corolla slightly 2-lipped; stamens not ascending under the upper lip. 18. AGALINIS.
- Corolla distinctly 2-lipped; stamens ascending under the upper lip.
Anther-sacs dissimilar, the inner one pendulous by its apex; leaves mostly alternate.
Calyx gamosepalous.
Calyx deeply cleft in front and behind, less deeply so on the sides; upper lip of the corolla much longer than the 3-lobed lower one. 19. CASTILLEJA
- Calyx almost equally 4-cleft; upper lip of the corolla slightly if at all longer than the 1-3-saccate lower one, which is minutely or obsoletely toothed.
Lip 1-saccate. 20. ORTHOCARPUS.
Lip 3-saccate. 21. TRIPHYSARIA.
- Calyx 2-phyllous, *i. e.*, cleft to the base on the sides or, by the absence of the lower leaf, 1-phyllous. 22. ADENOSTEGIA.
- Anther-sacs alike, parallel; leaves mostly opposite.
Margins of the 2-lobed upper lip of the corolla recurved; calyx 4-cleft. 23. EUPHRASIA.
- Margins of the upper lip of the corolla not recurved.
Ovules several or numerous; capsule several or many-seeded.
Calyx split below, or below and above, not inflated; capsule ovoid or oblong, oblique.
Galea prolonged into a filiform recurved beak; throat with a tooth on each side. 24. ELEPHANTELLA.
- Galea if prolonged into a beak, the latter not filiform, straight or incurved; throat without teeth. 25. PEDICULARIS.
- Calyx 4-toothed, inflated and veiny in fruit. 26. RHINANTHUS.
- Ovules 2 in each cell; fruit 1-4-seeded. 27. MELAMPYRUM.

1. VERBÁSCUM (Tourn.) L. MULLEN.

Annual, biennial, or rarely perennial, caulescent herbs, more or less glandular or densely pubescent with branched hairs. Leaves alternate, entire, toothed, or pinnatifid, sometimes decurrent. Flowers perfect, in terminal spikes, racemes, or panicles. Sepals 5, partly united. Corolla rotate, 5-lobed, slightly irregular, the upper lobe exterior in the bud. Stamens 5, all fertile, exserted, the upper 3, or all of the filaments pubescent. Ovary 2-celled; styles dilated or flattened at the apex. Capsule oblong to subglobose, 2-valved, septicidal. Seeds rugose, wingless.

- Plant densely woolly; flowers in a dense spike. 1. *V. Thapsus*.
Plant glabrous or glandular; flowers racemose.
Pedicels longer than the fruit; plant glabrous or sparingly glandular. 2. *V. Blattaria*.
Pedicels shorter than the fruit; plant densely glandular. 3. *V. virgatum*.

1. *V. Thapsus* L. Biennial; stem stout, 3-20 dm. high, woolly with densely matted branched hairs, winged; lower leaves spatulate or elliptic, 1-4 cm. long; upper stem-leaves oblanceolate, densely woolly; raceme dense and spike-like, continuous, 1-10 dm. long; calyx-lobes triangular-lanceolate; corolla deep yellow, rarely white, 1-2.5 cm. wide, pubescent without. Waste places, fields, and roadsides: N.S.—Fla.—Calif.—B.C.; nat. from Eu. *Plain—Submont.* Je—Au.

2. *V. Blattaria* L. Biennial; stem rather slender, 4-12 dm. high, glabrous below, glandular above; basal leaves obovate or spatulate; stem-leaves oblong or ovate, the upper clasping, 2-12 cm. long, dentate, incised or lobed, glabrous; raceme slender, interrupted, 1-5 dm. long; calyx-lobes linear or oblong, recurved; corolla white or yellow, 3-4 cm. broad; filaments magenta. Fields and waste places: Que.—Fla.—Calif.—B.C.; nat. from Eu. *Plain—Submont.* My—S.

3. **V. virgatum** With. Biennial; stem 5–10 dm. high, glandular-puberulent, purplish; basal leaves oblanceolate or spatulate, 1–3 dm. long, sinuate-dentate, somewhat pubescent; stem-leaves lanceolate, sessile or the upper clasping; calyx-lobes lanceolate, spreading; corolla yellow. Waste places and roadsides: Calif.—Ariz.—Utah; N.S.—Ont.; adv. from Eu. My-J.

2. **LINÀRIA** (Tourn.) L. BUTTER-AND-EGGS, TOAD-FLAX.

Annual or perennial herbs, with erect stems. Leaves alternate or opposite, or whorled on the shoots. Flowers in terminal racemes, spikes, or panicles; Sepals 5, partially united. Corolla irregular, 2-lipped; tube spurred at the base; throat partly closed by a convex fold. Stamens 4, didynamous, included. Capsule short, opening by 3-toothed pores below the apex. Seeds angled and wrinkled, sometimes winged.

Corolla yellow, with an orange throat, 2–3 cm. long.
Corolla blue or white, 12 mm. or less long.

1. *L. Linaria*.
2. *L. texana*.

1. **L. Linaria** (L.) Karst. Perennial; stem glabrous or puberulent above, 1–10 dm. high; leaves linear or nearly so, 2–7 cm. long; racemes dense; calyx-lobes ovate, acute or acuminate. *L. vulgaris* Mill. Waste places and fields: Newf.—Ga.—N.M.—Man.; nat. from Eu. Plain—Submont. My-O.

2. **L. texana** Scheele. Annual or biennial; stem 2–8 dm. high, glabrous; leaves linear-spatulate, 1–2.5 cm. long; racemes slender, 5–30 cm. long; calyx-lobes linear-lanceolate; corolla blue or white, 10–12 mm. long. *L. canadensis* Coult. & Nels., not Dum. Sandy soil: Okla.—Fla.—Tex.—Calif.—Ore.—Mex. Son. Mr-Je.

3. **ANTIRRHÏNUM** (Tourn.) L. SNAPDRAGON.

Annual or perennial caulescent herbs. Leaves alternate, or the lower opposite, entire. Flowers solitary in the upper axils, or in terminal racemes or panicles. Sepals 5, partially united. Corolla irregular, 2-lipped; tube more or less saccate below; throat closed by a convex fold. Stamens 4, included; filaments sometimes dilated above. Styles united. Ovules numerous. Capsule opening by 2 or 3 pores below the apex. Seeds wingless, smooth or wrinkled.

Stem erect, 1–4 dm. high, with very short straight pedicels.

Stem 6–12 dm. high, climbing by means of long filiform curved pedicels.

1. *A. Kingii*.
2. *A. Cooperi*.

1. **A. Kingii** S. Wats. Annual; stem slender, somewhat hairy at the base; leaves narrowly lanceolate to linear, 1–3 cm. long, the upper minute; calyx very oblique, glandular-hirsute; corolla 4–6 mm. long; capsule oblique, subglobose. Gravelly soil: Utah—Calif. Son. My-Jl.

2. **A. Cooperi** A. Gray. Annual; lower leaves ovate or oblong, the upper linear, the floral ones minute; corolla bright yellow, about 1 cm. long, conspicuously saccate at the base; palate hairy; capsule globose. Ravines: s Calif.—s Utah. *L. Son.*

4. **COLLÏNSIA** Nutt. BLUE-EYED MARY, BLUE-LIPS.

Annual caulescent herbs. Leaves opposite or whorled, narrow, entire or toothed. Flowers solitary or clustered in the upper axils, perfect, irregular. Calyx-lobes 5. Corolla 2-lipped, violet, pink or white, open; tube short; lower lip 3-lobed, the middle lobe involute. Stamens 4, didynamous, declined, enclosed in the middle lobe of the lower lip of the corolla; staminodium present, but gland-like, near the base of the corolla. Styles united. Capsule ovoid or globose, 2-valved, the valves 2-cleft.

1. **C. parviflora** Dougl. Annual; stem 1–3 dm. high, at last diffuse and spreading, minutely puberulent; leaves oblong, lanceolate, oblanceolate, or linear, entire or nearly so, the floral ones often in whorls of 3–5; corolla blue, 4–6 mm. long. *C. tenella* Piper, in part. Shaded hillsides: Ont.—Ariz.—Calif.—B.C. Submont.—Mont. Ap.-Jl.

5. **TONÉLLA** Nutt.

Annual caulescent herbs. Leaves opposite, ternately divided. Flowers axillary, perfect, slightly irregular. Calyx deeply 5-cleft. Corolla obscurely

2-lipped; lobes 5, unequal, rotately spreading; tube slightly gibbous above. Stamens 4, soon ascending, not inclosed; staminodium rudimentary. Capsule ovoid, 2-valved. Seeds 1-4 in each cell, oval.

1. **T. floribunda** A. Gray. Annual; stem 2-5 dm. high, glabrous; stem-leaves mostly 3-5-foliolate, with linear or oblong leaflets, 1-5 cm. long; floral leaves verticillate; corolla blue or purple; lobes broadly obovate. Banks and basaltic rocks: Ida.—Wash.—Ore. *Son.* Ap.—My.

6. SCROPHULÀRIA (Tourn.) L. FIGWORT.

Perennial, caulescent herbs. Leaves opposite, usually petioled, with broad, toothed or incised blades. Flowers perfect, in terminal, paniculate cymes. Calyx with 5 short broad lobes. Corolla 2-lipped, purple, yellowish, or green; tube usually short; upper lip erect; lower lip with a spreading or reflexed middle lobe. Stamens 4, short; staminodium scale-like, in ours spatulate. Styles united. Capsule ovoid, 2-valved. Seeds numerous, marginless, rugose.

Leaves simply serrate, none lobed at the base; corolla-tube barely twice as long as the calyx.

Leaves incised or doubly serrate with sharp teeth, the lower inclined to be incised-lobed at the base; corolla-tube more than twice as long as the calyx.

1. *S. serrata*.

2. *S. occidentalis*.

1. **S. serrata** Rydb. Stem 1-2 m. high, angled, sparingly puberulent or glabrous, slightly glandular in the inflorescence; leaf-blades ovate or cordate, 5-15 cm. long; corolla-tube short, 6-7 mm. long; upper lip 4-5 mm. long; sterile stamen obovate-spatulate, purple. Wet places: Ida. *Submont.* Jl.

2. **S. occidentalis** (Rydb.) Bickn. Stem 1-2 m. high, more or less puberulent, or glabrate below, glandular in the inflorescence; leaves ovate; corolla lurid-greenish; tube gibbous below, 5 mm. long; upper lip about 3 mm. long; sterile stamen greenish yellow, very broad, kidney-shaped, on a distinct claw; capsule ovoid, 8-10 mm. long. Low ground in thickets and woods: N.D.—Okla.—N.M.—Calif.—Wash. *Submont.*—*Mont.*

7. PENTSTÈMON (Mitchell) Schmel. BEARD-TONGUE, MAYFLOWER, PRIDE-OF-THE-MOUNTAIN.

Perennial, caulescent herbs. Leaves opposite, from petioled to sessile and clasping, entire or toothed, or rarely pinnatifid. Flowers irregular, in terminal racemes or panicles. Calyx deeply 5-cleft. Corolla 2-lipped, elongate, open; the tube often somewhat ventricose above, but not gibbous at the base; upper lip mostly erect, with 2 spreading lobes. Stamens 4; filaments nearly equal; staminodium well developed, spatulate, usually bearded. Styles united; stigma capitate. Capsule usually ovoid, 2-valved. Seeds numerous, wingless. Anther-cells either united or confluent.

Corolla blue, purple, white, or yellowish, more or less funnelform or salverform.

Anthers bearded.

Plants suffrutescent; leaves leathery; anthers densely villous; sterile stamens usually glabrous.

I. FRUTICOSI.

Plants not fruticose; leaves not leathery.

Plant more or less glandular at least in the rather few-flowered inflorescence; anthers densely villous; sterile stamen glabrous.

II. MONTANI.

Plants glabrous or puberulent, not at all glandular; inflorescence dense and many-flowered; anthers and sterile stamens sparingly bearded.

III. GLABRI.

Anthers glabrous or merely hirtello-ciliate along the line of dehiscence.

Anthers dehiscent for nearly their whole length or at least at their distal end.

Plants not suffrutescent at the base.

Leaves no linear-filiform.

Corolla decidedly funnelform, *i. e.*, throat much wider than the tube.

Sterile stamen glabrous; plant tall.

III. GLABRI.

Sterile stamen bearded.

Corolla over 3 cm. long, strongly ventricose; stem-leaves clasping.

Leaves strongly serrate.

IV. PALMERIANI.

Leaves with entire margins.

V. GRANDIFLORI.

Corolla about 2 cm. long or less; leaves linear or oblanceolate, not clasping; plant low.

Plants perfectly glabrous.

- Corolla strongly ventricose-gibbous; tube proper very short. VI. HALLIANI.
 Corolla not ventricose-gibbous; tube gradually dilated into a funnelform throat. VII. ACUMINATI.
 Plants glandular at least on the inflorescence.
 Stem-leaves distinctly petioled; blades broadly ovate or suborbicular, coarsely dentate. VIII. PETIOLATI.
 Stem-leaves sessile or nearly so; blades linear to lanceolate or oblong.
 Stem glabrous below. IX. WIPPLEANI.
 Stem glandular or puberulent. X. CRISTATI.
 Corolla-tube almost cylindrical or slightly widening upwards; corolla less than 2 cm. long.
 Stems several from a branching rootstock, low and weak. XI. HARBOURIANI.
 Stems solitary or a few from a taproot or short caudex. XII. CONFERTI.
 Leaves linear-filiform.
 Corolla-limb not strongly oblique; sterile stamen bearded. XIII. LARICIFOLII.
 Corolla-limb strongly oblique; sterile stamen glabrous. XIV. AMBIGUI.
 Plant suffruticose at the base. XV. CAESPITOSI.
 Anthers dehiscent only on their proximate half, the distal half of the cells saccate, remaining unopened.
 Plants densely glandular-pubescent throughout. XVI. GLANDULOSI.
 Plant glabrous or puberulent; if at all glandular only in the inflorescence. XVII. AZUREI.
 Corolla red, almost tubular.
 Anthers opening nearly their whole length.
 Corolla scarcely bilabiate; lower lip not reflexed. XVIII. PUNICEI.
 Corolla strongly bilabiate; lower lip reflexed. XIX. BARBATI.
 Anthers opening only on their proximal part. XX. BRIDGESIANI.

I. FRUTICOSI.

- Leaves more or less distinctly petioled, broadest at or above the middle, not long-acuminate.
 Leaf-blades obovate or oval, obtuse or the upper acutish.
 Plant 2-5 dm. high, erect. 1. *P. fruticosus*.
 Plant depressed, less than 2 cm. high.
 Corolla 3.5 cm. long; leaf-blades 1-3 cm. long. 2. *P. ellipticus*.
 Corolla 2.5-3 cm. long; leaf-blades 1 cm. long or less. 3. *P. Menziesii*.
 Leaf-blades oblanceolate, all acute.
 Leaf-blades oblanceolate, entire or some rarely slightly denticulate; calyx-lobes lanceolate, 5-10 mm. long. 4. *P. crassifolius*.
 Leaf-blades very narrowly oblanceolate, sharply dentate; calyx-lobes lance-subulate, 10-15 mm. long. 5. *P. Scouleri*.
 Leaves sessile, long-attenuate, broadest at the base.
 Leaves glabrous; calyx 10-12 mm. long; corolla 3.5-4 cm. long. 6. *P. Lyallii*.
 Leaves grayish-pilose; calyx 12-15 mm. long; corolla 2.5-3.5 cm. long. 7. *P. linearifolius*.

II. MONTANI.

- Leaves narrowly lanceolate; corolla 3.5-4 cm. long. 6. *P. Lyallii*.
 Leaf-blades ovate or cordate to broadly oblong; corolla about 3 cm. long. 8. *P. montanus*.

III. GLABRI.

- Anthers bearded, with long villous hairs; inflorescence secund.
 Corolla-tube decidedly shorter than the throat; corolla deep blue.
 Calyx-lobes oval or ovate, acute or obtuse, glabrous. 9. *P. strictus*.
 Calyx-lobes lanceolate, long-acuminate, minutely puberulent. 10. *P. strictiformis*.
 Corolla-tube nearly as long as the throat; corolla pale blue. 11. *P. comarrhenus*.
 Anthers not long-villous.
 Anthers sparingly short-hirsute.
 Calyx-lobes ovate or lanceolate, acuminate.
 Stem-leaves all lanceolate.
 Calyx-lobes with narrow scarious margins, not auriculate.
 Corolla about 1.5 cm. long; limb almost regular; tube slightly ventricose; plant usually puberulent. 12. *P. Fremontii*.
 Corolla 2 cm. long or longer; limb distinctly 2-lipped; plant glabrous.
 Corolla about 2.5 cm. long; upper stem-leaves linear-lanceolate. 13. *P. subglaber*.
 Corolla about 2 cm. long; upper stem-leaves broadly lanceolate to ovate. 14. *P. cyanocaulis*.
 Calyx-lobes with very broad scarious margins, forming erose basal auricles. 15. *P. alpinus*.
 Stem-leaves broadly ovate or subcordate.
 Calyx-lobes with narrow or no scarious margins, not auriculate.

Leaves shorter than the internodes; anthers opening at the distal end.

16. *P. cyananthus*.

Leaves longer than the internodes; anthers opening their whole length.

14. *P. cyanocaulis*.

Calyx-lobes with very broad scarious margins, forming basal auricles; anther-sacs opening their whole length.

17. *P. Brandegei*.

Calyx-lobes orbicular or broadly ovate, abruptly short-acuminate, very scarious and erose.

18. *P. glaber*.

Anthers perfectly glabrous.

Sterile filament glabrous or nearly so.

Plant glabrate.

Calyx-lobes obovate or ovate, abruptly acuminate, decidedly scarious-margined.

19. *P. speciosus*.

Calyx-lobes acute or obtuse, scarcely scarious-margined.

20. *P. unilateralis*.

Plant densely puberulent.

21. *P. Wardii*.

Sterile filament strongly bearded.

22. *P. perpulcher*.

IV. PALMERIANI.

One species.

23. *P. Palmeri*.

V. GRANDIFLORI.

One species.

24. *P. grandiflorus*.

VI. HALLIANI.

One species.

25. *P. Hallii*.

VII. ACUMINATI.

Inflorescence interrupted; bracts except the lowermost shorter than the flowers; basal leaves spatulate or oblanceolate.

Stamens exserted; bracts rounded-cordate, abruptly short-acuminate; sepals ovate, scarious-margined.

26. *P. cyathophorus*.

Stamens included.

Bracts ovate or cordate.

Calyx-lobes ovate, with scarious toothed margins, abruptly acuminate; bracts ovate, acute.

27. *P. pachyphyllus*.

Calyx-lobes narrowly lanceolate, not scarious-margined.

Corolla-limb 15-18 mm. broad, glabrous within; tongue of the sterile filament strongly incurved, short yellow-bearded at the apex.

28. *P. acuminatus*.

Corolla-limb about 1 cm. broad, usually slightly bearded within; tongue of the sterile filament less strongly incurved, yellow-bearded its whole length.

29. *P. nitidus*.

Bracts lanceolate to linear-lanceolate.

Stem-leaves except the uppermost obtuse, oblong or oblanceolate, tapering into a winged petiole.

30. *P. arenicola*.

Stem-leaves acute, sessile or the lowermost petioled, but the petiole not winged.

Calyx-lobes broadly obovate, scarious, erose, abruptly contracted into a very short acumination.

48. *P. Watsonii*.

Calyx-lobes ovate or lanceolate, acute or gradually acuminate.

31. *P. secundiflorus*.

Calyx-lobes lanceolate; plant 2.5-4 dm. high.

32. *P. Fendleri*.

Calyx-lobes ovate, decidedly scarious-margined; plant 2 dm. or less high.

Inflorescence dense; bracts large, long-acuminate, most of them exceeding the flowers; basal leaves linear or nearly so, narrower than the stem-leaves.

Bracts broadly lanceolate, or the upper ovate.

Bracts strongly veined; corolla 2.5-3 cm. long, ventricose; basal leaves linear.

33. *P. Haydenii*.

Bracts not strongly veined; corolla about 2 cm. long, scarcely ventricose; basal leaves linear-oblanceolate.

34. *P. caudatus*.

Bracts narrow, linear-lanceolate, not strongly veined.

35. *P. angustifolius*.

VIII. PETIOLATI.

One species.

36. *P. petiolotus*.

IX. WIPPLEANI.

One species.

37. *P. stenosepalus*.

X. CRISTATI.

Corolla-tube decidedly gibbous-ventricose; sterile stamen densely yellow-villous; corolla purplish.

Stem viscid-villous as well as puberulent, especially the upper part.

Inflorescence densely glandular-villous; corolla 2.5-3.5 cm. long; leaves entire or slightly denticulate.

38. *P. Erianthera*.

Inflorescence sparingly glandular-villous; corolla 2-2.5 cm. long; leaves sharply dentate.

39. *P. saliens*.

Stem merely puberulent.

Basal leaf-blades obovate, spatulate, or ovate, broader than the cauline leaves.

Corolla 2-2.5 cm. long.

40. *P. Cleburnei*.

Corolla 15-18 cm. long.

41. *P. Moffattii*.

Basal leaf-blades linear to linear-oblanceolate, usually narrower than the upper cauline leaves.

Corolla over 2 cm. long; calyx-lobes linear-lanceolate, about 8 mm. long.

42. *P. Jamesii*.

- Corolla glabrous within, less than 2 cm. long; calyx-lobes lanceolate, 4-5 mm. long. 43. *P. pumilus*.
 Corolla-tube funnelliform, scarcely gibbous; sterile stamen sparingly yellow-villous above; corolla white. 44. *P. albidus*.

XI. HARBOURIANI.

One species.

45. *P. Harbournii*.

XII. CONFERTI.

- Sterile filament usually naked; leaves sharply dentate. 46. *P. deustus*.
 Sterile filament bearded; leaves entire or denticulate.
 Calyx glabrous or puberulent but not glandular. 47. *P. confertus*.
 Corolla sulphur-yellow.
 Corolla purple.
 Calyx 2-3 mm. long; lobes rounded-ovate, acute, denticulate; leaves thin, the upper acuminate. 48. *P. Watsonii*.
 Calyx 5-6 mm. long; lobes ovate, abruptly acuminate or obtuse; leaves firm, not acuminate.
 Corolla more than 1 cm. long; upper stem-leaves broadly lanceolate, often rounded at the base; plants 3 dm. high or more.
 Calyx-lobes ovate, acuminate. 49. *P. Rydbergii*.
 Corolla lobes broadly obovate, obtuse or abruptly short-acuminate. 50. *P. laxus*.
 Corolla less than 1 cm. long; limb small; upper stem-leaves linear-lanceolate; plant seldom more than 3 dm. high. 51. *P. procerus*.
 Calyx and inflorescence more or less glandular.
 Leaves more or less denticulate.
 Upper stem-leaves broad, ovate-cordate, acuminate, clasping.
 Stem pubescent; calyx-lobes not scarious. 52. *P. ovalis*.
 Stem glabrous or sparingly puberulent up to the inflorescence; calyx-lobes margined.
 Leaves firm; inflorescence rather dense; calyx-lobes narrowly scarious-margined. 53. *P. pinetorum*.
 Leaves thin; inflorescence open; calyx-lobes not scarious-margined. 54. *C. leptophyllus*.
 Upper stem-leaves lanceolate or linear.
 Calyx-lobes elongate-lanceolate, not scarious; flowers ascending; stem-leaves linear-lanceolate or linear. 62. *P. gracilis*.
 Calyx-lobes ovate-lanceolate, scarious-margined below and usually toothed; stem-leaves oblong-lanceolate or lanceolate.
 Tall, 3-5 dm. high; calyx-lobes acute. 55. *P. Wilcoxii*.
 Low, less than 3 dm. high; calyx-lobes abruptly acuminate. 60. *P. virens*.
 Leaves entire or essentially so.
 Plant depressed, decumbent; stems less than 2 dm. high; basal leaves usually less than 3 cm. long, with rhombic-ovate or rounded-spatulate blades.
 Corolla about 1.5 cm. long; stem-leaves more or less denticulate. 56. *P. albertinus*.
 Corolla 1 cm. long or less; stem-leaves entire. 57. *P. brevifolius*.
 Plant not depressed, 2-7 dm. high; basal leaves more than 3 cm. long, with oblanceolate blades; corolla 1.5 cm. long or more.
 Calyx-lobes ovate, broadly scarious-margined.
 Corolla sulphur-yellow. 58. *P. attenuatus*.
 Corolla purplish.
 Stem-leaves ample, lanceolate or oblong.
 Stem and leaves glabrous or nearly so.
 Leaves thick, darkening in drying; stem-leaves always entire; inflorescence interrupted, congested. 59. *P. pseudoprocerus*.
 Leaves thin, not darkening in drying; stem-leaves usually denticulate; inflorescence not congested, a more or less continuous panicle. 60. *P. virens*.
 Stem and leaves decidedly puberulent. 68. *P. humilis*.
 Stem-leaves linear or linear-lanceolate, reduced; basal leaves numerous, oblanceolate to almost linear. 61. *P. aridus*.
 Calyx-lobes narrowly lanceolate, slightly scarious-margined.
 Leaves thick and darkening in drying; inflorescence congested and interrupted; corolla dark blue-purple.
 Plant 2-3 dm. high; upper stem-leaves linear-lanceolate or oblong. 62. *P. pseudohumilis*.
 Plant 5-7 dm. high; upper stem-leaves ovate-lanceolate, less than half as long as the internodes. 50. *P. laxus*.
 Leaves thin, light green, not darkening in drying; inflorescence a continuous panicle; corolla white, light blue, or pink; leaves linear or linear-lanceolate.
 Stem glabrous or nearly so.
 Inflorescence narrow; pedicels short; stem-leaves linear-lanceolate. 63. *P. gracilis*.
 Inflorescence open; pedicels long; stem-leaves narrowly linear. 64. *P. oliganthus*.
 Stem densely puberulent.

Basal leaf-blades linear-ob lanceolate.

Throat of the corolla funnelform, glandular-puberulent within; limb ample; lower lip almost equalling the upper; sterile stamens bearded at the end. 65. *P. puberulentus*.

Throat of the corolla almost cylindric; limb small; lower lip shorter than the upper, pubescent within; sterile filament bearded at least half its length.

Stem-leaves narrowly linear; calyx-lobes not scarious-margined. 66. *P. oreganus*.

Stem-leaves narrowly lanceolate; calyx-lobes usually with narrow scarious margins. 67. *P. radicosus*.

Basal leaf-blades oval or ovate. 68. *P. humilis*.

XIII. LARICIFOLI.

Calyx-lobes distinctly scarious-margined; lower lip of the corolla slightly hairy within or glabrous. 69. *P. exilifolius*.

Calyx-lobes not scarious-margined; lower lip of the corolla densely bearded within. 70. *P. laricifolius*.

XIV. AMBIGUI.

Corolla-tube over 1 cm. long. 71. *P. ambiguus*.

Corolla-tube about 5 mm. long. 72. *P. Thurberi*.

XV. CAESPITOSI.

Leaf-blades obovate, spatulate, or broadly oblanceolate.

Leaves green and glabrous or slightly puberulent; calyx-lobes oblong-lanceolate. 73. *P. suffrutescens*.

Leaves densely grayish or whitish puberulent; calyx-lobes lanceolate.

Calyx-lobes linear-lanceolate, over 5 mm. long; plant grayish puberulent. 74. *P. caespitosus*.

Calyx-lobes broadly lanceolate, scarcely 5 mm. long; plant almost white. 75. *P. Thompsoniae*.

Leaf-blades narrowly oblanceolate to linear or filiform.

Calyx-lobes scarcely scarious-margined, entire; inflorescence few-flowered; floral leaves like the rest.

Leaves green and glabrate.

Corolla 20–25 mm. long, deeply 2-lipped, with relatively broad tube.

Corolla 15–20 mm. long, less deeply 2-lipped, with a narrow tube. 76. *P. Crandallii*.

Leaves densely canescent-puberulent. 77. *P. xylus*.

Calyx-teeth scarious-margined, dentate or erose; inflorescence many-flowered, racemiform; floral leaves reduced. 78. *P. teucroides*.

79. *P. coloradensis*.

XVI. GLANDULOSI.

One species.

80. *P. glandulosus*.

XVII. AZUREI.

Leaves dentate, incised, or pinnatifid.

Corolla about 3 cm. long; flowers in a dense terminal panicle; anthers villous.

81. *P. venustus*.

Corolla 1–3 cm. long; flowers in an open more or less leafy panicle with spreading branches; anthers glabrous.

Leaves opposite.

Leaves incised or pinnatifid.

82. *P. Richardsonii*.

Leaves merely dentate or serrate.

Leaves serrate; corolla 15–20 mm. long.

83. *P. diffusus*.

Leaves saliently dentate; corolla 12–15 mm. long.

84. *P. diphyllus*.

Leaves in whorls of three.

85. *P. triphyllus*.

Leaves entire.

Calyx and inflorescence more or less glandular; leaves puberulent.

86. *P. Kingii*.

Calyx and inflorescence glabrous or the latter somewhat puberulent but not glandular.

Calyx-lobes lanceolate, acute or acuminate.

Stem-leaves lanceolate, oblong or oblanceolate to linear, glabrous.

Plant low and decumbent at the base; lower stem-leaves oblanceolate, the upper oblong; calyx-lobes narrowly lanceolate. 87. *P. Leonardi*.

Plant tall; stem-leaves lanceolate or oblong-lanceolate; calyx-lobes ovate-lanceolate, acuminate. 88. *P. platyphyllus*.

Stem-leaves linear, puberulent.

89. *P. Cusickii*.

Calyx-lobes broadly ovate or obovate, mucronate, scarious-margined; leaves linear to lanceolate. 90. *P. sepalulus*.

XVIII. PUNICEI.

Stem and leaves puberulent; upper stem-leaves more or less acuminate.

91. *P. coccinatus*.

Stem and leaves glabrous or nearly so; stem-leaves obtuse or acute.

Stem-leaves ovate to lanceolate; corolla 2–3 cm. long.

92. *P. Eatonii*.

Stem-leaves linear-lanceolate; corolla 1.5–2 cm. long.

93. *P. utahensis*.

XIX. BARBATI.

Lower lip bearded within.

94. *P. barbatus*.

Lower lip glabrous within.

Anthers glabrous; leaves usually glabrous.

Anthers long-bearded; leaves usually somewhat puberulent.

95. *P. Torreyi*.

96. *P. trichander*.

XX. BRIDGESIANI.

One species.

97. *P. Bridgesii*.

1. *P. fruticosus* (Pursh) Greene. Suffrutescent, 2-10 dm. high; leaves spatulate, mostly obtuse, usually serrulate, 2-3 cm. long, the upper ones of the flowering branches smaller, ovate, sessile; calyx about 1 cm. long, densely glandular-hirsute; sepals lanceolate, acutish; corolla about 3 cm. long, purple. Hills and mountain sides: Alta.—Mont.—Ida.—Wash.—B.C. *Submont.*—*Mont.* Jl—Au.

2. *P. ellipticus* Coult. & Fisher. Perennial, with a procumbent subterranean woody stem; branches erect, minutely puberulent, 7-20 cm. high; leaves firm, broadly elliptic or rotund, the lower short-petioled, distantly serrulate or entire; calyx densely viscid-pubescent, 10-12 mm. long; lobes lanceolate, attenuate; corolla violet-purple, 3-3.5 cm. long, strongly ventricose; anthers white-hairy. Mountains: Ida.—Mont.—Alta. *Mont.*—*Subalp.* Au.

3. *P. Menziesii* Hook. Densely matted suffrutescent perennial; branches 1-1.5 dm. high, ascending, puberulent; leaves short-petioled, obovate or broadly spatulate, more or less dentate, thick and leathery; calyx about 8 mm. long, sparingly viscid; lobes lanceolate, acutish or obtuse; corolla purple, 2.5 cm., rarely 3 cm. long. High mountains: B.C.—Wash.—Alta. *Subalp.*—*Alp.* Je—Au.

4. *P. crassifolius* Lindl. Low shrub, 5-15 dm. high; leaves petioled, glabrous, 2-5 cm. long, the upper floral ones much reduced, lanceolate or linear; calyx fully 1 cm. long, densely glandular-hirsute; corolla lilac-purple, pinkish at the base, about 3 cm. long, very slightly ventricose. Mountains: Wash.—Wyo.—Mont. *Submont.*—*Mont.* Je—Au.

5. *P. Scouleri* Dougl. Low shrub, 2-5 dm. high; leaves short-petioled, 2-3 cm. long, the upper lanceolate and somewhat reduced; calyx sparingly glandular; corolla lilac-purple, 3.5-4 cm. long. Mountains: B.C.—Ida.—n Calif. *Submont.* Je—Au.

6. *P. Lyallii* A. Gray. Perennial, with a woody caudex; stems about 3 dm. high, glabrous or nearly so; leaves sessile, lanceolate to narrowly linear-lanceolate, sparingly denticulate, 5-10 cm. long; calyx glandular-hirsute; lobes lanceolate, acute to attenuate. Mountains: B.C.—Ida.—Mont.—Alta. *Submont.*—*Mont.* Je—Jl.

7. *P. linearifolius* Coult. & Fisher. Perennial, with a woody caudex; stems 2-3 dm. high, grayish pubescent; leaves linear or linear-lanceolate, attenuate, 2-7 cm. long, entire or minutely denticulate; calyx glandular; lobes linear-lanceolate, attenuate; corolla light purple. Granite ledges: Ida.—Mont. *Submont.* Jl.

8. *P. montanus* Greene. Perennial, with a caespitose caudex; stems about 3 dm. high, cinereous-puberulent; leaves cinereous-puberulent, sessile, saliently dentate, 1-4 cm. long; calyx about 1 cm. long, densely glandular; lobes lanceolate, acute; corolla about 3 cm. long, pink-purple, only slightly ventricose. (?) *P. Woodsii* A. Nels. Mountains: Ida.—Mont.—Wyo. *Mont.*—*Subalp.* Jl—Au.

9. *P. strictus* Benth. Stem strict, glabrous or nearly so, 2-5 dm. high; basal leaves spatulate or oblanceolate, 5-10 cm. long; cauline leaves narrowly linear-lanceolate or linear, glabrous; calyx 4-5 mm. long; corolla 3 cm. long. Hills: Wyo.—N.M.—Utah. *Submont.*—*Mont.* Je—Au.

10. *P. strictiformis* Rydb. Stems 3-5 dm. high, glabrous and strict, simple; basal leaves petioled, 5-10 cm. long, oblanceolate, obtuse, glabrous and slightly glaucous; stem-leaves sessile, lanceolate, acuminate, 4-8 cm. long; corolla about 2.5 cm. long. Hills and plains: Colo. *Submont.*—*Mont.* Je—S.

11. *P. comarrhenus* A. Gray. Stem 2-4 dm. high, glabrous or puberulent below; basal leaves petioled; blades oval, spatulate or oblanceolate, 5-10 cm. long, finely puberulent; stem-leaves oblanceolate or linear; calyx-lobes ovate, 4-5 mm. long, short-acuminate; corolla 2.5-3 cm. long, ventricose, but less so than in *P. strictus*. Dry hills: Utah—Colo. *Submont.*—*Mont.* Je—Jl.

12. *P. Fremontii* T. & G. Stems 2-3 dm. high; lower leaves spatulate or oblanceolate, 3-6 cm. long, finely puberulent; upper leaves lanceolate or linear; inflorescence dense, not secund; calyx 5 mm. long, slightly puberulent; lobes lanceolate, acute or acuminate; corolla about 15 mm. long; sterile stamen with dilated hirsute tip. Dry hills: Wyo.—Colo.—Utah. *Submont.* Je.

13. *P. subglaber* Rydb. Stem strict, 3-5 dm. high; basal leaves oblanceolate, 5-10 cm. long; stem-leaves narrowly lanceolate to nearly linear; calyx about 6 mm. long; lobes lanceolate, acute or acuminate; corolla slightly ventricose; sterile stamen short-hirsute. *P. glaber utahensis* S. Wats. *P. utahensis* A. Nels., not Eastw. Mountains: Wyo.—Colo.—Utah—Ida. *Submont.*—*Mont.* Je—Au.

14. *P. cyanocaulis* Payson. Stem 3-6 dm. high, erect, glabrous; basal leaves spatulate, 4-7 cm. long; stem-leaves oblong-spatulate to lanceolate, sessile; calyx-lobes lanceolate, acute or acuminate, 4-5 mm. long, scarious-margined; corolla blue, 17-20 mm. long; sterile stamen sparsely hirsute, more than half its length. Dry mesas: w Colo. *Submont.* My—Je.

15. *P. alpinus* Torr. Stem 2-4 dm. high; basal leaves oblanceolate, obtuse, short-petioled; stem-leaves lanceolate and sessile, 5-10 cm. long, acute or acuminate; inflorescence dense and usually one-sided; calyx 8-10 mm. long; corolla funnelform, more or less ventricose, bluish purple; sterile stamen with yellow beard at the end. *P. oreophilus* Rydb. *P. riparius* A. Nels. Mountains: Colo.—s Wyo. *Submont.*—*Mont.* Je—Au.

16. *P. cyananthus* Benth. Stems 3-10 dm. high, glabrous and glaucous; lower leaves oblanceolate or spatulate, the upper ovate or subcordate; calyx 7-10 mm. long; lobes lanceolate; corolla 2-2.5 cm. long, slightly ventricose; sterile stamen narrow, hirsute. Hills and mountains: Utah—Ida.—Wyo. *Submont.*—*Mont.* My—Au.

17. *P. Brandegei* Porter. Stems 3-6 dm. high, stout, glabrous or minutely puberulent; basal leaves 5-8 cm. long, petioled, oblong to spatulate, glabrous or nearly so, glaucous; upper stem-leaves sessile, ovate or subcordate, 3-7 cm. long; calyx 4-5 mm. long; sterile stamen club-shaped, almost glabrous. *P. cyananthus Brandegei* Porter. Mountains: Colo. *Submont.*—*Mont.* Jl—S.

18. *P. glaber* Pursh. Stems stout, glabrous and glaucescent, 3-6 dm. high; lower leaves oblanceolate, 5-15 cm. long, glabrous, the upper oblong or lanceolate; calyx glabrous, about 5 mm. long; corolla bluish purple, about 3 cm. long, somewhat ventricose; sterile stamen sparingly hirsute. *P. eriantherus* Nutt. *P. Gordoni* Hook. Plains and hills: N.D.—Neb.—Ida. *Plain*—*Submont.* Je—Jl.

19. *P. speciosus* Dougl. Stem 2-6 dm. high, glabrous; basal leaves oblanceolate, glabrous, 5-10 cm. long; upper stem-leaves narrowly linear-lanceolate, acuminate; calyx 5-6 mm. long; corolla 2-2.5 cm. long, narrower below and more ventricose above than in *P. glaber*. *P. Rex* A. Nels. Plains: Wash.—Calif.—Nev.—*Mont.* My—Jl.

20. *P. unilateralis* Rydb. Stems 3-6 dm. high, glabrous, strict; lower leaves narrowly oblanceolate, 5-10 cm. long, the upper linear-lanceolate; inflorescence decidedly secund; calyx glabrous, about 5 mm. long; lobes round-oval or ovate, acute or obtuse; corolla narrow below, abruptly ventricose, 2 cm. long. *P. secundiflorus* A. Gray, not Benth. Mountains: Wyo.—N.M.—Utah. *Submont.*—*Mont.*

21. *P. Wardii* A. Gray. Stem 1-3 dm. high, densely minutely cinereous-pubescent; leaves thick, oblong or the upper oblong-lanceolate, puberulent; corolla pale and sparsely puberulent. *P. glaber Wardii* M. E. Jones. Mountains: Utah. *Submont.*

22. *P. perpulcher* A. Nels. Stem 4-8 dm. high, erect, puberulent below; leaves narrowly oblanceolate, 3-10 cm. long; stem-leaves linear-lanceolate to linear; calyx-lobes glabrous, ovate, subscarious and denticulate on the margins; corolla blue, less than 2 cm. long, glabrous within; anthers glabrous; sterile filament stiffly bearded, not dilated at the tip. *P. minimocanus* and (?) *P. payetensis* Nels. & Macbr. Dry banks: Ida. *Son.*

23. *P. Palmeri* A. Gray. Stem 6-10 dm. high, glabrous; lower leaves spatulate, petioled, the upper ovate, lanceolate, or oblong, sessile or perfoliate, sharply dentate; calyx glandular-pubescent; lobes broadly ovate, cuspidate, scarious-margined; corolla cream-colored, tinged with pink, from a narrow, short tube, strongly ventricose, about 2 cm. long; sterile stamen densely yellow-bearded. Dry regions: s Utah—Nev.—Calif. *Submont.* Je—Jl.

24. *P. grandiflorus* Nutt. Stem 6-12 dm. high, glabrous; basal leaves glaucous, glabrous, obovate, entire; upper stem-leaves broadly ovate, oval, or rounded; calyx about 5 mm. long, glabrous; lobes ovate, acute; corolla about 4 cm. long, pink, strongly ventricose, with a narrow tube; sterile stamen hooked and minutely pubescent at the apex. *P. Bradburji* Pursh. Prairies and plains: Wis.—Mo.—Okla.—Colo.—Wyo. *Plain.* My—Jl.

25. *P. Hallii* A. Gray. Caudex caespitose; stem glabrous, 1-2 dm. high; basal leaves linear-ob lanceolate, obtuse, thick, glabrous; stem-leaves narrowly linear-lanceolate or linear; inflorescence short; calyx 4 mm. long; lobes broadly obovate, abruptly acuminate, with scarious erose margins; corolla 15-20 mm. long, ventricose, without distinct tube; sterile filament short-bearded. High mountains: Colo.—Utah. *Subalp.—Alp.* Jl—Au.

26. *P. cyathophorus* Rydb. Stem very strict, 3-4 dm. high; basal leaves and lower stem-leaves spatulate, petioled, 3-6 cm. long, the others ovate or orbicular, often abruptly acuminate or mucronate; calyx 6-8 mm. long; lobes lanceolate, scarious-margined and more or less erose-dentate; corolla pink-purple, 12-15 mm. long, little oblique and scarcely ventricose; sterile stamen with a yellow beard. Mountains: n Colo.—s Wyo. *Submont.—Mont.* Jl.

27. *P. pachyphyllus* A. Gray. Stem 3-6 dm. high, stout, glabrous and glaucous; basal leaves petioled, 6-10 cm. long, glabrous and glaucous; blades thick, oval, rounded at the apex; lower stem-leaves oblong or elliptic, the upper ones and the bracts oval, the latter usually scarious-margined; calyx glabrous, 5 mm. long; corolla 15-20 mm. long; sterile stamen spatulate, densely bearded. *P. acuminatus major* Benth. *P. acuminatus congestus* M. E. Jones. Plains: Utah.—Ariz. *Son.* Je.

28. *P. acuminatus* Dougl. Stem glabrous and glaucous, strict, 2-4 dm. high; lower leaves oblanceolate, glabrous, glaucous, 2-6 cm. long; upper leaves and bracts broadly ovate or cordate, abruptly acuminate, strongly veined; calyx glabrous, 8-10 mm. long; corolla blue or purple, about 2 cm. long, funnelform. Plains: Wash.—Alta.—Ida.—Nev. *Son.* My—Jl.

29. *P. nitidus* Dougl. Stem 2-3 dm. high, glabrous, glaucous; lower leaves oblanceolate, 3-5 cm. long, glabrous, entire; upper leaves and bracts lanceolate or ovate, acute or abruptly acuminate; calyx glabrous, 4-6 mm. long; corolla blue, 15-18 mm. long, obliquely funnelform. Plains: Man.—S.D.—Wyo.—Wash.—Alta. *Plain.* My—Jl.

30. *P. arenicola* A. Nels. Stems 2-3 dm. high, glabrous and glaucous; lower leaves petioled, oblanceolate or spatulate, the middle ones oblong and the uppermost lanceolate; calyx glabrous, 4 mm. long; sepals lanceolate, acute, slightly scarious; corolla 12-15 mm. long; sterile stamen obliquely spatulate, bearded. Sand-dunes: Wyo. *Plain.* Je.

31. *P. secundiflorus* Benth. Stem glabrous and glaucous; basal leaves oblanceolate, 3-7 cm. long, glaucous and glabrous; stem-leaves lanceolate to ovate-lanceolate, more or less acuminate; inflorescence secund; calyx 5-6 mm. long, glabrous, often somewhat bluish; corolla about 2 cm. long, funnelform, bluish purple; sterile stamen club-shaped, curved, densely bearded. Dry plains or hills: Wyo.—N.M.—Utah. *Submont.—Mont.*

32. *P. Fendleri* A. Gray. Stem glabrous and glaucous, 1-2 dm. high; basal leaves petioled, 3-6 cm. long; blades oval or ovate; stem-leaves ovate to lanceolate; bracts small, lanceolate; calyx 4 mm. long; corolla 15-18 mm. long, almost salverform; sterile stamen club-shaped, densely yellow-bearded. Dry plains: Colo.—w Tex.—N.M.—(? Calif.). My—Jl.

33. *P. Haydenii* S. Wats. Stem 2-5 dm. high, stout, leafy, glabrous; lower leaves, especially those of the shoots, narrowly linear, the upper stem-leaves linear-lanceolate; calyx glabrous, about 8 mm. long; lobes lanceolate, acuminate; corolla blue, funnelform; sterile stamen bearded at the apex. Sand hills: Neb.—Wyo. *Plain.* Je-Jl.

34. *P. caudatus* Heller. Stem glabrous, 2-4 dm. high, leafy; lower leaves 4-7 cm. long; stem-leaves lanceolate, linear-lanceolate or the upper ovate-lanceolate, acuminate; calyx about 5 mm. long; lobes lanceolate, scarious-margined, long-acuminate; corolla violet, about 2 cm. long, funnelform; sterile stamen bearded on the upper half. *P. angustifolius caudatus* Rydb. Hills: N.M.—Colo. *Submont.* My-Je.

35. *P. angustifolius* Pursh. Stems 1-3 dm. high, glabrous; leaves linear or the upper linear-lanceolate, 5-10 cm. long, glabrous; calyx glabrous, about 5 mm. long; lobes lanceolate, acuminate, often with narrow scarious margins; corolla about 15 mm. long, blue, lilac, or white, funnelform, scarcely ventricose; sterile stamen bearded above. *P. coeruleus* Nutt. Plains: S.D.—Colo.—Mont. *Plain.* My-Jl.

36. *P. petiolatus* Brand. Stem about 1 dm. high, cespitose from a woody root, puberulent, glandular in the inflorescence; petioles 1-1.5 cm. long; leaf-blades 1-2 cm. long, cinereous-puberulent, sharply serrate, abruptly acuminate; bracts ovate, acuminate, 1-3 mm. long; calyx lobes ovate, 6 mm. long; corolla 15 mm. long, broadly funnelform; lower lip bearded within; sterile stamen bearded. Hills: Nev.—s Utah. *Submont.*

37. *P. stenosepalus* (A. Gray) Howell. Stem 1-5 dm. high, glabrous up to the inflorescence; basal leaves petioled, 3-7 cm. long, glabrous; blades spatulate or elliptic; stem-leaves sessile, lanceolate or linear-lanceolate, acuminate; calyx glandular-hirsute, 7-10 mm. long; lobes lance-subulate, attenuate; corolla 18-20 mm. long, funnelform, slightly ventricose, dull-white, rose, or purplish; sterile stamen club-shaped, bearded above. *P. glaucus stenosepalus* A. Gray. Mountains: Wyo.—N.M.—Ariz.—Utah. *Mont.—Subalp.*

38. *P. Erianthera* Pursh. Stem stout, 1-4 dm. high, leafy, canescent and more or less villous, especially above; basal leaves spatulate or oblanceolate, petioled, 5-10 cm. long; stem-leaves oblong or linear, entire or nearly so, grayish puberulent and sometimes villous on the veins; calyx fully 1 cm. long; lobes lance-subulate; sterile stamen with very long yellow hairs, two-thirds its length; throat long-bearded within. *P. cristatus* Nutt. Plains: N.D.—Neb.—Nev.—Wash. *Plain.* My-Jl.

39. *P. saliens* Rydb. Stems 2-3 dm. high, finely puberulent; basal leaves petioled, about 5 cm. long; blades obovate or oblanceolate, finely puberulent; stem-leaves oblanceolate to linear-lanceolate; calyx about 1 cm. long, villous-glandular; lobes linear-lanceolate, acuminate; throat and sterile stamen long-bearded. Plains: Mont. *Plain.* Je.

40. *P. Cleburnei* A. Nels. Stem low, densely puberulent, 1-2 dm. high; basal leaves entire or nearly so, petioled, ovate or elliptic, 2-4 cm. long; stem-leaves narrowly oblong; calyx minutely glandular, about 8 mm. long; lobes lanceolate; corolla-throat short-villous within; sterile stamen long-villous at the apex. *P. Jamesii* A. Nels., not Benth. *P. auricomus* A. Nels. Dry plains and hills: Wyo.—S.D.—Mont. *Plain.* My-Je.

41. *P. Moffattii* Eastw. Stems 1-3 dm. high, densely grayish puberulent; basal leaves petioled, ovate-spatulate, entire, grayish-puberulent; upper leaves lanceolate; calyx glandular-hirsute; lobes linear-oblong or linear-lanceolate; corolla purplish blue; sterile stamen moderately bearded towards the apex. *P. pseudo-humilis* M. E. Jones, not Rydb. Dry table-lands: Utah—Colo. *Submont.* My-Je.

42. *P. Jamesii* Benth. Stems 1-3 dm. high, grayish puberulent, glandular in the inflorescence; lower leaves narrowly linear-lanceolate, 3-10 cm. long; upper stem-leaves linear or linear-lanceolate; calyx glandular-villous, 8-10 mm. long; corolla glandular-villous; sterile stamen yellow-bearded at least half its length;

lower lip white-hairy in the throat. Plains and dry valleys: Colo. *Submont.*—*Mont.* My-Jl.

43. *P. pumilus* Nutt. Stems less than 1 dm. high, grayish-puberulent; basal leaves linear-ob lanceolate to spatulate, 1-3 cm. long, grayish-puberulent; stem-leaves linear; calyx 4.5 mm. long, viscid-puberulent; corolla about 18 mm. long, slightly viscid-puberulent; sterile stamen yellow-bearded half its length. Hills: *Mont.*—*Ida.* *Submont.*

44. *P. albidus* Nutt. Stems 1.5-4 dm. high, puberulent, viscid-villous above; lower leaves petioled, lanceolate or oblanceolate, 3-8 cm. long, densely puberulent; upper leaves linear or linear-lanceolate, entire or dentate; calyx viscid-villous, 5-7 mm. long; lobes lanceolate; corolla about 2 cm. long, viscid-puberulent. Prairies and plains: *Man.*—*Kans.*—*Colo.*—*Ida.*—*Alta.* *Plain.* My-Jl.

45. *P. Harbourii* A. Gray. Stems 5-15 cm. long, decumbent at the base, puberulent; leaves thick, oval or obovate, the lower petioled, the upper sessile, green and puberulent or glabrate; flowers few, crowded; calyx viscid-villous, 6-8 mm. long; lobes lanceolate; corolla purple, 2 cm. long; lower lip pubescent in the throat; sterile stamen spatulate, yellow-bearded half its length. *P. Bakeri* Greene. Rock-slides, on the higher peaks: *Colo.* *Mont.*—*Alp.* Jl—Au.

46. *P. deustus* Dougl. Perennial, with a woody base; stem glabrous, 1-4 dm. high; leaves firm, ovate, oblong or lanceolate, 1-3 cm. long; the lower petioled, the upper sessile; calyx glabrous or glandular-puberulent, 4 mm. long; lobes ovate or lanceolate, acute; corolla ochroleucous or dull-white, 10-12 mm. long; sterile stamen glabrous, occasionally anther-bearing. Dry regions: *Mont.*—*Wyo.*—*Nev.*—*Calif.*—*B.C.* *Son.*—*Submont.* My-Jl.

47. *P. confertus* Dougl. Stem slender, 1-5 dm. high, glabrous; lower leaves oblanceolate, 5-15 cm. long, glabrous, thin, entire; stem-leaves linear to lanceolate, acute; inflorescence interrupted; calyx 5 mm. long; lobes lanceolate to broadly ovate, abruptly acuminate, scarious-margined, erose; corolla 1 cm. long; lower lip bearded within. Dry banks and hills: *B.C.*—*Calif.*—*Wyo.*—*Alta.* *Submont.* My-Jl.

48. *P. Watsonii* A. Gray. Stem glabrous or glaucous, 3-5 dm. high; stem-leaves lanceolate, glabrous, sessile, acute or acuminate, 3-5 cm. long; calyx-lobes scarious-margined; corolla 12-15 mm. long, violet-purple; sterile stamen club-shaped, yellow-bearded. *P. phlogifolius* Greene. Dry plains: *Nev.*—*Ida.*—*Utah*—*Ariz.* Jl.

49. *P. Rydbergii* A. Nels. Stem 2-4 dm. high; basal leaves oblanceolate, petioled, 3-5 cm. long, entire, mostly acute or obtuse; stem-leaves sessile, oblong or lanceolate, entire, acute or the uppermost acuminate; calyx-lobes tinged with dark purple and white, with an erose-dentate margin; corolla purple, with very dark limb, 10-15 mm. long; lower lip bearded on the inside; sterile stamen narrowly clavate, short-bearded. *P. erosus* Rydb. *P. latiusculus* Greene. *P. lucerellus* Greene. Mountains: *Wyo.*—*Colo.*—*Nev.*—*Ida.* *Submont.*—*Mont.*

50. *P. laxus* A. Nels. Stem slender, 5-8 dm. high, minutely puberulent; lower leaves linear-ob lanceolate, the upper lanceolate or linear-lanceolate, minutely puberulent; flowers in a short thyrsus; corolla vivid-blue, about 12 mm. long, densely bearded inside the lower lip; sterile stamen not dilated, blue at the tip, curved at the apex, sparingly hairy or glabrate. Sage-brushlands: *Ida.* Jl.

51. *P. procerus* Dougl. Stem decumbent at the base, 1-3 dm. high, glabrous or puberulent; basal leaves petioled, oblanceolate or linear-ob lanceolate, glabrous, 4-8 cm. long; inflorescence usually compact, but in large specimens interrupted below; calyx glabrous, 5 mm. long; lobes obovate or cuneate, abruptly cuspidate, scarious-margined and erose; corolla dark purplish blue; lower lip bearded within. *P. micranthus* Nutt. *P. confertus coeruleso-purpureus* A. Gray. Hills and mountains: *Sask.*—*Colo.*—*Calif.*—*B.C.*—*Yukon.* *Plain*—*Subalp.* Je—Au.

52. *P. ovatus* Dougl. Stem 5-10 dm. high, more or less viscid above; basal leaves petioled; blades ovate, 4-8 cm. long, dentate, sparingly pilose; inflorescence a loose thyrsum; calyx somewhat viscid, 3-4 mm. long; lobes lance-ovate, acute; corolla nearly 2 cm. long; lower lip bearded in the throat; sterile stamen yellow-bearded above. Woods and banks: B.C.—Mont.—Ida. *Submont.*—Mont. My-Jl.

53. *P. pinetorum* Piper. Stem 6-10 dm. high, glabrous or nearly so; basal leaves petioled; blades ovate or elliptic, mostly entire, glabrous, thickish, 1-7 cm. long; calyx viscid-pubescent, 4 mm. long; lobes ovate, short-acuminate; corolla bright blue, varying to pink, 15-20 mm. long; lower lip bearded in the throat; sterile stamen bearded on the spatulate apex. *P. veronicacifolius* Greene. Woods and mountain sides: Mont.—Ida.—n Wash.—B.C. *Submont.* My-Jl.

54. *P. leptophyllus* Rydb. Stem 3-5 dm. high, glabrous or sparingly puberulent; lower leaves spatulate, petioled; upper stem-leaves ovate, 3-5 cm. long, sharply serrate, thin, subcordate at the base; calyx sparingly viscid-pubescent, 3-4 mm. long; lobes ovate, short-acuminate; corolla light blue, elongate-funnelform, 20-22 mm. long; lower lip sparingly bearded within; sterile stamen sparsely hairy. Mountains: Ida. *Submont.* Jl.

55. *P. Wilcoxii* Rydb. Stems glabrous or slightly puberulent above, simple; leaves glabrous and somewhat glaucous, dentate with small sharp callous teeth, acute, the basal ones petioled, lanceolate, the upper stem-leaves lanceolate and slightly clasping; calyx-lobes lanceolate, acute, slightly margined and sinuately toothed below; corolla purple, about 15 mm. long; lower lip longer than the upper, slightly bearded within; sterile stamen club-shaped, with a short dense brown beard. Plains: Mont.—Ida. *Plain.* My-Jl.

56. *P. albertinus* Greene. Stems about 2 dm. high, glabrous, only slightly glandular in the inflorescence; stem-leaves elliptic-ovate or lanceolate, subsessile; calyx sparingly glandular, 3-4 mm. long; lobes ovate, acute, entire, only slightly scarious-margined below; corolla light blue, scarcely ventricose. Mountains: Alta.—B.C. *Mont.* Jl.

57. *P. brevifolius* (A. Gray) A. Nels. Perennial, with a caespitose caudex; stems ascending or decumbent at the base, 1-2 dm. high, glabrous; stem-leaves obovate or elliptic, entire; calyx densely viscid, 3 mm. long; lobes ovate, acuminate, slightly scarious-margined; corolla light blue, 1 cm. long, cylindric-funnelform, scarcely ventricose. *P. humilis brevifolius* A. Gray. *P. brevis* A. Nels. High mountains: Utah—Nev.—Ida. *Mont.*—*Subalp.*

58. *P. attenuatus* Dougl. Stem 3-5 dm. high, glabrous up to the inflorescence; basal leaves petioled, glabrous; blades spatulate or elliptic; stem-leaves oblong or lanceolate or the uppermost ovate-lanceolate; calyx 6 mm. long; corolla narrowly funnelform, 15-18 mm. long, bearded in the throat. Plains: Wash.—Ida.—Ore. *Submont.* My-Jl.

59. *P. pseudoprocerus* Rydb. Stem glabrous up to the inflorescence, 1.5-3 dm. high; basal leaves petioled, 3-5 cm. long, thick, glabrous; upper stem-leaves lanceolate or linear; calyx about 5 mm. long; corolla fully 15 mm. long, dark purplish blue, cylindric-funnelform, puberulent; lower lip sparingly bearded; sterile stamen densely yellow-bearded at the spatulate end. Mountains: Mont.—Wyo.—Ida. *Submont.* Je-Jl.

60. *P. virens* Pennell. Stem 1-3 dm. high, glabrous up to the inflorescence; leaves glabrous, glaucescent, the lower petioled; blades 2-4 cm. long; upper stem-leaves lanceolate or oblong, usually denticulate; calyx 4 mm. long; corolla deep-blue, 15 mm. long, funnelform; lower lip slightly bearded; sterile stamen yellow-bearded on the spatulate tip. *P. humilis* A. Gray, mainly, not Nutt. Plains and hills: Alta.—Colo.—Nev. *Plain*—Mont. Je-Au.

61. *P. aridus* Rydb. Stems puberulent or glabrate up to the inflorescence, 1-2 dm. high; basal leaves 2-4 cm. long, thick; calyx 5 mm. long; corolla about 12 mm. long, tubular-funnelform; sterile stamen slightly bearded at the end. Dry hillsides: Mont. *Submont.*—Mont. Je-Jl.

62. *P. pseudohumilis* Rydb. Stem glabrous, 2-3 dm. high, simple; basal leaves petioled; blades elliptic or spatulate, thin; calyx 5-6 mm. long; corolla bluish purple, about 15 mm. long, funnelform; sterile stamen with spatulate yellow-bearded end. *P. Oweni* A. Nels. Wooded mountain sides: Alta.—Wyo.—Ida.—B.C. *Submont.*—*Mont.* Je—Au.

63. *P. gracilis* Nutt. Stem 2-4 dm. high, viscid in the inflorescence; basal leaves short-petioled; blades oblanceolate or elliptic, entire; stem-leaves mostly linear-lanceolate, usually denticulate; corolla almost cylindric, lilac or whitish, 18-20 mm. long, slightly bearded within; sterile stamen bearded three-fourths its length. Plains and prairies: Man.—Tex.—Colo.—Alta. *Plain*—*Submont.* Je—Jl.

64. *P. oliganthus* Woot. & Standl. Stem slender, 2-3 dm. high, glabrous below, glandular above; basal leaf-blades oblong or oval, 2 cm. long; stem-leaves linear-lanceolate or linear; calyx 4 mm. long, glandular-villous; corolla 20-25 mm. long, bearded in the throat; sterile stamen densely yellow-bearded. *P. Griffini* A. Nels. Mountains: N.M.—Colo. *Submont.* Jl—Au.

65. *P. puberulentus* Rydb. Perennial, suffruticose and branched at the base; stems 3-4 dm. high, finely puberulent; leaves narrowly linear-lanceolate or linear-oblanceolate, 2-5 cm. long, entire, acute, with strong midrib and somewhat revolute margins, finely puberulent on both sides; inflorescence elongate, racemiform, glandular-puberulent; calyx about 5 mm. long, glandular-puberulent; sepals ovate-lanceolate, acute; corolla about 18 mm. long, glandular-puberulent without and within; throat funnelform; limb ample, about 1 cm. wide, slightly bilabiate; sterile filament with yellow beard towards the end. Valleys: Ida.—Ore. *Submont.*—*Son.* Jl.

66. *P. oreganus* (A. Gray) Howell. Perennial, suffruticose at the base; stems strict, finely puberulent, 2-4 dm. high; basal leaves small, linear-oblanceolate; stem-leaves 2-4 cm. long, 1-3 mm. wide, densely and finely puberulent; calyx-lobes lanceolate; corolla purple, 18-20 mm. long, puberulent without; sterile filament bearded at least two-thirds its length. *P. Gairdneri oreganus* A. Gray. *P. linarioides seorsa* A. Nels. Lava fields: Ida.—Ore. *Submont.* Je.

67. *P. radicosus* A. Nels. Stems strict, erect, 2-3 dm. high, puberulent; basal leaves small or none; stem-leaves 2-4 cm. long; calyx viscid, 5 mm. long; corolla nearly tubular, dark blue, 14-18 mm. long, sparsely bearded within; sterile stamen bearded half its length. Dry plains: Mont.—Colo.—Utah—Ida. *Plain*—*Submont.* My—Jl.

68. *P. humilis* Nutt. Stems erect, 2-3 dm. high, puberulent throughout and viscid in the inflorescence; basal leaf-blades elliptic, acute, 2-3 cm. long, finely puberulent; stem-leaves sessile, oblong or linear; calyx 4-5 mm. long; corolla deep-blue, tubular-funnelform, sparsely bearded in the throat; sterile stamen bearded at the apex. *P. collinus* A. Nels. Hills: Wyo.—Ore.—B.C. *Plain*—*Submont.* Je—Jl.

69. *P. exilifolius* A. Nels. Stems glabrous, 1-2 dm. high; leaves numerous, narrowly linear, channelled or convolute, 1.5-2.5 cm. long; calyx glabrous, 5 mm. long; sepals ovate, acuminate; corolla white, tubular-funnelform, 12-15 mm. long; sterile stamen almost filiform, short-bearded. Dry plains and hilltops: Wyo.—Colo. *Plain*—*Submont.* Je—Jl.

70. *P. laricifolius* H. & A. Stems 1-2 dm. long, glabrous; leaves numerous, almost filiform, 1-2 cm. long, glabrous; calyx 5 mm. long, glabrous; lobes lance-subulate; corolla 12-15 mm. long, funnelform; sterile stamen club-shaped, bearded half its length. Plains and hills: Ida.—Wyo. *Submont.*—*Mont.* Jl.

71. *P. ambiguus* Torr. Stem glabrous, 3-6 dm. high, diffusely branched; bracts subulate; peduncles opposite, 1-3-flowered; calyx glabrous, 3 mm. long; lobes ovate, short-acuminate; corolla 2 cm. long, rose-colored or white; fifth stamen often anther-bearing. Plains: Tex.—Okla.—Colo.—Utah—Ariz.; Mex. *Son.* My—S.

72. *P. Thurberi* Torr. Stem 3-4 dm. high, glabrous; leaves 1-3 cm. long; calyx 2-3 mm. long, glabrous; lobes ovate; corolla scarcely 1 cm. long, more

funneliform; stamens more equal in length, the fifth sometimes anther-bearing. Arid places: s Utah—Ariz.—N.M.; Mex. *Son.* Jl—Au.

73. *P. suffrutescens* Rydb. Stems decumbent or prostrate, often rooting, retrorsely puberulent, 1–2 dm. long; leaves thick, spatulate, about 1 cm. long; inflorescence few-flowered; calyx 4–5 mm. long, puberulent; corolla 10–15 mm. long, tubular-funneliform, ventricose, glabrous within; sterile stamen bearded fully half its length. *P. caespitosus suffruticosus* A. Gray. *P. procumbens* Greene. High mountains: Colo.—Utah. *Mont.* Je—Jl.

74. *P. caespitosus* Nutt. Stems cinereous-puberulent, decumbent, 0.5–2 dm. long; leaves 5–15 mm. long, spatulate or oblanceolate, grayish puberulent; flower-clusters few-flowered; calyx puberulent, 6–8 mm. long; corolla 15–20 mm. long, tubular-funneliform, somewhat ventricose, sparingly villous within; sterile stamen strongly bearded. Dry hills: Wyo.—Colo.—Utah. *Submont.*—*Subalp.* Je—Jl.

75. *P. Thompsoniae* (A. Gray) Rydb. Stems ascending or decumbent, about 1 dm. high, densely puberulent; leaves spatulate or oblanceolate, 5–18 mm. long, densely puberulent; calyx white-puberulent, 5 mm. long or less; corolla about 15 mm. long, tubular-funneliform, sparingly bearded within; sterile stamen strongly bearded half its length. *P. pumilus Thompsoniae* A. Gray. Dry hills: s Utah—Ariz.—Nev. *Son.* Jl—Au.

76. *P. Crandallii* A. Nels. Stems prostrate or ascending, finely puberulent, 1–2 dm. high, leafy; leaves linear-oblanceolate, 1–2 cm. long, puberulent; calyx glandular-pubescent, 4 mm. long; lobes lanceolate, slightly scarious at the base; corolla elongate-funneliform, sparsely glandular-puberulent, sparingly villous in the throat; sterile stamen moderately bearded to near its base. Mountains: Colo. *Submont.*—*Mont.* Je—Au.

77. *P. xylus* A. Nels. Stems ascending, finely puberulent, 1–2 dm. high; leaves linear-spatulate, glabrous or nearly so, 1–2 cm. long; calyx glandular-puberulent; lobes linear-lanceolate, not scarious; corolla blue, sparingly puberulent, sparingly bearded in the throat; sterile stamen bearded half its length. Mountains: Colo. *Submont.*—*Mont.* My—Jl.

78. *P. teucrioides* Greene. Stems usually less than 1.5 dm., ascending, cinereous-puberulent; leaves spatulate-linear, entire, cinereous, about 1 cm. long; calyx 4 mm. long; lobes lance-subulate, not scarious-margined; corolla deep-purple, about 12 mm. long, cylindro-funneliform, scarcely gibbous; sterile stamen bearded to near the base. Dry hills: Colo.—Utah. *Submont.* My—Je.

79. *P. coloradensis* A. Nels. Stems cinereous-puberulent, 1–3 dm. high; leaves 1–2.5 cm. long, oblanceolate-linear, puberulent; inflorescence elongate; calyx puberulent, 4 mm. long; lobes ovate, short-acuminate; corolla lilac or purple, about 15 mm. long, funneliform, ventricose; lower lip bearded within; sterile stamen bearded half its length. *P. linarioides* Rydb. (Fl. Colo.), not A. Gray. Dry hills and plains: Tex.—Colo.—Utah—Ariz.; Mex. *Submont.* Ap—Au.

80. *P. glandulosus* Lindl. Stem 6–10 dm. high, viscid-pilose or puberulent; lower leaves petioled; blades 5–15 cm. long, ovate, lanceolate, or oblong, dentate, acuminate; upper stem-leaves ovate-lanceolate to cordate, often clasping, saliently dentate, pubescent; calyx viscid-pilose, 10–15 mm. long; lobes lanceolate, attenuate; corolla lilac, 3–4 cm. long, puberulent, funneliform, ventricose; sterile stamen glabrous. Mountain woods and along streams: Ore.—Ida.—Wash. *Son.*—*Submont.* My—Jl.

81. *P. venustus* Dougl. Stem 3–6 dm. high, glabrous or somewhat puberulent; leaves lanceolate to oblong- or oval-lanceolate, closely and sharply serrate, glabrous, 2–4 cm. long; calyx 3 mm. long, glabrous; sepals ovate, short-acuminate; corolla funneliform, somewhat ventricose; sterile stamen sparingly long-bearded half or three-fourths its length. Dry plains and hills: Ore.—Ida.—Wash. *Submont.* Je.

82. *P. Richardsonii* Dougl. Stem loosely branched, more or less puberulent; leaves ovate or lanceolate in outline, incised to laciniate-pinnatifid, 2–5 cm. long, puberulent; calyx 6 mm. long, viscid-puberulent; sepals ovate, apicu-

late; corolla reddish, 2-2.5 cm. long, funnelform, ventricose; sterile stamen sparingly villous-bearded at the apex. Rocky places: Alta.—Ida.—Ore.—B.C. *Son.—Submont.* Je—Au.

83. *P. diffusus* Dougl. Stem 3-6 dm. high, somewhat puberulent; leaves ovate or lanceolate, the upper subcordate, serrate, glabrate; inflorescence interrupted; calyx more or less pubescent, 6-8 mm. long; lobes ovate or lanceolate, acuminate; corolla blue or purple; sterile stamen sparingly bearded above. Wooded or rocky banks: B.C.—Ore. *Mont.* Je—Jl.

84. *P. diphyllus* Rydb. Stem much branched, minutely puberulent, 2-3 dm. high; leaves 3-5 cm. long, the lower petioled, the upper sessile, lanceolate, acute; calyx glandular-pubescent, 5 mm. long; lobes lanceolate, unequal; corolla funnelform, scarcely ventricose; sterile stamen filiform-clavate, sparingly bearded. Rocky woods: Mont.—B.C. *Submont.* Jl—Au.

85. *P. triphyllus* Dougl. Stem slender, 3-8 dm., puberulent or glabrate; leaves lanceolate or linear, 2-4 cm. long, denticulate to incised; calyx 6 mm. long, viscid-puberulent; lobes lanceolate, acuminate; corolla purple, 12-15 mm. long, tubular-funnelform; sterile stamen bearded at the apex. Dry soil: B.C.—Ida.—Ore. *Son.—Submont.* My—Je.

86. *P. Kingii* S. Wats. Stems branched, 2-4 dm. high, glabrous or pruinose; leaves oblanceolate, glabrous or puberulent, not glaucous, 2-3 cm. long; inflorescence strict; calyx sparingly viscid-puberulent; lobes ovate, acuminate; corolla 15-25 mm. long, cylindro-funnelform. Mountains: (? Utah)—Nev. *Submont.* Je—Jl.

87. *P. Leonardi* Rydb. Stem 1-2 dm. high, minutely puberulent; leaves glabrous and somewhat glaucous, 1-3 cm. long; inflorescence few-flowered; calyx glabrous, 5-6 mm. long; sepals narrowly lanceolate, attenuate; corolla 15-18 mm. long, narrowly funnelform; stamens included; sterile stamen long, glabrous. *P. Kingii* Coult. & Nels., mainly. Mountains: Utah. *Mont.* Jl—Au.

88. *P. platyphyllus* Rydb. Stems glabrous or minutely puberulent, 3-4 dm. high; leaves oval to broadly lanceolate, acute at each end, glabrous; calyx glabrous, 6-8 mm. long; corolla about 2.5 cm. long, funnelform, glabrous; stamens slightly exerted; anthers papillose-hispid on the margins; sterile stamen glabrous, gradually widened upwards. *P. heterophyllus latifolius* S. Wats. *P. latifolius* Krautter, not Hoffmgg. Cañons: Utah. *Submont.* Je—Au.

89. *P. Cusickii* A. Gray. Stems 2-4 dm. high, pruinose-puberulent; leaves narrowly linear, 2-4 cm. long, puberulent; thyrsus loose; calyx 5 mm. long, glabrous or puberulent, but not viscid; lobes ovate, acuminate; corolla 18-20 mm. long, ventricose, funnelform; sterile stamen spatulate-dilated at the tip, glabrous. *P. Macbridei* A. Nels. Slopes: Ore.—Ida. *Submont.* Je.

90. *P. sepalulus* A. Nels. Stems glabrous and glaucous, 3-6 dm. high; leaves narrowly lanceolate or linear, glabrous and glaucous; inflorescence open; calyx glabrous, 3 mm. long; corolla violet, funnelform, ventricose, 2.5 cm. long; anthers minutely papillose on the margin; sterile stamen glabrous, gradually dilated to the truncate apex. *P. azureus ambiguus* A. Gray. Cañons: Utah. *Submont.* Je—Jl.

91. *P. coccinatus* Rydb. Stem erect, 3-6 dm. high; basal leaf-blades ovate or elliptic, acute at both ends, 3-7 cm. long, densely puberulent; upper stem-leaves ovate or ovate-lanceolate, acuminate; calyx about 5 mm. long, puberulent; lobes broadly ovate, short-acuminate, scarious-margined and denticulate; corolla red, about 2.5 cm. long, nearly tubular; anthers papillose on the margin, glabrous; sterile stamen glabrous, club-shaped, truncate. *P. Eatonii undosus* M. E. Jones. Arid places: s Utah—Ariz.—se Colo. *Son.* My—Je.

92. *P. Eatonii* A. Gray. Stem 3-6 dm. high, glabrous; basal leaves 5-10 cm. long; blades spatulate or oblanceolate; calyx glabrous, 5 mm. long; lobes ovate or ovate-lanceolate, acute or somewhat acuminate, slightly scarious-margined; corolla carmine, tubular; sterile stamen usually slightly puberulent at the apex. Dry banks: Utah—Ariz.—Nev. *Submont.—Mont.* Je—Jl.

93. *P. utahensis* Eastw. Stem 3-6 dm. high, glabrous; basal leaves oblanceolate, thick, 5-8 cm. long, glabrous; calyx glabrous, 4 mm. long; lobes ovate or lance-ovate, acute; corolla carmine, 15-20 mm. long, slightly bilabiate, tubular-funnelform; sterile stamen dilated and hooked at the tip, glabrous. *P. confusus* M. E. Jones. *P. Eastwoodiae* Heller. Arid regions: Ariz.—s Utah. *Son.*

94. *P. barbatus* (Cav.) Nutt. Stem 3-18 dm. high, glabrous; lower leaves petiolate, oblong or ovate, glabrous; stem-leaves lanceolate to linear; calyx 5 mm. long, glabrous; lobes ovate; corolla 2.5-3 cm. long, tubular, strongly 2-lipped; anthers and sterile stamen glabrous. Mountains: N.M.—s Utah—Ariz.; also Mex. *Submont.*—*Mont.* Je-S.

95. *P. Torreyi* Benth. Stem glabrous, 3-6 dm. high, glabrous; basal leaves spatulate or oblanceolate; stem-leaves linear, glabrous; calyx glabrous, 4 mm. long; lobes ovate, acute; corolla scarlet, 3-3.5 cm. long; sterile stamen glabrous. Hills and mountain sides: N.M.—Colo.—e Utah—Ariz.; Mex. *Submont.*—*Mont.* Jl-O.

96. *P. trichander* (A. Gray) Rydb. Stem glabrous or slightly puberulent and glaucous, 3-7 dm. high; basal leaves spatulate or oblanceolate, 4-8 cm. long; stem-leaves linear; calyx glabrous, 5-6 mm. long; lobes ovate, more or less acuminate; corolla scarlet, about 3 cm. long; sterile stamen filiform, glabrous. Mountains: Colo.—Utah. *Submont.*—*Mont.* Je-Jl.

97. *P. Bridgesii* A. Gray. Stem glabrous up to the inflorescence, or pruinose-puberulent; lower leaves spatulate or oblanceolate, the upper linear, mostly glabrous; calyx 5 mm. long, viscid; lobes ovate or lanceolate, acuminate; corolla scarlet, tubular-funnelform, 2.5 cm. long, strongly bilabiate, not ventricose, glabrous within; anthers strongly sagittate, glabrous; sterile stamen glabrous. Rocky banks: Calif.—Ariz.—(? s Colo.)—Utah. *Submont.* Jl-Au.

8. PENTSTEMONOPSIS Rydb.

Perennial caulescent herbs. Leaves opposite, but mostly basal, oblanceolate or spatulate, the stem-leaves bract-like. Flowers perfect, racemose. Calyx 5-cleft to near the base. Corolla 2-lipped; tube gibbous at the base on the upper side. Stamens 4, nearly equal. Staminodium or sterile stamen glabrous. Capsule ovoid, 2-valved. Seeds numerous, with an arilliform reticulate coat.

1. *P. Tweedyi* (Canby & Rose) Rydb. Stem 1-1.5 dm. high, glabrous; leaves mostly basal, 2-3 cm. long, oblanceolate or spatulate, glabrous; stem-leaves small and bract-like; inflorescence secund; calyx 3 mm. long, glandular-puberulent; lobes ovate, acute; corolla white or tinged with purple, 8-10 mm. long, tubular; anthers and sterile stamen glabrous. *Pentstemon Tweedyi* Canby & Rose. *Chionophila Tweedyi* Henders. Rich soil: Mont.—Ida. *Submont.*—*Mont.* Je-Jl.

9. CHIONOPHILA Benth.

Perennial caulescent herbs. Leaves opposite, entire. Flowers perfect, racemose. Calyx funnelform, membranous, obscurely 5-lobed. Corolla 2-lipped; throat slightly dilate; upper lip erect, retuse; lower lip 3-lobed, bearded in the throat. Stamens 4, as in *Pentstemon*; staminodium small and short, glabrous. Styles united; stigma minute. Capsule oblong, 2-valved, loculicidal, the valves 2-parted. Seeds with a loose arilliform cellular-reticulate coat.

1. *C. Jamesii* Benth. Stem 1 dm. high or less, glabrous or minutely puberulent; basal leaves thick, entire, spatulate or oblanceolate, glabrous; stem-leaves small, linear; spike dense, secund, imbricate-bracteate; calyx tubular, 7-8 mm. long; corolla about 12 mm. long, cream-colored, glabrous, tubular. Higher mountains: Colo.—s Wyo. *Subalp.*—*Alp.* Jl-Au.

10. MIMULUS L. MONKEY-FLOWER.

Annual or perennial herbs. Leaves opposite, mostly toothed. Flowers perfect, axillary, solitary, sometimes disposed in leafy racemes or panicles. Calyx angled; tube longer than the unequal 5 lobes. Corolla 2-lipped, yellow or red; tube with two ridges within on the lower side; upper lip spreading or re-

flexed; lower lip erect. Stamens 4; filaments partly adnate to the corolla-tube. Styles glabrous, united up to the 2-lobed stigma. Capsule loculicidal; placentae separating from the valves, remaining united in the middle, seldom separating.

Calyx oblique, decidedly inflated in fruit; upper tooth much larger than the rest; corolla yellow.

Calyx-teeth acute; stem neither rooting at the nodes, nor floating.

Perennials, usually tall and erect, 3-6 dm. high; corolla 2-3.5 cm. long; upper calyx-tooth half longer than the rest.

Leaves glabrous; stem pubescent only above.

1. *M. Langsdorffii*.

Leaves and stem pubescent throughout.

2. *M. puberulus*.

Annuals, slender or low; corolla 2 cm. or less long.

Corolla 1.5-2 cm. long, at least twice as long as the calyx.

Stem long, usually slender; upper calyx-lobe about twice as long as the rest; calyx red-spotted.

3. *M. nasutus*.

Stem less than 1 dm. high; upper calyx-lobe only slightly longer than the rest; calyx not spotted.

4. *M. thermalis*.

Corolla 5-10 mm. long, about half longer than the calyx.

Plant perfectly glabrous.

5. *M. Hallii*.

Inflorescence and calyx villous-puberulent.

6. *M. microphyllus*.

Calyx-teeth obtuse; stem decumbent or floating, rooting at the nodes.

7. *M. Geyeri*.

Calyx neither oblique, nor inflated; its lobes nearly equal.

Perennials; flowers 1.5-4 cm. long; sepals linear-lanceolate.

Corolla crimson or rose.

Tall, with erect stem, 3-10 dm. high, not stoloniferous.

8. *M. Lewisii*.

Stem 1-2 dm. high, stoloniferous.

9. *M. Eastwoodiae*.

Corolla yellow; plant low or slender, weak.

Stem leafy throughout.

10. *M. moschatus*.

Stem leafy only at the base.

15. *M. primuloides*.

Annuals; flowers 0.5-2 cm. long; sepals ovate, triangular, or broadly lanceolate.

Leaves petioled; blades cordate to ovate-lanceolate.

Leaf-blades cordate or broadly ovate, indistinctly 5-ribbed.

Corolla 1.5-2 cm. long.

11. *M. peduncularis*.

Corolla 1 cm. or less long.

Leaves not very thin, dark green, decidedly pubescent; stem often purple and villous.

12. *M. floribundus*.

Leaves very thin, membranous, light green, glabrous or nearly so; stem very delicate, white.

13. *M. membranaceus*.

Leaf-blades ovate-lanceolate, tapering at the base, distinctly 3-ribbed.

14. *M. breviflorus*.

Leaves sessile, oval, oblong, lanceolate or linear.

Corolla yellow; lower lip lobed.

Leaves basal or nearly so; peduncle solitary, scape-like, many times longer than the leaves.

15. *M. primuloides*.

Leaves scattered; peduncles axillary, scarcely exceeding the leaves.

Plant villous, 1-4 dm. high; lower lip of the corolla with 2 brown spots.

16. *M. pilosus*.

Plant 1 dm. high or less, glabrous or glandular-puberulent; corolla spotless.

Leaves thick, indistinctly veined; corolla 4-6 mm. long.

17. *M. Suksdorfii*.

Leaves thin, more or less distinctly 3-ribbed; corolla about 8 mm. long.

18. *M. gratioides*.

Corolla rose-colored; lower lip entire.

Plant glandular-puberulent.

19. *M. rubellus*.

Plant glandular-villous.

20. *M. Breweri*.

1. ***M. Langsdorffii*** Donn. Stems erect or ascending, 1-10 dm. high, glabrous; lower leaves petioled, the upper sessile or clasping; blades ovate, rounded, or subreniform, sinuately dentate or denticulate, 2-7 cm. long, glabrous; calyx 10-15 mm. long, puberulent; teeth broadly triangular-ovate, acutish; corolla 2-3.5 cm. long, yellow, rarely spotted, bearded inside. *M. luteus* A. Gray, not L. *M. minor* A. Nels. Swamps and along streams: Sask.—N.M.—Calif.—Alaska; Mex. *Submont.*—*Subalp.* Ap—Au.

2. ***M. puberulus*** Greene. Stem 2-3 dm. high, viscid-hirtellous; lower leaves petioled, obovate or spatulate, somewhat puberulent; upper stem-leaves sessile, ovate, coarsely dentate; calyx viscid-puberulent, about 1 cm. long; teeth triangular, acute; corolla yellow, 2-2.5 cm. long, funnellform. Mountains: Colo. *Mont.* Je—Jl.

3. ***M. nasutus*** Greene. Stem glabrous or minutely puberulent, 1-5 dm. high, 4-angled; lower leaves spatulate, petioled, the upper rounded or reniform, clasping; calyx 6-8 mm. long, puberulent; teeth triangular, very acute; corolla

yellow, funnelform, 15–18 mm. long. Mountains: Ida.—(? Colo.)—Calif.—B.C. *Submont.*—*Mont.* Ap—Je.

4. **M. thermalis** A. Nels. Stem erect, 3–15 cm. high, glabrous below, puberulent above; leaf-blades nearly orbicular, obscurely dentate, 3–9 mm. long, the upper sessile, the lower short-petioled; calyx 5 mm. long, in fruit 1 cm. long; teeth broadly triangular-ovate, acute; corolla about 15 mm. long, funnelform, yellow, short-pubescent on the lower lip. Geyser formations: Yellowstone Park, Wyo. *Mont.* Au.

5. **M. Hallii** Greene. Stem angled, glabrous, 1–3 dm. high; leaves broadly ovate, sparingly dentate or entire, 1–2 cm. long, the lower petioled, glabrous; calyx 5 mm. long, in fruit nearly 1 cm. and subglobose-inflated, with a few spots; teeth triangular, acute, the upper tooth about twice as long as the others; corolla 5–8 mm. long, light yellow. Wet places in the mountains: Colo.—(? Mont.)—(? Ida.). *Submont.* My—Jl.

6. **M. microphyllus** Benth. Stem 1–2, rarely 3 dm. high, simple, erect, glabrous; leaves nearly all petioled; blades orbicular, sinuate-dentate, at the base cordate and more coarsely toothed, 1–2 cm. broad; those of the inflorescence similar, subsessile and usually villous-puberulent; calyx 8–10 mm. long; corolla yellow, about 1 cm. long; tube scarcely exerted from the calyx. Wet places: Wash.—Ore.—Ida. *Submont.* Ap—Je.

7. **M. Geyeri** Torr. Perennial; stem 1–4 dm. long, glabrous; leaves rounded or reniform, denticulate to entire, 8–25 mm. long, all except the uppermost with margined petioles; calyx glabrous or slightly puberulent, 5–8 mm. long; upper lobe broadly ovate, twice as long as the very short rounded other lobes; corolla yellow, 8–12 mm. long. *M. Jamesii* T. & G. In water: Mich.—Ill.—Colo.—Wyo.—N.D. *Plain*—*Submont.* Je—Au.

8. **M. Lewisii** Pursh. Stem 3–10 dm. high, more or less viscid-pilose; leaves lanceolate, oblong or ovate, dentate, 4–8 cm. long, viscid-pubescent; calyx glandular-pubescent, about 2 cm. long; teeth broadly-triangular, subulate-acuminate; corolla crimson, rose-red, or paler, 3.5–5 cm. long, bearded within. Along streams: Minn.—Colo.—Ariz.—Calif.—B.C. *Plain*—*Mont.* Je—Au.

9. **P. Eastwoodiae** Rydb. Perennial, with a rootstock and stolons; stems 1–2 dm. high, viscid-villous; leaves sessile, coarsely dentate, viscid, 3–5-ribbed, 2–5 cm. long, the lower cuneate, the upper obovate or oblanceolate; stolons 1–3 cm. long, rooting at the end; calyx narrowly funnelform; lobes lanceolate, subequal; corolla crimson, 3–4 cm. long; anthers sparingly bearded. In crevices of overhanging cliffs: se Utah. *Son.* Au.

10. **M. moschatus** Dougl. Stem 1–4 dm., decumbent or creeping; leaf-blades petioled, ovate or oblong-ovate, villous and viscid; calyx prismatic, 7–10 mm. long; teeth broadly lanceolate, acuminate, somewhat unequal; corolla 15–20 mm. long, yellow, funnelform. **MUSK FLOWER.** Wet places: Ont.—Colo.—Calif.—B.C. *Submont.*—*Mont.* My—Au.

11. **M. peduncularis** Dougl. Stem erect, viscid-puberulent, 1–6 dm. high; leaf-blades 0.5–2 cm. long, ovate, dentate; peduncles slender, surpassing the leaves; calyx nearly glabrous, 6 mm. long; teeth short, ovate; corolla funnelform, yellow, 1.5–2 cm. long. Sandy banks: Wash.—Ida.—Ore. *Son.* My—O.

12. **M. floribundus** Dougl. Stem 1–3 dm. high, erect or diffuse, villous and viscid; leaf-blades ovate or subcordate, viscid-villous; calyx short-campanulate, 4–5 mm. long; teeth triangular; corolla yellow, 6–10 mm. long, tubular-funnelform. Wet places, sandy soil: Mont.—Colo.—Ariz.—Calif.—B.C. *Submont.* My—Au.

13. **M. membranaceus** A. Nels. Stem weak, diffusely spreading, glabrous or slightly viscid, 2–20 cm. high; leaf-blades very thin, elliptic to ovate, entire or denticulate; calyx obscurely viscid-puberulent, 2–3 mm. long; teeth triangular-lanceolate; corolla yellow, nearly tubular, 5–8 mm. long. Wet shaded places in the mountains: Wyo.—Utah. *Mont.* Jl—Au.

14. **M. breviflorus** Piper. Stem slender, erect, 4–20 cm. high, minutely puberulent; leaves short-petioled; blades lanceolate to ovate, acute, minutely

few-toothed, about 1 cm. long; calyx narrowly campanulate, 2-3 mm. long, in fruit 6-8 mm. long; teeth triangular; corolla pale yellow, tubular, 4-5 mm. long; lobes rounded. Wet places: Wash.—Ida.—Ore. *Son.*—*Submont.* My—Je.

15. *M. primuloides* Benth. Perennial by filiform stolons; stems very short, with crowded, elliptic, soft-villous or in age glabrate, dentate leaves 1-2 cm. long; peduncles 5-10 cm. long, erect; calyx 5-7 mm. long, angled, oblong-cylindric; lobes ovate, acute, 1 mm. long; corolla yellow, 15-20 mm. long, with a narrow tube. Wet soil: Calif.—Nev.—Ida.—Wash. *Submont.*—*Mont.* Je—Au.

16. *M. pilosus* Benth. Stem 1-4 dm. high, softly villous; leaves lanceolate or oblong-lanceolate, sessile, entire, villous, obscurely 3-nerved at the base; calyx-teeth ovate or oblong, the upper slightly longer; corolla bright, slightly 2-lipped, nearly 1 cm. long; capsule oblong, ovate. Gravelly soil along streams: Ida.—Ariz.—Calif.—Ore. *Son.* JI.

17. *M. Suksdorfii* A. Gray. Stem 2-10 cm. high, branched at the base, viscid-puberulent, reddish; leaves sessile, oblong or linear, 1-2 cm. long, thick, reddish; calyx 3 mm. long, in fruit 5 mm. long; teeth short; corolla 4-6 mm. long, yellow; lobes obcordate. Wet places: Colo.—Ariz.—Calif.—B.C. *Submont.* Je—JI.

18. *M. gratioloides* Rydb. Stem branched, more or less reddish, generally less than 1 dm. high, somewhat viscid-puberulent above; leaves oblong-lanceolate, sessile, about 1 cm. long, sinuate-dentate; calyx 7-8 mm. long, cylindraceous in fruit; lobes short, broadly ovate, acute; corolla only slightly bilabiate. Hillsides: Colo.—Ariz. *Submont.* My—Je.

19. *M. rubellus* A. Gray. Stem viscid-puberulent, 2-10 cm. long; leaves sessile, lanceolate, 1-3 cm. long, entire or denticulate, usually reddish; calyx 4-5 mm. long, tubular; teeth rounded-ovate; corolla rose-colored or purple-tinted, 7-8 mm. long; lower lip entire. Cliffs and sand: s Utah.—N.M.—Calif.—Wash. *Son.* Ap—JI.

20. *M. Breweri* (Greene) Coville. Stem 5-10 cm. high, glandular-villous; leaves linear, entire, 2-3 cm. long, sessile; calyx glandular-villous, 4 mm. long; teeth short-triangular; corolla light purple, 8-10 mm. long; lobes subequal, emarginate. Damp rocky places: Calif.—B.C. *Mont.* Je—JI.

11. *EUNANUS* Benth.

Low annual herbs. Leaves opposite, usually dentate. Flowers perfect, on solitary peduncles in the upper axils. Calyx tubular, 5-angled and 5-toothed. Corolla more or less bilabiate, salver-shaped; lobes more or less spreading. Stamens 4, didynamous. Styles glandular above, united up to the peltate-funnelform stigma. Capsule shorter than the calyx, loculicidal, with the placentae separating in the middle and remaining attached to the valves. Seeds numerous, often muricate.

Calyx hardly at all oblique; teeth almost equal in length; stem glandular-pubescent.

Calyx-lobes lanceolate-subulate; upper stem-leaves somewhat acuminate; corolla more than 2 cm. long. 1. *E. Bigelovii*.

Calyx-lobes oblong-lanceolate, merely acute; leaves obtuse or acute; corolla 1.5-2 cm. long. 2. *E. Tolmiei*.

Calyx decidedly oblique; upper tooth twice as long as the lower; plant glandular-puberulent. 3. *E. Parryi*.

1. *E. Bigelovii* A. Gray. Stem glandular-pilose, 5-20 cm. high, branched; leaves linear or elliptic, or the upper ovate; calyx 10-12 mm. long, glandular; corolla salverform, about 2 cm. long or more, 1-2 cm. broad, crimson, with a yellow center. Sandy and stony places: Wash.—s Calif.—s Utah. *L. Son.* My—S.

2. *E. Tolmiei* Benth. Stem 2-15 cm. high, glandular-pubescent throughout, simple or branched from the base; leaves oblong-ovate to oblanceolate, 0.5-2 cm. long, 3-nerved, entire or somewhat toothed; calyx 6-10 mm. long; corolla pale purple or rarely yellowish, often spotted, narrowly funnelform. *M. clivicola* Greenm. (?) *Mimulus nanus* H. & A. *M. Tolmiei* Rydb. *E. clivicola* (Greenm.) Heller. Sandy places: Mont.—Wyo.—Ore. Je—Au.

3. E. Parryi (A. Gray) Greene. Stem glandular-puberulent or glabrate, 5-10 cm. high; leaves oblong or oblanceolate, 1-2 cm. long; calyx about 8 mm. long; teeth acute, the upper larger, ovate, the rest lanceolate; corolla yellow or pink, 1.5-2 cm. long, narrowly funnelform. Gravelly hills: s Utah—Ariz. *L. Son.* Ap-Je.

12. MONNIÈRA (B. Juss.) P. Br. WATER HYSSOP.

Perennial succulent herbs, with creeping or floating stems. Leaves opposite, entire or somewhat toothed, broadest above the middle, palmately veined, sessile. Flowers perfect, axillary, solitary, peduncled. Calyx subtended by 2 small bractlets; sepals nearly distinct, unequal, the uppermost the broadest. Corolla blue or white, nearly regular, 5-lobed; lobes spreading. Stamens 4, slightly didynamous, included; filaments adnate to the tube of the corolla. Capsule ovoid or oval, septicidal, the valves 2-cleft. Seeds numerous. [*Herpestes* Gaertn.]

1. M. rotundifolia Michx. Stem more or less densely pilose, creeping or floating, rooting at the nodes; leaves sessile, rounded-obovate or suborbicular, 1-2 cm. long; calyx glabrous, 4 mm. long; lobes elliptic, obtuse, the upper larger; corolla white or yellowish, 5-6 mm. long, campanulate; lobes rounded-oval. *Herpestes rotundifolia* Pursh. *Bacopa rotundifolia* Wettst. Water: Ill.—Va.—Tex.—Mont. *Plain.* Jl-S.

13. LIMOSÉLLA L. MUDWORT.

Low stemless, somewhat succulent annuals, or perennials by means of stolons. Leaves rosulate at the base, narrow, entire. Flowers perfect, solitary on scape-like peduncles. Calyx campanulate, 5-lobed. Corolla nearly regular, open-campanulate, 5-cleft. Stamens 4, with the short filaments adnate to the corolla-tube; anthers confluent 1-celled. Style short; stigma capitate. Capsule 2-celled at the base, 1-celled above, many-seeded. Seeds ovoid, rugulose.

Leaves petioled, with spatulate or oblanceolate blades.
Leaves linear-filiform, or subulate.

1. *L. aquatica*.
2. *L. tenuifolia*.

1. L. aquatica L. Small annual, with runners; leaf-blades 0.5-3 cm. long; glabrous; pedicels 0.5-3 cm. long; calyx 1-1.5 mm. long; teeth triangular, acute; corolla 2-2.5 mm. long, exserted, white or purplish. Water and mud: Lab.—Colo.—Calif.—B.C.; Eurasia. *Plain—Mont.* Je-O.

2. L. tenuifolia Wolf. Minute annual, with runners; leaves 1-3 cm. long; pedicels 1-2 cm. long; calyx 1-2 mm. long; lobes ovate, acute, corolla 2.5-3 mm. long. Mud and shallow water: Lab.—N.J.—N.M.—Calif.—B.C.; Eurasia and S. Am. *Plain—Mont.* Je-N.

14. GRATIOLA L. HEDGE HYSSOP.

Annual or perennial, somewhat succulent herbs. Leaves opposite, entire or toothed. Flowers solitary on axillary peduncles. Calyx usually subtended by 2 bractlets; sepals 5, nearly distinct. Corolla white, yellow, or purplish, 2-lipped. Stamens 2, included; staminodia 2, scale-like or filiform, or wanting; anther-sacs transverse, separated by a dilated membranous connective. Capsule globose or ovoid. Seeds striate.

Flowers without bracts.

Flowers subtended by a pair of bracts similar to the calyx-lobes.

1. *G. ebracteata*
2. *G. virginiana*.

1. G. ebracteata Benth. Stem 0.5-2 dm. high, leafy, glabrous or nearly so; leaves sessile, linear or lanceolate, 1-3 cm. long, entire or sparingly denticulate; sepals foliaceous, 6-8 mm. long, lanceolate; corolla yellowish, equalling the calyx. Wet places: B.C.—Mont.—n Calif. *Submont.* Ap-Au.

2. G. virginiana L. Stem 1-2 dm. high, viscid-puberulent or glabrate below; leaves usually glabrous, oblong-lanceolate to linear, 1-5 cm. long, entire or denticulate, sessile; bractlets 2, linear, 5-6 mm. long; calyx about 5 mm. long; sepals lanceolate; corolla light yellow or nearly white, 8-10 mm. long. Mud and shallow water: Me.—Fla.—Calif.—B.C. *Plain—Submont.* My-O.

16. **VERÓNICA** (Tourn.) L. SPEEDWELL, BROOKLIME.

Annual or perennial, caulescent herbs. Leaves opposite or rarely alternate or whorled, entire or toothed. Flowers perfect, axillary, racemose, spicate, or solitary. Calyx of 4, rarely 5, slightly united sepals. Corolla rotate, only slightly irregular, 4-lobed, the lower lobe usually narrower than the rest. Stamens 2, one on each side of the upper corolla-lobe. Styles wholly united. Stigmas capitate. Capsule flat, usually notched or 2-lobed at the apex, loculicidal. Seeds flattened or concave on the sides.

Flowers in axillary racemes.

Leaves all short-petioled; leaf-blades ovate, oblong or oval. 1. *V. americana*.

Leaves of the flowering shoots at least sessile, lanceolate to linear.

Pedicels less than twice as long as the fruit, the latter not strongly flattened; leaves broadly lanceolate. 2. *V. Anagallis-aquatica*.

Pedicels several times as long as the fruit, the latter strongly flattened; leaves linear-lanceolate or linear. 3. *V. scutellata*.

Flowers in terminal spikes or racemes, or solitary in the axils of the leaves.

Perennials; flowers in terminal spikes or racemes; bracts reduced and unlike the leaves.

All leaves sessile, ovate or oval to oblong.

Corolla 4-5 mm. wide, campanulate, blue; capsules obovate or oval, merely emarginate. 4. *V. Wormskjoldii*.

Corolla 8-9 mm. wide, broadly funnelform, violet; capsule obcordate.

5. *V. Cusickii*.

Lower leaves petioled; blades rounded oval or the upper oblong; capsule obcordate.

6. *V. serpyllifolia*.

Annuals; flowers solitary in the axils of the leaves, i. e., bracts resembling the other leaves and only slightly reduced.

Peduncles shorter than the leaves.

Leaf-blades spatulate, oblong, or linear; capsule emarginate.

7. *V. xalapensis*.

Leaf-blades oval or ovate, or the upper lanceolate; capsule obcordate.

8. *V. arvensis*.

Peduncles as long as the leaves or usually longer.

Leaf-blades ovate, or oblong, crenate.

Corolla less than 6 mm. wide.

Capsule narrowly emarginate.

9. *V. agrestis*.

Capsule deeply cleft to near the base.

10. *V. campylopoda*.

Corolla 9-11 mm. broad; capsule with an open shallow apical sinus.

11. *V. Buxbaumii*.

12. *V. hederacfolia*.

Leaf-blades orbicular or reniform, 3-5-lobed.

1. *V. americana* Schwein. Stem erect or decumbent, 1-6 dm. high, sometimes branched; leaves petioled; blades ovate to oblong-lanceolate crenate or serrate or sometimes entire, rounded or truncate at the base; racemes loosely-flowered; corolla blue or nearly white, 4-5 mm. broad; capsule thick, slightly notched, broader than long. *V. oxylobula* Greene. *V. crenatifolia* Greene, a reduced form. In water: Newf.—Va.—N.M.—Calif.—Alaska. *Plain*—*Subalp.* My—Au.

2. *V. Anagallis-aquatica* L. Stem glabrous or glandular pubescent above, 2-9 dm. high, branched; leaves sessile, lanceolate or oblong, 2-12 cm. long, acute, finely serrate or entire, often clasping; racemes spreading, many-flowered; corolla blue, 4-5 mm. broad; capsule minutely notched, suborbicular. Wet places and shallow water: N.S.—N.C.—Ariz.—B.C.; Eurasia and S. Am. *Plain*—*Submont.* My—S.

3. *V. scutellata* L. Stem ascending or decumbent at the base, 1-5 dm. high; leaves sessile, linear or lance-linear, acute, entire or remotely denticulate; racemes slender, divergent, zigzag; corolla 8-10 mm. wide; capsule flat, deeply emarginate. Swamps and wet places: Newf.—N.Y.—Colo.—Calif.—B.C.—Yukon. *Plain*—*Submont.* Je—Au.

4. *V. Wormskjoldii* R. & S. Stem 1-3 dm. high, glandular-villous above, glabrate below, strict; leaves ovate, oval, or elliptic, 1-3 cm. long, sessile, entire or crenulate, drying black; corolla dark blue, campanulate, 4-5 mm. broad; capsule elliptic-obovate, emarginate. *V. alpina unalaschkensis* C. & S. Wet meadows: Greenl.—N.H.—S.D.—N.M.—Ariz.—Alaska. *Mont.*—*Subalp.* Je—S.

5. *V. Cusickii* A. Gray. Stem 1-2 dm. high, glabrous or puberulent, glandular in the inflorescence; leaves oval to oblong, entire, 1-3 cm. long, darkening in drying; corolla open, with rounded lobes; capsule 6-7 mm. long. Along brooks: Ore.—Ida.—Wash. *Submont.*—*Subalp.* Jl—Au.

6. *V. serpyllifolia* L. Stems decumbent or creeping, 0.5–3 dm. high; leaves short-petioled or sessile; blades oblong, oval or suborbicular, 5–15 mm. long, entire or crenulate, obtuse; corolla white or purplish, 3–4 mm. broad; capsule retuse at the apex, obreniform, ciliate and puberulent. Open woods, fields, and thickets: Lab.—Ga.—Colo.—Calif.—Alaska; Eurasia. *Submont.*—*Subalp.* My—Au.

7. *V. xalapensis* H.B.K. Stem 1–3 dm. high, branched, with ascending branches, glandular-pubescent throughout; leaves thick, the lower ones petioled, spatulate, crenate, the upper linear or oblong; racemes spike-like; corolla whitish, 2–3 mm. wide; capsule orbicular, slightly notched, glandular. *V. peregrina* Coult., not L. Sandy soils: Sask.—Tex.—Calif.—B.C.; Mex. *Plain*—*Submont.* Je—S.

8. *V. arvensis* L. Stem pubescent, 0.5–3 dm. high, at first simple, later branched; lower leaves ovate or oval, crenate, 5–15 mm. long, petioled and opposite, the upper sessile, alternate and often entire; corolla blue or nearly white, 2 mm. broad; capsule broadly obcordate, 2 mm. high. Fields and waste places: N.S.—Fla.—Tex.—Minn.; B.C.—Ida.—Calif.; nat. from Eu. Mr—S.

9. *V. agrestis* L. Stem decumbent or creeping, 5–20 cm. long; leaf-blades broadly ovate or oval, obtuse at the apex, rounded or subcordate at the base; corolla small, blue, not longer than the calyx; capsule broader than high, 4 mm. broad. Fields and waste places: N.S.—N.J.—La.; Utah; nat. or adv. from Eu. My—S.

10. *V. campylopoda* Boiss. Stem 1–2 dm. high, erect or ascending, pubescent; leaves opposite or alternate, oblong or elliptic, entire or toothed, thick; sepals linear-lanceolate; fruit 3–4 mm. high, 5–6 mm. broad, cleft to near the base. Alfalfa fields: Utah; adv. from Asia Minor.

11. *V. Buxbaumii* Tenore. Stem finely pubescent, 1–4 dm. high, usually branched at the base; leaves opposite or alternate, short-petioled; blades ovate, oval, or suborbicular, 8–15 mm. long, coarsely serrate; sepals pubescent, elliptic or lanceolate; corolla blue, 9–11 mm. broad; capsule obreniform, 7–8 mm. broad, pubescent. Fields and waste places: N.Y.—Ga.—Colo.—Utah; nat. from Eu. Ap—N.

12. *V. hедераefolia* L. Stem diffusely branched, 0.5–4.5 dm. long; leaf-blades 5–25 mm. broad, pubescent; corolla 4 mm. broad, scarcely longer than the calyx; capsule broader than long, 2-lobed. Fields and waste places: N.Y.—N.J.—S.C.; Utah; adv. or nat. from Eu. Ap—O.

16. *SÝNTHYRIS* Benth.

Perennial herbs, with rootstocks. Leaves mainly basal, petioled, digitately veined, the blades reniform, orbicular, or ovate in outline, toothed or variously cleft; stem-leaves alternate, reduced and bract-like. Flowers perfect, in terminal racemes. Calyx of 4 oblong, slightly united sepals. Corolla campanulate, nearly regular in the manner of *Veronica*. Stamens 2; filaments adnate to the corolla-tube, one on each side of the upper corolla-lobe, slender; anther-sacs parallel or somewhat divergent. Styles wholly united, filiform; stigma capitate. Capsule compressed, usually emarginate, loculicidal. Seeds few or several, flat or concave on the sides.

Leaves twice or thrice pinnately divided.

Calyx and capsule glabrous; corolla 3–4 mm. long.

Calyx and capsule villous; corolla about 6 mm. long.

Leaves not pinnate; blades reniform or rounded, with cordate base.

Leaf-blades deeply cleft and laciniate.

Leaf-blades lobed and dentate or crenate.

1. *S. pinnatifida*.

2. *S. dissecta*.

3. *S. laciniata*.

4. *S. major*.

1. *S. pinnatifida* S. Wats. Leaves 1 dm. long or less, twice or thrice pinnately divided, with linear or lanceolate divisions, somewhat villous-tomentose, or glabrate; scape 5–15 cm. long, villous-tomentose; corolla whitish or pink, 3–4 mm. long; lobes oblong or elliptic; capsule 4 mm. long. High mountains: Utah—Ida. *Mont.* Jl—Au.

2. *S. dissecta* Rydb. Leaves 5–10 cm. long, petioled, villous-tomentose; blades oval in outline, twice or thrice pinnatifid; scape villous-tomentose, 5–20 cm. high; corolla about 6 mm. long, dark blue or purple, or in age paler; capsule obovate, 6 mm. long. High mountains: Mont.—nw Wyo. *Mont.* Je—Au.

3. *S. laciniata* (A. Gray) Rydb. Leaves glabrous, or at first slightly villous, with petioles 3–8 cm. long; leaf-blades cordate or reniform in outline, 1–3 cm. long, 9–13 cleft, with lacinate and cleft divisions; scape 5–15 cm. high, glabrous; corolla violet, light blue, or whitish, 4–5 mm. long; lobes oblong; capsule obovate, 5 mm. long, glabrous. *S. pinnatifida laciniata* A. Gray. Mountains: Utah—Mont. *Mont.* Je—Jl.

4. *S. major* (Hook.) Heller. Leaf-blades reniform, glabrous, firm, shining, 3–7 cm. broad, palmately many-lobed; the lobes dentate with triangular teeth; petioles 5–15 cm. long; scape 1–4 dm. high, glabrous; corolla purple, 6–7 mm. long; lobes elliptic. *S. reniformis major* Hook. Wet places: Wash.—Ida.—Ore. My—Jl.

17. *BESSEYA* Rydb. KITTEN-TAILS.

Perennial herbs with rootstocks. Leaves mostly basal, with oblong or ovate, crenate blades and short petioles; stem-leaves reduced, alternate, sessile. Flowers perfect, in terminal spikes. Sepals 4, or sometimes 1–3, almost distinct. Corolla irregular, 2-lipped, cleft nearly to the base or wanting; upper lip broad, entire, concave; lower lip irregularly 3-cleft. Stamens 2; filaments exserted, adnate to the tube of the corolla, or, if the latter is lacking, inserted on the outside of a hypogynous disk; anther-sacs parallel or nearly so. Capsule rather turgid, short, emarginate. Seeds several, flat.

Corolla present.

Flowers not reflexed; calyx-lobes 3–4.

Upper lip of the purple corolla twice as long as the calyx; plant 1–1.5 dm. high.

1. *B. alpina*.

Upper lip of the corolla only slightly longer than the calyx; plant 1.5–3 dm. high.

Corolla purple or pink, not ciliate; divisions of the lower lip obtuse.

2. *B. plantaginea*.

Corolla white or yellowish, ciliate on the margin; divisions of the lower lip acute.

3. *B. Ritteriana*.

Flowers reflexed; calyx-lobes 2; corolla greenish white.

4. *B. reflexa*.

Corolla lacking.

Calyx almost regularly 4-cleft.

5. *B. rubra*.

Calyx split to the base on the upper side, below irregularly divided or cleft into 2 (rarely 3) entire or toothed lobes.

Calyx cleft on the lower side to near the base or at least below the middle.

6. *B. gymnocarpa*.

Calyx cleft only slightly below.

7. *B. wyomingensis*.

1. *B. alpina* (A. Gray) Rydb. Petioles 2–6 cm. long; leaf-blades ovate, oval, or elliptic, sometimes subcordate at the base, 2–5 cm. long, crenate, soon glabrous; scape 1–1.5 dm. high; calyx densely white-villous; corolla 7–8 mm. long; stamens exserted. *Synthyris alpina* A. Gray. Higher mountains: Colo.—Wyo. *Mont.*—*Alp.*

2. *B. plantaginea* (Benth.) Rydb. Leaves more or less persistently tomentose; petioles 2–5 cm. long; leaf-blades oblong, lance-oblong or lance-elliptic, crenate, 5–15 cm. long; scape 1–3 dm. high; sepals oblong, villous-ciliate; upper lip of the corolla twice as long as the lower one. *S. plantaginea* Benth. Hillsides and mountains: Wyo.—N.M.—Ariz. *Submont.*—*Alp.* My—Au.

3. *B. Ritteriana* (Eastw.) Rydb. Leaf-blades elliptic or oblong, obtuse, cuneate at the base, crenate, 5–10 cm. long, sparingly pubescent; scape 2–3 dm. high, sparingly villous; sepals 3–4, orbicular or obovate, villous-ciliate; corolla about 6 mm. long; stamens exserted. *S. Ritteriana* Eastw. *S. flavescens* A. Nels. Higher mountains: Colo. *Submont.*—*Subalp.* My—Jl.

4. *B. reflexa* (Eastw.) Rydb. Leaf-blades 7 cm. long, elliptic-oblong, obtuse, truncate or cuneate at the base, finely crenate, thin and glaucous; scape 1–2 dm. high; calyx 5 mm. long; lobes only 2, orbicular, villous-ciliate; corolla 8 mm. long, sparingly fringed; filaments long-exserted. *S. reflexa* Eastw. High mountains: Colo. *Mont.* Au.

5. *B. rubra* (Dougl.) Rydb. Leaf-blades ovate, rounded at the apex, cordate or rounded at the base, crenate, 3–8 cm. long, more or less villous, or glabrate in age; scape 2–4 dm. high, villous, sometimes leafy below; calyx villous, 5 mm. long; stamens about twice as long as the calyx. *S. rubra* Benth. Hills: B.C.—Alta.—Ida.—Ore. Ap—Jl.

6. *B. gymnocarpa* (A. Nels.) Rydb. Leaf-blades oblong, elliptic, or ovate, crenate, sparingly villous or glabrate; stamens slightly exserted. *Wulfenia gymnocarpa* A. Nels. Hills: S.D.—Neb.—Colo.—Utah—Alta. *Submont.*—*Subalp.* Je—Au.

7. *B. wyomingensis* (A. Nels.) Rydb. Leaf-blades ovate to oblong, crenate, rounded or subcordate at base, 3–5 cm. long, obscurely puberulent; filaments twice as long as the calyx. *W. wyomingensis* A. Nels. *S. wyomingensis* Heller. Hills and mountains: S.D.—Colo.—Ida.—Mont. *Mont.* My—Je.

18. AGALÏNIS Raf. GERARDIA.

Annual or perennial, caulescent herbs. with slender stems. Leaves mainly opposite, narrow or scale-like, entire. Flowers perfect, solitary in the axils of the leaves. Calyx 5-toothed to the middle. Corolla in ours rose-purple, 2-lipped; lower lip exterior in the bud, 5-lobed. Stamens 4, didynamous, included; filaments pubescent; anthers all alike. Styles wholly united, filiform. Capsule ovoid, rounded at the apex, loculicidal. Seeds angled. [*Gerardia* L., in part.]

Pedicels slightly if at all longer than the calyx.

Corolla 2–2.5 cm. long.

Corolla 1–1.5 cm. long.

Pedicels 2–6 times as long as the calyx.

1. *A. aspera*.

2. *A. paupercula*.

3. *A. Besseyana*.

1. *A. aspera* (Dougl.) Britton. Annual; stem 1–6 dm. high, more or less scabrous; leaves linear, 1.5 mm. wide or less, 1–3 cm. long; calyx-tube 5–7 mm. long; lobes deltoid; corolla rose-purple; capsule elliptic or ovoid, 8–10 mm. long. *G. aspera* Dougl. Plains and prairies: Wis.—Ill.—Ark.—Kans.—Sask. *Plain.* Au—O.

2. *A. paupercula* (A. Gray) Britton. Annual; stem stout, 1–5 dm. high, smooth; leaves thickish, 1–3 cm. long, scabrous, often fasciated; calyx-tube campanulate, 3–4 mm. long; corolla rose-purple; capsule globose, 5–7 mm. long. *G. purpurea paupercula* A. Gray. Bogs and wet meadows: Que.—Ga.—Okla.—Sask. *Plain.* Jl—S.

3. *A. Besseyana* Britton. Annual; stem 2–6 dm. high, somewhat scabrous, branching above; leaves linear or narrowly lance-linear, 1–5 cm. long, acute, scabrous; calyx-tube campanulate, 4–5 mm. long; corolla rose-purple, fully 1 cm. long; capsule globose, 5–6 mm. long. *G. Besseyana* Britton. River bottoms and prairies: Ia.—La.—Colo.—Wyo. *Plain.* Jl—S.

19. CASTILLEJA Mutis. PAINTED CUP, INDIAN PAINT-BRUSH, PAINTER'S BRUSH, SQUAW FEATHER.

Annual or perennial caulescent herbs, often partly root-parasites. Leaves alternate, sessile, entire, or toothed, or pectinately lobed, those subtending the flowers partly or wholly brightly colored. Flowers perfect, in terminal leafy spikes. Calyx laterally flattened, 4-lobed, more deeply cleft above and below than on the sides. Corolla highly colored, laterally flattened, strongly 2-lipped; upper lip arched; lower lip much shorter, 3-lobed, only slightly saccate; lobes most commonly lanceolate. Stamens 4, didynamous, surrounded by the upper lip of the corolla; anther-sacs unequal; the outer attached by the middle, the inner by its apex, pendulous. Styles wholly united, slender; stigmas 2-lobed or entire. Capsule loculicidal. Seeds reticulate.

Annuals or biennial.

Leaves and bracts linear to lanceolate, entire.

Leaves pinnatifid; bracts dilated and lobed.

Perennials.

Galea several times longer than the very short lip, usually at least two-thirds as long as the corolla-tube; bracts in most species tinged with scarlet, crimson or rose.

Calyx cleft much deeper in front than behind.

I. STENANTHAE.

II. COCCINEAE.

III. LINARIAEFOLIAE.

Calyx about equally cleft in front and behind.

Stem canescent.

Stem tomentose-canescens; bracts entire, or trilobed, with broad rounded middle lobe. IV. INTEGRÆ.

Stem strigose or hirsutulous-canescens; bracts 3-cleft, with linear lobes. V. SUBCINERÆ.

Stem glabrous or pubescent, but not canescent.

Leaves entire, rarely the uppermost slightly 3-lobed; corolla-lip very short and callous.

Bracts usually entire and obtuse, oblong to obovate, broad, if 3-lobed with a broad middle lobe.

Bracts tinged with crimson or rose.

Bracts yellow with the very tips brown or red.

VI. RHEXIFOLIAE.

VII. LUTESCENTES.

Bracts usually 3-cleft with lanceolate lobes, if entire very acute.

VIII. LANCIFOLIAE.

Leaves, at least the upper, pinnately cleft; bracts also cleft; lower corolla-lip not callous, larger.

IX. HISPIDAE.

Galea less than 3 times as long as the lip, rarely half as long as the corolla-tube; bracts in most species tinged with yellow or brown.

Leaves entire; bracts also entire or slightly 3-lobed.

X. PALLIDAE.

Leaves pinnately divided, at least the upper ones.

Bracts slightly 3-lobed or entire; lobes truncate or rounded at the apex.

XI. LUTEAE.

Bracts deeply divided into lanceolate or linear-lanceolate lobes.

XII. LINEATAE.

Whole plant white-woolly.

Plant not white-woolly.

Calyx about equally cleft in front and behind or deeper cleft behind.

Lip of the corolla scarcely more than half as long as the galea, not decidedly saccate.

XIII. FASCICULATAE.

Lip at least two-thirds as long as the galea, decidedly saccate.

XIV. PALLESCENTES.

Calyx much deeper cleft in front than behind.

Corolla 1.5-3 cm. long, slightly exceeding the calyx.

XV. BRACHYANTHAE.

Corolla 4-5 cm. long, almost twice as long as the calyx.

XVI. SESSILIFLORAE.

I. STENANTHAE.

One species.

1. *C. exilis*.

II. COCCINEAE.

One species.

2. *C. coccinea*.

III. LINARIAEFOLIAE.

Bracts crimson or pink.

Plant low, caespitose, with several stems, about 2-3 dm. high; leaves and bracts pinnately divided; inflorescence short and head-like.

3. *C. collina*.

Plant tall, 4-10 dm. high, with a single or sometimes 2-3 stems; leaves entire or the upper with 2-3 lobes; inflorescence elongate.

Leaves all narrowly linear.

4. *C. linariaefolia*.

Upper leaves lanceolate.

5. *C. Crista-galli*.

Bracts yellowish or brownish.

Bracts cream-color; inflorescence villous-hirsute, with yellowish hairs.

6. *C. cognata*.

Bracts brownish; inflorescence villous, with short white hairs.

7. *C. arcuata*.

IV. INTEGRÆ.

Leaves entire.

Bracts oblong.

Bracts obovate.

Leaves pinnatifid.

8. *C. integra*.

9. *C. gloriosa*.

10. *C. Lindheimeri*.

V. SUBCINERÆ.

One species.

11. *C. subcinerea*.

VI. RHEXIFOLIAE.

Corolla 4-5 cm. long, nearly twice as long as the bracts.

12. *C. magna*.

Corolla 1.5-3.5 cm. long, little if at all surpassing the bracts.

Bracts scarlet or crimson, rarely pink.

Corolla about 3 cm. long; stem 3-5 dm. high.

Leaves narrowly lanceolate; bracts acute and usually deeply cleft.

13. *C. confusa*.

Leaves, at least the upper ones, broadly lanceolate or oblong-ovate; bracts rounded at the apex, entire or with a very broad middle lobe and small lateral ones.

14. *C. rhexifolia*.

Corolla 1.5-2 cm., rarely 2.5 cm. long; plant 2-3 dm. high.

Leaves lanceolate to linear.

Stem and leaves glabrous or puberulent.

15. *C. lauta*.

Stem and leaves viscid-pubescent.

16. *C. pinetorum*.

Leaves oblong, elliptic, or ovate-lanceolate.

Stem and leaves densely pubescent.

17. *C. Leonardi*.

Stem glabrous or puberulent; leaves finely puberulent.

- Bracts brownish or yellowish. 18. *C. humilis*.
19. *C. brunnescens*.

VII. LUTESCENTES.

Leaves linear; corolla 2-3 cm. long.

Stem 2-3 dm. high; corolla scarcely longer than the calyx. 20. *C. dubia*.

Stem 3-5 dm. high; corolla decidedly longer than the calyx.

Calyx-lobes obtuse.

Calyx-lobes acute or acuminate.

Leaves lanceolate; corolla nearly 4 cm. long; calyx-lobes acute. 21. *C. desertorum*.
22. *C. lutescens*.
23. *C. variabilis*.

VIII. LANCIFOLIAE.

Corolla 3.5-4 cm. long; galea 1.5-2 cm. long; leaves lanceolate.

Bracts brick-red or yellowish; leaves usually more or less pubescent.

Bracts crimson; leaves glabrous or nearly so.

Corolla 3 cm. long or less.

Calyx and upper part of the stem densely white-villous.

Calyx and upper part of the stem sparingly hirsute-villous.

Plants growing more or less in clumps, with a short caudex.

Corolla 2-3 cm. long; bracts usually more or less crimson.

Plant tall, 4-6 cm. high; calyx-lobes acute or acuminate.

Galea 15-18 mm. long.

Galea about 10 mm. long.

Plant low, 1-3 dm. high; calyx-lobes obtuse.

Corolla less than 2 cm. long; bracts brick-red.

Plants with solitary stems from horizontal or ascending rootstocks.

23. *C. variabilis*.
24. *C. Vreelandii*.
25. *C. trinervis*.
13. *C. confusa*.
26. *C. Tweedyi*.
27. *C. subpurpurascens*.
28. *C. mineata*.
29. *C. lancifolia*.

IX. HISPIDAE.

Calyx-lobes rounded at the apex; bracts purplish, much exceeding the flowers.

Calyx-lobes acute or rarely obtuse at the apex; bracts if at all only slightly exceeding the flowers.

Corolla about 4 cm. long.

Plant simple, with a horizontal rootstock; galea longer than the corolla-tube.

Plant caespitose, with a short caudex; galea not longer than the corolla-tube.

Corolla 1.5-3 cm. long; plant more or less caespitose, with a short caudex.

Stem more or less pubescent, 3-6 dm. high.

Lobes of the calyces and bracts lanceolate or oblong; bracts usually crimson.

Body of the leaves lanceolate; lobes directed forward.

Plant decidedly glandular- or viscid-pubescent.

Plant scarcely viscid, but puberulent and hirsute.

Corolla much exceeding the bracts; galea equalling or exceeding the tube.

Corolla slightly if at all exceeding the bracts; galea shorter than the tube.

Bracts with very short lobes or merely toothed; stem sparingly hirsute or merely puberulent.

Bracts with long narrow lobes; stem copiously hirsute.

Body of the leaves linear, the lobes linear, divergent.

Galea shorter than the corolla-tube.

Galea longer than the corolla-tube.

Lobes of the calyces and bracts narrowly linear; bracts brick-red.

Stem glabrous up to the inflorescence, 1-2 dm. high.

40. *C. pallida*.
41. *C. Cusickii*.
31. *C. Suksdorfii*.
13. *C. confusa*.
32. *C. viscida*.
33. *C. amplifolia*.
34. *C. Bradburyi*.
35. *C. hispida*.
36. *C. angustifolia*.
37. *C. chromosa*.
38. *C. linearis*.
39. *C. Haydeni*.

X. PALLIDAE.

Upper leaves long-acuminate, caudate-falcate.

Stem up to the inflorescence and leaves puberulent or glabrate.

Stem and leaves pilose.

Upper leaves neither caudate, nor falcate.

Bracts not pale-yellow; corolla usually less than 2 cm. long.

Stem slender, 2-4 dm. high; bracts rose or brownish.

Stems from a rootstock, sparingly villous.

Stems from a caudex, hirsutulous, or villous in the inflorescence.

Stem 0.5-2 dm. high, from a caespitose caudex.

Bracts puberulent, dark brownish scarlet.

Bracts villous, varying from light brownish crimson to greenish yellow.

Bracts pale yellow; corolla usually over 2 cm. long, except in the first.

Plant 0.5-2 dm. high, densely villous above.

Plant 2-4 dm. high, slightly if at all villous in the inflorescence.

42. *C. gracillima*.
43. *C. Bennittii*.
44. *C. parvula*.
45. *C. occidentalis*.

Stems solitary from a creeping rootstock; corolla usually margined with yellow; plant darkening in drying. 46. *C. luteovirens*.

Stems growing in clumps, with a short caudex; plant rarely darkening in drying. 47. *C. sulphurea*.

Upper leaves broadly lanceolate or ovate; all leaves 3-ribbed.

Leaves all linear, 1-ribbed, or the uppermost linear-lanceolate and indistinctly 3-ribbed. 48. *C. wyomingensis*.

XI. LUTEAE.

Plant seldom over 1 dm. high; bracts green or tinged with brownish rose; calyx with short obtuse lobes.

Stem less than 2 dm. high, sparingly villous; bracts tinged with brown.

Stem 2-3 dm. high, hirsutulous; bracts tinged with rose. 49. *C. pulchella*.

Plant 2-4 dm. high; bracts pale yellow. 43. *C. Bennittii*.

Stems villous; leaves lanceolate. 50. *C. lutea*.

Stems pilose; leaves linear or lance-linear. 41. *C. Cusickii*.

XII. LINEATAE.

One species. 51. *C. lineata*.

XIII. FASCICULATAE.

Bracts rhombic-obovate or broadly cuneate in outline, almost pectinately divided.

52. *C. Pecten*.

Bracts ovate or lanceolate in outline, pinnatifid.

Upper leaves and bracts, only 3-fid at or above the middle. 48. *C. wyomingensis*.

Leaves and bracts deeply divided into linear divisions. 53. *C. fasciculata*.

XIV. PALLESCENTES.

Plant low, less than 2 dm. high, finely puberulent.

54. *C. pallescens*.

Plant 1.5-3 dm. high, hirsute or villous as well as puberulent.

Lateral divisions of the calyx deeply cleft into two subulate lobes; corolla 12-15 mm. long. 55. *C. longispica*.

Lateral divisions of the calyx merely 2-toothed.

Lower lip two-thirds as long as the galea; corolla about 2.5 cm. long.

50. *C. lutea*.

Lower lip almost equalling the galea; corolla about 2 cm. long.

56. *C. pilifera*.

XV. BRACHYANTHAE.

Corolla 2-3 cm. long; stem glabrous or nearly so.

6. *C. cognata*.

Corolla 1.5-2.5 cm. long; stem pubescent.

Lower lip of the corolla fully half as long as the galea; plant less than 1 dm. high.

57. *C. puberula*.

Lower lip one-fifth to one-third as long as the galea; plant 3-4 dm. high.

Lower lip about one-third as long as the galea, its lobes lanceolate, acuminate.

Stem 5-6 dm. high, finely puberulent; bracts minutely puberulent.

58. *C. cervina*.

Stem 2-4 dm. high, more or less hirsute-villous; bracts shortly villous-hirsute.

59. *C. brachyantha*.

Lower lip one-fifth to one-fourth as long as the galea, its lobes ovate, acute.

60. *C. flava*.

XVI. SESSILIFLORAE.

One species.

61. *C. sessiliflora*.

1. *C. exilis* A. Nels. Stem strict, 3-8 dm. high, 'more or less glandular-hirsute or villous; leaves linear-lanceolate or lanceolate, long-attenuate, 3-10 cm. long, 3-nerved, more or less glandular-hirsute; inflorescence long, spike-like; bracts linear-lanceolate, attenuate, only the uppermost tipped with scarlet or crimson; calyx more deeply cleft above than below, about equalling the corolla; lobes linear-lanceolate; corolla about 2 cm. long, yellowish or tinged with pink on the margins; galea about 7 mm. long, obtuse; lip less than 2 mm., 3-cleft, with obtuse lobes. *C. stricta* Rydb., not DC. In swampy places, especially in saline soil: Wash.—Nev.—Colo.—Mont. *Plain*—Mont. *Jl*—Au.

2. *C. coccinea* (L.) Spreng. Stem usually simple, 3-6 dm. high, more or less short-villous; leaves of the basal rosette, oblong or obovate, entire, 2-5 cm. long; stem-leaves 3-8 cm. long, with 3-7 linear, obtuse divisions; bracts 3-5-cleft, tipped with crimson; lateral lobes usually lanceolate, acute, or obtuse, the middle one broadly oblong, rounded at the apex; calyx 1.5-2 cm. long, almost equally deeply cleft above and below, into two oblong, truncate or retuse divisions; corolla greenish yellow, about 2 cm. long; galea about 8 mm. long, rounded at the apex; lower lip about 3 mm. long. Meadows and thickets: Me.—N.C.—Tex.—Sask. *Plain*. *My*—*Jl*.

3. **C. collina** A. Nels. Stems many, puberulent and with scattered white villous hairs; leaves 2-4 cm. long, dark green, divided into linear divisions, puberulent; bracts green below, scarlet above the middle, usually twice cleft into linear or oblong divisions; calyx sparsely soft-pubescent, about 2 cm. long; corolla greenish, with crimson margins, nearly 3 cm. long; galea about 1.5 cm. long; lip about 2 mm. long. Gravelly ridges and among sage-brush: Wyo.—Colo. *Plain*—*Submont.* My—Je.

4. **C. linariaefolia** Benth. Stems glabrous or somewhat villous in the inflorescence; leaves narrowly linear or dissected into narrow, linear divisions, dark green, glabrous or nearly so, 5-10 cm. long; bracts 3-5-parted into linear-lanceolate or almost subulate divisions, more or less crimson and villous; calyx 3-4 cm. long, more or less villous; corolla 4-5 cm. long, greenish yellow, tinged with scarlet; galea about 2 cm.; lip saccate, about 4 mm. long. Hills and rocky places: Wyo.—N.M.—Ariz.—Calif.—B.C. *Submont.*—*Mont.* Jl-S.

5. **C. Crista-galli** Rydb. Stems about 4 dm. high, finely pilose throughout or more or less villous above; lower leaves linear or linear-lanceolate, 5-8 cm. long, 3-nerved, finely pubescent, the upper often divided into 3-5 oblong-linear divisions; bracts coccineous, 3-5-cleft, the middle lobe broad, oblong, acutish; calyx 2-2.5 cm. long, coccineous above; corolla about 3.5 cm. long, green and tinged with red; galea 13-15 mm. long; lip saccate, 2 mm. long. Mountain sides: Mont.—Colo. *Submont.*—*Mont.* Je.

6. **C. cognata** Greene. Stem strict, about 1 m. high, glabrous below, villous in the inflorescence; leaves nearly all entire, linear, 3-5 cm. long, glabrous or nearly so; bracts 3-cleft, with linear-lanceolate divisions, tinged with cream-color; calyx about 2 cm. long, villous; corolla 2.5 cm. long, greenish yellow; galea about 12 mm. long; lip saccate, 2 mm. long. Mountains of Colo. *Submont.*—*Mont.* Jl.

7. **C. arcuata** Rydb. Stems erect, strict, usually simple, 2-4 dm. high, shining, glabrous or short-villous in the inflorescence; leaves narrowly linear, 2-6 cm. long, 1-3 mm. wide, glabrous or the lower sparingly white-villous; bracts 3-cleft with lanceolate lobes; calyx 12-15 mm. long; corolla 2.5-3 cm. long, at last strongly curved, greenish, with yellow margins; galea 12-15 mm. long; lip about 3 mm. long. Mountain sides: c Utah. *Mont.*—*Subalp.*

8. **C. integra** A. Gray. Stems several, simple, tomentose-canescant, 2-4 dm. high; leaves entire, narrowly linear, more or less tomentulose-canescant, thick; inflorescence short and dense, bracts tomentose, crimson, rose-colored, pink, or even yellowish; calyx tomentulose, 2.5 cm. long; corolla green, with crimson margins, about 3 cm. long; galea 10-15 mm. long; lip 2 mm. long; lobes minute. Dry plains and table-lands: Colo.—N.M.—Ariz.—n Mex. *Plain*—*Mont.* My-S.

9. **C. gloriosa** Britton. Stems tomentose-canescant, 2-3 dm. high; leaves narrowly linear, canescant, 3-6 cm. long; inflorescence short and dense; bracts obovate, 4-5 cm. long, 2-2.5 cm. wide, rounded at the apex, crimson, somewhat canescant, entire, or 3-cleft with a broad middle lobe; calyx 3-4 cm. long, somewhat canescant; corolla about 4 cm. long, green, with crimson margins; galea about 2 cm. long; lip about 2 mm. long; lobes very short. Dry places: Ariz.—s Colo.—N.M.; n Mex. Mr—Jl.

10. **C. Lindheimeri** A. Gray. Stems several, 1-3 dm. high, hirsute or villous-canescant; leaves dissected into 3-5 linear divisions, canescant, 3-5 cm. long; inflorescence dense; bracts rose-colored or brick-red, 3-5-cleft, with oblong, obtuse divisions; calyx about 1.5 cm. long; corolla about 3 cm. long, green, with pink margins; galea about 1.5 cm. long; lip 3-4 mm. long. (?) *C. scabrida* Eastw. Dry places: w Tex.—s Colo. *Plain*—*Submont.* Ap—Jl.

11. **C. subcinerea** Rydb. Stem 3-5 dm. high, canescant-strigose; leaves canescant, 3-ribbed, 5-7 cm. long, the lower entire and linear, the upper 3-cleft; bracts broadly cuneate, 5-7-cleft, the upper tinged with yellow and brown-tipped; calyx 2.5 cm. long; corolla greenish yellow; galea 9 mm. long; lip 3.5 mm. long, slightly saccate. Dry mountain sides: Ida.—Mont. *Submont.*—*Mont.*

12. *C. magna* Rydb. Stem a meter or so high, glabrous and shining, angled; leaves lanceolate, 4-6 cm. long, glabrous, 5-ribbed and reticulate, more or less acuminate; inflorescence short and dense; bracts ovate, entire, tipped with crimson; calyx about 2.5 cm. long; corolla 4-5 cm. long, greenish, tinged with crimson and with crimson margins; galea fully 2 cm. long; lip about 3 mm. long. Woods: B.C. *Mont.*

13. *C. confusa* Greene. Stems glabrous below, villous above, 4-6 dm. high; leaves lanceolate or linear-lanceolate, 4-7 cm. long, acute or acuminate, 3-ribbed, glabrous or puberulent, entire or the uppermost 3-lobed; bracts ovate, entire to 5-lobed; calyx about 2 cm. long; corolla about 3 cm. long; galea 13-14 mm. long; lip about 4 mm. Mountains: Colo.—N.M. *Submont.—Subalp.* Je—Jl.

14. *C. rhexifolia* Rydb. Stem 3-6 dm. high, usually glabrous below, more or less villous above; leaves oblong-lanceolate to ovate, 3-5-nerved, about 5 cm. long, from glabrous to densely puberulent; bracts crimson, scarlet or rose; calyx about 2.5 cm. long, green below, colored above; corolla about 3 cm. long, puberulent, green and tinged and bordered with crimson or scarlet; galea about 1 cm. long, lip about 4 mm. long. Open woods and mountain sides: Alaska—Utah—Colo.—Sask. *Submont.—Subalp.* Je—Au.

15. *C. lauta* A. Nels. Stems several, glabrous or puberulent; leaves 2-5 cm. long, the lower linear-lanceolate, acuminate, the upper lanceolate; inflorescence short and dense; bracts ovate or obovate, entire or 3-cleft, with a broad middle lobe, villous-ciliate, tipped with crimson; corolla yellowish green, margined with crimson, 18-22 mm. long; galea 7-8 mm. long; lip about 2 mm. long. *C. oreopala subintegra* Fern. Moist mountain slopes: Ore.—Utah—Colo.—Mont. *Submont.—Subalp.* Je—Au.

16. *C. pinetorum* Fern. Stem slender, 3-4 dm. high, viscid-pilose; leaves linear-lanceolate, 3-5 cm. long, minutely pilose; inflorescence narrow; lower bracts entire, the upper 3-5-cleft, roseate or bright red above; calyx about 18 mm. long; corolla about 2.5 cm. long; galea about equalling the tube; lip 2 mm. long; lateral lobes longer than the middle one. Pine woods: Ore.—Ida.—Nev.—Calif. *Mont.* Jl—Au.

17. *C. Leonardi* Rydb. Stems several, 2-3 dm. long, more or less viscid-villous; leaves ovate-lanceolate or oblong-lanceolate, 1.5-3 cm. long, densely puberulent, 3-ribbed; bracts broadly ovate or obovate, rounded at the apex, densely pubescent, entire, tipped with crimson; calyx 1.5 cm. long, densely puberulent; corolla 2 cm. long or less, densely puberulent; galea about 1 cm. long; lower lip about 2 mm. long. Mountains: Utah. *Mont.* Jl—Au.

18. *C. humilis* Rydb. Stems several, about 2 dm. high, glabrous below, somewhat viscid-pubescent above; leaves oblong to elliptic-lanceolate or the uppermost ovate, 2-3 cm. long, obtuse or acute, finely puberulent; bracts entire, obovate, tipped with dark crimson; inflorescence short and dense; calyx densely puberulent, 10-12 mm. long; corolla about 15 mm. long, densely puberulent, greenish, with purple margins; galea 7-8 mm. long; lip 2 mm. long. Moist subalpine woods: Wyo.—Utah. *Mont.—Subalp.*

19. *C. brunnescens* Rydb. Stems 3-5 dm. high, more or less pubescent and purplish; leaves narrowly linear-lanceolate, more or less distinctly 3-nerved, 4-5 cm. long, finely pubescent; bracts ovate to oblong-lanceolate, obtuse or rounded at the apex, entire or with a short tooth on each side; calyx about 2 cm. long; corolla about 3 cm. long; galea about 1 cm. long; lip about 3 mm. Mountains, along streams: Colo.—Wyo.—Utah. *Submont.—Subalp.* Jl—S.

20. *C. dubia* A. Nels. Stems several, 2-3 dm. high, finely puberulent and with some white soft hairs; leaves linear, 3-5 cm. long, usually with one or two pairs of divergent linear lobes; bracts with three relatively broad lobes, decidedly yellowish, or at tips bright yellow; calyx about 2 cm. long; corolla scarcely longer; galea equalling the tube; lip very short, minutely toothed. *C. angustifolia dubia* A. Nels. Denuded slopes: Wyo. *Son.*

21. *C. desertorum* Geyer. Stems several, 3-5 dm. high, retrorsely pubescent, yellowish hirsute above; leaves linear-acuminate, hirsute, 3-ribbed, 4-5

cm. long, the upper usually 3-cleft; inflorescence dense and short; bracts lanceolate or ovate, usually 3-cleft; calyx 2-2.5 cm. long; corolla 3 cm. or nearly so, pubescent; galea 12 mm. long; lip 3 mm. long. Meadows: Mont.—Ida.—Wash. *Submont.* My.

22. *C. lutescens* (Greenm.) Rydb. Stems 3-5, 5 dm. high, more or less hirsute and puberulent; lower leaves linear or linear-lanceolate, entire, scabrous-puberulent and somewhat hirsute, 3-ribbed, the upper broader, 3-cleft and 5-ribbed; bracts ovate, 3-cleft, upper portion yellow and the tips often brown or red; calyx about 15 mm. long; corolla 2-2.5 cm. long; galea about 1 cm. long; lip 2 mm. long. *C. pallida lutescens* Greenm. Hills: Wash.—Ida.—Mont. *Submont.* My-Je.

23. *C. variabilis* Rydb. Stems pubescent, 4-8 dm. high; leaves linear-lanceolate or lanceolate, 4-6 cm. long, 3-ribbed, puberulent and more or less short-hirsute; bracts lanceolate, deeply 3-cleft, yellow above, with scarlet or brick-red tips or sometimes almost wholly brick-red; calyx viscid-villous, about 2.5 cm. long, tinged with yellow; corolla yellowish-green, with scarlet or yellow margins, about 4 cm. long; galea nearly 2 cm. long; lip dark green, 3 mm. long. Mountains: Utah. *Mont.*—*Subalp.* Jl-Au.

24. *C. Vreelandii* Rydb. Stem usually single, 6-8 dm. high, glabrous or nearly so, shining; leaves lanceolate, 3-5-ribbed, glabrous or nearly so, 4-6 cm. long, somewhat acuminate; bracts lanceolate, usually 3-lobed, with acute lobes, tipped with crimson; calyx 2-2.5 cm. long, tinged with crimson; corolla dark green, with purplish margins; galea about 2 cm. long; lower lip 2 mm. long. Banks, open woods, and meadows: Mont.—Wyo.—Utah—Wash. *Submont.* Je-Jl.

25. *C. trinervis* Rydb. Stem more or less villous, 3-6 dm. high; leaves dark green, finely puberulent, entire, acute, usually 3-ribbed, the lower linear, 5-8 cm. long and about 0.5 cm. wide, the upper lanceolate and often 15 mm. wide; bracts 3-5-lobed, the upper with almost crimson tips; calyx densely white villous, about 3 cm. long; corolla about 4 cm. long, green, but the galea with crimson margins; galea about 15 mm. long; lip 4-5 mm. long, dark green, with three narrow lobes. Open woods: Colo. *Mont.* Je-Jl.

26. *C. Tweedyi* Rydb. Stems 2-5 dm. high, finely puberulent or sometimes glabrate; leaves linear-lanceolate, 3-nerved, 3-6 cm. long, the upper somewhat broader and sometimes lobed; bracts light green, tipped with scarlet or brick-red; calyx about 2 cm. long; corolla about 2.5 cm. long, greenish, margined with red; galea 1 cm. long or less; lip 3 mm. long. Valleys and hillsides: B.C.—Wash.—Utah—Wyo.—Mont. *Submont.*—*Mont.* Je-Au.

27. *C. subpurpurascens* Rydb. Stems several, 1-3 dm. high, glabrous or slightly puberulent, villous above; leaves narrowly linear, finely puberulent, 3-5 cm. long, 2-3 mm. wide; inflorescence short and dense; bracts lanceolate, acute or obtuse, the lower usually entire, the upper more or less cleft, tipped with crimson; calyx 15-20 mm. long, especially towards the base; corolla 2.5-3 cm. long, green, with crimson margins; galea about 1 cm. long; lower lip 3 mm. long. *C. purpurascens* Rydb., not Greenm. Hillsides: Alta.—Mont. *Submont.*—*Mont.*

28. *C. mineata* Benth. Stems many, 4-6 dm. high, sparingly pubescent; leaves linear-lanceolate or linear, acuminate, 5-7 cm. long, sparingly pubescent; bracts lanceolate, 3-cleft, tipped with scarlet or brick-red; calyx about 15 mm. long, more or less hirsute; corolla about 2 cm. long, green, margined with red; galea about 1 cm. long; lip dark green, 2.5 mm. long. Meadows: Wash.—Ida.—Mont.—Sask. *Submont.* Jl-Au.

29. *C. lancifolia* Rydb. Stems solitary, 4-6 dm. high, sparingly villous or glabrate; leaves lanceolate, often acuminate, 3-5 cm. long, 3-ribbed, usually all entire, usually glabrous, but sometimes finely puberulent; bracts lanceolate, acute or acuminate, often more or less cleft, crimson; calyx hirsute and puberulent, equally cleft, 2.5 cm. long; lobes lanceolate, 5 mm. long; corolla about 3 cm. long, puberulent, green, with crimson margins; galea 12-15 mm. long; lower lip 3 mm. long. Valleys and hillsides: Alaska—Ore.—Utah—Colo.—Alta. *Submont.*—*Subalp.* Je-Au.

30. *C. obtusiloba* Rydb. Stem very sparingly hairy, 3-4 dm. high; lower leaves oblong-lanceolate, 3-nerved, minutely pubescent, 3-4 cm. long, entire, the upper broader, 3-cleft; bracts similar, but broader, purple; middle lobe elliptic, rounded at the apex; calyx about 2.5 cm. long; corolla yellowish and purple-tinged; upper lip nearly 1 cm. long; lower nearly 3 mm. Mountain parks: Colo. *Mont.* Jl.

31. *C. Suksdorfii* A. Gray. Stems simple, 3-6 dm. high, sparingly pubescent; lower leaves often entire, lanceolate, sparingly villous, 4-5 cm. long, the upper 3-cleft, with ascending lobes; bract 3-5-lobed, with lanceolate lobes; corolla nearly 4 cm. long; galea fully 2 cm. long; lip about 4 mm. long. Mountains: Wash.—Mont.—B.C. *Mont.* Au.

32. *C. viscida* Rydb. Stems 1-3 dm. high; leaves 1.5-3 cm. long, 3-5-cleft at the middle, densely glandular-puberulent, the body lanceolate, 3-ribbed, the lobes narrowly lanceolate and directed forward; bract similar to the leaves, tipped with crimson or scarlet; calyx 18-20 mm. long; corolla about 2.5 cm. long, dark green, with crimson margins; galea about 1 cm. long; lip 3 mm. long. Mountains: Utah. *Submont.*—*Subalp.* Je—Au.

33. *C. ampliflora* Rydb. Stems 3-4 dm. high, puberulent and somewhat villous; most of the leaves entire, lanceolate, 2-3 cm. long, with a short and rather dense pubescence, the upper 3-5-lobed; bracts 3-lobed, with a broad rounded middle lobe, crimson, 1-1.5 cm. long; calyx 1.5-2 cm. long, villous; corolla nearly 3 cm. long, more than usually turgid; galea fully 1.5 cm. long; lip 3 mm. long. Open woods: Mont. *Submont.* Jl.

34. *C. Bradburyi* (Nutt.) G. Don. Stem 3-4 dm. high; leaves 3-4 cm. long, puberulent and slightly hirsute, 3-ribbed, 3-5-cleft above the middle; body lanceolate; lobes linear or lanceolate, directed forward; bracts obovate, usually 3-5-lobed or toothed at the apex, the middle lobe usually rather broad and rounded, tipped with scarlet; calyx about 2 cm. long; corolla about 2.5 cm. long, green, with crimson margins; galea 10-12 mm. long; lip 2 mm. Hillsides: B.C.—Ore.—Mont.—Wyo. *Submont.* My—Jl.

35. *C. hispida* Benth. Stems 3-5 dm. high, hirsute-villous as well as puberulent; leaves 2.5-5 cm. long, hirsute-villous, 3-5-cleft above the middle; body lanceolate or ovate-lanceolate; lobes lanceolate, directed forward; bracts similar, tipped with crimson; calyx 2.5 cm. long, villous; corolla 2-3 cm. long; galea about 12 mm. long; lip 2.5 mm. long. Hillsides: B.C.—Wash.—Utah—Colo.—Alta. *Submont.*—*Mont.* Ap—Jl.

36. *C. angustifolia* (Nutt.) G. Don. Stems 1-4 dm. high, usually rather copiously hirsute and puberulent; leaves 3-6 cm. long, 3-7 cleft, the lower lobes usually arising below the middle, hirsute and puberulent; bracts deeply 3-5-cleft, crimson-tipped; calyx 1.5-2 cm. long; corolla 2-2.5 cm. long, yellowish green, with crimson margins; galea about 1 cm. long; lip 3 mm. long. (?) *C. multisecta* A. Nels. *C. Buffumii* A. Nels. Dry places: B.C.—Nev.—Colo.—Alta. *Submont.*—*Mont.* Ap—Jl.

37. *C. chromosa* A. Nels. Stems erect or ascending, 2-4 dm. high, usually simple, puberulent and hirsute with white crisp hairs; lower leaves usually entire, lanceolate to linear, 3-7 cm. long, the upper pinnatifid, 3-5 cm. long, with 2-4 linear or lanceolate divaricate lobes; bracts similar to the upper leaves, but with shorter, blunter lobes, tipped with scarlet or crimson; calyx densely white-villous, about 2 cm. long; corolla about 2 cm. long; galea fully 1 cm.; lip about 3 mm. long. Plains and hillsides: Wyo.—Colo.—Utah. *Submont.* My—Je.

38. *C. linearis* Rydb. Stem simple, 3-4 dm. high, finely villous-pubescent; leaves narrowly linear, about 5 cm. long and 2 mm. wide, pubescent, entire or the upper with a pair of narrowly linear lobes; bracts broader, deeply cleft into three linear lobes, tipped with brick-red; calyx villous, 2-2.5 cm. long; corolla 2.5-3 cm. long, greenish yellow; galea about 12 mm. long, with red margins; lower lip dark green, about 3 mm. long, 3-lobed. Meadows: Colo. *Mont.* Jl.

39. *C. Haydeni* (A. Gray) Cockerell. Stems glabrous up to the inflorescence; leaves linear or linear-lanceolate, entire or the upper broader and 3-5-

cleft, glabrous or nearly so; bracts deeply 3-7-cleft, dark crimson, villous especially on the veins; calyx nearly 2 cm. long; corolla 2-2.5 cm. long, green, margined with dark crimson; galea about 8 mm. long; lip nearly 3 mm. long. *C. pallida* Hayden A. Gray. High mountains: Colo. *Alp.* JI.

40. *C. pallida* (L.) Kunth. Stems 2-4 dm. high, glabrous or puberulent below, sparingly villous in the inflorescence with long white hairs; leaves narrowly linear or the upper linear-lanceolate, 5-7 cm. long, puberulent; bracts ovate, entire or toothed, tipped with yellow or white; calyx nearly 2 cm. long; corolla a little over 2 cm. long, somewhat silky-villous; galea about 8 mm. long; lip 4 mm., saccate. Arctic and subarctic regions: Alaska—B.C.—Alta.—Mack. *Subalp.*—*Alp.* Je—JI.

41. *C. Cusickii* Greenm. Stems several, 3-4.5 dm. high, short-pilose, somewhat cinereous; leaves 3-nerved, hirtellous, linear or linear-lanceolate, 2-4 cm. long, entire or the upper with one or two pairs of lobes on each side; raceme dense, bracts oblong, obtuse or rounded at the apex, usually entire; calyx pubescent; corolla 2-2.5 cm. long, pale yellow, tinged with red; galea 6-7 mm. long; lip 3 mm. long, 3-cleft. Meadows: Ore.—Ida. JI.

42. *C. gracillima* Rydb. Stems usually solitary, slender, purplish, 2-4 dm. high, sparingly villous; leaves linear-lanceolate, 2-4 cm. long, 3-ribbed, sparingly short-villous; bracts ovate, entire, toothed or 3-cleft, puberulent, villous-ciliate; calyx about 15 mm. long; corolla purplish, slightly longer than the calyx; galea 8 mm. long; lip about 3 mm. long, its lobes ovate. Meadows, especially near hot springs: Alta.—Wyo. *Mont.* JI—Au.

43. *C. Bennittii* Nels. & Macbr. Stems 2-3 dm. high, hirsutulous; leaves linear, entire or sometimes irregularly narrowly lobed; inflorescence dense; bracts 3-cleft, with blunt lobes, the middle broader; calyx 1.5-2 cm. long, the divisions shallowly round-lobed; corolla 1.5-2 cm. long; galea 6-7 mm. long; lip half as long, with short teeth. Sage-brush plains: Ida. *Plain.* Je.

44. *C. parvula* Rydb. Stems many, puberulent; leaves lanceolate, 1-2 cm. long, puberulent; bracts ovate, dark brownish-crimson, finely puberulent, entire or with short lobes; calyx 12-14 mm. long, puberulent; corolla 17-18 mm. long, greenish, with purple margins; galea about 7 mm. long; lip 2.5-3 mm. long. High mountains: e Utah. *Mont.*—*Subalp.* JI.

45. *C. occidentalis* Torr. Stems puberulent below, villous above; leaves linear or linear-lanceolate, 1.5-4 cm. long, puberulent or somewhat villous; bracts ovate, entire or toothed, varying from brownish crimson to greenish yellow, villous with white or yellowish hairs; calyx about 1.5 cm. long, villous; corolla about 18 mm. long, usually dark brownish or greenish purple; galea 8 mm. long; lip about 4 mm. (?) *C. arapahoensis* Daniels. Alpine peaks: B.C.—Utah—Colo.—Alta. *Subalp.*—*Alp.* JI—S.

46. *C. luteovirens* Rydb. Stem 3-4 dm. high, leafy, slightly pubescent when young, soon glabrate; leaves lanceolate to almost linear, 3-4 cm. long, 3-9 mm. wide, finely puberulent, 3-ribbed, acute, entire, or rarely the upper 3-lobed; lower bracts ovate, obtuse, entire, tipped with light greenish yellow or greenish white, the upper ones 3-toothed at the apex and greenish yellow throughout; calyx villous, 15-17 mm. long; corolla 22-24 mm. long, greenish; galea 6-7 mm. long, with yellow margins; lower lip 2.5-3 mm. long, bluntly 3-lobed. Mountain meadows: Colo.—Utah—Wyo. *Submont.*—*Mont.*

47. *C. sulphurea* Rydb. Stems several, 3-5 dm. high, glabrous or finely puberulent; leaves lanceolate or the upper ovate, 3-ribbed, 4-5 cm. long, finely puberulent; bracts broadly ovate, obtuse, entire or with small teeth, puberulent, light yellow; calyx about 1.5 cm. long; corolla greenish, 22-25 mm. long; galea about 1 cm. long; lip 3-4 mm. long. Mountains: (?) B.C.—Mont.—Utah—Colo.—S.D. *Submont.*—*Mont.* Je—Au.

48. *C. wyomingensis* Rydb. Stems 3-4 dm. high, striate, sparingly puberulent; leaves linear, 4-5 cm. long, minutely puberulent, not or less distinctly 3-nerved, entire, or the upper 3-lobed; bracts lanceolate to ovate, tinged with sulphur-yellow, 3-lobed at the apex or the lower entire; calyx villous, nearly 2 cm.

long, sulphur-yellow; corolla greenish, tinged and bordered with sulphur-yellow; galea about 6 mm. long; lip about 2 mm. long. Mountains: Mont.—Colo.—Utah. *Submont.*—*Mont.* Jl—Au.

49. *C. pulchella* Rydb. Stems 5–15 cm. high, ascending, more or less villous especially above; leaves 1–4 cm. long, the lower entire and linear-lanceolate, the upper broader and 3-cleft, puberulent and slightly villous; bracts elliptic, usually 3-cleft, the middle lobe broad and rounded, villous; calyx yellowish, about 18 mm. long; corolla slightly exserted; galea 7 mm. long; lip 5 mm. long. Mountains: Mont.—Wyo. *Mont.* Jl—Au.

50. *C. lutea* Heller. Stems 2–3 dm. high, villous throughout, densely leafy; lower leaves lanceolate and entire, the rest broader, 2–4 cm. long, 3–5-ribbed, villous, 3–7-cleft at the apex; bract similar but broader, lobes rounded or obtuse at the apex, sulphur-yellow; calyx 2.5–3 cm. long; corolla rarely exserted; galea about 8 mm. long; lip 5 mm.; lobes oblong, obtuse. *C. pallida camporum* Greenm. *C. comporum* Howell. *C. villosa* Rydb. Hillsides: Wash.—Ida.—Wyo.—Mont. *Submont.*—*Mont.* Ap—Au.

51. *C. lineata* Greene. Stems about 3 dm. high, densely white-floccose; leaves ascending, densely floccose, linear, about 5 cm. long, entire or with narrow linear spreading lobes; bracts 3-cleft, with linear lobes; calyx densely villous, about 18 mm. long; corolla greenish, 2 cm. long; galea 8–9 mm. long; lip about 5 mm. Mountain slopes: Colo. *Mont.* Jl.

52. *C. Pecten* Rydb. Stem stout, 4–5 dm. high, puberulent throughout; lower leaves linear, entire, 5–6 cm. long, puberulent, the upper 3–5-cleft with linear divisions; bracts rhombic-obovate or broadly cuneate in outline, almost pectinately cleft into linear divisions, puberulent, upper portion yellowish or the tips brownish; calyx about 2 cm. long, puberulent; corolla a little over 2 cm. long; galea 8–9 mm. long; lip about 4 mm. long, its lobes oblong. Valleys: Ida. *Submont.*

53. *C. fasciculata* A. Nels. Stems 2–3 dm. high, cinereous-puberulent and villous-hirsute; leaves 3–6 cm. long, more or less divided into linear divergent lobes or entire and linear, cinereous-puberulent; bracts tipped with yellow or brick-red, 3-cleft below the middle; calyx puberulent, yellowish, 15 mm. long; corolla 17–20 mm. long, yellow; galea 6–7 mm. long; lip about 3 mm. Foot-hills and mountain slopes: Wyo.—Mont.—Ida. *Submont.* Je—Au.

54. *C. pallescens* (A. Gray) Greenm. Stems usually ascending, 1–1.5 dm. high, finely grayish puberulent; leaves entire, narrowly linear, or with narrowly linear lobes, 2–3 cm. long, grayish puberulent; bracts 3–5-cleft, tinged with yellow or brownish; calyx puberulent, 18–20 mm. long; corolla slightly longer than the calyx; galea 4–5 mm. long; lip 3–4 mm. *Orthocarpus pallescens* A. Gray. Hills and mountain sides: B.C.—Wash.—Wyo.—Mont. *Submont.*—*Mont.* Je—Au.

55. *C. longispica* A. Nels. Stems 2–3 dm. high, both finely puberulent and villous-hirsute; leaves 2–5 cm. long, 3-cleft to the middle into linear lobes, more or less villous; bracts 3-cleft; corolla 12–15 mm. long; galea 5–6 mm. long; lip 4–5 mm. long. Dry ground: Wyo.—Ida. Jl—Au.

56. *C. pilifera* A. Nels. Stems several, erect, 1.5–2.5 dm. high; leaves nearly linear, entire, or with a few linear lobes, 3–6 cm. long; corolla yellowish, about 2 cm. long; galea 6 mm. long; lip nearly as long; lobes linear, about as long as the undivided portion. Mountain valleys: n Wyo. *Mont.* Jl.

57. *C. puberula* Rydb. Stems less than 1 dm. high, finely puberulent; leaves 2–3 cm. long, pinnately divided into linear lobes or entire and linear, finely puberulent; bracts similar, but shorter and broader, tinged with yellowish, often more villous; calyx more or less villous, 1–1.5 cm. long; corolla yellowish, 18–20 mm. long; galea 6–8 mm. long; lower lip 3–4 mm. long, gibbous. High mountains: Colo. *Mont.*—*Alp.*

58. *C. cervina* Greenm. Stems 5–7 dm. high, finely puberulent; leaves entire, narrowly linear or more often 3–5-parted, with narrowly spreading linear divisions, puberulent; bracts laciniately 3–5-lobed, tipped with yellow; calyx 1.5–

2 cm. long; corolla 2-2.5 cm. long; galea about 6 mm. long; lip nearly half as long. Dry ground: B.C.—Wash. *Submont.* Je—Au.

59. *C. brachyantha* Rydb. Stems 2-4 dm. high, puberulent and more or less villous-hirsute especially below; leaves narrowly linear or cleft, with linear divisions, 2-5 cm. long, puberulent; bracts 3-5-cleft into linear divisions, tipped with yellowish; calyx more or less villous; corolla 15-20 mm. long; galea 7-8 mm. long; lip about 3 mm., gibbous. *C. breviflora* A. Gray. Mountains: Colo.—Wyo. *Plain*—Mont. Je—Au.

60. *C. flava* S. Wats. Stems puberulent and more or less villous-hirsute, especially below, 3-5 dm. high; leaves narrowly linear, entire or dissected into a few linear lobes, finely puberulent; bracts 3-cleft, with linear divisions, puberulent and villous-ciliate; calyx about 15 cm. long; corolla 2-2.5 mm. long, yellow; galea 8-10 mm. long; lower lip scarcely 2 mm. long, greenish. Dry soil, especially among sage-brush: B.C.—Ida.—Utah—Colo.—Mont. *Submont.*—Mont. Je—Au.

61. *C. sessiliflora* Pursh. Stems 1-3 dm. high, more or less densely villous; leaves entire, linear or dissected into linear lobes, 3-5 cm. long, puberulent; bracts broader, 3-cleft, with lanceolate or linear-lanceolate divisions, finely canescent; calyx 3-4 cm. long; corolla 4-5 cm. long, yellow, puberulent; galea 10-15 mm.; lip about 5 mm. long. Dry plains and hills: Ill.—Mo.—Tex.—Ariz.—Sask. *Plain.* Je—Au.

20. ORTHOCÁRPUS Nutt. OWL'S CLOVER.

Annual caulescent herbs. Leaves alternate, sessile, pectinately cleft or entire, those subtending the flowers usually highly colored. Flowers perfect in terminal leafy spikes. Calyx tubular or deeply campanulate, nearly equally 4-cleft. Corolla very irregular, 2-lipped; upper lip erect, slightly arched, equalling or slightly shorter than the more or less 3-lobed saccate lower lip. Stamens 4, didynamous, ascending under the upper lip; anther-sacs dissimilar, the outer one attached by its middle, the inner pendulous by its apex. Styles wholly united, slender; stigmas entire. Capsule oblong, loculicidal. Seeds many, reticulate.

Bracts dilated, entire or with a broad middle lobe and narrow lateral ones, somewhat petaloid.

Bracts herbaceous, resembling the leaves, 3- (rarely 5-) cleft, with lanceolate lobes.

Corolla yellow; spike dense; seeds ridged.

Plant hirsute; corolla not three times as long as the calyx.

Plant puberulent; corolla 3-4 times as long as the calyx.

Corolla white, turning rose-purple; spike lax; seeds loosely reticulate.

1. *O. tenuifolius*.
2. *O. luteus*.
3. *O. Tolmiei*.
4. *O. purpureo-albus*.

1. *O. tenuifolius* Benth. Stem 1-2 dm. high, simple or branched above, somewhat hirsute, purplish; leaves usually dissected, with linear-filiform or subulate divisions, puberulent and sparingly hirsute; lower bracts leaf-like, usually 5-cleft, hirsute-ciliate; middle lobe lanceolate and the lateral ones subulate; upper bracts with an oblong to oval purple-tipped and rounded middle lobe; calyx about 1 cm. long, its lobes subulate; corolla about 2 cm. long, wholly yellow or purplish at the apex; galea about 5 mm. long; lip 4 mm., only slightly gibbous. Plains and bench lands: B.C.—Wash.—Ida. *Plain*—*Submont.* Je—Au.

2. *O. luteus* Nutt. Stem 1-4 dm. high, more or less hirsute, strict; leaves narrowly linear-lanceolate to almost subulate, entire, or rarely 3-cleft, attenuate, 1.5-5 cm. long; bracts 3-5-cleft, with lanceolate acute divisions, puberulent; calyx 5-6 mm. long, hirsute; its lobes lanceolate, about 1 mm. long; corolla yellow, 10-15 mm. long; galea and lip nearly 5 mm. long, lip slightly gibbous. Sandy soil: B.C.—Wash.—Ariz.—N.M.—Neb.—Sask. *Submont.*—Mont. Je—Au.

3. *O. Tolmiei* H. & A. Stem 2-4 dm. high, puberulent; leaves narrowly linear-lanceolate, usually entire, 2-5 cm. long; bracts usually 3-cleft, puberulent, with linear-lanceolate or subulate divisions; calyx 4-5 mm. long, its lobes lanceolate; corolla 15-18 mm. long, yellow or tipped with brownish or purplish; galea about 5 mm. long; lip slightly shorter, deeply gibbous. Pastures and mountain valleys: Ida.—Utah—Wyo. *Submont.*—Mont. Jl—S.

4. **O. purpureo-albus** A. Gray. Stem strict, somewhat viscid, puberulent, 3-5 dm. high; leaves narrowly lance-linear to almost filiform, usually entire; bracts 3-cleft to near the base into linear-lanceolate attenuate divisions; calyx about 6 mm. long; its lobes linear-lanceolate, acuminate; corolla about 15 mm. long; galea about 6 mm. long; lip 5 mm. long, only slightly gibbous. Mountains and table lands: Ida.—Ariz.—N.M.—Colo.—*Submont.*—*Mont.* Jl—Au.

21. **TRIPHYSARIA** (Benth.) Rydb. PELICAN FLOWER, JOHNNY-TUCK.

Annual caulescent herbs. Leaves alternate, often pectinate, or else entire, those subtending the flowers usually colored. Flowers perfect, in terminal leafy spikes. Calyx deeply 4-cleft. Corolla irregular, 2-lipped; upper lip erect, straight, narrow, much shorter than the lower, which is 3-lobed and strongly 3-saccate. Stamens 4, didynamous, ascending under the upper corolla-lobe; anther-sacs solitary or two and then dissimilar in the manner of the two preceding genera. Stigma capitate or sometimes 2-lobed. Capsule oblong, loculicidal; seeds many, reticulate.

1. **T. hispida** (Benth.) Rydb. Stem 2-3 dm. high, soft-hirsute, strict, simple; leaves with linear-lanceolate, attenuate divisions, or the lower entire, soft-hirsute; spike leafy; bracts similar to the leaves; calyx-lobes subulate; corolla white, 15-18 mm. long, viscid-puberulent; lip saccate, 2-3 mm. deep; galea subulate. Low ground: Wash.—Ida.—Nev.—n Calif. *Submont.* My—Jl.

22. **ADENOSTEGIA** Benth.

Branching annuals. Leaves narrow, alternate. Flowers perfect, in leafy spikes at the ends of the branches. Calyx cleft to the base on the sides and therefore 2-leaved, or sometimes 1-leaved by the want of the lower division. Corolla tubular, with a funnelform throat, slightly 2-lipped; the upper lip narrow, entire; the lower round, slightly 3-toothed or entire. Stamens 4, didynamous, or sometimes the shorter pair wanting. Styles wholly united, with an inflexed apex; stigma entire. Capsule compressed, loculicidal. Seeds few. [*Cordylanthus* Nutt.]

Calyx diphyllous; flowers short-pedicelled, with 2-4 bractlets; flowers in head-like spikes. Stamens 4; anthers 2-celled; both divisions of the calyx 5-6-ribbed; leaves 3-7-parted.

Bracts as well as the whole plant puberulent.

Corolla 2.5 cm. long, more purplish.

Corolla 12-20 mm. long, dull yellow.

Bracts ciliate with long white, more or less curled, hairs.

1. *A. Wrightii*.

2. *A. ramosa*.

3. *A. ciliosa*.

Stamens 2; anthers 1-celled; posterior division of the calyx only 2-ribbed; leaves narrowly linear, entire, except those subtending the heads.

4. *A. bicolor*.

Calyx monophyllous, *i. e.*, the anterior division lacking; flowers sessile without bractlets; flowers in more elongate spikes.

Leaves and bracts all entire; anthers of the shorter stamens with only the smaller lower sacs.

5. *A. canescens*.

Leaves 3-5-parted; anthers of all the stamens 2-celled.

6. *A. Kingii*.

1. **A. Wrightii** (A. Gray) Greene. Stems puberulent, or almost glabrous, 3-6 dm. high; leaves 3-5-parted into filiform divisions, sparingly puberulent; bracts similar to the leaves; calyx about 2 cm. long or more; corolla usually exserted; galea nearly 1 cm. long; lips slightly shorter. *Cordylanthus Wrightii* A. Gray. Dry places and sandhills: w Tex.—s Colo.—Utah—Ariz. *Son.* Jl—O.

2. **A. ramosa** (Nutt.) Greene. Stem much branched, finely puberulent, 1-4 dm. high; leaves dissected into filiform divisions, grayish puberulent; bracts similar; calyx 12-20 mm. long; galea 6-8 mm. long; lip about 5-6 mm. long. *C. ramosus* Nutt. In dry places: Ore.—Nev.—n Colo.—Wyo. *Submont.*—*Mont.* Je—Au.

3. **A. ciliosa** Rydb. Stem puberulent, purplish, 1.5-2 dm. high; leaves 2-3 cm. long, finely puberulent, 3-5-cleft into filiform divisions; bracts similar to the leaves but with broader bases; calyx nearly 1.5 cm. long, more or less ciliate; corolla about 15 mm. long; galea 5-6 mm. long; lip nearly as long, pubescent without. Slopes and plains: Wyo.—Ida. *Submont.* Jl—Au.

4. **A. bicolor** (A. Nels.) Rydb. Stem 2-5 dm. high, softly pilose and glandular-viscid; leaves usually entire, narrowly linear or 3-5-divided, softly pilose and viscid; bracts usually 3-cleft with linear divisions; calyx usually more or less scarious, purplish, villous; upper division about 1 cm. long, 2-ribbed and 2-lobed at the apex; lower division oblong, 3-ribbed; corolla purplish, nearly 15 mm. long; galea about 4 mm. long; lip about 3 mm. long. *Cordylanthus bicolor* A. Nels. Low grounds and hillsides: Nev.—Ida. *Submont.* Jl-S.

5. **A. canescens** (A. Gray) Greene. Stem strict, branched, villous or glabrous below, densely villous above; leaves entire, linear-lanceolate, 1-3 cm. long, more or less villous; bracts lanceolate, 1.5-2 cm. long, softly-villous, 1-3-ribbed; upper division of the calyx 15-20 mm. long, softly villous, with 2 principal ribs; corolla nearly 2 cm. long, puberulent; galea about 7 mm. long; lip nearly as long. Saline soil: Calif.—Utah. *Son.* Jl-Au.

6. **A. Kingii** (S. Wats.) Greene. Stem erect, branched, 1-3 dm. high, more or less glandular-pubescent; leaves 3-cleft, 3-4 cm. long, with narrowly linear divisions; bracts 3-5-cleft, clasping; upper division of the calyx lanceolate, 2-3-toothed at the apex, about 2 cm. long; corolla 1.5-2 cm. long, purple, pubescent; galea 8-10 mm. long, little exceeding the 3-toothed lip. *C. Kingii* S. Wats. Limestone ridges: Nev.—sw Colo. *Son.*—*Submont.* Jl.

23. EUPHRASIA (Tourn.) L. EYEBRIGHT.

Low herbs, parasitic on other plants. Leaves opposite, dentate or incised. Flowers perfect, small, in terminal leafy spikes. Calyx 4-cleft, or rarely 5-cleft and with one lobe smaller than the other 4. Corolla very irregular, 2-lipped; upper lip 2-lobed, the margins recurved; lower lip much larger, 3-lobed, spreading. Stamens 4, didynamous, ascending under the upper lip; anther-sacs equal, parallel. Capsule oblong, loculicidal. Seeds many, oblong, longitudinally ribbed.

Bracts with acute or obtuse teeth.

Teeth of the bracts obtuse; corolla 5-6 mm. long; inflorescence capitate.

Teeth of the bracts acute; corolla 4.5-5.5 mm. long; inflorescence becoming spicate.

1. *E. mollis*.

2. *E. disjuncta*.

3. *E. hudsonica*.

Bracts with subulate or bristle-tipped teeth.

1. **E. mollis** (Ledeb.) Wettstein. Stem 4-10 cm. high, mostly simple; leaves 8-15 mm. long, ovate, coarsely crenate-dentate, densely pubescent; spike head-like when young, at last with 1-3 lower bracts remote; calyx densely pilose; corolla 5-6 mm. long, like that of the next species but deeper purple. Grassy banks: Alaska—Yukon—Mont.—B.C.; e Siberia. *Subarctic.* Au.

2. **E. disjuncta** Fern. & Wieg. Stem slender, 6-30 cm. high, branched below, puberulent; leaves ovate or orbicular, 8-18 mm. long, crenate-dentate; spike interrupted, at last 5-25 cm. long; bracts large, coarsely dentate; corolla 4-5.5 mm. long, with a yellow eye; upper lip purple, the lower white, with purple lines. Open places: Lab.—Me.—Alta.—Alaska. *Subarctic.* Je-S.

3. **E. hudsonica** Fern. & Wieg. Stem 5-20 cm. high, pubescent, simple or branched below; leaves oblong, 10-15 mm. long, sparingly pubescent, with few acute teeth; spike elongate, at last 5-15 cm. long; bracts oblong, 7-15 mm. long; corolla 5.5-6 mm. long, whitish, with pale violet lines. Grassy places: Hudson Bay—Alta.—Mack. *Subarctic.* Au.

24. ELEPHANTÉLLA Rydb. LITTLE RED ELEPHANT, ELEPHANT'S HEAD, ELEPHANT FLOWER.

Perennial herbs, with rootstocks, blackening in drying. Leaves alternate, pinnately divided, with toothed segments. Flowers perfect, in terminal spikes. Calyx obliquely campanulate, 5-toothed. Corolla 2-lipped; upper lip strongly arcuate, produced into a long filiform upcurved beak, enclosing the long style; lower lip 3-lobed, the lateral lobes reflexed. Stamens 4, didynamous, ascending under the upper lip; anthers approximate in pairs; sacs transverse, parallel. Capsule compressed, beaked, loculicidal.

1. **E. groenlandica** (Retz.) Rydb. Stem 2-6 dm. high, glabrous; leaves petioled, or the upper sessile, lanceolate in outline, pinnatifid, 5-20 cm. long; lobes linear or lanceolate, doubly dentate; spike dense, 1-3 dm. long; calyx glabrous, 5-7 mm. long; teeth triangular-ovate; corolla proper reddish-purple or claret-colored, about 1 cm. long, the long curved beak 12-15 mm. long. Swamps and wet meadows: Greenl.—Lab.—N.M.—Calif.—Alaska. *Mont.*—*Subalp.* Je—Au.

25. **PEDICULÀRIS** (Tourn.) L. LOUSEWORT, INDIAN WARRIOR,
DUCK-BILL.

Perennial (all ours) or annual herbs. Leaves alternate, opposite or whorled, pinnately veined, pinnatifid, lobed, or merely crenate. Flowers perfect, in terminal spikes or racemes. Calyx cleft on the lower side, 2-5-lobed. Corolla strongly 2-lipped; upper lip laterally compressed, sometimes short-beaked, toothed, or blunt; lower lip erect or ascending, 3-lobed, the lobes mostly spreading. Stamens 4, didynamous, ascending under the upper lip; anther approximate in pairs; anther-sacs transverse, parallel. Capsule compressed, curved, beaked, loculicidal. Seeds many, pitted, striate, or ribbed.

Galea produced into a distinct beak.

Beak long, strongly incurved; lip very broad, meeting or enclosing the tip of the beak.

Leaves undivided, minutely doubly crenate.

1. *P. racemosa*.

Leaves pinnately divided into linear dentate divisions.

Corolla-tube not exerted; beak more or less spirally incurved; calyx deeply cleft in front.

Corolla white; calyx greenish-striate and glabrous.

2. *P. contorta*.

Corolla purplish or rose; calyx purple-striate and villous at the base.

3. *P. ctenophora*.

Corolla-tube distinctly exerted; beak crescent-shaped, arcuate; calyx not deeply cleft in front.

4. *P. lunata*.

Beak short and straight; lip narrower and not meeting the tip of the galea.

Beak about as long as the width of the galea; lip reflexed; primary divisions of the leaves short (8 mm. or less long), not narrowed at the base.

Corolla yellow or ochroleucous.

5. *P. Parryi*.

Corolla purple.

6. *P. Hallii*.

Beak much shorter than the width of the galea; lip ascending; lower primary divisions of the leaves 8-30 mm. long, usually narrowed at the base.

Plant 1-2 dm. high; bracts ovate, all shorter than the flowers.

7. *P. Canbyi*.

Plant 3-6 dm. high; bracts linear, oblong, or lanceolate, the lower equalling or exceeding the flowers.

8. *P. siifolia*.

Galea not produced into a distinct beak, but often with two lateral teeth near the apex.

Leaves pinnately divided or lobed.

Leaves divided to the midrib or nearly so into narrow, acute, dentate or serrate or incised divisions.

Galea distinctly arcuate; stems 2-15 dm. high (except in *P. scopulorum*, which often is only 1-2 dm. high).

Galea toothless; plant 4-10 dm. high; lip not reaching the tip of the galea.

Corolla pale yellow; spike elongate, 6-30 cm. long; bracts lanceolate, usually produced and exceeding the flowers.

9. *P. bracteosa*.

Corolla tinged with purple; spike 3-10 cm. long; bracts ovate, short-acuminate and about half as long as the flowers.

10. *P. montanensis*.

Galea with two lateral teeth.

Plant tall, 3-15 dm. high; corolla sordid yellow, 3-3.5 cm. long; lip almost reaching the tip of the galea.

11. *P. Grayi*.

Plant lower, 1-4 dm. high; corolla purple, 2-2.5 cm. long; lip not reaching the tip of the galea.

Leaves divided to the midrib, *i. e.*, rachis not winged; divisions incised.

12. *P. cystopteridifolia*.

Leaves not quite divided to the midrib, *i. e.*, rachis winged; divisions merely dentate.

13. *P. scopulorum*.

Galea scarcely arcuate, nearly straight, except the hood-like rounded apex, usually toothless; plant less than 1 dm. high.

Spike very dense, densely lanate; lower lip almost equalling the galea.

14. *P. lanata*.

Spike laxer, sparingly if at all lanate; lower lip of the corolla much shorter than the upper.

Corolla 18-22 mm. long; lower lip 5 mm. long; galea merely tinged with purple.

15. *P. Oederi*.

Corolla about 12 mm. long; lower lip of the corolla about 3 mm. long; upper portion of the galea dark purple or crimson.

16. *R. flammea*.

Leaves pinnately lobed two-thirds to the midrib or less, with broadly oblong or rounded, obtuse and crenate lobes.

Plants caulescent; stamens merely acute.

Stem 1-3 dm. high; lower lip of the corolla much shorter than the upper.

17. *P. canadensis*.

Stem 3-10 dm. high; lower lip of the corolla reaching almost to the tip of the galea.

18. *P. lanceolata*.

Plants almost acaulescent; stamens aristate-acuminate at the base.

19. *P. centranthera*.

20. *P. crenulata*.

Leaves merely crenate.

1. ***P. racemosa*** Dougl. Stems caespitose, 3-5 dm. high, glabrous; leaves lanceolate or linear, doubly crenate, 3-8 cm. long; spike leafy-bracted; calyx 5-6 mm. long, very oblique; lateral calyx-lobes lanceolate to triangular, the lower rounded, the upper obsolete; corolla white, 12-15 mm. long; lip broadly reniform, 6-7 mm. long, about 12 mm. wide. Mountain sides: B.C.—Calif.—N.M.—Alta. *Submont.*—*Subalp.* Je—Au.

2. ***P. contorta*** Benth. Stems 2-4 dm. high, glabrous; leaves glabrous, the lower 8-15 cm. long; divisions linear, dentate; raceme 1-2 dm. long; bracts pectinately divided into linear divisions; calyx about 7 mm. long; lobes linear, the lower and lateral ones subequal, the upper much smaller; corolla strongly curved; lip reniform, about 8 mm. long and 12 mm. broad. Mountains: B.C.—Calif.—Ida.—Alta. *Submont.*—*Mont.* Je—Au.

3. ***P. ctenophora*** Rydb. Resembling the preceding species; stem about 3 dm. high, glabrous or slightly arachnoid-hairy in the inflorescence; bracts broader than in the preceding, more or less arachnoid. Mountains: *Mont.*—*Wyo.* *Mont.* Je—Au.

4. ***P. lunata*** Rydb. Stem about 4 dm. high, slightly striate and purplish; leaves alternate, glabrous, dark green, 5-12 cm. long; segments linear or linear-oblong, crenate; spike 15-20 cm. long; bracts pectinately divided, with prolonged endlobes, slightly arachnoid-villous; calyx about 9 mm. long, its teeth broadly lanceolate, about 3 mm. long; corolla pinkish, over 2 cm. long; lower lip very broad, indistinctly 3-lobed with large rounded lateral lobes. Mountains: *Wyo.*—Ida. *Mont.* Au.

5. ***P. Parryi*** A. Gray. Stem 1-4 dm. high, glabrous; leaves glabrous, 5-12 cm. long, pinnately divided to near the midrib; divisions lanceolate, 3-6 mm. long, crenate; stem-leaves usually much reduced; raceme 3-13 cm. long; bracts shorter than the flowers, divided into lance-linear divisions; calyx about 7 mm. long, usually glabrous; corolla 12-15 mm. long; galea about 8 mm. long; beak subconic at right angles to the galea; lip rather deeply 3-lobed, 4 mm. long. Mountains: *Wyo.*—*N.M.*—*Utah*—*Mont.* *Mont.*—*Subalp.* Jl—Au.

6. ***P. Hallii*** Rydb. Stem glabrous up to the inflorescence, 1-2 dm. high; leaves 5-8 cm. long, mostly basal, deeply pinnately divided to near the midrib into lance-oblong crenate divisions 4-5 mm. long; bracts deeply dissected into linear divisions; calyx more or less arachnoid-villous, 7-9 mm. long; lobes lanceolate; corolla purple, resembling that of the next preceding species, but the beak slightly shorter. Mountains: n *Wyo.* *Subalp.* Je—Au.

7. ***P. Canbyi*** A. Gray. Stem usually less than 1.5 dm. high, but leafy, glabrous; leaves pinnately divided to the midrib, 3-6 cm. long; divisions lanceolate, usually more or less doubly serrate, 5-15 mm. long; spike short and dense; bracts ovate, slightly villous; calyx 8 mm. long, villous, its lobes lanceolate; corolla 15-18 mm. long, light yellow; galea about 8 mm. long, helmet-shaped, with a short usually slightly porrect beak; lip about 4 mm. long, with rounded lobes. Mountains: n *Mont.* *Subalp.* Jl.

8. ***P. siifolia*** Rydb. Stem glabrous, 3-6 dm. high, leafy; leaves pinnately divided to the midrib, glabrous, 5-15 cm. long; divisions lanceolate, 1-4 cm. long, more or less doubly serrate-dentate; spike short, 3-8 cm. long; calyx glabrous, 8-9 mm. long, its lobes lanceolate; corolla yellowish, nearly 2 cm. long; galea about 8 mm. long, curved, helmet-shaped, with a short conical beak; lip 4 mm. long, rather deeply 3-cleft, with rounded lobes. Meadows: *Ida.*—*Mont.* *Mont.*

9. ***P. bracteosa*** Benth. Stem 3-10 dm. high, glabrous; leaves glabrous, 6-30 cm. long; divisions lanceolate, 2-6 cm. long, laciniately double-serrate; spike elongate, 6-30 cm. long; calyx 8-10 mm. long, villous, its lobes lanceolate; corolla

yellowish, about 2 cm. long; galea 11-12 mm. long; lip erect, 5 mm. long, with rounded crenulate teeth. In lowland, among bushes: B.C.—Calif.—Utah—Colo.—Alta. *Submont.*—*Subalp.* Je—Au.

10. *P. montanensis* Rydb. Stem 3-6 dm. high, glabrous; leaves similar to those of the preceding, glabrous; calyx about 8 mm. long, its lobes subulate; corolla 15-18 mm. long, purplish, except a yellow spot on the lip; galea 8 mm. long; lip 4 mm. long, 3-lobed. Mountains: B.C.—Wash.—Wyo.—Alta. *Submont.*—*Mont.* Je—Au.

11. *P. Grayi* A. Nels. Stem 5-20 dm. high, glabrous or pubescent above; leaves 2-6 dm. long, somewhat pubescent, especially when young; divisions lanceolate, often 5-7 cm. long, with triangular dentate lobes; spike 2-4 dm. long; bracts lance-linear, about equalling the flowers; calyx about 1 cm. long, villous-puberulent, its lobes lance-linear; corolla nearly 3 cm. long; galea 12-15 mm. long, cucullate; lip 1 cm. long with broad rounded lobes. *P. procera* A. Gray, not Adams. Mountain woods: N.M.—Wyo.—e Utah. *Mont.*—*Subalp.* Jl—Au.

12. *P. cystopteridifolia* Rydb. Stem 2-4 dm. high, purple-tinged; leaves 5-15 cm. long, glabrous; divisions lanceolate, about 1 cm. long, incised and serrate; bracts lanceolate, long-acuminate; calyx densely villous, nearly 1 cm. long, its lobes lanceolate; corolla over 2 cm. long, dark reddish purple; galea nearly 1 cm. long, arcuate, cucullate; lip about 7 mm. long, with rounded lobes. *P. elata* Pursh, not Willd. *P. cystopterides* Clements. Mountains: Mont.—Wyo. *Mont.*—*Subalp.* Jl—Au.

13. *P. scopulorum* A. Gray. Stem 1-2 dm. high, glabrous or villous above; leaves 4-8 cm. long, divisions lanceolate 3-5 mm. long, dentate; spike short, 3-5 cm. long; bracts lanceolate, arachnoid-villous; calyx 8 mm. long, arachnoid-villous, its lobes subulate-triangular; corolla purple, 15-18 mm. long; galea over 1 cm. long, arcuate and cucullate at the apex. Mountains: Colo. *Subalp.*—*Alp.* Jl.

14. *P. lanata* Willd. Stem densely lanate; leaves 2-3 cm. long, glabrous, blackening in drying; divisions oblong, crenate, 1-2 mm. long; spike dense, 3-5 cm. long; calyx about 7 mm. long; lobes oblong; corolla reddish purple or rose-colored, about 2 cm. long; galea about 7 mm. long; lip almost as long, deeply 3-lobed, with rounded lobes. Arctic-alpine situations: Greenl.—Lab.—Canadian Rockies—Alaska; Eurasia. *Alp.* Je—Jl.

15. *P. Oederi* Vahl. Stem 1-1.5 dm. high, glabrous; leaves glabrous, 3-6 cm. long; divisions broadly oblong to oval, dentate, 3-5 mm. long; spike more lax, 3-10 cm. long; calyx 8-12 mm. long, slightly more deeply cleft in front; lobes lanceolate; corolla 18-22 mm. long, yellowish, with purple-tinged galea, which is about 8 mm. long; lip deeply 3-cleft, with rounded lobes. *P. versicolor* Vahl. Arctic-alpine situations: Alaska—Mont.; Eurasia. *Alp.* Jl—Au.

16. *P. flammea* L. Stem glabrous, 3-10 cm. high; leaves darkening in drying, 2-6 cm. long; divisions oblong or oval, crenate, 3-5 mm. long; spike 2-5 cm. long, with almost erect flowers; calyx about 8 mm. long; lobes lanceolate; corolla about 15 mm. long, citron-yellow, with dark purple or crimson galea, which is about 6 mm. long. Arctic-alpine situations: Greenl.—Lab.—Canadian Rockies—Alaska; Eu. *Alp.* Je—Au.

17. *P. canadensis* L. Stems 1.5-4.5 dm. high, more or less pubescent, or glabrate below; leaves 7-13 cm. long, more or less pubescent; lobes oblong, obtuse, incised and dentate; spike 1-2 dm. high; the lower bracts foliaceous; calyx oblique, deeply cleft on the lower side; lobes minute, triangular; corolla yellow or reddish, 2-2.5 cm. long; galea nearly 1.5 cm. long, arcuate, beakless, but with 2 teeth near the apex; lip about 8 mm. long, 3-lobed. Woods and thickets: N.S.—Fla.—N.M.—Colo.—Man.; Mex. *Submont.*—*Mont.* My—Jl.

18. *P. lanceolata* Michx. Stem glabrous or nearly so, 3-10 dm. high; leaves often opposite, lanceolate, 5-13 cm. long; lobes oblong or ovate, obtuse, crenate-dentate; spikes 5-10 cm. long; calyx about 1 cm. long, cleft above and below, the two lobes somewhat foliaceous and crenate; corolla 2-2.5 cm. long, yellow, sometimes ringed with rose; galea 12-14 mm. long, arcuate, truncate at the

apex; lower lip 10-12 mm. long; lobes rounded. In swamps: Ont.—Conn.—Va.—Neb.—Sask. *Plain.* JI-O.

19. *P. centranthera* A. Gray. Stem short, glabrous, with the spike 1.5 dm. or less; leaves 5-15 cm. long, glabrous; divisions oval or ovate, doubly dentate, about 1 cm. long, with callous mucronate teeth; bracts linear or nearly so, ciliate and often toothed towards the apex; calyx about 2 cm. long, its lobes linear to linear-lanceolate; corolla 3-3.5 cm. long, purple or yellowish; galea slightly curved, about 1 cm. long; lip about 8 mm. long with short rounded crenate lobes. Mountains: N.M.—Colo.—Utah—Calif. *Submont.* Ap-Je.

20. *P. crenulata* Benth. Stem more or less villous-puberulent, 2-4 dm. high; leaves linear, obtuse, 3-7 cm. long, doubly crenate; spike 3-10 cm. long; bracts similar to the leaves; calyx cleft in front, 2-3-lobed; lobes ovate-lanceolate; corolla 2-2.5 cm. long, purplish or white; galea about 1 cm. long, curved, not beaked, but with two small triangular teeth; lip 7-8 mm. long, rather deeply 3-lobed; lobes rounded. Mountains: Wyo.—Colo.—Nev. *Submont.*—*Mont.* Je-Au.

26. RHINANTHUS L. RATTLE-BOX, YELLOW RATTLE.

Annual, erect, caulescent herbs, blackening in drying. Leaves opposite, toothed or lobed. Flowers perfect, in terminal, leafy, one-sided spikes or solitary in the upper leaf-axils. Calyx compressed, 4-toothed, much inflated in age and reticulate. Corolla irregular, 2-lipped; upper lip compressed, arched, minutely 2-toothed below the apex; lower lip shorter, with 3 spreading lobes. Stamens 4, didynamous, ascending under the upper lip; anthers pilose; sacs transverse. Capsule orbicular, flat, loculicidal. Seeds several, orbicular, winged. Corolla-tube exerted; teeth of the upper corolla-lip triangular, 1 mm. long.

Corolla-tube included; teeth of the upper lip rounded.

1. *R. Kyrollae*.

2. *R. rigidus*.

1. *R. Kyrollae* Chab. Stem 3-7 dm. high, usually without black lines, glabrous, or pilose at the nodes and in decurrent lines, often branched at flowering time, yellowish; leaves elongate, lanceolate, oblong, or linear, dentate, with acute teeth, scabrous; calyx short-hairy, ciliate on the margins; corolla 8-9 mm. long; tube yellow. *R. Crista-Galli* Rydb. (Fl. Colo.) Thickets and meadows: N.S.—Md.—Colo.—Wash.—Alta. *Submont.* JI-Au.

2. *R. rigidus* Chab. Stem 2-6 dm. high, rigid, pilose in decurrent lines, at first simple, later branched, with strongly ascending branches; leaves glabrous or scabrous above and puberulent beneath, lanceolate or linear-lanceolate, dentate and hispidulous-ciliate on the margins; calyx glabrous or puberulent; corolla 7-8 mm. long. Meadows: Alta.—Colo.—Wash.—Alaska. *Submont.*—*Mont.* Je-Au.

27. MELAMPYRUM (Tourn.) L. COW-WHEAT.

Annual herbs, often blackening in drying. Leaves opposite, entire or few-toothed. Flowers perfect, solitary in the upper leaf-axils, or in leafy-bracted spikes. Calyx 4-toothed, the upper 2 teeth somewhat longer. Corolla irregular, 2-lipped; tube gradually enlarged upwards; upper lip compressed, obtuse or retuse; lower lip 3-lobed, 2-grooved beneath. Stamens 4, didynamous, ascending under the upper lip. Anther-sacs parallel. Capsule flat, oblique, loculicidal. Seeds 2-4, smooth, strophiolate.

1. *M. lineare* Lam. Stem 1-5 dm. high, 4-angled, with puberulent lines; leaves lanceolate or linear-lanceolate, acuminate, short-petioled, 2-7 cm. long, entire; bracts broader, often ovate-hastate, or with salient bristle-pointed teeth; calyx-teeth subulate; corolla 8-12 mm. long, white or whitish, turning purplish. Dry woods: N.S.—N.C.—Ida.—B.C. *Mont.* My-Au.

Family 118. LENTIBULARIACEAE. BLADDERWORT FAMILY.

Small scapose or caulescent herbs, growing in water or wet places. Leaves when submerged dissected into linear or filiform segments, often bladder-bearing, or when aerial basal and entire, or rarely wanting. Scapes naked

or with minute scales, 1-many-flowered. Flowers perfect, irregular. Calyx of 2 or 5 herbaceous sepals. Corolla more or less 2-lipped; tube spurred or saccate. Stamens 2, the filaments adnate to the base of the corolla-tube on the upper side, flattened, twisted. Anthers 1-celled. Pistil solitary, with free central placenta; style thick and short; stigma 2-lobed, with unequal lobes. Fruit a 2-valved or irregularly dehiscent capsule. Seeds numerous, anatropous, rugose; endosperm wanting.

Calyx of 2 sepals; corolla-tube closed by a palate; plants submerged, with dissected leaves.

Calyx of 5 sepals; corolla with an open throat; plants aerial, with basal entire leaves.

1. UTRICULARIA.

2. PINGUICULA.

1. UTRICULARIA L. BLADDERWORT.

Aquatic plants. Stems horizontal, mostly submerged. Leaves finely dissected and in ours bladder-bearing; bladders urn-shaped, the mouth closed by a lid. Flowers perfect, racemose. Sepals 2, slightly united. Corolla 2-lipped, in ours yellow, with the throat closed by a palate; upper lip 2-lobed or entire; lower lip 3-lobed or entire, with a spur at the base. Capsule irregularly dehiscent, many-seeded.

Leaves 2-3 times pinnately divided, with long divisions; corolla about 12 mm. broad; spur prominent, elongate-conic, curved.

Leaves dichotomously divided, with very short divisions; corolla 4-6 mm. wide; spur a mere protuberance.

1. *U. vulgaris*.

2. *U. minor*.

1. *U. vulgaris* L. Stem submerged, leafy, 3-12 dm. long; bladders 3-5 mm. long; scape 1-3 dm. long; racemes 5-10-flowered; corolla yellow, 12-15 mm. broad; upper lip entire, erect; lower lip 3-lobed, spreading; spur not appressed, horn-like, slightly curved, shorter than the lower lip. Shallow water: Newf.—Fla.—Calif.—B.C. *Plain*—*Subalp.* Je—Au.

2. *U. minor* L. Stem leafy, submerged, short; bladders few, 2 mm. long or less; scape 0.5-1.5 dm. high; corolla pale yellow, 4-6 mm. broad; spur much shorter than the lower lip. Shallow water: Greenl.—N.J.—Calif.—B.C. *Submont.*—*Mont.* Jl—Au.

2. PINGUICULA (Tourn.) L. BUTTERWORT.

Terrestrial scapose herbs of wet places. Leaves in basal rosettes, flat, entire, producing above a mucilaginous secretion. Scapes 1-flowered. Sepals 5, often more or less united. Corolla yellow, violet, or in ours purple, more or less 2-lipped, with an open throat; lobes entire or cleft; tube produced below into a nectariferous spur. Stamens 2. Capsule 2-valved. Seeds many.

Lower lip of the corolla about 15 mm. long; base of the corolla conic, ending in a straight filiform cylindric spur.

Lower lip of the corolla 10-12 mm. long; base of the corolla ovoid-conic, ending in a tapering, slightly recurved spur.

1. *P. macroceras*.

2. *P. vulgaris*.

1. *P. macroceras* Willd. Leaves oval or obovate, 2-4.5 cm. long, 1-1.5 cm. wide; scape 5-10 cm. high; calyx about 4 mm. long; upper lip 2-cleft fully half its length into deltoid lobes; lower lip still deeper cleft, with lanceolate lobes; corolla dark purple, 10-15 mm. broad; spur about 1 cm. long. Bogs: Alaska—Alta.—Mont.—Wash.; e Asia. *Subalp.* My—Au.

2. *P. vulgaris* L. Leaves elliptic or oval, 2-5 cm. long, 1-2 cm. wide; scape 3-12 cm. high; calyx about 3 mm. long; upper lip not cleft to the middle, with triangular lobes; corolla paler, less than 1 cm. wide; spur 6-8 mm. long. Bogs: Greenl.—Newf.—Vt.—Mont.—Alta.—Yukon; Eurasia. *Subalp.*—*Subarctic.* My—Jl.

Family 119. OROBANCHACEAE. BROOM-RAPE FAMILY.

Root-parasites, destitute of green foliage. Leaves scale-like. Flowers perfect or rarely dioecious. Calyx of 4 or 5, more or less united sepals. Corolla more or less bilabiate, persistent and withering. Stamens 4, didyna-

mous, mostly included; filaments tere, adnate to the tube of the corolla; anthers 2-celled or rarely 1-celled. Styles wholly united; stigma capitate or 2-lobed. Fruit a capsule, enclosed in the withering corolla. Seeds very many, anatropous, furrowed or tuberculate; endosperm transparent.

Flowers subtended by bractlets.
Flowers without bractlets.

1. MYZORRHIZA.
2. THALESIA.

1. MYZORRHIZA Philippi. BROOM-RAPE.

Whitish or pinkish herbs, parasitic on the roots of other plants. Leaves scale-like, usually pubescent. Flowers spicate, racemose or corymbose, subtended by bractlets. Calyx of 5, nearly equal, narrow lobes. Corolla 2-lipped; tube more or less curved; throat open; lips erect. Capsule 1-celled, 2-valved. [*Aphyllon* A. Gray, in part.]

Flowers all manifestly pedicelled; inflorescence corymbose; anthers woolly.

Flowers sessile or nearly so; only the lowest sometimes short-pedicelled; flowers spicate or paniculate.

Inflorescence spicate, though sometimes branched; corolla usually purple; stem not bulbous at the base.

Corolla 20–25 mm. long; anthers woolly.

Corolla 15–20 mm. long; anthers glabrous.

Inflorescence usually a loose elongated panicle; corolla yellow, about 12 mm. long; stem bulbous at the base.

1. *M. corymbosa*.
2. *M. multiflora*.
3. *M. ludoviciana*.
4. *M. pinorum*.

1. ***M. corymbosa*** Rydb. Stem 5–10 cm. high, glandular-puberulent; scales about 1 cm. long, lance-ovate, acute; bracts linear, about 1 cm. long; bractlets linear-subulate; calyx-tube 4 mm. long; lobes lance-subulate; corolla dark purple, about 2.5 cm. long; anthers woolly. Parasitic on composites, &c.: Mont.—Wyo.—Ida.—B.C. *Submont.*—Mont. Jl.

2. ***M. multiflora*** (Nutt.) Rydb. Stem 1–2 dm. high, glandular-puberulent; scales ovate, acute, 1 cm. long; calyx-tube about 4 mm. long; lobes linear-lanceolate, attenuate, 8–10 mm. long; corolla dark purple; lobes oblong, acutish. *Orobanch multiflora* Nutt. *Aphyllon multiflorum* A. Gray. Parasitic on *Covillea* and other shrubs: Tex.—s Colo.—Utah—Calif.; Mex. *Son.* My—Jl.

3. ***M. ludoviciana*** (Nutt.) Rydb. Stem 0.5–2 dm. high, glandular-puberulent, simple or branched; scales ovate, scarcely 1 cm. long; calyx-tube 3–4 mm. long; lobes lanceolate, attenuate, 7–8 mm. long; corolla usually purple, rarely yellowish; upper lip often only slightly cleft; lobes oblong, acute. *O. ludoviciana* Nutt. Parasitic on *Artemisia* and other Composites, &c., in sandy soil: Sask.—Ill.—Tex.—Calif.—Wash.—B.C. *Plain*—*Submont.* Je—Au.

4. ***M. pinorum*** (Geyer) Rydb. Stem 2–3 dm. high, glandular- and crisp-hairy; scales lanceolate, acute; calyx-tube 3 mm. long; lobes lance-subulate, 4 mm. long; corolla-lips 3–4 mm. long, the upper 2-cleft, the lower 3-divided to the base into lanceolate acute lobes. *O. pinorum* Geyer. *A. pinetorum* A. Gray. Parasitic on conifers: Ida.—Wash. *Submont.* Je—Au.

2. THALESIA Raf. CANCER-ROOT.

Pale or pink root-parasites. Stem simple or branched. Leaves scale-like. Calyx 5-cleft, with nearly equal lobes. Corolla slightly bilabiate; tube more or less curved; upper lip 2-lobed; lower lip 3-lobed. Stamens included. Stigma peltate. Capsule 1-celled, 2-valved, with 4 placentae. [*Aphyllon* Mitchell.]

Calyx-lobes subulate, much longer than the tube; stem very short, 1–3-flowered.

Corolla lilac or pink, 2 cm. or less long; tube 4–5 mm. wide at the throat; lobes oblong, acutish or obtuse.

Corolla deep purple, often with yellowish veins; lobes oval or semi-orbicular, rounded.

Corolla 15–18 mm. long; tube strongly curved, 4–5 mm. wide at the throat.

Corolla 20–30 mm. long; tube not so strongly curved, 5–8 mm. wide at the throat.

Calyx-lobes lanceolate or triangular, about equalling the tube; stem evident, several-flowered.

Corolla purplish, its lobes rounded or merely mucronate; sepals more or less acuminate.

Corolla sulphur-yellow, its lobes acute; sepals acute.

1. *T. sedi*.
2. *T. minuta*.
3. *T. purpurea*.
4. *T. fasciculata*.
5. *T. lutea*.

1. **T. sedi** (Suksd.) Rydb. Peduncles 1-3, slender, 5-10 cm. long, yellow or straw-colored; scales 1 cm. long or less, ovate, usually short-acuminate; calyx-tube conic-campanulate, 2 mm. long, glandular-puberulent; lobes subulate from a broad base, 4-5 mm. long, attenuate; corolla not strongly curved; lobes oblong, acutish or obtuse. *Aphyllon sedi* Suksd. Parasitic on *Sedum*: Ore.—Mont.—B.C. *Submont.* My-Je.

2. **T. minuta** (Suksd.) Rydb. Peduncles 1-4, slender, 2-8 cm. long; scales 1 cm. long or less, acute; calyx-tube campanulate, 2 mm. long; lobes subulate, from a broad base, 4 mm. long; corolla hairy inside on the yellow folds; lobes broadly oval, rounded at the apex, not spreading. *A. minutum* Suksd. Parasitic on *Lithophragma*, etc.: Ore.—Mont.—B.C. *Submont.* Ap-Jl.

3. **T. purpurea** Heller. Peduncles 1-3, stout, 8-15 cm. high; scales broadly ovate, obtuse, glabrous; calyx-tube campanulate, 3-4 mm. long; lobes lance-subulate, 3 mm. long; corolla lobes obovate or semiorbicular, rounded or retuse at the apex, the lower ones usually more or less spreading. Parasitic on bushes: Ore.—Mont.—Wash. *Submont.* My-Jl.

4. **T. fasciculata** (Nutt.) Britton. Stem 2-10 cm. long; pedicels 3-12, 2-8 cm. long; scales brownish, ovate, obtuse; calyx-tube 3-4 mm. long, campanulate; lobes triangular-lanceolate, acuminate, 3-4 mm. long; corolla 2-3 cm. long. *O. fasciculata* Nutt. *A. fasciculatum* A. Gray. Parasitic on *Artemisia*, other Compositae, *Eriogonum*, *Phacelia*, &c.: Sask.—Ind.—N.M.—Calif.—Yukon; Mex. *Plain—Subalp.* My-Au.

5. **T. lutea** (Parry) Rydb. Stem 5-10 cm. long, rather slender; scales ovate, acute, glandular-puberulent; pedicels 2-5 cm. long; calyx-tube broadly campanulate, 3 mm. long; lobes triangular or lance-triangular; corolla about 2 cm. long; lobes elliptic. *A. fasciculatum luteum* A. Gray. Parasitic on grasses: Neb.—Wyo.—Ariz. *Plain.* Ap-Jl.

Family 120. **MARTYNIACEAE.** UNICORN-PLANT FAMILY.

Annual or perennial herbs, with branching stem. Leaves opposite, rarely alternate, with broad blades. Flowers perfect, irregular. Calyx 4- or 5-lobed. Corolla gamopetalous, bilabiate; tube more or less curved; upper lip 2-lobed, exterior in the bud; lower lip 3-lobed. Stamens 4, didynamous, all anther-bearing, or the posterior two without anthers; filaments elongate. Gynoecium of 2 united carpels; ovary 1-celled, with 2 parietal placentae; style slender; stigmas 2. Fruit a beaked capsule. Seeds flattened; endosperm wanting.

1. **MARTYNIA** L. UNICORN-PLANT.

Characters of the family.

1. **M. Louisiana** Mill. A densely viscid annual; stem with spreading branches, 2-9 dm. long; leaves petioled; blades suborbicular or rounded-ovate, 5-30 cm. broad, sinuate, cordate at the base; calyx cleft on the lower side; corolla white or pink, spotted with yellow and purple within; pod 8-15 cm. long, strongly curved, separating into two elastically spreading valves; the beak longer than the body. *M. proboscidea* Glox. Waste places and banks: Me.—Ga.—Tex.—Colo.—Neb.

Family 121. **PLANTAGINACEAE.** PLANTAIN FAMILY.

Annual or perennial herbs. Leaves basal or alternate. Flowers perfect, monoecious, or dioecious, bracteate. Sepals 4, persistent, often scarious-margined, slightly united. Corolla campanulate or tubular, with 4, erect or spreading lobes, scarious, nerveless, persistent. Pistil solitary; ovary superior, 1-4-celled; stigma single, filiform. Stamens 2 or 4; filaments adnate to

the tube of the corolla; anthers 2-celled, versatile, opening lengthwise. Fruit a circumscissile capsule; seeds one to several in each cell, amphitropous; endosperm fleshy.

1. PLANTAGO (Tourn.) L. PLANTAIN, RIBGRASS.

Annual or perennial herbs, in ours acaulescent and with basal leaves only. Blades often broad, prominently ribbed. Flowers spicate, in an elongate spike, sometimes conspicuously bracted. Calyx-lobes equal, or 2 longer. Corolla mostly salver-shaped, constricted at the throat. Capsule more or less membranous. Seeds with flattened or concave faces.

Flowers all perfect; corolla not closed over the fruit; stamens 4.

Leaves lanceolate to ovate; neither leaves nor spike silky pubescent or lanate; stamens in all the flowers long-exserted.

Spike cylindrical; seeds not concave on the faces.

Leaves ovate, abruptly contracted at the base; seeds more than 2 in each cell.

Pyxis dehiscent at the middle, round-ovoid, obtusish; leaves usually thick and the dense spike obtuse. 1. *P. major*.

Pyxis dehiscent far below the middle, elongate-ovoid, very acute; leaves thin and the lax spike acute. 2. *P. asiatica*.

Leaves lanceolate, gradually tapering into the petioles; seeds not more than 2 in each cell.

Leaves thin; plant not woolly at the base.

3. *P. Tweedyi*.

Leaves thick.

Plant sparingly pubescent, with red or brown wool at the base.

4. *P. eriopoda*.

Plant copiously villous with jointed hairs, not woolly at the base.

5. *P. septata*.

Spike short, oblong, 1-3 cm. long; seeds concave on the faces; leaves narrowly lanceolate.

6. *P. lanceolata*.

Leaves linear; leaves or peduncles or both more or less pubescent with long silky hairs; anther in the more fertile flowers included; seeds solitary in each cell, concave on the faces.

Bracts aristate or herbaceous, at least the lower ones 2-many times as long as the flowers.

Bracts all much exceeding the flowers.

Plant dark green; spike compact.

7. *P. aristata*.

Plant light green; spike more slender.

8. *P. spinulosa*.

Upper bracts scarcely exceeding the flowers.

9. *P. zerodea*.

Bracts neither aristate nor foliaceous, slightly if at all exceeding the flowers.

Bracts linear-subulate; spike long-cylindric.

10. *P. Purshii*.

Bracts ovate, obtuse; spike globose to oblong.

11. *P. scariosa*.

Flowers subdioecious or polygamo-dioecious; corolla in the fertile plant remaining closed or early closing over the capsule; stamens 2; leaves filiform.

12. *P. elongata*.

1. *P. major* L. Perennial; leaves petioled; blades oval or ovate, sparingly pubescent or glabrous, 5-35 cm. long, 5-7-ribbed, entire or coarsely toothed; scape 8-15 cm. long; spike dense, 4-20 cm. long; sepals ovate, acute, not keeled; corolla-lobes spreading or reflexed; pyxis ovoid, 3 mm. long; seeds 6-18. Waste places: Newf.—B.C.—Calif.—Fla.; nat. from Eu. *Plain—Mont.* My-S.

2. *P. asiatica* L. Perennial; leaves petioled; blades oval or ovate, sparingly pubescent or glabrate, thin, 1-2 dm. long, 5-7-ribbed, dentate or subentire; scape 1-2.5 dm. high; spike laxer than in the preceding; bracts ovate, scarious-margined, round-keeled; sepals suborbicular, scarious, with green midrib, not keeled; corolla-lobes spreading; pyxis ovate, 3-4 mm. long; seeds 14-20. *P. nitrophila* A. Nels. Alkaline ground and waste places: Sask.—Neb.—Colo.—B.C. *Plain—Submont.* My-S.

3. *P. Tweedyi* A. Gray. Perennial; leaves short-petioled; blades narrowly lanceolate or oblanceolate, glabrous, 3-5-ribbed, thin, 3-7 cm. long; scape 1-2 dm. high; spike 2-5 cm. long, dense; bracts and sepals broadly oval, with green midrib, 2 mm. long; pyxis ovoid, acute, 4 mm. long, circumscissile near the base. Grassy slopes: Mont.—N.M.—Utah. *Submont.—Subalp.* Je-Au.

4. *P. eriopoda* Torr. Perennial; leaves petioled; blades oblanceolate, lance-oblong or elliptic, entire, 3-9-ribbed, pubescent, 0.5-2 dm. long; scape 1.5-4 dm. high; spike 2-10 cm. long, dense above; sepals oblong-obovate, scarious-margined; pyxis ovoid-oblong, obtuse, circumscissile below the middle. *P. retrorsa* Greene. Alkaline or saline soil: N.S.—Que.—Minn.—N.M.—Nev.—Alta. *Plain—Submont.* Je-S.

5. *P. septata* Morris. Perennial; leaves short-petioled; blades narrowly lanceolate, entire, about 1.5 dm. long, 1.5 cm. wide, 5-ribbed, woolly; scape about 15 cm. high, woolly, especially below; spike about 5 cm. long, in fruit rather loose; bracts and sepals rounded-ovate, scarious-margined, obtuse, 2 mm. long, glabrous; pyxis finely reticulate, circumscissile one-third from the base, oblong, rounded at the apex. Plains and gulches: Alaska—Mont.—Mack. *Plain—Subarctic.* Je—Au.

6. *P. lanceolata* L. A biennial or perennial; leaves 4–30 cm. long, linear-elliptic to elliptic, acute, 3–7-ribbed, entire or denticulate, hairy at the base; scapes 1–7 dm. long; spike dense, 1–8 cm. long; calyx-lobes 2–3 mm. long, broadly oblong, obtuse; capsule oblong, circumscissile at the middle, 2-seeded. Lawns and waste places: N.B.—Alaska—Colo.—Fla.; nat. from Eu. *Plain.* Ap—N.

7. *P. aristata* Michx. Annual; leaves linear, acuminate, pubescent, 3-ribbed, 1–5 mm. wide; scape stout, erect, 7–30 cm. long; spike 3–12 cm. long, pubescent; bracts 1–3 cm. long; sepals spatulate-oblong, obtuse; corolla-lobes ovate, spreading; pyxis 2.5–3 mm. long, circumscissile at the middle; seeds 2. Dry soil: Me.—B.C.—N.M.—Fla. *Plain.* My—O.

8. *P. spinulosa* Decne. Annual; leaves linear, acuminate, 3-ribbed, 3–6 mm. wide, villous; scape 5–10 cm. long; spike interrupted, 3–7 cm. long, villous; bracts 7–15 mm. long, spreading; sepals spatulate-oblong, obtuse; corolla-lobes ovate, spreading; capsule 2.5 mm. long, obtuse, circumscissile at the middle, 2-seeded. Sask.—Alta.—Tex. *Plain.* My—O.

9. *P. xerodea* Morris. Annual; leaves linear, 3–20 cm. long, 2–4 mm. wide, glabrate or villous; scape 1–20 cm. high, pubescent; spike 1–6.5 cm. long; bracts herbaceous, linear, attenuate, the lower three times as long as, the upper merely equalling the flowers, scarious-margined at the base; sepals oblong, scarious, with green rib; pyxis round-ovate, circumscissile just below the middle. *P. picta* Morris. Arid regions: Ariz.—s Utah—s Calif. *L. Son.*

10. *P. Purshii* R. & S. Annual; leaves ascending, linear, or nearly so, acute, short-petioled, 3-ribbed, 3–8 cm. long, entire, woolly; scape 5–35 cm. long; spike dense, cylindric, 2–12 cm. long, very villous; sepals oblong, obtuse, scarious-margined; corolla-lobes ovate, spreading; pod oblong, circumscissile about the middle, 2-seeded. *P. graphalioides* Nutt. Plains and river valleys, in sandy soil: Ont.—Sask.—B.C.—Ariz.—Tex.—Mo. *Plain—Mont.* My—Au.

11. *P. scariosa* Morris. Annual; leaves linear or lance-linear, 2–4 cm. long, 2–4 mm. wide, obscurely 3-ribbed, white-villous; scape 3–12 cm. long, villous; spike 6–20-flowered, globose to oblong, 5–18 mm. long, densely villous; bracts scarious, with green rib, ovate, obtuse; sepals similar, with green or purple rib; pyxis twice as long as the sepals, circumscissile just below the middle. Arid places: Calif.—Utah—Ariz. *Son.*

12. *P. elongata* Pursh. Annual; leaves cinereous-pubescent, linear, entire or nearly so, 1-ribbed, 3–10 cm. long, 0.5–2 mm. wide; scape 3–8 cm. high; spike 1–10 cm. long; bracts triangular-ovate, scarious-margined, 2 mm. long; corolla-lobes triangular, 0.5 mm. long; pyxis oblong-ovate, rounded at the apex, circumscissile just below the middle. *P. myosuroides* Rydb. Wet places: Sask.—Okla.—Utah.—Alta.

FAMILY 122. RUBIACEAE. MADDER FAMILY.

Herbaceous or woody plants, with opposite or apparently verticillate leaves and usually perfect, but often dimorphous or trimorphous, regular and symmetrical flowers. Ovary inferior, sunken into and adnate to the hypanthium. Corolla in ours funnelform or rotate, gamopetalous and 3–5-lobed. Stamens as many as the lobes of the corolla and alternate with them; filaments adnate to the corolla; anthers mostly linear-oblong. Ovary in ours 2-celled, ripening into a didymous indehiscent, dry or fleshy fruit. Ovules solitary in each cell. Endosperm in our genera fleshy or horny.

Leaves opposite; corolla funnelliform.
 Leaves apparently verticillate; corolla rotate.
 Flowers 3-4-merous, usually white; fruit dry.
 Flowers 5-merous, yellow; fruit baccate.

1. KELLOGGIA.
 2. GALIUM.
 3. RUBIA.

1. KELLÓGGIA Torr.

Perennials, with opposite leaves, small interposed stipules and small white or pinkish flowers in paniculate cymes. Flowers perfect, 3-5- (mostly 4-) merous. Hypanthium obovoid. Calyx-teeth minute, persistent. Corolla funnel-salverform; lobes valvate in the bud. Stamens adnate to the corolla up to the throat, exserted; filaments flat; anthers fixed above the base. Ovary 2-celled; style filiform, exserted; stigmas 2, linear-clavate. Ovules solitary, erect, anatropous. Fruit dry, coriaceous, beset with uncinate bristles, separating into 2 carpels. Albumen fleshy.

1. **K. galioides** Torr. Stem slender, glabrous or puberulent, 1-3 dm. high; leaves narrowly lanceolate, 1.5-5 cm. long, sessile, 1-3-nerved, acute at the apex; corolla 5-7 mm. long and as wide; fruit 3-4 mm. long and, with the bristles, 3-4 mm. in diameter. Mountain woods: Wyo.—Wash.—Ariz.—Calif. *Submont.*—*Mont.* Je—Jl.

2. GALIUM L. BEDSTRAW, CLEAVERS.

Annual or perennial herbs, some somewhat woody at the base, with 4-angled stems and branches, apparently verticillate leaves* and small, mostly white flowers in cymes or panicles. Flowers perfect or in some species dioecious. Hypanthium globose or ovoid. Calyx obsolete. Corolla wheel-shaped, 4-parted, or rarely 3-parted. Stamens 4, rarely 3; filaments short. Styles 2; stigmas capitellate; ovary 2-celled, with one ovule in each cell. Fruit didymous, of two indehiscent carpels, often bristle-hairy, dry.

Flowers perfect; fruit hirsute with uncinate hairs, or glabrous.

Annuals.

Stem coarse, reclining; leaves 6-8 in the whorls.

Leaves linear or oblanceolate.

Leaves 2-7 cm. long; nutlets when ripe 3-5 mm. in diameter; flowers white.

Leaves 0.5-2 cm. long; nutlet when ripe 2-3 mm. in diameter; flowers

ochroleucous.

Leaves elliptic.

Stem slender, erect or ascending; leaves 2-4 in the whorls.

Leaves ovate or oblong, 5-7 mm. long; fruit nearly sessile.

Leaves linear-oblong or linear, often 10-20 mm. long; fruit distinctly peduncled.

Leaves mostly 4 in the whorls, 5-15 mm. long.

Leaves obovate to broadly oblong-lanceolate, somewhat fleshy.

Corolla-lobes almost 1 mm. long; pedicels and generally also the

stem glabrous.

Corolla-lobes about 0.5 mm. long; pedicels and stem more or less

scabrous.

Leaves linear-oblong or linear-oblanceolate.

Leaves of the stem mostly 5-6 in the whorls, 15-30 mm. long.

Leaves cuspidate-pointed.

Fruit uncinate long-hispid; stem glabrous or sparingly hirsute or bristly;

inflorescence axillary, mostly simple.

Stem retrorse-bristly; pedicels scarcely exceeding the bracts.

Stem glabrous or sparingly hirsute; pedicels much exceeding the small

bracts.

Fruit minutely hispidulous or granular-scabrous; stem scabrous on the angles;

inflorescence paniced.

Leaves firm, with strong midrib, lanceolate or oblanceolate; pedicels in

fruit somewhat spreading.

Leaves thin, oblong, rounded and mucronate at the apex; pedicels very

fine, in fruit spreading at right angles.

1. *G. flariflorum*.

2. *G. Brandegei*.

3. *G. subbiflorum*.

4. *G. triflorum*.

5. *G. columbianum*.

6. *G. flariflorum*.

7. *G. asperulum*.

8. *G. filipes*.

* The leaves are really opposite; but the interposed stipules are large and leaf-like.

Flowers dioecious, in small cymes; fruit with long, not uncinate hairs; perennials.

Leaves linear.

14. *G. coloradense*.

Leaves ovate or lanceolate.

Plant glabrous or nearly so.

Leaves of the stem lanceolate to ovate, 8–15 mm. long.

15. *G. Watsoni*.

Leaves broadly ovate, 5–8 mm. long.

16. *G. Bloomeri*.

Plant decidedly puberulent.

Plant pruinose-puberulent; leaves broadly ovate, not cuspidate.

17. *G. multiflorum*.

Plant hispidulous-puberulent; leaves lanceolate, cuspidate.

18. *G. stellatum*.

1. *G. Aparine* L. Stem weak, prostrate or scrambling over bushes, 3–15 dm. long, retrorsely hispid on the angles; leaves 6–8 in the whorls, oblanceolate, sometimes almost linear, 2–7 cm. long, 4–10 mm. wide, cuspidate, the margins and midribs retrorsely hispid; flowers white in 1–3-flowered cymes in the upper axils. Copses: N.B.—Fla.—Mo.—Tex.—Calif.—B.C.; nat. from Eu. *Plain—Submont.* My—S.

2. *G. Vaillantii* DC. Stem prostrate, retrorsely hispid as the preceding, but the internodes shorter, and the whole plant smaller; leaves 6–8 in the whorls, usually oblong-linear, sometimes slightly oblanceolate, cuspidate-pointed; flowers in 2–9-flowered cymes. Low ground among bushes: Ont.—Fla.—Tex.—Calif.—B.C.; Eurasia. *Plain—Submont.* My—Au.

3. *G. proliferum* A. Gray. Stem hispidulous, branching, 3 dm. high; leaves 5–8 mm. long, acute, with a strong midrib, mostly 4 in the whorls, the alternate ones often smaller; flowers solitary on axillary peduncles which are about twice as long as the leaves, almost sessile in the axil of two leaf-like bracts; peduncles sometimes with one or two proliferations from the axils of the bracts; carpels about 2 mm. in diameter. On stony hills: Tex.—s Utah—Ariz.; Mex. *L. Son.* Ap—Je.

4. *G. bifolium* S. Wats. Stem slender, erect, glabrous, 1–1.5 dm. high; leaves 2–4 in the whorls, often very unequal, thin, acutish, 1-nerved; flowers solitary on axillary peduncles, horizontal and curved under the fruit; carpels about 2 mm. in diameter. In mountain meadows and around springs: B.C.—Mont.—Colo.—Calif. *Submont.* My—Jl.

5. *G. boreale* L. Stem erect, glabrous, 2–7 dm. high; leaves 4 in the whorls, from linear to broadly lanceolate, obtuse or acutish, 3–5 cm. long, the margins sometimes ciliate and slightly revolute, often with fascicles of smaller leaves in the axils; flowers white or ochroleucous (var. *linearifolium*) in terminal, densely many-flowered compound cymes; carpels about 2 mm. in diameter. Rocky places, hillsides, and along streams: Que.—N.J.—Neb.—N.M.—Calif.—Alaska; Eurasia. *Plain—Mont.* My—Au.

6. *G. Brandegei* A. Gray. Stem loosely branched, glabrous, slender, 5–15 cm. high, generally depressed; leaves unequal, 4–12 mm. long, somewhat fleshy, obtuse; midrib faint; flowers usually solitary or geminate, on axillary peduncles; corolla white; fruit glabrous, its carpels about 1.5 mm. in diameter. Around springs: Wyo.—N.M.—Ariz.—Calif. *Submont.—Mont.* Je—Au.

7. *G. subbiflorum* (Wiegand) Rydb. Stem slender, prostrate, 1–3 dm. long, somewhat scabrous on the angles; leaves mostly obtuse, slightly fleshy and with a faint midrib, 5–15 mm. long; peduncles axillary, usually solitary, or more rarely geminate, 1-flowered, or less commonly 2–3-flowered; corolla white, 3-lobed; fruit glabrous, its carpels 1–1.5 mm. in diameter. *G. trifidum subbiflorum* Wiegand. Wet places: Minn.—N.M.—s Calif.—Wash. *Plain—Mont.* Je—Au.

8. *G. trifidum* L. Stem slender, ascending or depressed, 2–4 dm. long, branched, scabrous on the angles; leaves 5–15 mm. long, obtuse, 1-nerved, thin, dark green and dull on both sides; midrib and margins scabrous; flowers on slender 1–3-flowered axillary peduncles; corolla white, 3-lobed, its lobes about 0.5 mm. long; fruit glabrous, its carpels about 1.5 mm. in diameter. Wet meadows and swamps: Lab.—Newf.—N.Y.—Colo.—Alaska. *Plain—Submont.* Je—Au.

9. *G. columbianum* Rydb. Stem slender, 3–10 dm. long, branched, somewhat scabrous on the angles; leaves of the stem generally linear-oblong or

oblanceolate, obtuse, 1-nerved, scabrous on the midrib and margins; leaves of the branches generally 4 in the whorls, smaller; flowers axillary or in small terminal cymes, white; peduncles slender, 5-20 mm. long, solitary or geminate, 1-3-flowered, often curved; corolla white, 3-lobed; fruit glabrous; carpels about 1.5 mm. in diameter. Damp woods and on grassy banks: Mont.—Wash.—Alaska. *Submont.* Je—Au.

10. *G. flaviflorum* Heller. Stem diffuse, 3-10 dm. long; leaves mostly 6 in the whorls, elliptic or lance-oblong, retrorsely hispidulous on the midrib and margins, 2-5 cm. long; peduncles axillary, 2-4-flowered, about equalling the leaves; bracts lanceolate; corolla pale greenish yellow, 4-lobed; fruit hispid with uncinat hairs; carpels 2-3 mm. in diameter. Hills: N.M.—s Colo. *Submont.* —Mont. Jl—Au.

11. *G. triflorum* Michx. Stem diffuse, 3-10 dm. long, glabrous or very sparingly hirsute, shining; leaves mostly 6 in the whorls, narrowly oval or slightly oblanceolate, 1-ribbed, narrowed at both ends, 3-7 cm. long; peduncles axillary or terminal, often exceeding the leaves, mostly 3-flowered; corolla greenish white, 4-lobed; fruit long-hispid with uncinat hairs; carpels 3-4 mm. in diameter. Damp open woods: Newf.—Ala.—Colo.—Calif.—Alaska. *Plain*—Mont. Je—Au.

12. *G. asperulum* (A. Gray) Rydb. Stem erect or ascending, but weak, 3-6 dm. long, retrorse-hispidulous on the angles; leaves thin, 2-4 cm. long, linear-oblanceolate, 1-ribbed, cuspidate at the apex, hispidulous on the ribs and margins; flowers in axillary and terminal, more or less compound cymes; branches merely ascending-spreading in fruit, 1-1.5 cm. long; corolla purplish, its lobes acute; fruit very short uncinat-hispid or granular-scabrous; carpels 1-1.5 mm. in diameter. *G. asperrimum asperulum* A. Gray. In copses and rocky places: Wash.—Ida.—Utah—Calif. *Submont.*

13. *G. filipes* Rydb. Stem ascending, about 5 dm. long, minutely, retrorsely hispidulous; leaves broadly oblanceolate, obtuse and cuspidate at the apex, thin, 2-4 cm. long, retrorsely hispidulous on the veins and margins; flowers in axillary or terminal cymes, the latter more compound; pedicels divaricate, very slender, in fruit often 1 cm. long; corolla purplish, 4-lobed; lobes acuminate; fruit minutely hispidulous; carpels 1.5 mm. thick, fully 2 mm. long. Among bushes: Utah—Nev. *Submont.* Jl.

14. *G. coloradense* W. Wight. Stem erect, perfectly glabrous, with upright branches, about 3 dm. high, slightly woody at the base; leaves rather thick and firm, linear, acute, 1-ribbed, 1-2.5 cm. long and 2-3 mm. wide, 4 in the whorls; cymes of the sterile plant 8-15-flowered, those of the fertile plant 1-5-flowered; corolla apparently yellowish, 2 mm. wide; hypanthium of the sterile flowers glabrous; carpels, including the hairs, 3-4 mm. in diameter. Dry regions: sw Colo.—se Utah. *Submont.* Je—Jl.

15. *G. Watsoni* (A. Gray) Heller. Stem branched, with a somewhat woody base, 0.5-4 dm. high, glabrous or nearly so; cymes of the sterile plant 3-9-flowered, those of the fertile plant 1-5-flowered; leaves 4 in the whorls, generally unequal in size, 8-15 mm. long, rather firm, more or less distinctly 3-ribbed, acute or acuminate; corolla yellowish, about 3 mm. in diameter; hypanthium of sterile flowers sparingly short-hispid; carpels, with hairs, 5-6 mm. in diameter. On dry mountains: Ida.—Ore.—Ariz. *Submont.* Je—Au.

16. *G. Bloomeri* A. Gray. Stem glabrous, branched, somewhat woody at the base, 1-3 dm. high; leaves 4 in the whorls, firm, 5-8 mm. long, 3-ribbed, acute or more commonly abruptly short-acuminate; cymes of the sterile plant 3-9-flowered, those of the fertile plant 1-5-flowered; corolla yellowish, about 2 mm. in diameter; hypanthium of the sterile flower glabrous or puberulent, or with a few long hairs at the base; carpels, with hairs, 3-4 mm. in diameter. Dry mountains: Utah—Ida.—Nev.—Calif. *Submont.* Je—Au.

17. *G. multiflorum* Kellogg. Stem branched, very similar to the preceding in habit; leaves 4 in the whorls, acute, more or less distinctly 3-ribbed, 5-12 mm. long; cymes of the sterile plant 3-7-flowered, those of the fertile plant 1-3-flowered, with very short pedicels; corolla light yellow, about 3 mm. broad; hypan-

thium of the sterile flowers puberulent or with a few long hairs; carpels, with hairs, 4-7 mm. in diameter. Barren hills and mountains: Utah—Wash.—Calif. *Submont.*

18. *G. stellatum* Kellogg. Stem intricately branched, woody at the base, 1-4 dm. high; leaves 1-ribbed, 4-10 mm. long, very firm; cymes of the sterile plants 3-5-flowered, those of the fertile ones 1-3-flowered, with very short pedicels; corolla white, 1.5 mm. in diameter; hypanthium in both kinds of flowers hairy, but longer so in the fertile ones; carpels in fruit, with hairs, 3-4 mm. in diameter. Arid regions: Utah—Ariz.—Calif.—L. Calif. *Son.*

3. RUBIA L. MADDER.

Perennial herbs, often woody below. Leaves apparently verticillate as in *Galium*. Flowers in axillary and terminal cymes. Corolla rotate or campanulate, 5-lobed. Styles 2, connate at the base; stigmas capitate. Fruit didymous or globose, succulent.

1. *R. tinctorum* L. Stem about 1 m. high, armed with small hooked prickles on the angles; leaves lanceolate, retrorse-prickly on the ribs and margins; flowers bright yellow; lobes ovate-lanceolate, acute; berry subglobose, black, the size of a pea. Waste places: Utah; adv. from the Mediterranean region. Je—Au.

FAMILY 123. CAPRIFOLIACEAE. HONEYSUCKLE FAMILY.

Shrubs, trees, vines, or perennial herbs, with opposite leaves and perfect, regular or irregular flowers, mostly in cymes. Stipules generally none. Calyx 3-5-lobed or 3-5-toothed. Corolla gamopetalous, from rotate to tubular, often gibbous at the base; limb 5-lobed and sometimes 2-lipped. Stamens 5, in *Linnaea* only 4, adnate to the corolla and alternate with its lobes; anthers versatile. Ovary inferior, enclosed in the hypanthium, 1-6-celled. Fruit a 1-6-celled berry, drupe, or capsule. Ovules anatropous. Seed with a fleshy albumen; embryo small.

Style deeply 3-5-cleft; shrubs or trees with compound cymose inflorescence and drupaceous fruit.

Leaves pinnate; ovary 3-5-celled, each cell with one ovule.

1. *SAMBUCUS*.

Leaves simple; ovary 1-celled and 1-ovuled.

2. *VIBURNUM*.

Style slender, undivided; stigma capitate.

Trailing evergreen herb; flowers long-peduncled, geminate; stamens 4, didynamous.

3. *LINNAEA*.

Shrubs; stamens generally 5.

Fruit a few-seeded berry.

Corolla rarely gibbous at the base, regular or nearly so; fruit 2-seeded.

4. *SYMPHORICARPOS*.

Corolla gibbous at the base, mostly irregular and bilabiate; fruit several-seeded.

Flowers in heads at the ends of the branches or in verticils in the upper axils; upper leaves connate; vines.

5. *LONICERA*.

Flowers in pairs on axillary peduncles; leaves not connate; erect shrubs.

Bracts and bractlets minute, not foliaceous; berries of the two flowers more or less united.

6. *XYLOSTEON*.

Bracts and bractlets foliaceous; berries of the two flowers distinct.

7. *DISTEGIA*.

Fruit a 2-celled capsule; corolla slightly gibbous and somewhat irregular.

8. *DIERVILLA*.

1. *SAMBUCUS* (Tourn.) L. ELDER.

Shrubs or trees with opposite, odd-pinnate leaves, large pith in the young branches, small whitish flowers in compound cymes. Hypanthium ovoid or turbinate. Calyx-lobes minute, generally 5. Corolla rotate or saucer-shaped, regular, 5-lobed. Stamens 5, inserted at the base of the corolla; anthers oblong. Style short, 3-5-cleft; ovary and berry-like drupe 3-5-celled, each cell containing 1 ovule or seed.

Cyme not flat-topped, thyrsoïd-paniculate, the axis continuous.

Fruit red or rarely yellow.

Young branches, inflorescence and the lower surfaces of the leaves pubescent.

1. *S. pubens*.

Whole plant glabrous.

Fruit black.

Cyme flat-topped, umbelliform, 4-5-rayed, the rays again variously compound; fruit blackish.

Fruit without bloom or nearly so, generally less than 5 mm. broad.

Leaflets ovate, ovate-lanceolate, to obovate, dark green.

Leaflets lanceolate, pale green.

Fruit with copious bloom, generally over 5 mm. broad.

2. *S. microbotrys*.

3. *S. melanocarpa*.

4. *S. canadensis*.

5. *S. neomexicana*.

6. *S. coerulea*.

1. *S. pubens* Michx. Shrub, 6-35 dm. high; leaflets 5-7, dark green, ovate-lanceolate or oval, long-acuminate, generally narrowed and slightly oblique at the base, 5-12 cm. long, sharply serrate; cyme about 5-6 cm. high and 4-5 cm. broad; corolla white, turning brownish in drying; drupe scarlet or red or occasionally amber yellow, 4-6 mm. in diameter. *S. racemosa* Hook., not L. Damp rocky places: N.S.—Ga.—Colo.—B.C.—Alaska. *Submont.* Ap—My.

2. *S. microbotrys* Rydb. Shrub low, 5-20 dm. high, with pale green foliage; leaflets ovate or rarely ovate-lanceolate, acute or short-acuminate, 3-9 cm. long, mostly rounded and oblique at the base, coarsely serrate; cyme small, about as long as broad, about 3 cm. in diameter; flowers whitish; fruit bright red, 4-5 mm. in diameter. Damp places in mountains: S.D.—Colo.—Ariz.—Utah. *Submont.*—*Subalp.* My—Je.

3. *S. melanocarpa* A. Gray. Shrub 1-2 m. high, glabrous, or the young leaves pubescent, with dark green foliage; leaflets 5-7, oval or ovate to ovate-lanceolate, coarsely serrate, abruptly acuminate, often obtuse or rounded and decidedly oblique at the base, 4-15 cm. long; cyme convex, fully as broad as high, 4-7 cm. in diameter; corolla white, but turning somewhat brownish in drying; fruit black, without bloom, 5-6 mm. in diameter. Along streams: Alta.—N.M.—Utah—B.C. My—Je.

4. *S. canadensis* L. A shrub, 1-3 meters high, glabrous or nearly so, with dark green foliage; leaflets 5-11, mostly 7, ovate or oval, sharply serrate, mostly short-acuminate at the apex, acute or obtuse at the base, sometimes pubescent on the veins beneath, 5-12 cm. long, often with linear stipels; cyme flat-topped, 5-15 cm. high and 1-2 dm. broad; flowers white; fruit purplish black, 4-5 mm. in diameter. In wet soil: N.S.—Fla.—Tex.—Colo.—Mont.—Sask. *Plain*—*Submont.* Je—Jl.

5. *S. neomexicana* Wooton. Shrub 2 meters high, almost perfectly glabrous, with pale green foliage; leaflets 5-7, lanceolate, coarsely serrate, long acuminate at the apex, acute and generally very oblique at the base, 4-12 cm. long; cyme 4-8 cm. high and 6-15 cm. broad; flowers white; fruit bluish black, 4-5 mm. in diameter. Wet places in the mountains: N.M.—Colo. *Submont.*—*Mont.*

6. *S. coerulea* Raf. Shrub in clumps, 2-4 m. high, glabrous throughout and with pale green foliage; leaflets 5-9, thickish, oblong, acute or acuminate, coarsely serrate, generally rounded and very oblique at the base, 5-15 cm. long, rarely with minute stipels; cyme 5-7-rayed, 4-6 cm. high and 8-15 cm. broad; flowers pure white; fruit black, but covered with a dense white bloom, 5-6 mm. in diameter. *S. glauca* Auth. *S. decipiens* M. E. Jones. *S. ferax* A. Nels. Along creeks: B.C.—Alta.—Utah—Ariz.—Calif. *Submont.*

2. *VIBURNUM* (Tourn.) L. ARROW-WOOD, CRANBERRY TREE, SNOW-BALLS.

Shrubs or small trees with simple, often stipulate leaves. Flowers in compound cymes. Hypanthium ovoid, hemispherical, or turbinate. Calyx-teeth 5. Corolla rotate to short-campanulate, regular, 5-lobed. Stamens 5; anthers oblong. Style short, 3-cleft; ovary 1-3-celled; each cell with a single ovule. Drupe 1-seeded; seed compressed.

Leaves palmately veined, usually 3-lobed; fruit red.

Outer flowers of the cyme large, neutral and radiant.

None of the flowers radiant.

Leaves pinnately veined, not lobed; fruit blue or black.

Leaves coarsely dentate, pubescent.

Leaves sharply but finely serrulate, glabrous or nearly so.

1. *V. Opulus*.

2. *V. pauciflorum*.

3. *V. pubescens*.

4. *V. Lentago*.

1. **V. Opulus** L. Shrub sometimes 3.5 m. high; leaves glabrous or nearly so above, more or less pubescent on the veins beneath, deeply 3-lobed, rounded or truncate at the base, the lobes divergent, long-acuminate, coarsely toothed; cyme peduncled, flat-topped, the exterior neutral flowers 1-2 cm. broad; fruit globose, red, very acid, 8-10 mm. in diameter; stone flat, orbicular, not grooved. Low places: N.B.—N.J.—Ore.—B.C.; Eurasia. *Submont.* Je—Jl.

2. **V. pauciflorum** Pylaie. Shrub 1-2 m. high; leaves 3-5-ribbed, truncate or cordate at the base, more or less pubescent, 4-10 cm. broad, generally with 3 shallow lobes, these acute or short-acuminate, coarsely dentate; cyme rather few-flowered, short-rayed, 1-3 cm. broad; drupe round or ovoid, 8-10 mm. long; stone flat, orbicular, scarcely grooved. Woods: Newf.—Pa.—Colo.—Alaska. *Submont.* Je—Jl.

3. **V. pubescens** (Ait.) Pursh. Shrub 5-15 dm. high, with gray branches; leaves ovate, acute or acuminate, rounded or subcordate at the base, 3-8 cm. long, velvety pubescent beneath; cymes 3-7 cm. broad; drupe nearly black, 8 mm. long; stone 2-grooved on the faces. Rocky woods: N.B.—Ga.—Ia.—(? Wyo.)—Man. Je—Jl.

4. **V. Lentago** L. Bush or small tree, sometimes 10 m. high; leaf-blades ovate, 4-10 cm. long, glabrous or slightly pubescent beneath, sharply serrulate, mostly rounded at the base and acuminate at the apex; cyme broad, sessile, 5-12 cm. in diameter; drupe oval, sweet, bluish black, with a bloom, 10-14 mm. long; stone flat, circular or oval. NANNY-BERRY. In rich soil, in woods and along streams: Me.—Ga.—Colo.—Man. *Submont.* My.

3. LINNÆA (Gronov.) L. TWIN-FLOWER.

Trailing or creeping evergreen, with slender branches, and opposite petioled leaves. Flowers pink or purplish, borne in pairs at the end of long terminal peduncles. Hypanthium ovoid. Calyx-teeth 5, subulate-lanceolate, deciduous in fruit. Corolla funnelform, almost regular, not gibbous at the base; limb 5-lobed. Stamens 4, didynamous, included. Ovary 3-celled; two of the cells with several abortive ovules, the third with a single perfect ovule; style slender, exserted; stigma capitate. Fruit coriaceous, 3-celled, but 1-seeded.

Calyx-lobes about 2 mm. long; leaves round, oval, or orbicular.

1. *L. americana*.

Calyx-lobes about 4 mm. long; leaves of the fertile shoots mostly broadly obovate-spatulate.

2. *L. longiflora*.

1. **L. americana** Forbes. Stem trailing, with pubescent branches; leaves somewhat coriaceous; blade round, oval, or orbicular, 8-15 mm. in diameter, generally crenate above the middle; peduncles slender, often 1 dm. long; bracts and bractlets linear-subulate; calyx-lobes lance-linear, not longer than the ovary; corolla rose-colored, fragrant, about 1 cm. long, funnelform. *L. borealis* Am. auth., not L. In cold woods: Greenl.—N.J.—Mich.—Colo.—Alaska. *Submont.*—*Subalp.* Je—Au.

2. **L. longiflora** (Torr.) Howell. Stem 3-6 dm. long; leaves of the flowering shoots generally more elongate, broadly ovate or spatulate, 1-2.5 cm. long and 1-2 cm. wide; sepals linear-subulate, 4 mm. long, much longer than the ovary; corolla generally longer, often 12-13 mm. in length. *L. borealis longiflora* Torr. Woods: Alaska—Ida.—Calif.; e Asia.

4. SYMPHORICARPOS (Dill.) Ludw. CORAL-BERRY, SNOW-BERRY, WOLF-BERRY, STAG-BERRY.

Shrubs, with opposite short-petioled leaves and white or pink flowers in small terminal or axillary clusters. Hypanthium globose or ellipsoid. Calyx-teeth 4-5. Corolla from open-campanulate to salverform, regular, rarely slightly gibbous at the base, 4-5-lobed. Stamens 4-5, adnate to the corolla. Ovary 4-celled; two of the cells with several abortive ovules, the other two each with a single pendulous ovule; style filiform; stigma capitate. Fruit a globose or ovoid 4-celled, but only 2-seeded berry.

Corolla short, open-campanulate.

Fruit red; style bearded.

Fruit white; style glabrous.

Style and stamens somewhat exserted; leaves thick.

Style and stamens not exserted; leaves rather thin.

Erect shrub; leaves 2-5 cm. long; clusters several-flowered.

Diffuse shrub; leaves 1-2.5 cm. long; clusters 1-2-flowered.

1. *S. Symphoricarpos*.

2. *S. occidentalis*.

3. *S. racemosus*.

4. *S. pauciflorus*.

Corolla elongate, oblong-campanulate to salverform.

Style glabrous; corolla with short, slightly spreading lobes.

Corolla oblong-campanulate, 6-8 mm. long.

Leaves decidedly pubescent; stem puberulent; leaves rounded-oval, obtuse or rounded at the apex.

Leaves glabrate or slightly pubescent.

Leaves rounded-ovate or rounded-oval, 3-4 cm. long.

Leaves oval, acute, 1-2 cm. long.

Corolla tubular-funneliform, 8-12 mm. long.

Style bearded; corolla salverform, with long divaricate lobes.

5. *S. rotundifolius*.

6. *S. utahensis*.

7. *S. vaccinioides*.

8. *S. oreophilus*.

9. *S. longiflorus*.

1. ***S. Symphoricarpos*** (L.) MacMill. Shrub 5-15 dm. high, with pubescent purplish branches; leaf-blades oval or ovate, entire or wavy, soft pubescent beneath, 2-4 cm. long; flower-clusters shorter than the leaves; corolla campanulate, pinkish, 4 mm. long; berry ovoid-globose, 3-4 mm. long. *S. vulgaris* Michx. *S. orbiculatus* Moench. CORAL-BERRY. River banks: N.Y.—Ga.—Tex.—Colo.—Mont. *Plain*. JI.

2. ***S. occidentalis*** Hook. Shrub 1-1.5 m. high, with slender, light-colored branches; leaves rounded-oval, broadly ovate or almost orbicular, 3-7 cm. long, obtuse or rounded at the apex, more or less pubescent beneath, rather thick and firm, the margins entire or on vigorous shoots deeply sinuately toothed; flower-clusters spicate, 10-25 mm. long; corolla 6 mm. long; fruit globular, white, 8-10 mm. in diameter. Hillsides, open woods, and river banks: Mich.—Mo.—Colo.—B.C. *Plain*—*Submont.* Je-JI.

3. ***S. albus*** (L.) Blake. Shrub erect, 5-15 dm. high, with slender glabrous branches; leaves rather thin, oval, obtuse at both ends, sometimes slightly pubescent beneath, sub-entire or on young shoots sinuate dentate; terminal flower-clusters often interrupted spicate, the axillary few-flowered; corolla thin, slightly gibbous, 6 mm. long, bearded within; fruit white, globose, 6-10 mm. in diameter. *S. racemosus* Michx. Rocky places and on river banks: N.S.—Va.—Wyo.—Colo.—Calif.—B.C. *Submont.* Je—Au.

4. ***S. pauciflorus*** (Robbins) Britton. Shrub low, diffusely branched, 15-25 dm. high; leaves broadly oval or orbicular, softly pubescent beneath, 12-25 mm. long, entire; flowers 2-3 in terminal spikes and solitary in the upper axils; corolla open-campanulate, 4-6 mm. long, bearded within; fruit oval to globose, 4-6 mm. in diameter. Rocky places: Vt.—Pa.—Neb.—N.M.—B.C. *Submont.* Je-JI.

5. ***S. rotundifolius*** A. Gray. Shrub low, less than 5 dm. high, with spreading pubescent branches; leaves thick, 1-2 cm. long, orbicular to broadly oval, generally entire; flowers in small axillary clusters; corolla elongate-campanulate, 6-8 mm. long, pubescent within, below the stamens; fruit white, ovoid, 10 mm. long and 7 mm. broad; stones oval, obtuse at both ends. Mountains: w Tex.—Colo.—Nev.—Calif. *Submont.*

6. ***S. utahensis*** Rydb. Shrub 1 m. or more high, with brownish bark; leaves broadly ovate, more or less rounded at both ends, obtuse or often mucronate, often coarsely sinuately toothed, pubescent when young, 3-4 cm. long and 2-3 cm. wide; flowers in terminal one-sided, drooping, short spikes, or with smaller clusters in the upper axils; corolla elongate-campanulate, about 8 mm. long. Dry mountain-sides: n Utah—Colo. *Submont.*

7. ***S. vaccinioides*** Rydb. Shrub intricately branched, with dark grayish brown shreddy bark on the old branches and yellowish brown on the young ones; leaves about 2 cm. long, oval, acute at both ends, dark green above, more or less glaucous beneath, puberulent or glabrate; corolla 6-8 mm. long; fruit white, about 1 cm. long and 7 mm. in diameter. *S. tetonensis* A. Nels. Dry hillsides: Alta.—Wash.—Nev.—Wyo. *Submont.*

8. *S. oreophilus* A. Gray. Shrub glabrous or somewhat pubescent, often 1 m. high; leaves rather thin, oblong to broadly oval, mostly acute, about 2 cm. long; corolla-tube glabrous within, 4-5 times as long as the rounded, slightly spreading lobes; fruit white, about 1 cm. long, ovoid. *S. glabratus* Eastw. Hill-sides and river banks: Colo.—Ida.—Calif.—Ariz.—N.M. *Submont.*

9. *S. longiflorus* A. Gray. Shrub glabrous or minutely pubescent, less than 1 m. high; leaves spatulate-oblong to oval, thick and somewhat glaucous, 6-12 mm. long; corolla salverform, slender, 10-15 mm. long; tube glabrous within, 3-5 times as long as the oblong widely spreading lobes; fruit white, oblong; stones oblong. Mountains: Utah—Nev. *Submont.*

6. *XYLÓSTEON* Adans. BUSH OR FLY HONEYSUCKLE, TWINBERRY.

Erect branching shrubs, with opposite simple leaves. Flowers axillary in pairs, the common peduncle bibracteate at the summit. Bracts and bractlets if present small, lanceolate or subulate. Hypanthium ovoid or globose. Calyx-teeth 5, minute. Corolla funnelform-campanulate, more or less gibbous at the base and more or less irregular; limb 5-lobed, more or less 2-lipped. Stamens adnate to the corolla-tube; anthers linear or oblong. Ovaries 2-3-celled, those of the two flowers often more or less united; ovules numerous in each cell, pendulous, style slender; stigma capitate. Berry fleshy, 2-3-celled, few-seeded.

Leaves pale or glaucous, thick, narrow, oblong; fruit black or black-blue with a bloom.

1. *X. coeruleum*.

Leaves bright green, thin, usually broad; fruit red.

Leaves glabrous, oval or broadly oblong.

2. *X. utahense*.

Leaves pubescent and ciliate, ovate or broadly oval, often subcordate at the base.

Leaves rounded at the apex; bracts 1 mm., about one-third as long as the ovaries.

3. *X. ebractulatum*.

Leaves acute or obtuse; bracts one-half as long as the ovaries or more.

4. *X. ciliatum*.

1. *X. coeruleum* (L.) Dum-Cours. Shrub erect, 5-10 dm. high; leaves 2-4 cm. long, rounded at the apex, pale and more or less pubescent beneath, glabrate above; flowers short-peduncled; bracts linear-subulate, longer than the ovaries; corolla yellow, 12-15 mm. long, often pubescent; ovaries of the two flowers wholly united, forming in fruit an oblong, bluish-black berry. *Lonicera coerulea* L. Low grounds: Lab.—Pa.—Wis.—Wyo.—Calif.—Alaska; Eurasia. *Submont.*—*Mont.* Je.

2. *X. utahense* (Wats.) Howell. Shrub low and rather simple, perfectly glabrous and with light bark; leaves usually broadly oval, obtuse at both ends, glabrous, thin, 3-5 cm. long; bracts subulate, about half as long as the slightly united, divergent ovaries; corolla light yellow, funnelform, nearly 2 cm. long; fruit almost globular, red, 6-8 mm. in diameter. *L. utahensis* S. Wats. Mountain woods: B.C.—Utah—Wyo.—*Mont.* *Submont.*

3. *X. ebractulatum* Rydb. Shrub divaricately branched, 1-2 m. high, with gray bark; leaves short-petioled, thin, light green, somewhat glaucous and hairy beneath, ciliate on the margins, elliptic to broadly ovate, obtuse, rounded or cordate at the base, 2-6 cm. long; bracts small, 1 mm. long and scarcely one-third as long as the divergent ovaries; bractlets none; corolla funnelform, about 2 cm. long, hairy within; ovaries almost distinct; fruit red, 6-8 mm. in diameter. *L. ebractulata* Rydb. In cañons and open woods: B.C.—*Mont.*—Wyo.—Ida. *Submont.*

4. *X. ciliatum* (Muhl.) Pursh. Shrub, 1-2 m. high, with glabrous branches; leaves thin, bright green, ovate, rounded or cordate at the base, pubescent beneath when young, more glabrate in age, strongly ciliate on the margins; bracts about half as long as the divergent, almost distinct ovaries; bractlets minute, rounded; corolla light yellow, almost regular, about 16 mm. long; fruit ovoid, red, about 6 mm. in diameter. *L. ciliata* Muhl. Moist woods: N.S.—Pa.—Mich.—Sask. *Boreal.*

7. *DISTÈGIA* Raf. SWAMP HONEYSUCKLE, BEARBERRY.

Erect shrubs, with opposite leaves and 2-3-flowered axillary peduncled clusters. Bracts and bractlets close under the flowers, broad oval or ovate, often

cordate at the base, much enlarged in fruit. Corolla cylindric-campanulate, strongly gibbous at the base; limb almost regular, with 5 short rounded almost erect lobes. Fruit of the flowers distinct and surrounded by the bractlets and the bracts. Otherwise as in *Xylosteon*.

1. *D. involucrata* (Richardson) Cockerell. Shrub 1-3 m. high; leaves short-petioled, ovate, oval, or obovate, 5-15 cm. long, acute or acuminate at the apex, rounded or acute at the base, glandular-dotted and more or less pubescent; bracts and bractlets foliaceous, and enlarged and reddish in fruit; bracts ovate or cordate, obtuse or acute; corolla yellow, pubescent; stamens and style slightly exserted; fruit globose or oval, dark purple or black, about 8 mm. in diameter. *Lonicera involucrata* (Richards.) Banks. On wooded river banks: Que.—Mich.—Colo.—Calif.—Alaska. *Submont.*—*Subalp.*

8. *LONICERA* L. HONEYSUCKLE.

Mostly climbing shrubs, with opposite simple leaves, the uppermost in ours connate. Flowers usually irregular, in interrupted spikes or heads in the axils of the leaves. Hypanthium ovoid or globose. Calyx-lobes 5, small. Corolla in ours funnelform or trumpet-shaped, more or less gibbous at the base and more or less irregular; limb 5-lobed and more or less 2-lipped. Stamens adnate to the tube of the corolla; filaments slender; anthers linear or oblong. Ovary 2-3-celled; ovules numerous in each cell, pendulous; style slender; stigma capitate. Berry fleshy, 2-3-celled, few-seeded.

Corolla 3 cm. long, its limb slightly bilabiate; lobes short; leaves glabrous except the ciliate margins.

Corolla 2 cm. long, decidedly bilabiate; leaves hairy beneath.

1. *L. ciliosa*.

2. *L. glaucescens*.

1. *L. ciliosa* (Pursh) Poir. High twining shrub, with glabrous stem and light colored sheddy bark; leaves broadly oval or obovate, subsessile, obtuse, glaucous beneath, perfectly glabrous except the ciliate margins, the upper one or two pairs connate; flowers in a terminal interrupted spike of 1-3 verticils, also often in short-peduncled clusters in the axils of the upper leaves; corolla trumpet-shaped, 25-35 mm. long, yellow to red, glabrous or nearly so, gibbous at the base; limb only slightly bilabiate; style and stamens exserted; fruit red. Copses and hillsides: Calif.—Ariz.—Mont.—B.C. *Submont.*

2. *L. glaucescens* Rydb. Shrub more or less twining, with light colored shreddy bark; leaves obovate or oval, mostly subsessile, glabrous above, glaucous and more or less hairy beneath, the margins chartaceous, not ciliate; flowers in a short terminal interrupted spike; corolla yellow, changing into reddish, 2-2.5 cm. long, slightly hairy or puberulent without, pubescent within, funnelform, strongly gibbous at the base; style and stamens more or less hairy, and exserted; fruit red. Hillsides and among bushes: Ont.—Pa.—Okla.—(Black Hills) S.D.—Mack. *Plain*—*Submont.*

9. *DIERVILLA* (Tourn.) Mill. BUSH HONEYSUCKLE.

Shrubs, with simple opposite leaves and yellow flowers in small terminal or axillary cymes, or solitary. Hypanthium slender. Calyx-lobes 5, linear. Corolla narrowly funnelform, slightly gibbous at the base; limb 5-lobed, nearly regular. Stamens 5, adnate to the tube of the corolla; anthers linear. Ovary 2-celled; ovules numerous; style filiform; stigma capitate. Fruit a linear-oblong septicidal, 2-valved, many-seeded capsule.

1. *D. Diervilla* (L.) MacMill. Shrub 1-1.5 m. high, generally glabrous; leaves ovate, or oval, acuminate, generally rounded at the base, serrulate, 5-12 cm. long; flower-clusters 1-5-flowered, terminal or in the upper axils; corolla yellow, pubescent without and within, about 18 mm. long, three of its lobes somewhat united; capsule slender, beaked and crowned with the persistent sepals. *Diervilla trifida* Moench. *D. Lonicera* Mill. Dry or rocky woods: Newf.—N.C.—Ky.—Sask.

FAMILY 124. **ADOXACEAE.** MOSCHATEL FAMILY.

Herbs with scaly or tuberiferous rootstocks. Leaves basal and opposite cauline, ternately compound. Flowers small, greenish, in terminal head-like clusters. Hypanthium hemispheric, adnate to the ovary. Calyx-lobes 2 or 3. Corolla rotate, regular, 4-6-lobed. Stamens twice as many, inserted in pairs in the tube; anthers 1-celled. Ovary 3-5-celled; styles 3-5-parted; ovules 1 in each cell. Fruit a small drupe, with 3-5 nutlets.

1. **ADOXA** L. MOSCHATEL, MUSK-ROOT.

Characters of the family.

1. **A. Moschatellina** L. Stem erect, 5-15 cm. high; basal leaves 1-4, long-petioled, ternately compound; divisions broadly ovate or orbicular, thin, glabrous, 3-cleft; stem-leaves a single pair, ternate; flowers 3-6; corolla of the terminal flower 4- or 5-lobed, that of the others 5- or 6-lobed; drupe green. Mossy woods: Hudson Bay—Wis.—Ia.—Colo.—Utah—Mack. *Submont.*—*Subalp.* Je-Jl.

FAMILY 125. **LORANTHACEAE.** MISTLETOE FAMILY.

Mostly shrubby parasites, with green tissue and jointed branches, growing on woody plants. Leaves mostly opposite, sometimes reduced to green scales. Flowers dioecious or monoecious, regular. Calyx entire-margined or lobed. Corolla of 2-6 more or less united petals, often green and calyx-like, or wanting. Stamens 2-6; anthers 2-celled or confluent 1-celled. Gynoecium of a compound pistil, but 1-celled. Fruit a berry; seed solitary.

Anthers 2-celled, opening by an apical pore or slit; berry globose; both staminate and pistillate flowers usually 3-merous.

Anthers 1-celled, opening by a transverse circular slit; berry compressed; staminate flowers 3-merous, the pistillate ones 2-merous.

1. PHORADENDRON.

2. RAZOUMOFSKYA.

1. **PHORADENDRON** Nutt. AMERICAN MISTLETOE.

More or less fleshy shrubby dioecious or monoecious parasites. Leaves opposite, either petioled, with well developed blades or sometimes scale-like. Inflorescence axillary of several-jointed spikes. Flowers sessile, sunken in the rachis; hypanthium enclosing the ovary. Calyx usually 3-lobed; lobes in the pistillate flowers persistent on the fruit. Corolla wanting. Stamens 3, inserted at the base of the calyx-lobes; anthers 2-celled, opening by an apical pore or slit. Ovary 1-celled, 1-ovuled; style short; stigma obtuse. Fruit a globose berry, with a viscid mesocarp.

Leaves reduced to scales; pistillate flowers 2 on each internode.

Canescent; twigs terete; spike several-jointed.

Glabrous; twigs bluntly 4-angled; spike 1-jointed.

Leaves with well developed blades; pistillate flowers 6 or more on each internode.

1. *P. californicum*.2. *P. juniperinum*.3. *P. Cockerellii*.

1. **P. californicum** Nutt. Plant dioecious; internodes 1-2 cm. long, softly canescent, becoming glabrate; scales spreading, 2 mm. long; spikes mostly solitary, usually with about 4 joints, each with 2 pistillate or 4-6 staminate flowers; bracts acute; fruit red, 3 mm. thick. Parasitic chiefly on leguminous trees and shrubs, also on *Covillea*, *Zizyphus*, &c.: Calif.—s Utah—Ariz.; Sonora and L. Calif. *L. Son.*

2. **P. juniperinum** Engelm. Plant dioecious; internodes 0.5-1 cm. long, glabrous; scales spreading, deltoid, 1-2 mm. long; spike solitary, 3 mm. long of a single joint, with either 2 pistillate or 6 or 8 staminate flowers; bracts blunt; fruit straw- or wine-colored, 3 mm. thick. Parasitic on species of *Sabina*: w Tex.—s Colo.—Utah—Ariz.; Chihuahua. *Son.*

3. **P. Cockerellii** Trelease. Plant dioecious; internodes 2-4 cm. long, glabrate; leaf-blades elliptic to oblanceolate, obtuse, 3.5-5.5 cm. long, 1.5-2 cm.

wide; spikes mostly solitary, 1.5–3 cm. in flower, becoming 4–5 cm. long, glabrous, 4-jointed, each joint bearing near the top 6 pistillate or 20–30 staminate flowers; bracts ciliate; berry white, glabrous, 4 mm. thick. Parasitic on poplars, willows and ashes: Tex.—s Colo.—N.M.; Chihuahua. *Son.*

2. RAZOUMÓFSKYA Hoffm.

Small shrubby fleshy parasites, mostly dioecious. Leaves opposite, reduced to scales. Flowers solitary in the axils of the upper scales. Calyx of the staminate flowers 2–5-lobed, usually 3-lobed. Stamens as many as and adnate to the lobes; anthers sessile, 1-celled, opening by a transverse circular slit. Hypanthium of the pistillate flowers enclosing the ovary. Calyx-lobes 2, persistent on the fruit. Berry ovoid, more or less flattened. [*Arceuthobium* Bieb.]

Staminate flowers all or nearly all at the ends of the branches, on distinct pedicels, dichotomously paniculate.

Staminate flowers nearly all axillary, forming simple or compound spikes.

Branches 1–2 mm. in diameter.

Plant yellowish green; accessory branchlets of fruiting specimens flower-bearing.

Spikes short, 3–5-flowered; stems bluntly angled.

Rather simple, 1–3 cm. high; leaves and sepals obtusish, not distinctly keeled.

Stout, 3–5 cm. high, branched; leaves and sepals decidedly acute and keeled.

Spikes many-flowered; stems sharply angled.

Plant greenish brown; accessory branches merely leaf-bearing.

Branches 3–4 mm. in diameter.

1. *R. americana*.

2. *R. Douglasii*.

3. *R. laricis*.

4. *R. cyanocarpa*.

5. *R. divaricata*.

6. *R. cryptopoda*.

1. ***R. americana*** (Nutt.) Kuntze. Stems dichotomously and verticillately branched, greenish yellow; staminate plant 5–10 cm. high, 1–2 mm. thick at the base; pistillate plant 2–5 cm. high; staminate flowers 2 mm. wide; lobes round-ovate; pistillate flowers somewhat smaller; fruit 2 mm. long, bluish. *A. americanum* Nutt. Parasitic on *Pinus Murrayana*, *contorta*, and *divaricata*: Sask.—Colo.—Ore.—B.C. *Mont.* Au-O.

2. ***R. Douglasii*** (Engelm.) Kuntze. Plant slender, 1–3 cm. high, greenish yellow, dichotomously branched; branches simple or with accessory branches behind the first; flowers in short usually 5-flowered spikes, less than 2 mm. wide, the staminate ones with round-ovate calyx-lobes; fruit 5 mm. long. *A. Douglasii* Engelm. On *Pseudotsuga mucronata*: Mont.—N.M.—Ariz.—Ore.—B.C. *Mont.*

3. ***R. laricis*** Piper. Divaricately branched, 3–5 cm. high, greenish yellow; branches angled; flowers in short 3–7-flowered spikes, the staminate ones fully 2 mm. wide, 3-merous; lobes ovate, abruptly acute; scales (reduced leaves) decidedly acute; fruit unknown. *A. Douglasii Laricis* (Piper) M. E. Jones. On *Larix occidentalis*: Wash.—Mont.—Ida.—Ore. *Mont.*

4. ***R. cyanocarpa*** A. Nels. Stems simple or branched below, the staminate ones 2–3 cm. high, sharply 4-angled, yellowish green, the pistillate ones olive-green; staminate flowers 5–20 on the spikes; calyx-lobes usually 3, ovate, keeled; berry obovate, bluish green. On *Pinus flexilis*: Wyo.—Colo. *Mont.* Jl-S.

5. ***R. divaricata*** (Engelm.) Kuntze. Stem 5–10 cm. high and 2 mm. thick, olive-green to pale brownish; branches often spreading and recurved, only leaf-bearing; staminate flowers in 1–7-flowered spikes, 2 mm. wide; lobes ovate, acute; fruit 3–4 mm. long. *A. divaricatum* Engelm. On *Caryophyllus edulis* and *monophylla*: N.M.—Colo.—Utah—Ariz. *Son.* Au-S.

6. ***R. cryptopoda*** (Engelm.) Coville. Stout, 5–10 cm. high, 4–6 mm. thick, paniculate, much branched, brownish-yellow to olive-brown; staminate plant smaller than the pistillate one; staminate spikes compressed; flowers mostly 3-merous, 2.5–3 mm. wide; lobes ovate, acute; fruit 5 mm. long. *A. cryptopodum* and *robustum* Engelm. On *Pinus scopulorum*, *ponderosa*, *arizonica*, *Jeffreyi*, &c.: N.M.—Colo.—Ariz. *Son.*—*Mont.*

FAMILY 126. SANTALACEAE. SANDALWOOD FAMILY.

Herbs, shrubs, or trees, mostly root-parasites or saprophytes. Leaves without stipules, simple. Flowers perfect, monoecious, or dioecious, mostly greenish. Hypanthium well developed and enclosing the ovary, adnate at

least to the base. Calyx 3-6-lobed; lobes valvate. Corolla wanting. Stamens as many as the calyx-lobes, opposite and adnate at the base. Ovary 1-celled, 2-4-ovuled. Fruit a drupe or nut.

1. **COMÁNDRA** Nutt. BASTARD TOADFLAX.

Smooth sometimes parasitic perennials. Leaves alternate, mostly sessile. Flowers perfect, greenish, cymose. Hypanthium campanulate or urn-shaped, enclosing and adnate to the ovary. Calyx 5-lobed. Corolla wanting. Stamens 5, inserted at the base of the calyx-lobes; anthers 2-celled, connected to the lobes by a tuft of hairs. Fruit drupe-like or nut-like.

Flowers in corymbose cymes at the end of the stem; leaves sessile; style slender.

Leaves all linear, spreading or reflexed; hypanthium in anthesis cylindrical, constricted above.

Leaves at least those of the stem lanceolate, those of the branches narrower; hypanthium in anthesis turbinate, becoming constricted later.

Cymes 1-3-flowered on lateral peduncles; leaves short-petioled; style short.

1. **C. linearis** Rydb. Stem simple, 3-4 dm. high, angled; leaves all linear, spreading, pale, glaucous, 3-5 cm. long, 3-5 mm. (rarely 7 mm.) wide; hypanthium in flower 5-6 mm. long, 2.5-3 mm. thick; calyx-lobes linear-lanceolate, 3 mm. long; fruit ellipsoid, green. Dry soil: Utah. *Son.* *Au.*

2. **C. pallida** A.DC. Stems 2-4 dm. high, branched above, from a stout rootstock; leaves ascending, pale and glaucous, those of the stem 1-5 cm. long, 2-8 mm. wide, those of the branches much narrower; hypanthium in flower 4 cm. long; calyx-lobes lanceolate, 3 mm. long; fruit about 8 mm. long, 5-6 mm. thick, green. Sandy soil: Man.—Tex.—Ariz.—Wash.—B.C. *Son.*—*Plain*—*Submont.* *Je*—*Au.*

3. **C. livida** Richards. Stem slender, 1-3 dm. high; leaf-blades oval, thin, bright green, 1-2.5 cm. long, 6-12 mm. wide; hypanthium in flower 1.5-2 mm. long; calyx-lobes deltoid, 1 mm. long; fruit sub-globose, 6 mm. long, red. Bogs and wet places: Lab.—Vt.—Mich.—B.C.—Yukon. *Boreal.* *Je*—*Jl.*

FAMILY 127. **VALERIANACEAE.** VALERIAN FAMILY.

Annual or perennial herbs, usually heavy-scented, usually with dichotomously branched stems. Leaves opposite, entire or pinnately divided. Flowers perfect, monoecious or dioecious, in cymes. Hypanthium well developed, enclosing the ovary. Calyx of 3-5 sepals, sometimes elongating in fruit and pappus-like. Corolla tubular, funnelform, or salver-shaped; lobes 3-5, imbricate. Stamens distinct; anthers introrse. Gynoecium of 3 united carpels, 1-3-celled, but only one cell perfect; styles and sometimes also stigmas united. Fruit achene-like. Seed solitary, pendulous; endosperm usually wanting; embryo straight.

Sepals minute or wanting; fruit 3-celled, but only one seed-bearing.

Fruit laterally winged; stem not dichotomous.

Fruit wingless; stem dichotomous.

Calyx-lobes inrolled in flower, in fruit expanding and pappus-like; fruit strictly 1-celled.

1. **PLECTRITIS.**

2. **VALERIANELLA.**

3. **VALERIANA.**

1. **PLECTRITIS** DC. CORN SALAD.

Annual herbs, with simple leaves. Flowers thyrsoid-glomerate, the clusters both terminal and sessile in the upper axils. Calyx-teeth wanting. Corolla with a short tube, funnelform throat, usually bearing a descending spur, and a more or less 2-lipped limb. Ovary 3-celled, but two cells empty. Fruit 3-angular, with one angle dorsal and the other two lateral and winged.

1. **P. macroptera** (Suksd.) Rydb. Stem glabrous, 1-3 dm. high; basal leaves spatulate, 1-4 cm. long; upper leaves oblong or lanceolate; corolla pinkish, 2-3 mm. long, 2-lipped; upper lip erect, the lower one spreading; fruit pubescent, rounded on the back; wings incurved on the margins, their terminal lobes

fully as long as the beak. *Aligera macroptera* Sucksd. Sandy places: Wash.—Ida.—Utah—Ore. *Son.* Ap—Je.

2. VALERIANÉLLA (Tourn.) Hill. CORN SALAD, LAMB'S LETTUCE.

Annual herbs, with dichotomously branched stem. Leaves opposite, simple, entire or toothed, or rarely pinnatifid. Flowers perfect in head-like or corymbiform cymes. Calyx-teeth small or obsolete. Corolla funnelform; tube usually gibbous below; limb 5-toothed. Stamens 3. Ovary 3-celled, but only one ovule-bearing, the other two empty and more or less enlarged in the wingless fruit.

1. *V. Locusta* (L.) Betcke. Stem glabrous or pubescent, 2-3 dm. high; basal leaves spatulate or oblanceolate, 3-5 cm. long, entire; upper leaves oblong, sometimes denticulate; corolla blue, about 2 mm. long; fruit flattened, somewhat oval in cross-section, the two empty cells together about equalling the fertile one, the latter corky on the back. *V. olitoria* (L.) Poll. Waste places: N.Y.—Pa.—La.—Va.; Ida.; nat. from Eu. Ap—Jl.

3. VALERIÀNA (Tourn.) L. VALERIAN, TOBACCO-ROOT.

Perennial herbs, heavy-scented. Leaves opposite, entire to pinnately divided. Flowers perfect or polygamous or polygamo-dioecious. Calyx-limb at first inrolled, at last spreading, developing into 5-15 plumose bristles. Corolla funnelform or salver-shaped, 5-lobed; tube often gibbous or saccate at the base. Stamens usually 3. Ovary 1-celled; style slightly 2-3-cleft at the apex. Fruit achene-like, flattened, 1-nerved on one side and 3-nerved on the other.

Leaves thick, the lower entire or with linear entire divisions, the veining almost parallel; plants with thick fleshy taproots.

Fruit and ovaries pubescent; bracts in the staminate plant linear-lanceolate.

1. *V. edulis*.

Fruit glabrous.

Fruit scurfy, muricate or rugose.

Basal leaves oblanceolate; fruit broadly ovate; corolla of the staminate plant

2.5-3 mm. wide; root thick.

Basal leaves narrowly linear-oblanceolate; fruit narrowly ovate; corolla of

staminate flowers less than 2 mm. wide; root rather slender.

3. *V. fufurescens*.

Fruit smooth, narrowly ovate; inflorescence of staminate plant rather dense, with short branches; corolla 3-4 mm. wide.

4. *V. ceratophylla*.

Leaves thin, the cauline ones pinnate; veining distinctly pinnate; plants with rootstocks.

Bases of the stem-leaves and nodes of the stem neither ciliate nor bearded; stem finely pruinose-puberulent.

Fruit pilose; flowers perfect.

5. *V. pubicarpa*.

Fruit glabrous; plant polygamo-dioecious.

6. *V. puberulenta*.

Bases of the stem-leaves and the nodes of the stem ciliate or bearded; stem otherwise glabrous or slightly pubescent.

Ovary and fruit at least when young pubescent.

7. *V. micrantha*.

Ovary and fruit glabrous.

Basal leaf-blades ovate-cordate.

8. *V. ovata*.

Basal leaf-blades spatulate, oval or lanceolate, tapering at the base.

Corolla of the pistillate plants 2-3 mm. long and slightly wider; inflorescence in fruit elongate and narrow.

9. *V. septentrionalis*.

Corolla of the pistillate plants 3 mm. or more long; inflorescence even in fruit short, corymbiform or subcapitate.

Lateral leaflets or lobes of the stem-leaves small, linear-lanceolate, acuminate.

10. *V. acutiloba*.

Lateral leaflets of the stem-leaves ample, ovate to lanceolate, acute.

Corolla 3-4 mm. long; leaflets from entire to slightly sinuate.

11. *V. occidentalis*.

Corolla 5-8 mm. long; leaflets from sinuate to coarsely toothed.

Leaflets sinuate or sinuate-denticulate; corolla 5-6 mm. long; tube attenuate at the base.

12. *V. Scouleri*.

Leaflets coarsely sinuate-dentate; corolla 6-8 mm. long, not conspicuously narrowed below.

13. *V. sitchensis*.

1. *V. edulis* Nutt. Stem glabrous, 4-10 dm. high; basal leaves thick, oblanceolate, 1-2 dm. long, puberulent at least on the veins and margins; upper stem-leaves usually pinnatifid with linear approximate divisions, the upper bracts and the bractlets lanceolate, somewhat scarious, puberulent; corolla of the staminate flowers yellowish, 3 mm. broad; its tube obpyramidal, 1 mm. high, slightly hairy; corolla of the pistillate flowers less than 1 mm. high and broad;

fruit ovate, 4-5 mm. long. Hillsides and dry meadows: Mont.—Colo.—Utah—Ida. *Submont.*—*Subalp.* Je—Au.

2. **V. trachycarpa** Rydb. Stem glabrous or nearly so, 5-7 dm. high; basal leaves 7-18 cm. long, finely puberulent; stem-leaves 1-2 pairs, pinnatifid with linear lobes; corolla of the essentially pistillate plant 1-1.5 mm. wide; fruit not hairy, 5 mm. long, 2.5 mm. wide. Mountains: Wyo.—N.M.—Utah. *Submont.*—Mont. Jl—S.

3. **V. furfurescens** A. Nels. Stem glabrous, 5-10 dm. high; basal leaves 1-2 dm. long; stem-leaves few, entire or with a few approximate divisions; bracts linear; bractlets lanceolate; corolla of staminate flowers light yellow; stamens scarcely exerted; corolla of pistillate flowers about 0.5 mm. high and broad; fruit 3-4 mm. long, 1.5 mm. wide. Hillsides and mountains: Wyo.—Colo. *Submont.*—Mont. Jl.

4. **V. ceratophylla** (Hook.) Piper. Stem 4-8 dm. high, glabrous; basal leaves oblanceolate, puberulent on the veins and margins, 1-2 dm. long; bracts and bractlets linear or linear-lanceolate; pistillate corolla 1-1.5 mm. wide; fruit 4-5 mm. long, scarcely 2 mm. wide. *Patrinia ceratophylla* Hook. Grassy slopes and meadows: Mont.—Wyo.—Ore.—B.C. *Submont.*—Mont. My—Jl.

5. **V. pubicarpa** Rydb. Stem 2-4 dm. high; basal leaves spatulate or oblanceolate, 2-6 cm. long, glabrous or nearly so; stem-leaves 2-4 pairs, the lowest pair similar to the basal ones, the rest 3-5-foliolate, or the uppermost simple, minute; leaflets oblong or lanceolate, 2-5 cm. long, entire; inflorescence short and dense; corolla 4-6 mm. long, 4 mm. wide, pubescent; fruit 5 mm. long. Mountains: Mont.—Utah—Ida. *Submont.*—Mont. Je—Au.

6. **V. puberulenta** Rydb. Stem 1.5-3 dm. high; basal leaves spatulate, 2-5 cm. long; stem-leaves 1-3 pairs, usually 3-foliolate; terminal leaflet elliptic or oblong to lanceolate, 1-3 cm. long, the lateral ones about half as long; inflorescence of the pistillate plants corymbiform, that of the smaller staminate ones subcapitate; corolla 4-5 mm. long, 2.5-3 mm. wide; fruit nearly 5 mm. long and 2 mm. wide. Mountains: Utah. *Submont.*—Mont. Je—Au.

7. **V. micrantha** E. Nels. Stem glabrous or nearly so; basal leaves entire or with 1-2 pairs of small rounded or oblong lobes on the petioles; blades or terminal leaflets ovate or elliptic, 3-7 cm. long; cauline leaves with 5-7 elliptic to lanceolate leaflets; cyme as broad as high or broader; corolla white, the staminate ones 2-3 mm. broad and high, the pistillate barely 2 mm.; achenes narrowly ovate, 3-4 mm. long, pubescent, at least when young. Mountains: Mont.—Colo.—Utah—Ida. *Submont.*—Mont. Jl—Au.

8. **V. ovata** Rydb. Stem about 3 dm. high, glabrous; basal leaves entire, petioled, glabrous; blades ovate, usually truncate or slightly cordate at the base; stem-leaves 2-3 pairs; lateral lobes oblong to linear-lanceolate, the terminal one lanceolate or of the lower leaves elliptic; inflorescence small and corymbiform; corolla funnellform-salvershaped, about 8 mm. long; limb of the fertile flowers about 4 mm. wide, that of the staminate ones about 6 mm. wide; fruit ovate, glabrous, 4 mm. long. Wooded hillsides: Colo.—N.M. *Mont.* My—Jl.

9. **V. septentrionalis** Rydb. Stem weak and slender, 2-5 dm. high, glabrous or nearly so; basal leaves usually entire; blades spatulate or elliptic, 2-5 cm. long; stem-leaves usually 2 pairs, with 3-7 leaflets; terminal leaflet usually elliptic, twice as large as the lanceolate lateral ones; fruit 4 mm. long, 1.5 mm. wide. *V. wyomingensis* E. Nels. Hillsides and meadows: Lab.—Que.—Nev.—B.C. *Submont.*—Mont. My—Jl.

10. **V. acutiloba** Rydb. Stem of fertile plant 4-5 dm. high; basal leaves entire, 5-7 cm. long; blade spatulate or obovate, acute; stem-leaves usually 3 pairs, pinnately divided; lateral divisions lanceolate to linear, long-acuminate, the terminal one large, oblanceolate or of the upper leaves linear-lanceolate, entire or saliently toothed; cyme dense, contracted; corolla about 4.5 mm. long; fruit broadly ovate, about 4 mm. long; staminate plant lower, 3-4 dm. high, with more sterile shoots; stem-leaves usually only 2 pairs, less divided, with only 1-2 pairs of lateral divisions; cymes denser; corolla 5-6 mm. long, more

oblique, about 5 mm. wide. Mountains: Wyo.—N.M.—Utah. *Mont.*—*Alp.* Je—Au.

11. *V. occidentalis* Heller. Stem 5–8 dm. high, glabrous or sparingly puberulent; basal leaves petioled, thin, simple, elliptic or spatulate, entire, 2–8 mm. long; stem-leaves 2–4 pairs, pinnate, with 3–9 leaflets, those of the lower leaves elliptic, those of the upper narrowly lanceolate; inflorescence open; corolla white, of the pistillate flowers, 3–3.5 mm. long, 3–4 mm. broad; fruit glabrous, 5 mm. long, 2 mm. wide. Wet places in the mountains: *Mont.*—*Colo.*—*Utah*—*Wash.*—*B.C.* *Submont.*—*Mont.* Je—Au.

12. *V. Scouleri* Rydb. Stem glabrous; basal leaves simple or 3–5-foliolate; blade or terminal leaflet obovate or orbicular, the lateral ones elliptic; stem-leaves 3–7-foliolate; leaflets oval or elliptic or those of the upper leaves lanceolate; flowers usually perfect; corolla white; fruit glabrous, 6 mm. long, 2 mm. wide. Wet places: *B.C.*—*Alta.*—*Mont.*—*Ore.* *Submont.*—*Mont.* Je—Au.

13. *V. sitchensis* Bong. Stem 4–7 dm. high, glabrous or nearly so; stem-leaves 3–5-foliolate; leaflets of the lower ones broadly ovate, of the upper lanceolate, 5–8 cm. long, sparingly pilose or nearly glabrous; basal leaves similar or simple, usually none at flowering time; cyme short and corymbiform; flowers mostly perfect; fruit glabrous, 6 mm. long, 2 mm. broad. Wet places: *Alaska*—*Ore.*—*Ida.*—*Yukon.* *Submont.*—*Mont.* Jl—Au.

FAMILY 128. **ARISTOLOCHIACEAE.** BIRTHWORT FAMILY.

Perennial herbs or vines. Leaves alternate, or basal, petioled. Flowers perfect, regular or irregular. Hypanthium usually well developed, often wholly enclosing the ovary. Calyx regular or irregular, mostly of 3 sepals. Corolla wanting. Stamens 6 to many; filaments either free or adnate to the style column. Styles united; ovary 4–6-celled; ovules many in each cavity. Fruit a capsule. Seeds numerous; endosperm fleshy.

1. **ĀSARUM** (Tourn.) L. WILD GINGER.

Perennial acaulescent herbs, with elongate rootstocks. Leaves 2, basal, petioled; blades cordate or reniform. Flowers perfect, regular, solitary, on a scape arising between the leaves. Hypanthium well developed, campanulate, enclosing the ovary, angled. Sepals 3, inflexed in bud. Stamens 12, free. Ovary inferior, 6-celled; styles 6, united.

1. *A. caudatum* Lindl. Leaf-blades cordate-reniform, acutish at the apex, sparingly pubescent on the veins, 5–10 cm. broad; peduncle 1–3 cm. long; calyx-lobes lanceolate, caudate-attenuate, 2.5–5 cm. long. Woods and thickets: *B.C.*—*Ida.*—*Calif.* *Submont.*—*Mont.* Ap—Jl.

FAMILY 129. **CUCURBITACEAE.** GOURD FAMILY.

Annual or perennial succulent herbs, trailing or climbing by means of tendrils. Leaves alternate, palmately veined or lobed, usually rough-hairy. Flowers usually axillary, monoecious or dioecious. Calyx of 4–6, more or less united sepals, imbricate. Corolla of as many petals which are more or less united. Stamens 1–5, often 3, two with 2-celled and one with 1-celled anthers; filaments distinct or united; anthers extrorse, often twisted. Gynoecium of a compound pistil; ovary 1–3-celled; styles terminal, united; stigma thick, dilated, or ringed. Fruit a pepo (large fleshy or dry berry with thick rind). Seeds usually numerous, flat and horizontal; endosperm wanting; embryo straight, with thick cotyledons.

Fruit large, with a tough rind, 1-celled, with 3–5 placentae and numerous seeds; corolla large, yellow, campanulate; flowers solitary in the axils.

Fruit spiny, becoming papery and spongy, 2–3-celled; seeds few; corolla white, rotate; staminate flowers racemose or paniculate.

1. CUCURBITA.

2. MICRAMPELIS.

1. CUCÚRBITA (Tourn.) L. GOURD, PUMPKIN, SQUASH.

Annual or perennial, rough-pubescent trailing vines. Leaves petioled, lobed or entire, often cordate. Tendrils more or less branched. Flowers large, solitary in the axils of the leaves, monoecious. Hypanthium in the staminate flowers campanulate, in the pistillate ones urn-shaped. Sepals 5. Corolla yellow, campanulate, 5-lobed, the lobes recurved at the ends. Stamens 3, in the staminate flowers with distinct filaments and linear, coherent, contorted anther, in the pistillate flowers reduced to staminodia. Pistil in the former wanting, in the latter with a single ovary and 3-5 stigmas, which are 2-branched or at least 2-lobed. Pepo 1-celled, with 3-5 placentae, many-seeded, usually large, fleshy, with a tough rind. Seeds flattened.

1. *C. foetidissima* H.B.K. Perennial, with a thick, long taproot; stem trailing, 1-8 m. long; leaves with stout petioles; blades ovate-triangular or ovate, thick, canescent-scarious, truncate or cordate at the base, 1-4 dm. long, often sinuately-lobed, denticulate; hypanthium of the staminate flowers hemispheric, that of the pistillate flowers ellipsoid; corolla 6-15 cm. long, campanulate, greenish orange; fruit globose, 5-10 cm. in diameter, smooth, bitter. *C. perennis* A. Gray. Dry plains and valleys: Tex.—Neb.—Colo.—Calif.—Mex. *Plain*—*Son.* My-S.

2. MICRÁMPELIS Raf. BALSAM APPLE, MOCK APPLE.

Annual or perennial herbaceous climbing vines. Leaves petioled, membranous, 5-7-lobed. Tendrils simple or compound. Flowers monoecious, small, the staminate ones racemose or paniculate, the pistillate ones solitary or clustered in the axils of the leaves. Hypanthium of the staminate ones broadly campanulate, that of the pistillate ones urn-shaped. Sepals 5 or 6. Corolla white or greenish, rotate, 5- or 6-lobed. Stamens in the former 2 or 3 with united filaments and horizontal anthers, in the latter reduced to more or less prominent staminodia. Pistil in the former wanting, in the latter with an inferior ovary; stigmas 2- or 3-parted, or -lobed. Fruit covered with soft spines, becoming papery, spongy and fibrous within, 2- or 3-celled. Seeds few, 1-4 in each cavity, smooth, flattened, erect. [*Echinocystis* T. & G.]

1. *M. lobata* (Michx.) Greene. Annual; stem angular, nearly glabrous, climbing, 4-8 m. high; leaf-blades thin, scarious on both sides, 3-7-lobed, with triangular-lanceolate lobes, cordate at the base; staminate flowers 4-5 mm. long, numerous in compound racemes, light greenish yellow; pistillate flowers solitary or two together; fruit globose-ovoid, 4-5 cm. long, 3-4 cm. thick. *Echinocystis lobata* T. & G. Alluvial soil among bushes: Me.—Va.—Tex.—Colo.—Ida.—Sask. Jl-S.

FAMILY 130. CAMPANULACEAE. BELLFLOWER FAMILY.

Annual or perennial caulescent herbs (all ours) or rarely shrubs. Leaves without stipules, alternate, simple. Flowers perfect, racemose or spicate or solitary, terminal or axillary, regular. Hypanthium well developed, enclosing the ovary. Sepals 5, partially united, persistent. Corolla of 5 united petals, campanulate, tubular, or rotate. Stamens 5, inserted with the corolla; filaments distinct; anthers introrse. Gynoecium of 2-5 united carpels; ovary inferior or nearly inferior, 2-5-celled; styles united; stigmas with 2-5 lobes or rarely capitate. Fruit a 2-5-celled capsule, opening loculicidally or by pores. Seeds numerous, angled or flattened; endosperm fleshy; embryo straight.

Capsule opening by 2-5 lateral pores.

Corolla campanulate or funnelform; flowers all well developed; capsule turbinate.

1. CAMPANULA.

Corolla rotate; earlier flowers cleistogamous; capsule linear.

2. SPECULARIA.

Capsule thin-walled, irregularly bursting between the ribs, obpyramidal; earlier flowers cleistogamous.

3. HETEROCODON.

1. CAMPÁNULA (Tourn.) L. BELLFLOWER, HAREBELL, BLUEBELL.

Perennial (all ours with rootstocks) or sometimes annual herbs. Leaves alternate, usually more or less toothed. Flowers perfect, all alike, in racemes or panicles, rarely solitary. Sepals 5, narrow, united only at the base. Corolla campanulate or funnelform, usually blue, with 5 lobes. Stamens 5; filaments dilated at the base; anther oblong. Ovary 3-5-celled; styles united; stigmas 3-5. Capsule turbinate, obconic, or obpyramidal, opening by pores, usually formed by the uplifting of small lids, either near the apex or near the base of the capsule. Seeds smooth.

Flowers more than 1 cm. long; plant simple or with erect or ascending branches.

Style not exerted.

Capsule erect, opening by pores near the summit, just below the base of the sepals.

Hypanthium and pod club-shaped, constricted just below the sepals, often hairy; leaves entire; sepals obtuse. 1. *C. uniflora*.

Hypanthium and pod turbinate, not constricted; sepals acuminate.

Hypanthium villous; leaves saliently dentate. 2. *C. lasiocarpa*.

Hypanthium glabrous; leaves entire or minutely denticulate.

3. *C. Parryi*.

Capsule nodding, opening by pores near the base.

Sepals erect; leaves thick.

Sepals spreading or reflexed; leaves thin.

4. *C. petiolata*.

5. *C. heterodoxa*.

Style exerted.

6. *C. MacDougalii*.

Flowers 5-8 mm. long; branches divaricate; stem retrorse-hispid.

7. *C. aparinoides*.

1. ***C. uniflora*** L. Stem 1 dm. high or less, glabrous; lower leaves spatulate, 2-3 cm. long, entire or nearly so; upper leaves linear; hypanthium in fruit 1 cm. long, often pubescent; sepals lance-linear, 3 mm. long, erect, obtuse; corolla narrowly campanulate, 7-10 mm. long. Arctic-alpine situations: Greenl.—Lab.—Colo.—Utah—Alaska; Eurasia. *Subalp.—Alp.* Jl—Au.

2. ***C. lasiocarpa*** Cham. Stem 1.5 dm. high or less, 1-flowered, glabrous or slightly ciliate; lower leaves petioled, 2-4 cm. long; blades spatulate, oblanceolate, or obovate, sharply dentate, glabrous or sparingly ciliate; upper leaves linear or lance-linear; hypanthium turbinate-obconic, in fruit over 1 cm. long, more or less villous; sepals subulate, acute, 6-10 mm. long, often toothed; corolla campanulate, 15-25 mm. long. Arctic-alpine situations: Yukon—Alta.—B.C.—Alaska; Siberia and Japan. *Alp.* Jl—Au.

3. ***C. Parryi*** A. Gray. Stem 1-3 dm. high, glabrous; lower leaves spatulate or oblanceolate, callous-denticulate or entire, 2-6 cm. long, thin, ciliate on the margins, petioled; upper leaves linear or lance-linear; hypanthium turbinate-obconic, in fruit 1-1.5 cm. long, glabrous; sepals subulate, erect, 15-18 mm. long; corolla 15-20 mm. long, funnelform, cleft to near the middle; lobes ovate, acute. Mountains: Wyo.—N.M.—Ariz.—Utah. *Mont.—Subalp.* Jl—S.

4. ***C. petiolata*** A. DC. Stem 1-4 dm. high, glabrous or retrorsely short-hirsute; basal leaves long-petioled; blades ovate or ovate-cordate, 1-3 cm. long, usually longer than broad, rather thick, sinuate-dentate, with rounded or acute, but not sharp teeth; stem-leaves linear or linear-lanceolate or the upper almost filiform; hypanthium glabrous, turbinate; sepals subulate, 6-7 mm. long, ascending; corolla campanulate, 15-20 mm. long; lobes broadly ovate, acutish. *C. rotundifolia* Western authors. Hills and mountains: Mack.—S.D.—N.M.—Ariz.—w Calif.—B.C. *Plain—Subalp.* Je—S.

5. ***C. heterodoxa*** Vest. Stem 1-4 dm. high, decumbent at the base, glabrous; basal leaves long-petioled; blades small, rounded-cordate, 1-1.5 cm. long and about as broad, thin, sinuate-dentate; lower stem-leaves petioled and usually lanceolate, often broadly so, often denticulate, the upper narrowly linear; hypanthium campanulate, in fruit 8 mm. long; sepals subulate, 8-10 mm. long; corolla 15-25 mm. long, campanulate; lobes broadly ovate, 4-5 mm. long. Cliffs: Alaska—B.C. *Mont.* Je—Au.

6. ***C. MacDougalii*** Rydb. Stem slender, glabrous, about 3 dm. high; leaves very thin, the basal ones and lower stem-leaves with slender petioles 2-4 cm. long; blades broadly ovate, 2-3 cm. long, coarsely sinuate-dentate; upper stem-leaves lanceolate to linear, entire, the largest 5-6 cm. long; sepals linear-subulate,

10-12 mm. long, at last reflexed; corolla 13-15 mm. long, nearly of the same shape as that of *C. petiolata*; style exserted, straight. Woods: Ida. *Mont.* JI.

7. *C. aparinoides* Pursh. Stem filiform, 2-6 dm. high, retrorsely scabrous on the angles; leaves lanceolate or linear-lanceolate, 2-5 cm. long; hypanthium hemispheric; sepals lanceolate, 1.5-2 mm. long; corolla open-campanulate, white or tinged with blue, cleft beyond the middle, 5-8 mm. long. Wet meadows: N.B.—Ga.—Colo.—Sask. *Plain.* Je—Au.

2. *SPECULÀRIA* (Heist.) Fabricius. VENUS'S LOOKING-GLASS.

Annual or biennial herbs. Leaves alternate, sessile or clasping. Flowers of two kinds, the earlier ones cleistogamous, close-fertilized in the bud, with a calyx of 3-4 sepals and an undeveloped corolla, the latter ones with 5 sepals and a rotate or funnelform corolla. Stamens 5; filaments distinct, linear. Ovary 3-celled; stigmas 3. Capsule prismatic or cylindric, opening by pores near the top or the middle. [*Legouzia Durande.*]

Leaves cordate-clasping; capsule oblong.

1. *S. perfoliata*.

Leaves linear or linear-lanceolate; capsule linear-cylindric.

2. *S. leptocarpa*.

1. *S. perfoliata* (L.) A. DC. Stem 2-5 dm. high, retrorsely hispid on the angles, leafy; leaves round-cordate, crenate, 7-20 mm. long, clasping or the lower merely sessile; sepals of the earlier flowers 3 or 4, 2-3 mm. long, longer than the rudimentary corolla, those of the later flowers 5, lanceolate-subulate, 4-5 mm. long; corolla 7-10 mm. long, almost rotate; capsule opening at or below the middle. Hillsides and dry woods: Me.—Fla.—Ariz.—Ore.—B.C.; Mex. *Plain*—*Mont.* My—S.

2. *S. leptocarpa* (Nutt.) A. Gray. Stem erect, 1-3 dm. high, retrorsely hispidulous; leaves lanceolate or linear-lanceolate, 1-3 cm. long; sepals of the earlier flowers 3, subulate, 5 mm. long; sepals of the later flowers 5, subulate, 8-10 mm. long; corolla broadly funnelform, 6-8 mm. long; capsules opening near the apex. Dry soil: Mo.—Ark.—Tex.—Colo.—Mont. My—Jl.

3. *HETEROCÒDON* Nutt.

Slender annuals. Leaves alternate, sessile. Flowers of two kinds, the earlier cleistogamous, with rudimentary corolla. Calyx with short tube and 5 large foliaceous lobes. Corolla of the later flowers blue, 5-lobed. Capsule obovoid, 3-angled, 3-celled, many-seeded, thin and membranous, bursting irregularly on the sides. Seeds oblong, obscurely triangular.

1. *H. rariflorum* Nutt. Annual; stem slender, delicate, diffusely spreading, 1-3 dm. high; leaves orbicular, cordate-clasping, coarsely dentate, 5-10 mm. in diameter; hypanthium campanulate, hispid; sepals ovate, 2 mm. long, dentate and ciliate; corolla of the early flowers rudimentary, that of the later ones 3-6 mm. long, campanulate. Shady grassy places: B.C.—Ida.—Nev.—Calif. *Son.* My—S.

FAMILY 131. *LOBELIACEAE*. *LOBELIA* FAMILY.

Annual or perennial herbs, or in warmer climates trees. Leaves alternate, without stipules, in ours simple. Flowers perfect, rarely dioecious, irregular. Hypanthium enclosing the ovary. Calyx of 5 almost distinct sepals. Corolla 2-lipped; upper lip 2-cleft, often to or nearly to the base of the corolla; lower lip longer, less deeply 3-lobed. Stamens 5, epigynous; filaments often coherent into a tube; anthers usually united or merely connate. Gynoecium of 2-5 united carpels. Ovary single, 2-5 celled; styles terminal, wholly united; stigmas fringed. Fruit a 1-several-celled capsule or rarely a berry. Seeds numerous, smooth or furrowed; endosperm fleshy; embryo straight.

Anthers distinct, merely surrounding the pistil; stem-leaves reduced, subulate, bract-like.

1. *NEMACLADUS*.

Anthers united; stem-leaves developed.

Hypanthium cylindric or linear-clavate; pod at maturity 1-celled.

Aquatic plants with two kinds of flowers, the submerged ones cleistogamous; pod splitting on one side.

Land plants of wet situations; flowers all alike; pod splitting lengthwise by 1-3 slits, but the valves remaining united at the apex.

Hypanthium turbinate or oblong; pod 2-celled, 2-valved.

Corolla with a closed tube.

Corolla split to near the base on the upper side.

4. PORTERELLA.

5. LOBELIA.

1. NEMACLADUS Nutt.

Small annuals. Leaves alternate, small, the basal ones obovate, the cauline ones reduced, subulate, bract-like. Flowers perfect, irregular. Sepals 5, nearly distinct. Corolla bilabiate; lower lip 3-lobed; upper lip 2-parted. Stamens 5; filaments monadelphous above the middle; anthers oval, free, merely surrounding the stigma; stigma 2-lobed. Capsule 2-celled, 2-valved from the top, 20-30-seeded.

1. N. ramosissimus Nutt. Stem much branched, about 1 dm. high, glabrous or puberulent; basal leaves 1 cm. long or less; stem-leaves 1-2 mm. long; hypanthium turbinate, or hemispheric in fruit; sepals lanceolate, 1 mm. long; corolla 2 mm. long. Arid places: s Calif.—s Utah—Ariz.—L. Calif. *Son.* Ap-Jl.

2. HOWELLIA A. Gray.

Aquatic annual herbs. Leaves alternate, the submerged ones setaceous, the emerged ones narrow, entire. Flowers of two kind, the submerged ones cleistogamous. Hypanthium linear or linear-clavate. Sepals 5, nearly distinct, narrow and subequal. Corolla of the emerged flowers with its short tube split almost to the base on the upper side; lobes nearly equal. Stamens monadelphous; tube nearly free from the corolla; anthers oval, the two smaller with 3 bristles, the three larger naked. Ovary 1-celled, with 2 filiform parietal placentae. Capsule membranous, bursting irregularly on one side. Seeds few, smooth.

1. H. aquatilis A. Gray. Submerged aquatic, with only the end of the stem emerged; submerged leaves alternate or verticillate, flaccid, filiform, 1-5 cm. long, less than 1 mm. wide; emerged leaves lance-linear, often toothed; sepals linear-subulate, 2 mm. long; corolla of the submerged flowers rudimentary, that of the emerged flowers 1.5-2 mm. long; fruit 12-15 mm. long. Lakes and ponds: Ore.—Ida. *Submont.* My-Jl.

3. BOLELIA Raf.

Glabrous annuals. Leaves alternate, sessile, narrow, entire. Flowers perfect, axillary, sessile. Hypanthium linear-cylindric, usually twisted. Sepals foliaceous, 5, nearly distinct. Corolla with a short, entire tube, 2-lipped; upper lip with 2 narrow, spreading or reflexed lobes; lower lip very broad, 3-lobed, spreading. Filaments and anthers wholly united; two of the anthers bristle-tipped. Capsule long and slender, early becoming 1-celled, with 2 parietal placentae, opening by 1-3 long slits, but valves remaining united at the apex. Seeds numerous. [*Downingia* Torr.]

Corolla scarcely exceeding the obtuse sepals; stamens shorter than the sepals.

Corolla and stamens much exceeding the acute sepals.

1. *B. brachyantha*.

2. *B. elegans*.

1. B. brachyantha Rydb. Stem 1-3 dm. high, branched from the base; leaves oblong-lanceolate, 5-10 mm. long, thick and somewhat fleshy; sepals linear or oblong-linear, about 5 mm. long; corolla scarcely exceeding the calyx; stamens shorter than the sepals; fruit about 3 cm. long. *Downingia brachyantha* Nels. & Macbr. In water: Mont.—Ida.—Nev.—Ore. *Submont.* Je-Au.

2. B. elegans (Dougl.) Greene. Stem simple or branched below, 5-30 cm. high, glabrous; leaves lanceolate, 1-3 cm. long, fleshy; sepals linear, 6-7 mm. long; corolla 8-10 mm. long; fruit 3-4 cm. long. *D. elegans* Torr. In water: B.C.—Ida.—Nev.—Calif. *Submont.* Je-Au.

4. PORTERELLA Torr.

Small diffuse or creeping annuals or perennials (?). Leaves alternate, narrow, entire. Flowers perfect, axillary. Hypanthium oblong-clavate. Sepals 5, narrow, almost distinct. Corolla with a long closed tube, not split; upper lip

erect, 2-cleft; lower lip larger, 3-cleft and widely spreading. Filaments and anthers completely united; two of the anthers with minute bristle-tufts. Capsule 2-celled, 2-valved. Seeds many, somewhat fusiform.

Pedicels longer than the floral leaves.
Pedicels shorter than the floral leaves.

1. *P. carnosula*.
2. *P. eximia*.

1. ***P. carnosula*** (H. & A.) Torr. Stem glabrous, branched, 2–25 cm. high; leaves fleshy, lanceolate, entire, sessile, 5–15 mm. long; pedicels 7–15 mm. long; sepals linear, 3–5 mm. long; corolla 8–10 mm., blue, with yellow throat; fruit 8–10 mm. long. *Laurentia carnosula* H. & A. Mud: Mont.—Wyo.—Calif. Je—Au.

2. ***P. eximia*** A. Nels. Perennial (?); stem about 1 dm. high, glabrous; leaves lanceolate or lance-linear, long-acuminate, 15–25 mm. long; pedicels short, 4–7 mm. long; sepals linear, 3–6 mm. long, obtusish; corolla deep blue with only the folds at the sinuses of the lip yellow, 8–12 mm. long. *L. eximia* A. Nels. Muddy shores: w Wyo. Mont. Au.

5. **LOBELIA** (Plum.) L. LOBELIA, CARDINAL-FLOWER.

Terrestrial herbs with leafy stems, or aquatic ones with long scapes. Leaves alternate, or in the aquatic species mostly basal. Flowers perfect, in spikes, racemes, or panicles. Hypanthium short, oblong to turbinate. Sepals 5, practically distinct. Corolla split to or nearly to the base on the upper side; upper two lobes narrow, spreading or reflexed, the lower 3 lobes united to a broad spreading lip. Stamens 5; filaments monadelphous, free from the corolla; anthers united, two or all bearded at the apex. Ovary 2-celled; stigmas 2-lobed. Capsule 2-valved. Seeds many.

Corolla red.

Leaves oblong-ovate to ovate-lanceolate.
Leaves narrowly lanceolate to linear.

1. *L. cardinalis*.
2. *L. splendens*.

Corolla blue or whitish.

Corolla 2–2.5 cm. long.
Corolla less than 1 cm. long.

3. *L. syphilitica*.

Stem leafy.

Stem-leaves spatulate or oblanceolate; raceme many-flowered; plant puberulent.

4. *L. hirtella*.

Stem-leaves linear or linear-oblanceolate; racemes few-flowered; stem and leaves glabrous.

5. *L. strictiflora*.

Stem scapiform; leaves all in a basal rosette, usually submerged.

6. *L. Dortmanna*.

1. ***L. cardinalis*** L. Perennial by means of slender offsets; stem 5–12 dm. high, glabrous or nearly so; leaves irregularly serrate or serrulate; hypanthium hemispheric, 3 mm. long; sepals subulate, about 1 cm. long; corolla red or crimson, rarely rose-colored, 3–4 cm. long. Wet ground: N.B.—Fla.—Tex.—Colo.—Sask. Plain. Jl–O.

2. ***L. splendens*** Willd. Perennial, with slender offsets; stem 3–10 dm. high; glabrous or minutely puberulent; leaves denticulate; sepals subulate, about 8 mm. long; corolla crimson, 2–2.5 cm. long. Wet places: Tex.—Utah—Calif.; Mex. Son. Jl–S.

3. ***L. syphilitica*** L. Perennial with offsets; stem glabrous or with scattered hairs, 5–10 dm. high; leaves thin, lanceolate or oblong, sinuate-dentate, 5–15 cm. long, more or less puberulent; raceme spike-like; sepals subulate, about 1 cm. long, ciliate, with auricles in the sinuses; corolla 2–2.5 cm. long, with thick tube; hypanthium hemispheric. Wet places: Me.—Ga.—La.—Colo.—S.D. Plain. Au–O.

4. ***L. hirtella*** (A. Gray) Greene. Perennial, with offsets; stem simple, 2–4 dm. high, finely short-pilose; lower leaves spatulate or obovate, often sinuate-denticulate, 2–4 cm. long, puberulent; bracts, pedicels, hypanthium, and calyx hirsutulous; hypanthium turbinate, 2 mm. long; sepals 4 mm. long, subulate, minutely auricled at the sinuses; corolla light blue, 7–8 mm. long. *L. spicata hirtella*. Hills and prairies: Minn.—Ia.—Kans.—Sask. Jl–Au.

5. *L. strictiflora* (Rydb.) Lunell. Biennial; stem slender, glabrous or puberulent at the base, 1-3 dm. high, simple or with a few erect branches; basal leaves petioled; blades spatulate or oblanceolate, puberulent or glabrate; pedicels erect, 5-8 mm. long, usually glabrous, sometimes glandular-pilose; hypanthium turbinate, 2-3 mm. long; sepals subulate, 3 mm. long; corolla 7-8 mm. long. *L. Kalmii strictiflora* Rydb. Meadows and bogs: Man.—N.D.—Mont.—Wash.—B.C. *Submont.* JI-Au.

6. *L. Dortmanna* L. Acaulescent perennial; leaves all basal, tufted, linear, fleshy, terete, fistulose, with two longitudinal tubes, 1-5 cm. long; scape 1-4 dm. high, simple; hypanthium turbinate, in fruit clavate; sepals lanceolate, 2-3 mm. long; corolla blue, 12-15 mm. long. In water: Lab.—N.J.—Wash.—B.C.; Eu. *Subarctic.* JI-Au.

FAMILY 132. **DIPSACEAE.** TEASEL FAMILY.

Herbs, with opposite or rarely whorled leaves. Flowers perfect, in involucre heads, each usually with an involucre. Calyx cup-like or of several bristles. Corolla gamopetalous, tubular-funnelform, with 2-5-lobed limb. Stamens 2-4, adnate to the upper part of the corolla-tube; filaments distinct; anthers versatile, opening lengthwise. Gynoecium of a single carpel; ovary inferior, 1-celled; style elongate, entire; stigma globose to elongate. Fruit an achene; embryo straight; endosperm fleshy.

1. DIPSACUS L. TEASEL.

Coarse herbs. Leaves opposite, coarsely toothed or pinnatifid. Involucral bracts and paleae of the receptacle rigid. Involucre calyx-like, enclosing the ovary. Calyx cup-shaped or 4-lobed. Corolla 4-lobed, slightly irregular, blue or white. Stamens 4. Achenes 8-ribbed.

1. *D. sylvestris* Huds. Coarse biennial herb, armed with stout prickles; stem 1-2.5 m. high; basal leaves oblanceolate, crenate-serrate, 2-4 dm. long; stem-leaves lanceolate, entire, sparingly spiny on the margins, clasping; heads ovoid, 5-6 cm. long; bracts linear-lanceolate; paleae with a long straight spine-point; corolla 10-13 mm. long, white, with lilac lobes. Waste places and fields: Me.—Va.—Mich.; Colo.—Utah; adv. or nat. from Eu. JI-S.

FAMILY 133. **AMBROSIACEAE.** RAGWEED FAMILY.

Annual or perennial herbs, rarely shrubs, monoecious or dioecious. Leaves alternate, or opposite on the lower part of the stem. Flowers in small heads, the staminate and pistillate ones in the same head or in different heads. Involucral bracts few, distinct or more or less united. Pistillate flowers, when in distinct heads usually enclosed in a bur-like or nut-like involucre. Staminate flowers with tubular, obconic, or funnelform corollas, 4-5-lobed; pistillate flowers corolla-less or with a small border or crown. Calyx none or rudimentary. Ovary inferior. Stamens 5, distinct. Stigmas 2, hairy at the top. Ovules and seeds solitary.

Staminate and pistillate flowers in the same heads, the latter few (rarely solitary or none), marginal.

Achenes turgid, obovoid or pear-shaped, marginless.

Involucres of 5 dilated-ovate, rigidly acuminate bracts; achenes with a large terminal areola, surrounded by a disk.

Involucres not with dilated rigidly acuminate bracts; terminal areola minute.

Heads paniculate; corolla of the pistillate flowers rudimentary or none.

Heads spicately or racemously disposed; corolla of the pistillate flowers evident.

Achenes flattened, wing-margined; involucre of 5 ovate or oblong herbaceous bracts and within them 1-2 large scarious ones subtending the pistillate flowers.

4. **DICORIA.**

Staminate and pistillate flowers in different heads, the latter 1-4, without corolla and enclosed in a nut-like or bur-like involucre.

Involucres of the staminate heads with united bracts; receptacles low; rudimentary styles penicillate or fimbriate at the apex.

Involucres of the solitary pistillate flower with 9-12 dilated scarious wings; anther-tips blunt. 5. HYMENOCLEA.

Involucres of the 1-4-flowered pistillate heads not winged, but usually armed with spines or tubercles; anther setiferous-acuminate.

Spines or tubercles of the 1-flowered pistillate heads in a single row.

Spines of the 1-4-flowered pistillate heads in more than one row. 6. AMBROSIA.

Involucres of the staminate heads with distinct bracts; receptacle cylindraceous; spines of the 2-flowered pistillate heads in several rows, uncinat. 7. FRANSERIA.

8. XANTHIUM.

1. OXYTÈNIA Nutt.

Small shrubs. Heads small; involucres of 5 coriaceous-herbaceous, dilated, ovate, rigidly acuminate bracts. Receptacle convex. Staminate flowers 10-20, villous at the base, subtended by slender paleae, or these wanting in the central flowers; pistillate flowers 5, without a trace of corolla. Achenes obovate-turgid, very villous. Pappus none or of a single minute scale.

1. *O. acerosa* Nutt. Shrub 1-2 m. high, canescent; branches erect, often leafless and rush-like; leaves alternate, pinnately 3-7-parted, with filiform divisions, 3-12 cm. long, or the upper entire and filiform; heads numerous, in dense panicles, about 4 mm. high; bracts ovate, mucronate, canescent. Dry plains and cañons: sw Colo.—N.M.—se Calif. Son. Au.

2. CYCLACHAËNA Fresen. HORSEWEED, CARELESS WEED.

Annual herbs, with mostly opposite petioled leaves. Heads paniculate, not leafy-bracteate. Involucres of 5 obovate bracts. Receptacle chaffy, the paleae subtending the pistillate flowers broad, nearly as large as the bracts, partly embracing the achenes. Fertile flowers 5, marginal, their corollas none or rudimentary. Staminate flowers 10-15, with funnelliform corollas. Filaments monadelphous. Achenes pyriform, without pappus.

1. *C. xanthifolia* (Nutt.) Fresen. Stem 1-2 m. high, puberulent above; leaf-blades ovate or ovate-lanceolate, cuneate to subcordate at the base, 5-10 cm. long, canescent beneath, scabrous above; heads 4-5 mm. broad, hemispheric; bracts ovate. *Iva xanthifolia* Nutt. Waste places and along streams: Sask.—Mich.—Neb.—N.M.—Wash.—Alta. Plain—Submont. Jl-S.

3. ÌVA L. MARSH ELDER, BOZZLEWEED, SALT SAGE, POVERTY WEED.

Annual or perennial herbs, or shrubs. Leaves opposite or alternate above, glabrous or coarsely pubescent. Heads axillary or in terminal bracteate spikes. Involucres campanulate or hemispheric, or turbinate; bracts 3-6, distinct or partially united. Pistillate flowers 1-8, marginal; corolla a short truncate tube. Disk-flowers perfect but sterile, with funnelliform, 5-lobed corollas. Anthers entire at the base, mucronate above. Achenes broadest above the middle, without pappus.

1. *I. axillaris* Pursh. Perennial, suffrutescent at the base; stems much branched, 2-6 dm. high, sparingly hirsute or glabrate; leaves sessile, entire, obovate, oblong, or linear-oblong, 1-3 cm. long, fleshy, pubescent or glabrate, the upper alternate; heads axillary, 4-5 mm. broad, hemispheric; bracts of the involucres 4-5, connate at least at the base; pistillate flowers 4-5; staminate flowers 12-15. Alkaline or saline meadows: Man.—Okla.—N.M.—Calif.—B.C. Plain—Submont. My-S.

4. DICÒRIA T. & G.

Branched annuals. Lower leaves opposite, the upper alternate. Involucre of 5, oval or oblong, herbaceous bracts; within these 1 or 2 large, broad, thin-scarious paleae subtending the 1 or 2 pistillate flowers, or these lacking when the heads are wholly staminate. Staminate flowers 6-12, with rudimentary pistils, subtended by a few narrow, hyaline paleae; corollas of the staminate flowers

obconic. Filaments monadelphous. Corolla of the pistillate flowers wanting. Achenes oblong, flat on the inside, convex or angled on the outside, with thin-scarious, pectinately dentate wings. Pappus rudimentary, of a few small bristle-like scales.

Upper leaf-blades broadly spatulate, ovate, or roundish.

Inner bracts 10–15 mm. long; achenes with pectinate margins. 1. *D. Wetherillii*.

Inner bracts 6–8 mm. long; achenes with continuous erose margins. 2. *D. canescens*.

Leaves all oblong-lanceolate to linear.

Fertile flowers solitary in the heads; teeth of the achenes connected by a scarious margin. 3. *D. Brandegei*.

Fertile flowers 2 in each head; achenes without scarious margins. 4. *D. paniculata*.

1. *D. Wetherillii* Eastw. Stems strigose; leaves spatulate, hirsute-canescenscent with appressed hairs; staminate flowers several, longer than the outer bracts; pistillate flowers usually 2; inner bracts hood-shaped, enclosing the achenes, 10–15 mm. long, 10 mm. broad, intricately veined, pitted, glandular-hairy; achenes oblong, mottled with brown, sparingly glandular. Sandy places: s Utah. *L. Son.*

2. *D. canescens* T. & G. Stem intricately branched, 3–10 dm. high, hispidulous; lower leaves opposite, lanceolate or oblong, coarsely toothed, the upper alternate, round-ovate or orbicular, white with appressed pubescence, 1–3 cm. long, crenate; fertile flowers 2; inner bracts petaloid, orbicular, concave; staminate flowers many. Desert washes: se Calif.—Ariz.—s Utah. *L. Son.*

3. *D. Brandegei* A. Gray. Stem diffusely branched, 3–10 dm. high, canescenscent-hispid; leaves petioled; blades 1–5 cm. long, strigose-canescenscent, sinuate-denticulate; heads few, some wholly staminate; fertile flowers solitary; inner bracts dilated-cuneate, rather small. Sandy bottoms: s Colo.—s Utah—Ariz. *Son. Au.*

4. *D. paniculata* Eastw. Stem 3–5 dm. high, branched from the base, hispid-canescenscent; leaf-blades sparingly dentate or entire, 1–2 cm. long; heads numerous, paniculate; inner bracts large, truncate or obcordate, suborbicular, glandular-ciliate; fertile flowers 2; achenes obovate, 6 mm. long, dark brown, dentate with horny teeth; staminate flowers 9–10. Sandy flats: sw Colo.—se Utah. *Son.*

5. HYMENOCLEA T. & G.

Low shrubs. Heads unisexual, monoecious. Involucres of the staminate heads saucer-shaped, of 4–6 more or less united bracts; paleae of the receptacle subtending the outer flowers obovate or spatulate, those of the inner flowers filiform or none. Filaments distinct; anther-tips blunt; the abortive styles with dilated fimbriate or penicillate tips. Involucres of the 1-flowered pistillate heads ovoid or fusiform, beaked, with 9–12 dilated and silvery-scarious persistent transverse wings on the lower portion.

1. *H. Salsola* T. & G. Low shrubs, much branched, puberulent; leaves alternate, linear-filiform, 1–5 cm. long; heads numerous, paniculate; staminate heads hemispheric, 5 mm. broad, many-flowered; bracts of the pistillate involucre spirally arranged, imbricate, when dry spreading, suborbicular, 6–8 mm. broad, silvery-scarious. Saline soil: s Calif.—Nev.—s Utah—Ariz. *L. Son.*

6. AMBRÒSIA (Tourn.) L. RAGWEED, ROMAN WORMWOOD, BITTER-WEED.

Annual or perennial, often more or less woody, caulescent herbs, mostly monoecious, rarely dioecious. Leaves opposite or alternate, usually much divided, or rarely merely toothed. Staminate heads in terminal spikes or racemes. Involucres saucer-shaped or hemispheric, with 5–12 partly united bracts; receptacle naked or with filiform paleae. Corollas funnelform, 5-lobed. Anthers mucronate at the apex; style rudimentary, brush-like at the apex. Pistillate involucres enclosing the single flower, turbinate or subglobose, with several tubercles or spines in a single series. Corolla wanting. Stigmas filiform. Achenes ovoid or obovoid; pappus wanting.

Involucres of the staminate heads 3-ribbed; leaves palmately 3-5-cleft or entire.

1. *A. trifida*.
Involucres of the staminate heads not ribbed; leaves once to thrice pinnatifid.

Annual; fruit with acute teeth.

Leaves thin, not strongly veined, bipinnatifid.

Leaves thick, strongly veined, pinnate with broad toothed or cleft segments.

Perennial with rootstock; fruit with unarmed or blunt tubercles.

2. *A. elatior*.

3. *A. media*.

4. *A. psilostachya*.

1. *A. trifida* L. Annual; stem 1-5 m. high, more or less hispid; leaves petioled; blades scabrous on both sides, ovate in outline, 3-5-cleft or entire, serrate, acute or acuminate; sterile racemes many; heads nodding; involucre 3-ribbed on the back, slightly hispidulous or glabrous; fruit 6-7 mm. long, turbinate, 3-5-ribbed, with as many conical tubercles. Moist and waste places: Que.—Fla.—Colo.—B.C. *Plain*. JI-O.

2. *A. elatior* L. Annual; stem 3-10 dm. high, strigose and ciliate; leaves with ciliate petioles, thin, hispidulous or glabrate above, more or less grayish-strigose beneath, bipinnatifid, with lanceolate, acute divisions; staminate heads nodding, oblique, about 3 mm. broad, puberulent or in the western form more ciliate-pilose; fruit obovoid; body slightly pubescent or glabrate, 2.5-3 mm. long, with 5-7 sharp spines about 0.5 mm. long; beak 1-1.5 mm. *A. artemisiifolia* A. Gray, not L. Waste places: N.S.—Va.—Colo.—Wash.—B.C. *Plain*—*Submont.* Au-O.

3. *A. media* Rydb. Annual; stem 4-6 dm. high, hispid and strigose; leaves pinnatifid, or the upper merely cleft, 5-10 cm. long, scabrous above, hispid-strigose beneath; divisions lanceolate, the lower lobed or toothed; staminate heads numerous; involucre 5-lobed and crenulate, 4-5 mm. broad, hispid-strigose; fruit obovoid; body 3 mm. long, puberulent; beak 1 mm. long, pubescent; spines 5-7, sharp, subulate, 0.5 mm. long. Dry places: S.D.—Kans.—N.M.—Nev.—Wash. *Plain*—*Submont.* JI-O.

4. *A. psilostachya* DC. Stem 3-8 dm. high, canescent-strigose; leaves sessile or the lower with short broadly-winged petioles, grayish-strigose on both sides, thick and strongly veined, pinnatifid; divisions entire, toothed or cleft, lanceolate, acute; staminate heads nodding, oblique, 3 mm. wide; fruit round-elliptic; body pubescent, 3-3.5 mm. long, usually unarmed, sometimes with obtuse tubercles. *A. coronopifolia* T. & G. Prairies and plains: Ill.—Sask.—La.—Calif.—Ida. *Plain*—*Submont.* JI-O.

7. FRANSERIA Cav.

Annual or perennial herbs, rarely shrubby, resembling *Ambrosia*. Leaves mostly alternate, lobed or pinnatifid. Heads monoecious, the staminate ones in terminal racemes or spikes. Involucres hemispheric, open, with 5-12 more or less united bracts; receptacle chaffy. Corollas short, 5-lobed. Anthers scarcely coherent. Styles rudimentary, simple. Pistillate heads solitary or in small clusters below the staminate or rarely mixed with them. Involucres closed, globose or ovoid, beaked, enclosing 1-4 pistils, with several processes in more than one series, becoming bur-like at maturity. Stigmas 2. Achenes obovoid. [*Gaertneria* Medic.]

Fruit not villous.

Spines of the fruit flat, never hooked.

Plant shrubby; leaves silvery white; pistillate heads mostly 2-flowered and 2-beaked.

Plant annual; leaves strigose, not white; pistillate heads 1-flowered and 1-beaked.

Leaves bi- or tri-pinnatifid.

Leaves pinnately 3-5-cleft.

Spines terete, usually more or less curved.

Bur 1-beaked, 1-2-flowered; leaves not tomentose beneath.

Annual; divisions of the leaves oblong or linear-oblong, acute.

Perennial with a suffrutescent base; leaf-segments linear, obtuse.

Bur 2-beaked, 2-flowered; leaves tomentose beneath; plants perennial with a rootstock.

Leaves interruptedly pinnatifid, with lobed or coarsely toothed divisions.

6. *F. discolor*.

5. *F. linearis*.

4. *F. tenuifolia*.

Leaves pinnately 3-5-parted or entire; divisions or blades merely serrulate or entire.

Fruit villous; stem shrubby.

7. *F. tomentosa*.
8. *F. eriocentra*.

1. ***F. albicaulis*** Torr. Low shrub, often spinescent, divaricately branched, with white bark, 3-10 dm. high; leaves pinnate or bipinnate, silvery white; segments small, obovate, usually toothed; spike solitary; pistillate heads often mixed with the staminate ones, the latter about 4 mm. broad; involucre canescent, lobed to the middle; fruit about 8 mm. long; spines flattened, subulate, spreading or recurved in age. Desert regions: s Utah—Nev.—Calif.—Ariz.; n Mex. *L. Son.* Mr—My.

2. ***F. acanthocarpa*** (Hook.) Coville. Annual; stem erect, diffusely branched, 3-6 dm. high, hirsute or hispid, with white hairs; leaves petioled or the upper sessile, bi- or tri-pinnatifid; divisions or their lobes oblong, elliptic or linear, hispid-strigose on both sides or glabrate above; staminate heads nodding, about 3 mm. broad; involucre dark brown with 3 blackish ribs, cleft beyond the middle into 6-7 oval lobes; fertile heads 1-flowered; fruit 12-20 mm. long, with 7-12 flattened lance-subulate divergent spines. *F. Hookeriana* Nutt. *Gaertneria acanthocarpa* Britton. Plains and sandy valleys: Sask.—Mo.—Tex.—Calif.—B.C. *Son.*—*Submont.* Jl—O.

3. ***F. montana*** Nutt. Annual; stem 3-6 dm. high, strigose or hispidulous, angled, branched; leaves petioled, ovate in outline, pinnately 3-5-divided, hispidulous-strigose on both sides; divisions ovate or obovate, or the terminal one rhombic, often 2-3-cleft and round-lobed; staminate heads similar to those of the preceding, but the involucre scarcely cleft to the middle; fruit similar but 1 cm. long or less, and spines more crowded. Sandy places: Utah—Ore.—se Calif. *Son.* Au—O.

4. ***F. tenuifolia*** Harv. & Gray. Perennial; stem 3-15 dm. high, pubescent or nearly glabrous; leaves bi- or tri-pinnatifid into oblong or linear divisions, strigose; staminate heads about 4 mm. broad; involucre pilose, lobed to near the middle; bur 1-2-flowered, but with a single beak, glandular-puberulent and with a depression above each hooked spine. Valleys: Tex.—Colo.—s Calif.; Mex. *Son.* My—N.

5. ***F. linearis*** Rydb. Perennial, shrubby at base; stems about 2 dm. high, sparingly hirsute, branched; leaves once or twice pinnate, 3-4 cm. long, strigose above, minutely tomentulose beneath; lobes linear, obtuse, 3-5 mm. long; staminate heads nodding, 3-4 mm. wide; involucre strigose, cleft scarcely half-ways into rounded-ovate lobes; pistillate involucre with few hooked slender spines. *G. linearis* Rydb. Dry plains: Colo. *Submont.* Jl.

6. ***F. discolor*** Nutt. Perennial with a rootstock; stem 2-4 dm. high, sparingly pubescent; leaves petioled, interruptedly pinnatifid, strigose above, white-tomentose beneath; larger division oblanceolate, cleft and with triangular teeth; staminate racemes usually solitary; heads about 5 mm. wide; involucre finely pubescent, with 5-8 short, lobes; pistillate heads 2-flowered; fruit ovoid, 4-5 mm. long; spines short, with conic bases and usually slightly curved tips; beaks 2, short, hooked at the apex. *Gaertneria tomentosa* (Nutt.) Heller. Dry soil: S.D.—Kans.—Ariz.—Wyo. *Plain*—*Submont.* Jl—Au.

7. ***F. tomentosa*** A. Gray. Perennial; stem 3-10 dm. high, strict, purplish, somewhat tomentose or glabrate below; leaves pinnately 3-5-parted or entire, white-tomentose on both sides or grayish above; blades or divisions lanceolate-serrate; staminate racemes paniculate; heads about 4-5 mm. broad; involucre tomentose, round-lobed; bur 6-8 mm. long, glandular-puberulent, 2-flowered, 2-beaked, with terete hooked spines. *Gaertneria Grayi* A. Nels. River bottoms: Neb.—Kans.—Colo. *Plain.* Au—S.

8. ***F. eriocentra*** A. Gray. Low shrub, with gray bark, minutely tomentose; leaves 2-4 cm. long, oblanceolate or cuneate-oblong, soon glabrate above, white-tomentulose beneath, coarsely sinuately toothed or lobed; staminate heads few, in short, terminal racemes, 6-7 mm. broad; involucre canescent, with triangular lobes; fruit about 1 cm. long, the beak equalling the body; spines slender, slightly

flattened, villous-pubescent. Desert regions: s Utah—Nev.—Ariz.—Calif. *Son.* Ap—Je.

8. *XANTHIUM* L. COCKLEBUR; CLOTBUR.

Annual (all ours) or perennial herbs, monoecious. Leaves alternate, with toothed or lobed blades. Staminate heads in terminal spikes or racemes; involucre of several distinct bracts, in 1-3 series; receptacle chaffy; corolla tubular, 5-lobed; filaments monadelphous; anthers free, mucronate; styles rudimentary, simple. Pistillate heads axillary; involucre closed, 1-3-beaked, usually 2-beaked, oblong or ovoid, with usually many spines; flowers 1-3, mostly 2; corolla wanting; stigmas 2; pappus none.

Spines of the fruit about 20.

Spines of the fruit 50-200.

Bur and its spines merely puberulent or glandular, only slightly if at all hispid.

Bur and especially its numerous spines very hispid as well as glandular.

Prickles of the bur very numerous and dense, brownish-pubescent.

Prickles of the bur fewer, scattered, yellowish-pubescent.

Body of the bur oval or ovate, not twice as long as broad.

Body of the bur oblong, twice as long as thick, densely spiny.

Bur about 2 cm. long; spines not longer than the width of the body.

Bur 2.5-3 cm. long; spines much longer than the width of the body.

1. *X. oligocanthum*.

2. *X. pennsylvanicum*.

3. *X. echinatum*.

4. *X. glanduliferum*.

5. *X. commune*.

6. *X. speciosum*.

1. *X. oligocanthum* Piper. Stem erect or spreading, 3-4 dm. long, sparsely hispid; leaf-blades reniform-orbicular to rounded-ovate, sinuately lobed, scabrous on both sides; fruit oblong; body glandular-hispid, 1.5-2.5 cm. long, 6-8 mm. thick; spines 15-25, hooked at the apex, glandular-hispid to the middle; beaks elongate-conic, curved only at the very apex. Fields and lake-banks: Wash.—Colo. *Plain*—*Submont.* S.

2. *X. pennsylvanicum* Wallr. Stem 3-10 dm. high, glabrous below, rough above; leaf-blades thick, roughish, ovate, more or less distinctly 3-5-lobed, with broad blunt teeth; fruit puberulent and glandular, oblong, 15-20 mm. long, 5-8 mm. thick; spines 3-4 mm. long, puberulent below; beaks stout, incurved and hooked, 6-7 mm. long. *X. canadense* Mill., in part. Waste places: Que.—Mass.—Va.—Colo. *Plain.* Au—O.

3. *X. echinatum* Murr. Stem 3-6 dm. high, rough, purple-blotched; leaves sinuately-lobed, firm, scabrous; fruits usually clustered, ovoid or oval, 15-20 mm. long, 8-12 mm. thick, glandular; prickles about 5 mm. long, about equalling the thick, conical, hispid beaks. Valleys and river banks: N.S.—N.C.—Colo.—N.D. *Plain*—*Submont.* Au—O.

4. *X. glanduliferum* Greene. Stem 3-6 dm. high, rough and angled, sometimes purplish; leaves very thick and very scabrous, sinuately lobed and dentate, with triangular teeth; fruit broadly ellipsoid, 10-15 mm. long, 6-9 mm. thick, yellow; prickles 3-4 mm. long; beak very stout, conic, 4-5 mm. long. Valleys, especially in alkaline soil: Sask.—Mo.—Neb.—Calif.—B.C. *Plain.* Au—S.

5. *X. commune* Britton. Stem rather slender, 3-8 dm. high, roughish; leaf-blades broadly ovate, more or less sinuately lobed and dentate, scabrous, especially above; fruit oblong, 15-25 mm. long, 7-12 mm. thick; prickles 4-5 mm. long; beaks slightly incurved and hooked, about 5 mm. long. Waste places, valleys, and marshes: Que.—Va.—Tex.—Ariz.—Alta. *Plain*—*Submont.* Au—O.

6. *X. speciosum* Kearney. Stem stout, 8-15 dm. high, angled above, scabrous; leaf-blades usually distinctly 3-5-lobed and dentate, very scabrous on both sides; fruit large, 25 mm. long or more; prickles 8-10 mm. long; beaks 10-12 mm. long, somewhat incurved, strongly hooked. Waste places and valleys: N.Y. (introduced ?)—Wis.—Mo.—Tex.—Ida.—Wash. Au—O.

FAMILY 134. **CARDUACEAE.** THISTLE FAMILY.

Herbs or shrubs, in the tropics sometimes trees. Leaves various, without stipules. Flowers aggregate in heads, inserted on a common receptacle and surrounded by an involucre of distinct or partly united bracts, in one or several series, the disk-flowers in the center, (*i. e.*, all except those of the marginal series) or all flowers hermaphrodite or by the abortion of the pistil staminate, very rarely pistillate, the ray-flowers or marginal flowers pistillate or neutral. Plants sometimes dioecious or monoecious. Calyx reduced to a pappus consisting of bristles, awns, scales, or a cup-like crown, or wanting. Corolla of the disk flowers usually tubular or trumpet-shaped, 5- (rarely 4-) lobed or -toothed; that of the ray-flowers usually with a limb cleft on one side and drawn out into strap-shaped or oblong, usually 3-5-toothed ligule. When the ray-flowers are present, the head is said to be radiate, or when they are wanting, discoid. Androecium of 5 stamens; filaments more or less adnate to the corolla-tube; anthers more or less united into a ring (syngeneis); except in *Kuhnia*. Gynoecium 2-carpellary, but with a single ovule and seed; style single; branches in of the fertile flowers 2, often appendaged. Fruit an achene. Endosperm wanting. [COMPOSITAE.]

Anther-sacs not tailed at the base.

Stigmatic lines at the base of the style-branches or below the middle; heads always discoid, never yellow or brown.

Style-branches filiform or subulate, hispidulous. Tribe 1. VERNONIEAE.

Style-branches more or less clavate, papillose-puberulent.

Tribe 2. EUPATORIEAE.

Stigmatic lines extending to the tips of the style-branches or to the appendage thereof, if present; heads most commonly radiate and with yellow or brown disk-flowers.

Style-branches of the perfect flowers with more or less distinct appendages, these usually strongly hairy outside, glabrous inside, but never with a ring of longer hairs.

Tribe 3. ASTEREAE.

Style-branches of the perfect flowers without appendages, or if with appendages, these hairy on both sides and with a ring of longer hairs.

Pappus never capillary; style-branches rarely appendaged.

Bracts of the involucre herbaceous or foliaceous.

Receptacle with chaffy paleae subtending the flowers.

Tribe 6. HELIANTHEAE.

Receptacle naked, or in *Gaillardia* and in some species of *Chaenactis* with bristles; but not chaffy bracted.

Plant-tissues without oil glands. Tribe 7. HELENIEAE.

Plant-tissues, especially the leaves and the bracts with oil-tubes; plants therefore heavy-scented. Tribe 8. TAGETEAE.

Bracts of the involucre dry and scarious. Tribe 9. ANTHEMIDEAE.

Pappus capillary; style-branches often appendaged.

Tribe 10. SENECTIONEAE.

Anther-sacs caudate at the base; heads never radiate and corollas yellow only in a few species of *Cirsium*.

Anthers not appendaged at the top; heads heterogamous or dioecious.

Pistillate flowers with filiform corollas. Tribe 4. GNAPHALIEAE.

Pistillate flowers with tubular-ampliate corollas. Tribe 5. ADENOCAULEAE.

Anther with elongated cartilaginous, mostly caudate appendages at the top; flowers all hermaphrodite or the marginal neutral; corolla not filiform.

Tribe 11. CYNAREAE.

One genus.

Tribe 1. VERNONIEAE.

1. VERNONIA.

Tribe 2. EUPATORIEAE.

Achenes 5-angled without intervening ribs.

Pappus double of 2-12 capillary bristles and as many or fewer outer short thin scales.

Pappus of wholly capillary bristles, mostly uniseriate.

2. HOFFMEISTERIA.
3. EUPATORIUM.

Achenes 8-20-ribbed or 8-20-striate.

Bracts of the involucre herbaceous or partly colored, not striate.

Bracts of the involucre not herbaceous, striate-nerved.

Pappus-bristles plumose; anthers distinct; bracts few.

6. LACINIARIA.

Pappus-bristles scabrous or barbellate; anthers united; bracts usually many.

5. KUHNIA.

4. COLEOSANTHUS.

Tribe 3. ASTEREEAE.

A. Plants not dioecious.

I. Marginal pistillate flowers, if present, ligulate.

a. Ray-flowers yellow or none.

1. Pappus of scales or awns or lacking, never of numerous capillary bristles.

a. Bracts not conspicuously scarious-margined.

Heads small, not over 4 mm. high, few-flowered; pappus more or less paleaceous.

Disk-flowers usually fertile; leaves linear to filiform.

7. GUTIERREZIA.

Disk-flowers sterile; leaves short, obovate or spatulate.

8. AMPHIPAPPUS.

Heads large, many-flowered; involucre in all except one species viscid.

Involucres hemispherical; pappus of a few deciduous awns.

9. GRINDELLA.

Involucres turbinate; pappus of persistent linear, very acute paleae.

10. VANCELEVEA.

b. Bracts with conspicuous scarious fimbriate margins.

11. ACAMPTOPAPPUS.

2. Pappus at least in part of numerous capillary bristles.

a. Pappus double, the inner of capillary bristles, the outer of paleae or short bristles; involucres many-flowered, hemispherical with narrow imbricated bracts.

12. CHRYSOPSIS.

b. Pappus wholly of capillary bristles.

Heads discoid.

Leaves resinous-punctate.

13. ERICAMERIA.

Leaves not resinous-punctate.

Involucres narrowly turbinate, its bracts more or less chartaceous, keeled, arranged in definite (usually 5) vertical ranks; achenes elongate-linear; tips of style-branches subulate-filiform.

14. CHRYSOTHAMNUS.

Involucres broadly turbinate to hemispheric, its bracts more or less imbricate, but not in definite vertical ranks; achenes scarcely elongate-linear.

Style-tips obtuse; involucre bracts narrow and poorly imbricate. (Rayless species of)

45. ERIGERON.

Style-tips acute; bracts either broad or well imbricate or both.

Achenes truncate at the top, gradually tapering towards the base, usually cinereous-pubescent; bracts neither broad nor abruptly acuminate.

Appendages or tips of the style-branches filiform; undershrubs with white-tomentulose stems and glandular-hairy foliage; leaves entire-margined.

21. MACRONEMA.

Appendages or tips of the style-branches subulate to ovate.

Leaves with spinulose-tipped teeth; corolla-tube slender. (Rayless species of)

17. SIDERANTHUS.

Leaves not spinulose; corolla-tube dilated above.

15. ISOCOMA.

Achenes elongate-obovoid, *i. e.*, tapering at both ends, but more so below, multi-striate, glabrous or slightly hairy; bracts of the involucres broad and abruptly acuminate; appendages of the style-branches ovate to short-subulate.

20. OONOPSIS.

Heads radiate.

Rays scarcely longer than the disk-flower.

18. PYRROCOMA.

Rays conspicuous, much exceeding the disk.

Leaves pinnate or toothed; lobes or teeth spinulose-tipped.

Pappus of the fertile achenes deciduous in a ring; annuals, equally leafy throughout; bracts more or less foliaceous.

16. PRIONOPSIS.

Pappus persistent.

Bracts chartaceous, not foliaceous, merely with a green tip; plants annual, or perennial with a caudex, equally leafy throughout; pappus in age more or less spreading; achenes turbinate and densely silky.

17. SIDERANTHUS.

Bracts more or less foliaceous, at least above; plants perennial with taproots, large basal leaves, and few and rather small stem-leaves; pappus not spreading; achenes oblong, glabrous or sparingly pubescent.

18. PYRROCOMA.

Leaves entire or toothed, but teeth not spinulose-tipped.

Bracts not longitudinally striate.

Shrubs with glandular-punctate leaves.

Heads large, solitary; involucre bracts in about 2 series; rays numerous.

19. STENOTOPSIS.

- Heads small, paniculate or corymbose; bracts well imbricate, in several series; rays few or none.
13. ERICAMERIA.
- Herbs or undershrubs; leaves not glandular-punctate.
Bracts abruptly acuminate; stems leafy up to the sessile heads.
20. OONOPSIS.
- Bracts not abruptly acuminate.
Style-appendages filiform, much longer than the stigmatic portion; low shrubs with whitish bark and foliaceous outer bracts.
21. MACRONEMA.
- Style-appendages of the stigmas ovate or triangular, not longer than the stigmatic portion.
Plants low, caespitose, with a woody caudex, more or less evergreen leaves, and solitary peduncled heads.
22. STENOTUS.
- Plants with wholly herbaceous stem, woody, if at all, only at the caudex; leaves not evergreen.
Bracts, at least the outer, foliaceous or with foliaceous tips.
Disk-flowers tubular; plants with a tap-root.
18. PYRROCOMA.
- Disk-flowers more or less widened upwards; plants with rootstocks or short caudices.
Heads solitary; rays numerous.
23. TONESTUS.
- Heads corymbiform-cymose; rays small and narrow.
24. ORIOCHRYSUM.
- Bracts not at all foliaceous or merely with green tips.
Bracts slightly if at all unequal and slightly imbricated; heads solitary or few, peduncled.
45. ERIGERON.
- Bracts well imbricated and unequal in length.
Rays not more numerous than the disk-flowers; receptacle alveolate.
Inflorescence racemose or paniculate; bracts not in vertical rows.
25. SOLIDAGO.
- Inflorescence corymbiform; bracts in distinct vertical rows.
26. PETRODORIS.
- Rays more numerous than the disk-flowers; receptacle fimbriolate; heads corymbose.
27. EUTHAMIA.
- Bracts of the involucre longitudinally striate; heads in congested corymbs.
28. OLIGONEURON.
- b. Ray-flowers blue, pink, or white.
1. Pappus a mere crown or of few scales or awn-like bristles.
Pappus of a cup-shaped crown and a single awn; dwarf annuals, branched at the base.
29. MONOPTILON.
- Pappus of a series of long awns or that of the rays of short scales; annuals or perennials.
30. TOWNSENDIA.
2. Pappus of numerous capillary bristles.
- a. Rays only slightly if at all exceeding the pappus; annuals.
Bracts in 2-3 series, the outer foliaceous; stigma-tips acute.
31. BRACHYACTIS.
- Bracts in 1-2 series, narrow, not foliaceous; stigma-tips obtuse.
46. LEPTILON.
- b. Rays conspicuous, longer than the pappus, usually equalling or exceeding the width of the disk.
Style-tips lanceolate or oblong to filiform.
Bracts in a single series, with hyaline-scarious erose-fimbriate margins; dwarf winter annuals.
32. EREMASTRUM.
- Bracts in at least 2 or usually in more than 2 series.
Pappus simple, of similar bristles.
Plants rush-like, spiny.
33. LEUCOSYRIS.
- Perennials, with a rootstock or caudex.
Bracts acuminate, as well as the leaves tipped with callous points or spines; plants with solitary heads at the ends of the stems or branches, and caespitose caudices.

Achenes pubescent; bracts all narrow, the outer not passing into the leaves; heads distinctly peduncled. 34. *XYLORRHIZA*.

Achenes glabrous; outer bracts broad, foliaceous, passing into the leaves; heads subsessile. 35. *HERRICKIA*.

Bracts not acuminate, or if long-attenuate with soft tips.

Pappus dilated at the apex; bracts narrow, more or less keeled. 36. *UNAMIA*.

Pappus not dilated at the apex.

Bracts broad, with a distinct keel or mid-vein, not at all foliaceous. 37. *EUCEPHALUS*.

Bracts usually narrow, when broad neither keeled nor with a prominent midvein.

Bracts more or less foliaceous or foliaceous-tipped, usually in several series; heads usually several, racemose or paniculate; stigma-tips lanceolate to subulate, shorter than the stigmatic portion. 38. *ASTER*.

Bracts not foliaceous, narrow and in 1-3 series.

Style-tips slender, usually twice as long as the stigmatic portions; achenes terete. 39. *OREOSTEMMA*.

Style-tips ovate or triangular and acuminate-subulate; achenes flat. 40. *ASTERIGERON*.

Annuals or biennials, or if short-lived perennials, with a taproot; bracts in many series, with herbaceous spreading or reflexed tips; stigma-tips linear to filiform. 41. *MACHAERANTHERA*.

Pappus double, the inner of capillary bristles, the outer of short bristles or scales.

Inner pappus-bristles more or less thickened above; bracts thin-coriaceous, without herbaceous tips, shorter than the disk. 42. *DOELINGERIA*.

Inner pappus-bristles filiform, not thickened above; bracts equalling the disk. 43. *IONACTIS*.

Style-tips triangular or ovate, obtuse or rarely acutish; bracts not foliaceous.

Involucres turbinate; bracts well imbricate, in several series, scarious-margined; disk-flowers white. 44. *LEUCELENE*.

Involucres hemispherical or broader; bracts not scarious-margined, in 1-3 series; disk-corollas yellow, rarely ochroleucous. 45. *ERIGERON*.

II. Marginal pistillate flowers not ligulate, reduced to a filiform or narrow short tube. 46. *ESCHENBACHIA*.

B. Heads unisexual, dioecious, discoid; pappus of the staminate flowers with clavate tips. 47. *BACCHARIS*.

Tribe 4. GNAPHALIEAE.

Shrubs; bracts coriaceous; receptacle naked; pistillate flowers numerous; corolla reduced to a short slender tube; hermaphrodite flowers few and sterile, their pappus with clavate tips. 48. *BERTHELOTIA*.

Herbs, if at all shrubby only at the base; bracts more or less scarious.

Receptacle chaffy; style or style-branches of the hermaphrodite sterile flowers not truncate.

Pistillate flowers all subtended by paleae and without pappus.

Paleae in fruit enclosing the achenes and falling off with them, tipped with a hyaline appendage.

Heads ovoid; paleae subtending the pistillate flowers boat-shaped, with erect conspicuous hyaline tips, those of the 4-5 hermaphrodite flowers barely concave or plane.

Paleae subtending the central flowers hyaline and deciduous; bracts of the involucre in several series. 49. *STYLOCLINE*.

Paleae subtending the central flowers coriaceous-herbaceous, ending in a hooked spine, persistent; bracts of the involucre none beside the paleaceous ones enclosing the marginal flowers. 50. *ANCISTROCARPUS*.

Heads globose; paleae subtending the pistillate flowers cucullate-saccate and utricular, the apex introrse and the ovate appendage inflexed or porrect; paleae and pappus of the hermaphrodite flowers lacking. 51. *PSILOCARPUS*.

Paleae in fruit open and merely subtending the achenes, without a hyaline appendage. 52. *DIAPERIA*.

Pistillate flowers of two kinds, the outer with, the inner without pappus, the latter and the central fertile hermaphrodite flowers not subtended by individual paleae, but the cluster surrounded by a ring of open scarious paleae, the outer subtended by boat-shaped ones. 53. *OGLIFA*.

Receptacle not chaffy; style or style-branches of the hermaphrodite flowers mostly truncate.

Plants dioecious, or the pistillate heads with a few hermaphrodite flowers in the center.

Pappus-bristles of the pistillate flowers falling off in a ring; central hermaphrodite flowers none. 55. ANTENNARIA.

Pappus-bristles of the pistillate flowers falling off separately; central hermaphrodite flowers present in the pistillate heads. 56. ANAPHALIS.

Plants not dioecious; flowers fertile throughout the heads; hermaphrodite in the middle, surrounded by pistillate ones. 57. GNAPHALIUM.

Tribe 5. ADENOCAULEAE.

Leaves cordate, white-woolly beneath.

58. ADENOCALON.

Tribe 6. HELIANTHEAE.

A. Bracts (at least the outer series) not enclosing the achenes of the rays; plants not glandular-viscid.

I. Disk-flowers hermaphrodite but sterile.

Marginal pistillate flowers, with conspicuous rays.

Achenes not flattened; ligules in ours white; involucre of very dissimilar sets of bracts. 59. MELAMPODIUM.

Achenes flattened; ligules in ours yellow.

Ray-flowers in 2-3 series; achenes falling away free.

60. SILPHITUM.

Ray-flowers in 1 series; achenes adnate to 2 or 3 paleae and falling away with them. 61. ENGELMANNIA.

Marginal pistillate flowers reduced to a truncate or obliquely-cleft tube; the ligules, if any, reduced to 2 or 3 small teeth.

Acaulescent caespitose perennials; pappus of a pair of lanceolate membranous scales. 62. BOLOPHYTA.

Caulescent annuals; pappus none. 63. PARTHENICE.

II. Disk-flowers fertile.

a. Ray-flowers fertile; the ligules with very short tube, persistent on the achenes and becoming papery in texture.

Achenes of the disk compressed; leaves entire.

64. CRASSINA.

Achenes obtusely 4-angled.

Leaves toothed; paleae pointless, partly enclosing the achenes.

65. HELIOPSIS.

Leaves entire; paleae linear-lanceolate, not enclosing the achenes. (§ *Kalliac-tis*, i. e., *B. Carcyana*, of) 71. BALSAMORRHIZA.

b. Ray-corollas deciduous from the achenes or wanting.

1. Pappus a crown or none, or of a few squamellae on the angles of the achenes, and rarely minute ones between.

a. Achenes of the disk-flowers not obcompressed (except in *Ratibida* and *Ximenesia*); paleae usually more or less concave and clasping.

Receptacle conic, subulate or columnar.

Achenes 4-angled.

Ray-flowers purplish or rarely whitish; disk-corollas almost without a tube; pappus coroniform. 66. BRAUNERIA.

Ray-flowers yellow or none; disk-corollas with a short but manifest tube.

Achenes quadrangular-compressed; apex of the achenes covered by the base of the corolla-tube.

67. GYMNOLOMIA.

Achenes nearly equally 4-angled; apex not covered by the base of the corolla. 68. RUDBECKIA.

Achenes 5-angled; ray-flowers white.

70. GALINSOGA.

Achenes flattened, broad-margined or winged.

69. RATIBIDA.

Receptacle from flat to convex.

Achenes of the disk neither sharp-angled, margined, nor winged.

Rays fertile, their achenes commonly 3-angled or obcompressed; plants with thick balsamiferous taproots.

Pappus none; stem scapiform or with reduced leaves.

71. BALSAMORRHIZA.

Pappus a lacerate chaffy crown or of distinct squamellae; stem low but leafy.

72. WYETHIA.

Rays sterile or wanting; plants not with fleshy taproot.

Pappus none or a minute ring.

67. GYMNOLOMIA.

Pappus of 2 scarious awns.

73. HELIANTHUS.

Achenes of the disk thin-edged, margined or winged.

Ray-flowers neutral; achenes scarcely winged.

Pappus none or an awn to each angle of the achenes.

74. ENCELIA.

Pappus of small teeth between the 2 or more awns or scales over the angles of the achenes.

Plants scapose; achenes with a callous margin.

75. ENCELLOPSIS.

Plants caulescent; achenes not margined.

76. HELIANTHELLA.

- Ray-flowers fertile; achenes winged; pappus-awns without intermediate squamellae. 77. *XIMENESIA*.
- b. Achenes obcompressed; paleae flat or hardly concave; involucre distinctly double.
- Bracts of the involucre distinct or nearly so.
- Pappus in ours of small teeth, a mere border, or wanting. 78. *COREOPSIS*.
- Pappus of 2-4 barbed or hispid awns. 79. *BIDENS*.
- Bracts of the inner involucre united at least to near the middle. 80. *THELESERMA*.
2. Pappus of 5-many, linear to lanceolate squamellae with thickened axis and hyaline margins.
- Rays fertile; paleae of the receptacle thin and scarious; pappus-squamellae fimbriate. 81. *PTILONELLA*.
- Rays sterile; paleae of the receptacle bristle-form; pappus-squamellae not fimbriate. 110. *GAILLARDIA*.
- B. Bracts of the involucre uniserial, partly or wholly enclosing the achenes of the fertile ray-flowers; plants glandular-viscid.
- Achenes of the inconspicuous rays laterally compressed and enclosed in the con-
duplicately infolded involucre bracts.
- Disk-flowers several; corolla hairy; stout annuals with sessile or short-peduncled heads. 82. *MADIA*.
- Disk-flowers solitary; corolla glabrous; slender low annuals with small heads on filiform peduncles. 83. *HARPAECARPUS*.
- Achenes of the ray-flowers with broad and rounded backs, or more commonly obcompressed.
- Ligules of the ray-flowers minute; achenes completely invested by the whole involucre bract; disk-flowers solitary; heads small and short-peduncled. 84. *HEMIZONELLA*.
- Ligules of the ray-flowers conspicuous; achenes enclosed in the basal portion of the bracts, the dilated margins of which are abruptly infolded; disk-flowers several or many.
- Ray-flowers about 5, with deeply 3-cleft ligules; disk-flowers sterile, without pappus. 85. *LAGOPHYLLA*.
- Ray-flowers 8-20, with merely 3-lobed or toothed ligules; disk-flowers mostly fertile with pappus of 5-20 bristles. 86. *BLEPHARIPAPPUS*.

Tribe 7. *HELENIAE*.

- I. Ligules persistent and becoming papery on the striate achenes; plants more or less woolly.
- Pappus of scales; rays 3-4, very broad; involucre of 4-10 coriaceous woolly bracts. 87. *PSILOSTROPHE*.
- Pappus none; rays 5-50; involucre of numerous thin herbaceous bracts. 88. *BAILEYA*.
- II. Ligules deciduous or none.
- A. Achenes flat with only marginal nerves; disk-corollas 4-toothed.
- Pappus none or of a single bristle; bracts distinct; suffruticose plants. 89. *MONOTHRIX*.
- Pappus of a lacerate-ciliate crown and sometimes with an additional pair of short awns; bracts more or less connate; not suffruticose plants. 90. *PERICOME*.
- B. Achenes angled, not flat, nerved or striate.
1. Receptacle naked.
- a. Bracts of the involucre pale or colored, at least the margins and tips scarious.
- Corollas of the disk-flowers with reflexed or spreading lobes; bracts of the broadly campanulate involucre obovate or broadly oblong. 96. *HYMENOPAPPUS*.
- Heads discoid. 97. *LEUCAMPYX*.
- Heads radiate; ligules obscurely toothed, yellowish or white. 98. *OTHAKE*.
- Corolla of the disk-flowers with linear, erect lobes; bracts of the turbinate involucre spatulate to linear-oblanccolate in two series; ligules if present deeply cleft, purple. 99. *ANTHROPEAS*.
- b. Bracts of the involucre neither colored nor scarious.
- Pappus of numerous barbellulate white bristles, somewhat broadened and united at the base into a ring. 104. *SYNTRICHOPAPPUS*.
- Pappus of scales or wanting.
- Achenes either linear-prismatic or clavate-obpyramidal, *i. e.*, very elongate.
- Bracts more or less carinate-concave and partly enfolding the achenes; leaves more or less floccose woolly.
- Low and diffuse winter annuals; anther-tips subulate; bracts herbaceous; tube of the disk-corollas equaling the throat. 103. *ANTHROPEAS*.
- Perennials; anther-tips obtuse; bracts firm; tube of the disk-corollas shorter than the throat. 102. *ERIOPHYLLUM*.
- Bracts wholly herbaceous, broad and flat or merely concave, not embracing the achenes; plants not floccose-lanate.
- Foliage impressed-punctate; leaves at least the lower opposite.
- Perennials, suffruticose at the base; leaf-segments oblong to linear. 91. *PICRADENIOPSIS*.

Annuals; leaf-segments filiform or nearly so.

95. CEPHALOBEMBIX.

Foliage not impressed-punctate; leaves alternate.

Bracts obovate, cuneate or oblanceolate.

Perennials with a woody caudex; leaves entire; pappus of 10 squamellae.

93. PLATYSCHKURRIA.

Annuals; leaves dissected; pappus wanting.

92. AMAURIOPSIS.

Bracts linear.

Bracts in one row or two subequal rows; plant not fleshy; achenes linear.

Heads radiate, but ligules inconspicuous; pappus of opaque squamellae.

99. RIGIOPAPPUS.

Heads discoid; pappus of hyaline squamellae.

Achenes angled; squamellae with strong midribs.

100. CHAMAECHENACTIS.

Achenes scarcely angled; squamellae not conspicuously ribbed.

101. CHAENACTIS.

Bracts in 2-3 rows; heads radiate; leaves more or less fleshy.

94. HULSEA.

Achenes obpyramidal, not 4 times as long as broad.

Bracts of the involucre erect, not spreading nor reflexed.

Involucres many-flowered; pappus present; achenes tapering below.

Bracts of the involucre nearly equal and similar, all distinct.

Bracts few; corolla flesh-colored; rays wanting.

100. CHAMAECHENACTIS.

Bracts numerous; corollas yellow; rays usually present.

Leaves entire; squamellae short, obtuse or abruptly contracted into a point.

105. TETRANEURIS.

Leaves pinnatifid; squamellae linear-lanceolate, attenuate but not awn-tipped.

106. RYDBERGIA.

Outer bracts united below; leaves usually pinnatifid with narrow divisions.

107. HYMENOXYIS.

Involucres few-flowered; pappus wanting; achenes linear, 8-10-striate.

108. FLAVERIA.

Bracts of the involucre spreading or reflexed.

Leaves not decurrent on the stem; tubes of the disk-flowers moderately long.

109. DUGALDIA.

Leaves decurrent on the stem; tubes of the disk-corollas very short or reduced to a ring.

110. HELENUM.

2. Receptacle with bristle-like chaffs.

Involucral bracts spreading or reflexed.

111. GAILLARDIA.

Involucral bracts erect.

101. CHAENACTIS.

Tribe 8. TAGETEAE.

Bracts of the involucre more or less united; style-branches of the disk-flowers elongate.

Bracts of the involucre united only at the base; style-branches with conical tips; squamellae of the pappus many-aristate.

112. BOEBERA.

Bracts of the involucre united into a cup; style-branches obtuse.

113. THYMOPHYLLA.

Bracts of the involucre distinct; style-branches very short, obtuse, without an appendage.

114. PECTIS.

Tribe 9. ANTHEMIDEAE.

Receptacle chaffy.

Achenes flattened; involucre campanulate or obovoid, small; ligules short and broad.

115. ACHILLEA.

Achenes terete, at least not flattened; involucre hemispherical, large; ligules elongate.

Ray-flowers fertile; paleae of the receptacle membranous, subtending all the flowers.

116. ANTHEMIS.

Ray-flowers neutral; paleae of the receptacle subulate, stiff, subtending only the inner disk-flowers.

117. MARUTA.

Receptacle naked or merely pubescent.

Heads radiate; achenes 5-10-ribbed all around.

Ligules white, flat, spreading, longer than the disk-corollas.

119. LEUCANTHEMUM.

Ligules yellow, concave, erect, not longer than the disk-flowers.

120. TANACETUM.

Heads in ours discoid; achenes 2-5-ribbed.

Anthers obtuse.

Heads solitary, peduncled; flowers in our species all alike (the ray-flowers found in other species lacking).

118. CHAMOMILLA.

Heads in contracted panicles or glomerules, or in one species solitary; flowers of two kinds, the marginal pistillate, but without ligules.

121. SPHAEROMERIA.

Anthers with pointed tips; heads racemose, rarely solitary; marginal pistillate flowers without ligules.

Plants spiny; achenes and corollas cobwebby.

122. PICROTHAMNUS.

Plants not spiny; achenes not cobwebby.

123. ARTEMISIA.

Tribe 10. SENECEONEAE.

- Plants scapiferous, dioecious or nearly so, with large basal leaves appearing after flowering; hermaphrodite flowers usually sterile. 124. PETASITES.
 Plants not scapiferous; not dioecious; disk-flowers hermaphrodite, fertile.
 Involucres of many or several bracts.
 Involucres lax, of commonly much overlapping or unequal bracts.
 Low annual herbs, with alternate leaves.
 Heads discoid; receptacle flat; corollas with very short tube. 126. PSATYROTES.
 Heads radiate; receptacle conical; disk-flowers with long tube. 125. CROCIDIUM.
 Suffrutescent perennial, with opposite leaves; heads radiate. 127. HAPLOESTES.
 Involucres of connivent erect herbaceous equal bracts, with or without smaller calyculate ones below.
 Leaves mostly opposite; pappus of a single series of rigid bristles. 128. ARNICA.
 Leaves alternate; pappus of numerous soft bristles. 129. SENECEO.
 Involucres of 4-6 firm concave erect and strongly overlapping bracts; shrubs with alternate leaves and discoid heads. 130. TETRADYMIA.

Tribe 11. CYNAREAE.

- Achenes attached by the very base; flowers all alike or nearly so; hermaphrodite.
 Leaves not prickly; filaments glabrous; style-branches slender, free.
 Involucre globose; bracts subulate, spine- or awn-like, spreading, hooked at the tip. 131. ARCTIUM.
 Involucre oblong or obovoid; bracts appressed, mucous. 132. SAUSSUREA.
 Leaves more or less prickly; filaments bearded or papillose, rarely glabrous; style-branches more or less united into a cylindrical body with a hair-ring below.
 Receptacle densely bristly; pappus plumose. 133. CIRSIUM.
 Receptacle deeply honeycombed, scarcely bristly; pappus not plumose. 134. ONOPORDON.
 Achenes obliquely attached by one side; marginal flowers usually neutral, with enlarged oblique corollas. 135. CENTAUREA.

3. VERNONIA Schreb. IRON-WEED.

Coarse erect perennial herbs, with alternate leaves and corymbose-paniculate, purple or rose-colored, or rarely white flowers. Involucre hemispherical to oblong-cylindric or turbinate; its bracts imbricate in several or many series, dry or partly herbaceous. Receptacle flat, naked. Ray-flowers none. Corollas regular, 5-cleft, with narrow lobes. Anthers sagittate at the base, but not caudate. Achenes 8-10-ribbed, truncate at the apex, callous at the base. Pappus in two series in our species, the outer of small squamellae or short stout bristles, the inner of capillary scabrous bristles.

Leaves ovate-lanceolate, pinnately veined; bracts obtuse or acute. 1. *V. corymbosa*.
 Leaves linear or lance-linear; lateral veins indistinct; bracts short-acuminate.

2. *V. marginata*.

1. *V. corymbosa* Schwein. Stem glabrous, usually red, 4-8 dm. high; leaves sessile, ovate-lanceolate, 4-7 cm. long, acute, regularly serrate, scabrous above, glabrous and pitted beneath; heads corymbose, 8-12 mm. high, about 21-flowered; involucre campanulate or hemispheric; bracts purple, appressed; achenes glabrous or nearly so. *V. fasciculata* Coult., not Michx. Valleys: Man.—Neb.—N.D. *Plain.* Au.

2. *V. marginata* (Torr.) Raf. Stem glabrous or nearly so, 4-8 dm. high; leaves linear or linear-lanceolate, 5-15 cm. long, entire or minutely serrulate, punctate on both sides, puberulent above; heads in a flat-topped corymb, about 1 cm. high; bracts purple, ovate or lance-ovate; achenes glabrous. *V. Jamesii* T. & G. Plains: Neb.—Okla.—Tex. *Plain.* Au.

2. HOFMEISTERIA Walp.

Low suffrutescent plants, with incised leaves and long-peduncled heads with white flowers. Involucre campanulate or hemispherical, its bracts imbricate in several series, striate-nerved. Receptacle naked. Ray-flowers none. Corollas of disk-flowers regular, 5-cleft. Anthers not caudate at the base. Style-branches clavate, stigmatose only at the base. Achenes 5-angled, not caudate, but with

a strong basal callus. Pappus double, the inner of 2-12 slender or capillary bristles equalling the slender corolla, the outer of alternating short thin paleae.

1. *H. plurisetia* A. Gray. Shrub 3-5 dm. high, with white bark; leaves long-petioled; blades lanceolate, deltoid or hastate, 5-10 mm. long, dentate or entire; heads about 20-flowered, 8-10 mm. high; bracts with spreading tips, glandular-puberulent, the outer herbaceous, the inner chartaceous; pappus of 10-12 bristles and as many narrow acute chaff. Arid regions: s Calif.—Nev.—s Utah—Ariz. *L. Son.* Ap—My.

3. *EUPATÓRIUM* L. JOE-PYE WEED, THOROUGHWORT, BONESET,
WHITE SNAKE-ROOT.

Ours erect branching perennial herbs, with opposite or verticillate, often punctate leaves, cymose-paniculate heads, and white to purple flowers. Involucre oblong to hemispheric, its bracts imbricate in 2-several series. Receptacle from flat to conic, naked. Ray-flowers none. Corolla of the disk-flowers regular, with slender tube and 5-lobed limb. Anthers obtuse at the base, appendiculate at the tip. Style-branches elongate, flattened, or thickened above, stigmatic at the base. Achenes 5-angled, truncate at the apex. Pappus simple, of numerous capillary scabrous bristles.

Leaves verticillate in whorls of 3's; flowers pink or rose-colored.

Leaf-blades lanceolate, acuminate, strongly reticulate and rugose. **1. *E. Bruneri*.**

Leaf-blades broadly ovate, acute, neither strongly reticulate nor rugose.

2. *E. maculatum*.

Leaves opposite; flowers white or slightly tinged with pink.

Achenes hispidulous on the angles.

Bracts unequal in length, distinctly ribbed only towards the base.

3. *E. texense*.

Bracts essentially equal in length, strongly ribbed to near the apex.

4. *E. arizonicum*.

Achenes merely glandular-puberulent or glabrate.

5. *E. occidentale*.

1. *E. Bruneri* A. Gray. Stem more or less canescent, 5-15 dm. high; leaf-blades serrate, scabrous above, velutinous beneath, 10-15 cm. long; bracts more or less purplish, the outer ovate, pubescent, the inner linear-oblong, glabrous, all rounded or obtuse at the apex; heads nearly 1 cm. high. *E. atromontanum* A. Nels. *E. Rydbergii* Britton. Moist soil: Sask.—Ia.—Colo.—Utah—B.C. *Plain—Submont.* Jl—S.

2. *E. maculatum* L. Stem scabrous or pubescent, at least above, 5-20 dm. high, striate, often spotted with purple; leaves ovate or the upper ovate-lanceolate, acute, coarsely serrate, puberulent beneath and often pubescent on the veins above; bracts purplish, the outer ovate, rounded at the apex, the inner linear-oblong, acutish; heads about 1 cm. high. Moist soil: N.Y.—Ky.—N.M.—Sask. *Plain.* Au—S.

3. *E. texense* (T. & G.) Rydb. Shrubby at the base; stem 5-10 dm. high, puberulent; leaf-blades ovate, deltoid or cordate, coarsely dentate, triple-nerved, more or less scabrous on both sides, 2-5 cm. long; inflorescence corymbiform-paniculate; heads 8 mm. high; bracts in about 2 series, only slightly imbricate, lanceolate, acute, puberulent; flowers about 12. Rocky hills: Tex.—Colo.—Ariz. *Son.—Submont.* Jl—S.

4. *E. arizonicum* (A. Gray) Greene. Stems 3-7 dm. high, from a woody caespitose caudex, yellowish green, finely puberulent; leaf-blades ovate or cordate, 2-5 cm. long, dentate, with small obtuse teeth, triple-nerved, minutely scabrous; inflorescence paniculate; heads about 7 mm. high; bracts in 2 series, practically equal in length, scabrous-puberulent, lanceolate. *E. occidentale arizonicum* A. Gray. Cañons: s Utah—N.M.—s Calif. *L. Son.* Au—O.

5. *E. occidentale* Hook. Stems 2-5 dm. high, finely puberulent or glabrate; leaf-blades ovate, rounded or truncate at the base, 2-5 cm. long, triple-nerved, minutely scabrous-puberulent, more or less dentate; heads paniculate, 7-8 mm. high; bracts in two series, equal, puberulent, faintly ribbed. Rocky places: Wash.—Ida.—n Utah—Calif. *Son.* Jl—S.

4. **COLEOSANTHUS** Cass.

Herbs or shrubs, with opposite or alternate leaves. Heads discoid with white, ochroleucous or pink flowers, paniculate, cymose, or rarely solitary. Involucre campanulate or oblong, its bracts striate, imbricate in several series. Receptacle flat or convex, naked. Disk-corollas regular, slender, 5-lobed. Anthers obtuse at the base. Style-branches elongate, obtuse, thickened upwards. Achenes 10-ribbed. Pappus simple, of numerous, long, scabrous or barbellate bristles. [*Brickellia* Ell.]

Leaf-blades ovate-cordate or deltoid.

Leaves subsessile or short-petioled, ovate, veiny, spinulose-toothed, acuminate; bracts firm-chartaceous, 3-6 mm. wide. 1. *C. atractyloides*.

Leaves slender-petioled, not spinulose-toothed; bracts thin, 2 mm. wide or less.

Heads 30-50-flowered.

Leaves thin, minutely puberulent; their teeth usually broadly triangular, acute; peduncles usually longer than the heads. 2. *C. grandiflorus*.

Leaves thicker, densely scabrous-pubescent, veiny, their teeth rounded-ovate, obtuse or mucronate. 3. *C. umbellatus*.

Heads 9-25-flowered.

Tips of the bracts not spreading; leaf-blades 2-5 cm. long.

Leaves distinctly petioled; blades subcordate, 2-5 cm. long.

Leaves firm, crenate-dentate. 4. *C. albicaulis*.

Leaves thin, crenate. 5. *C. tener*.

Leaves short-petioled; blades lanceolate, 1-4 cm. long. 6. *C. brachyphyllus*.

Tips of the bracts squarrose-spreading; leaf-blades less than 1 cm. long.

Leaves on the peduncles many, passing into the bracts; inner bracts much longer than the outer ones; upper parts of the plant velutinous and glandular.

Stem and pedicels glandular-villose; head about 13 mm. high, 20-24-flowered; achenes 4-4.5 mm. long. 7. *C. microphyllus*.

Stem lanulose; heads about 11 mm. high, about 1-8-flowered; achenes about 3.5 mm. long. 8. *C. Watsonii*.

Leaves on the peduncles few; bracts gradually increasing in length upwards; plant scabrous-puberulent. 9. *C. scaber*.

Leaves linear or oblong, sessile.

Heads 30-40-flowered.

Achenes glandular; bracts comparatively firm.

10. *C. oblongifolius*.

Achenes hispidulous on the angles, not glandular; bracts thin.

11. *C. tinifolius*.

12. *C. longifolius*.

Heads 3-5-flowered.

1. ***C. atractyloides*** (A. Gray) Kuntze. A shrub, 2-5 dm. high, divaricately branched; young branches straw-colored and shining; heads solitary, 1.5 cm. high; involucre campanulate; bracts ovate, acuminate, puberulent. *C. venulosus* A. Nels. *Brickellia atractyloides* A. Gray. Rocky ravines: s Utah—Ariz.—Calif.—Nev. *L. Son.* Ap-Je.

2. ***C. grandiflorus*** (Hook.) Kuntze. Stem 6-10 dm. high, paniculately branched, puberulent or glabrate, straw-colored; head paniculate-cymose, nodding, 12-15 mm. high; lower bracts ovate, abruptly acuminate, the inner linear-oblong, obtuse or acutish; pappus-bristles scabrous. *Brickellia grandiflora* Nutt. Cañons, badlands, and draws: Alta.—Colo.—Utah—Ore.—Wash. *Submont.*—*Mont.* Jl-S.

3. ***C. umbellatus*** Greene. Stems 3-6 dm. high, minutely puberulent; leaf-blades deltoid, 3-6 cm. long, scabrous-puberulent; heads nodding in congested, umbel-like clusters, 10-12 mm. high; outer bracts ovate, pubescent and ciliate-acuminate, the innermost linear. *C. congestus* A. Nels. *C. Garrettii* A. Nels. *C. minor* (A. Gray) Daniels. *Brickellia grandiflora minor* A. Gray. Hillsides and cañons: N.M.—Ariz.—Wyo. *Submont.*—*Mont.* Jl-S.

4. ***C. albicaulis*** Rydb. Shrubby at the base, 0.5-1 m. high; bark of the younger branches straw-colored or grayish, hirsute-puberulent; leaves short-petioled; blades broadly cordate, strongly veined, thick, scabrous-puberulent, crenate-dentate; heads 2-6, in small axillary clusters on short peduncles, 10-20-flowered; lower bracts short-ovate, the inner linear, all acutish or obtuse; corolla cream-colored; pappus white. Cañons and foothills: Colo.—Utah—N.M. *Submont.*—*Mont.* Au-S.

5. ***C. tener*** (A. Gray) Kuntze. Shrubby at the base; leaves petioled; blades long-ovate, abruptly contracted at the base, 3.5-4.5 cm. long, crenate;

heads similar to those of the preceding, mostly clustered in the axils. *B. tenera* A. Gray. Cañons: N.M.—Utah—Nev.—Ariz.; Mex. *Submont.*

6. *C. brachyphyllus* (A. Gray) Kuntze. Stem slender, from a slightly woody caudex; leaves lanceolate, acute, slightly serrate or entire, 1–4 cm. long, 3-nerved; inflorescence lax; heads about 1 cm. high, 4 mm. thick, about 9-flowered; bracts 16–17, acuminate, 5–7-striate, ciliolate; achenes hirsute; pappus-bristles short-plumose. *B. brachyphylla* A. Gray. Hills: N.M.—sw Colo.—Ariz. *Son.*—*Submont.*

7. *C. microphyllus* (Nutt.) Kuntze. A shrub, 3–6 dm. high, with ascending branches, densely short-pilose and glandular; leaves round-ovate, dentate, thick, 1–2 cm. long, densely glandular-puberulent; heads obconic, 12–14 mm. high; lower bracts ovate, thick; the inner two rows linear; achenes 4–4.5 mm. long, hispidulous on the angles. *B. microphylla* (Nutt.) A. Gray. Dry soil: Ore.—Ida.—Calif. *Son.*—*Submont.* *Au.*

8. *C. Watsonii* (B. L. Robins.) Rydb. Shrubby, 4–6 dm. high; stem and peduncles softly lanulate or crisp-puberulent; branches spreading; leaves as in preceding species; head about 11 mm. high, 18-flowered; achenes about 3.5 mm. long. *B. Watsonii* B. L. Robins. Mountains: Utah—Nev.—Calif. *Submont.*

9. *C. scaber* (A. Gray) Greene. A shrub 4–6 dm. high, with slender ascending branches, scabrous-puberulent and more or less viscid; leaves sessile, broadly ovate, coarsely dentate, 5–10 cm. long, 3-ribbed, scabrous; heads obconic, 1 cm. high; bracts thin, the lower lanceolate, the inner linear, erect, wholly chartaceous; flowers 10–12; achenes scabrous-hispidulous on the angles. *B. microphylla scabra* A. Gray. Mountains and dry soil: s Wyo.—N.M.—Ariz.—Nev. *Submont.*

10. *C. oblongifolius* (Nutt.) Kuntze. Perennial, with a caespitose woody caudex; stems 2–4 dm. high, straw-colored, puberulent; leaves elliptic, oblong, or linear, glandular-puberulent, firm, more or less triple-nerved; heads about 2 cm. high, obconic-campanulate; bracts glandular-puberulent, acute, the outer ovate-lanceolate, the inner linear. *B. oblongifolia* Nutt. River banks: B.C.—Mont.—Utah—n Calif. *Je*—*Au.*

11. *C. linifolius* (D. C. Eat.) Kuntze. Perennial, with a caespitose woody caudex; stems 2–4 dm. high, densely short-pubescent, subvelutinous; leaves linear-lanceolate or linear, densely puberulent; heads obconic-campanulate, about 15 mm. high; bracts linear-lanceolate or linear, attenuate, thin. *C. humilis* Greene. *Brickellia linifolia* D. C. Eat. Dry places: Calif.—s Colo.—N.M. *Son.*—*Submont.* *My*—*Jl.*

12. *C. longifolius* (S. Wats.) Kuntze. Suffruticose perennial; branches leafy, straw-colored; leaves lance-linear, 3-nerved, 2–7 cm. long, 4–6 mm. wide; heads 5–6 mm. long, obconic; bracts oblong to linear, obtuse; achenes glabrous or nearly so. *B. longifolia* S. Wats. Dry regions: Ariz.—s Utah—s Nev.—Calif. *Son.*

5. *KÜHNIA* L. FALSE BONESET.

Perennial herbs, with alternate resinous-dotted leaves. Heads discoid, cymose-corymbose with white or purplish flowers. Involucre narrow, turbinate-campanulate, its bracts striate, imbricate in several unequal series. Disk-corollas regular; tube slender; limb 5-cleft. Anthers obtuse and entire at the base, almost distinct. Receptacle flat, naked. Style-branches thickened upwards, obtuse, stigmatic only at the base. Achenes 10–20-costate. Pappus simple, of numerous plumose bristles.

*Leaves oblong or lanceolate, 3-ribbed, more or less toothed.

Leaves densely puberulent beneath.

Inner bracts abruptly acute or cuspidate.

Inner bracts gradually acuminate.

Leaves glabrous or nearly so beneath.

Leaves linear, 1-ribbed, entire.

1. *K. glutinosa*.

2. *K. Hitchcockii*.

3. *K. reticulata*.

4. *K. leptophylla*.

1. *K. glutinosa* Ell. Stem erect, 3–6 dm. high, puberulent and somewhat viscid; leaves sessile, lanceolate or ovate-lanceolate, puberulent on both sides,

usually sharply dentate, veiny, 3-7 cm. long; heads numerous, 12-16 mm. high; outer bracts lanceolate, attenuate; pappus tawny. *K. eupatorioides corymbulosa* T. & G. Dry prairies and plains: Ill.—Ala.—Tex.—Colo.—Mont. *Plain.* Je-O.

2. *K. Hitchcockii* A. Nels. Stem decumbent, divaricately branched, minutely puberulent; leaves lance-linear or linear, puberulent, entire or with few sharp teeth, 3-4 cm. long; outer bracts linear-lanceolate, long-attenuate, or the inner narrowly linear; pappus tawny. Dry plains: Kans.—Colo. *Plain.* Au-S.

3. *K. reticulata* A. Nels. Stems 3-4 dm. high, finely puberulent; leaves puberulent on the upper side and on the veins beneath, punctate, strongly reticulate-veined beneath, oblong-lanceolate, 2-4 cm. long, irregularly toothed or entire; bracts in 4-5 series, shorter than the disk, the outer short, lanceolate, the inner broadly linear, acute; pappus white. Cañons: Wyo. *Submont.* Au.

4. *K. leptophylla* Scheele. Stems 5-8 dm. high, striate and minutely puberulent; leaves numerous, minutely puberulent, linear or lance-linear, 2-4 cm. long, entire or nearly so, revolute-margined; inflorescence paniculate; bracts in 5 series, the outer short, lanceolate, the inner linear, cuspidate; achenes strigose; pappus dingy white. *K. Gooddingii* A. Nels. Rocky hills: Colo.—Tex.—Ariz. *Son.—Submont.* Jl-S.

6. LACINIARIA Hill. BLAZING STAR, BUTTON SNAKE-ROOT.

Perennial herbs, with a globular corm or thickened rootstock. Leaves narrow, entire, alternate, more or less punctate. Heads discoid, racemose or spicate, with rose-purple or rarely white flowers. Involucre oblong to hemispheric; bracts more or less herbaceous, not striate, imbricate in several unequal series. Receptacle flat or nearly so, naked. Anthers obtuse at the base. Style-branches elongate, obtuse, flattened at the end, stigmatose only at the base. Achenes 10-ribbed, slender, tapering to the base. Pappus 1-2 series of equal, firm, plumose or barbellate bristles. [*Liatris* Schreber.]

Pappus plumose.

Heads 15-60-flowered; corolla-lobes hairy within.

Heads 4-6-flowered; corolla-lobes glabrous within.

Pappus merely barbellate.

Heads few, hemispheric, 15-45-flowered.

Heads in a short raceme-like or corymbiform inflorescence; bracts obovate, with a dark rose-purple lacinate apex; leaves usually glabrous. 3. *L. ligulistylis*.

Heads in a long spike-like inflorescence; bracts spatulate or obovate-oblanccolate, with a pale merely erose apex; leaves usually hispidulous or crisp-hairy.

4. *L. aspera*.

Heads oblong, 3-15-flowered, numerous in a long spike.

Bracts obtuse, appressed.

Bracts acute, their tips spreading.

5. *L. spicata*.

6. *L. pycnostachya*.

1. *L. squarrosa* (L.) Hill. Stems often tufted, pubescent, 1-6 dm. high; leaves numerous, linear, 3-30 cm. long, often with scattered hairs; heads solitary or few, subtended by bract-like leaves; involucre cylindric, 1.5-2 cm. high; bracts lanceolate or oblong or linear-acuminate, squarrose-spreading. *Liatris squarrosa* (L.) Willd. Sandy soil: Ont.—Fla.—Tex.—Colo.—Minn. *Plain.* Jl-S.

2. *L. punctata* (Hook.) Kuntze. Stem glabrous or nearly so, 2-7.5 dm. high; leaves strongly punctate, 1-nerved, ciliate on the margins, otherwise glabrous, linear; spike dense, elongate, 5-15 cm. long; heads 12-16 mm. long, sessile; involucre narrowly campanulate; bracts cuspidate or acuminate, ciliate on the margins; flowers purple or rose. *Liatris punctata* Hook. Dry plains and hills: Sask.—Ia.—Tex.—Ariz.—Alta. *Plain—Mont.* Au-O.

3. *L. ligulistylis* A. Nels. Stem glabrate below, white-pubescent above, striate, 3-5 dm. high; leaves bright green, obscurely punctate, linear-oblanccolate, ciliate on the margins, 5-12 cm. long; heads 15-20 mm. high, broadly campanulate or hemispheric; bracts orbicular or oval; flowers 50-70, purple. *L. formosa* Greene. Hills: Man.—S.D.—Colo.—Alta. *Plain—Submont.* Jl-Au.

4. *L. aspera* (Michx.) Greene. Stem 3-10 dm. high, crisp-hairy especially above; leaves numerous, the lower linear-oblanccolate, the upper linear; heads globose-campanulate, 15-18 mm. high; bracts orbicular or oval. *Liatris aspera*

Michx. *L. scariosa* Auth., not *L.* Prairies: Wis.—Mo.—Kans.—N.D. *Plain.* Au-S.

5. *L. spicata* (L.) Kuntze. Stem 3-18 dm. high, glabrous or nearly so; leaves numerous, linear, obtuse, 5-30 cm. long, obscurely punctate, glabrous; heads very numerous, campanulate, about 1 cm. high; spike 2-4 dm. long; bracts oblong, scarious-margined at the apex; flowers purple, rarely white. *L. kansana* Britton. *Liatris spicata* (L.) Willd. Moist soil: Mass.—Fla.—La.—Colo. *Plain.* Au-O.

6. *L. pycnostachya* (Michx.) Kuntze. Stem more or less hirsute above, 6-15 dm. high, very leafy; leaves linear or lance-linear, attenuate at the apex, often 3 dm. long; heads 3-6 flowered, 8-12 mm. long; bracts oblong, pubescent and ciliate, purple-tinged; flowers purple. *Liatris pycnostachya* Michx. Prairies: Wis.—Ky.—La.—Tex.—S.D. *Plain.* Au-S.

7. GUTIERREZIA Lag. BROWN-WEED.

Annual or perennial herbs or shrubs, with glutinous foliage. Leaves alternate, narrow, entire. Heads radiate, usually many, clustered in terminal corymbs. Involucres campanulate, oblong, or clavate, few- or many-flowered, small; bracts leathery, imbricate in few series. Ray-flowers few, pistillate, fertile. Disk-flowers hermaphrodite, perfect, or the central ones sometimes sterile; corollas yellow. Anthers obtuse at the base. Stigmas flattened; appendages narrow. Achenes obovate or oblong, terete or 5-angled; pappus of many short scales or that of the ray-flowers sometimes wanting.

Disk- and ray-flowers in the head 4-7 each.

Surface of the leaves marked with large dots, each bordered by a hyaline scale.

Surface of the leaves not lepidote, either puberulent or glabrous. 1. *G. lepidota*.

Axils of the leaves with fasciculate branches.

Axils of the leaves without fasciculate branches. 2. *G. fasciculata*.

Plant ligneous only at the short persistent caudex.

Leaves linear, usually 1.5-4 mm. wide.

Involucres oblong-turbinate, over 5 mm. high; outer bracts lanceolate; stems 3-4 dm. high. 3. *G. scoparia*.

Involucres campanulate, somewhat turbinate at the base, less than 5 mm. high; bracts ovate; stems 1-2 dm. high. 4. *G. diversifolia*.

Leaves linear-filiform, less than 1 mm. wide.

Ligules of the rays nearly as long as the involucre. 5. *G. filifolia*.

Ligules of the rays about half as long as the involucre.

Heads usually peduncled and solitary at the ends of the branches. 6. *G. divaricata*.

Heads usually subsessile in clusters of 3-4 at the ends of the branches.

Plant low, 1-2 dm. high; branches green; leaves 1-2 cm. long. 7. *G. juncea*.

Plants 2-5 dm. high; branches with straw-colored or gray bark; leaves 3-4 cm. long. 8. *G. Sarcotroche*.

Plant shrubby. Involucres elongate, clavate-turbinate, 2-3 mm. wide; bracts oblong. 9. *G. longifolia*.

Involucres campanulate, only slightly turbinate at the base, 3-4 mm. wide; outer bracts ovate or obovate. 10. *G. linearis*.

Disk- and ray-flowers in the head only 1-2 each. 11. *G. glomerella*.

1. *G. lepidota* Greene. Stem about 4.5 dm. high, glabrous; lower leaves narrowly oblanceolate, obtuse, the upper linear, all ascending, scabrous on the margins; heads corymbose-paniculate; involucres about 6 mm. high, turbinate; bracts in 4 series, with thick blunt tips; ray- and disk-flowers each 6 or 7, light yellow; pappus squamellae lanceolate, acute. Perhaps belonging to some other genus. Plains: Grand Junction, Colo. *Son.* Au.

2. *G. fasciculata* Greene. Stem shrubby below, 3-5 dm. high, sparingly scaberulous; leaves few, widely spreading, linear; axillary fascicled branches often bearing a single head; involucre oblong-clavate, 4 mm. high; bracts in 4 series, the outer with stout green tips; disk- and ray-flowers each 5, pale yellow; achenes silky; pappus squamellae lanceolate. Valleys: Colo. *Son.* Au.

3. *G. scoparia* Rydb. Plant woody only at the base, about 3 dm. high; branches numerous, puberulent, mostly simple up to the inflorescence; leaves linear, 3-5 cm. long, 1-2 mm. wide, puberulent; inflorescence corymbiform;

heads subsessile, 2-5 together; disk- and ray-flowers each about 4. Dry plains: Wyo.—Colo. *Submont.* S-O.

4. *G. diversifolia* Greene. Stems 1-2 dm. high, angled, scabrous; lower leaves often oblanceolate, the rest linear, 2-4 cm. long, about 2 mm. wide, scabrous; inflorescence corymbiform; heads subsessile, clustered; bracts oblong, with thick, obtuse or acutish tips; ray-flowers 5 or 6, disk-flowers 8-10. (?) *G. viridifolia* Greene. Plains: Sask.—N.M.—Utah—Alta. *Submont.* Jl-S.

5. *G. filifolia* Greene. Stems 3-6 dm. high, puberulent; leaves 1-4 cm. long, scabrous-puberulent; involucre obovoid-turbinate, 3-4 mm. long; outer bracts ovate, acute, green-tipped, the inner obtuse, apiculate, scarcely at all green; ligules about 3 mm. long; ray- and disk-flowers each 3 or 4. Dry plains: Ida.—N.M.—Ariz.—Nev. *Plain—Submont.* Au-O.

6. *G. divaricata* (Nutt.) T. & G. Stem 2-4 dm. high, branched, glabrous or nearly so; leaves 1-2 cm. long, about 0.5 mm. wide, glabrous, spreading; involucre turbinate obconic, 4-5 mm. high; bracts lanceolate, acute, green-tipped; ray-flowers 5 or 6; ligules 2 mm. long; disk-flowers 5-8. Plains: Wyo.—Tex.—Utah. *Plain—Submont.* Au-S.

7. *G. juncea* Greene. Stems 1-2 dm. high; leaves 0.5 mm. wide, puberulent, spreading, early deciduous; inflorescence corymbiform; involucre turbinate, 3 mm. long; bracts ovate, acute, green-tipped except the innermost; ray- and disk-flowers each 4 or 5. Dry hills and plains: Okla.—Colo.—Ariz.—Tex. *Plain—Mont.* Jl-Au.

8. *G. Sarothrae* (Pursh) Britt. & Rusby. Stems 1-3 dm. high; leaves puberulent; heads numerous in flat-topped cymes; involucre turbinate, 4 mm. high; bracts oblong, acute, slightly green-tipped; ray-flowers 3-5; ligules 1.5-2 mm. long; disk-flowers 2-5. *G. Euthamiae* T. & G. *G. myriacephala* A. Nels. Dry plains: Sask.—Kans.—Utah—Alta. *Plain—Submont.* Jl-S.

9. *G. longifolia* Greene. Shrub 5-10 dm. high; young branches scabrous-puberulent or nearly glabrous; leaves linear, 3-6 cm. long, 1-2 mm. wide, slightly scabrous; inflorescence ample, flat-topped; heads subsessile, often 2 or 3 together; involucre 4-6 mm. high; bracts with thick green obtuse or acutish tips; ray- and disk-flowers each 4 or 5. Dry hills and plains: Colo.—Utah—N.M.—Tex. *Plain—Submont.* Au.

10. *G. linearis* Rydb. Shrubby and branched, 3-6 dm. high; leaves linear, about 3 cm. long, 1-2 mm. wide, puberulent and viscid, punctate; heads 5-6 mm. high; bracts scarious-margined; inflorescence corymbiform; heads subsessile, 2 or 3 together; ray- and disk-flowers each 3-4. Plains: Neb.—Kans.—N.M.—Colo. *Plain—Submont.* Jl-S.

11. *G. glomerella* Greene. Suffrutescent, fastigiate branched, 4-6 dm. high; branches of the season striate, glabrous; leaves linear-filiform, 2-4 cm. long, about 1 mm. wide, scabrous-puberulent; inflorescence corymbiform; heads sessile, 2-5 together; involucre oblong, 2 mm. high; bracts glutinous, oblong, obtuse. Dry plains: Tex.—Colo.—Ariz. *Plain—Son.* Au-S.

8. AMPHIPAPPUS T. & G.

Shrubs with glabrous foliage. Leaves alternate, small, entire. Heads numerous, conglomerate in small clusters forming a corymb, radiate; involucre campanulate, few-flowered; bracts leathery, imbricate in few series. Ray-flowers 1 or 2, short, pistillate and fertile. Disk-flowers hermaphrodite, but sterile, with rudimentary glabrous ovaries. Achenes of the ray-flowers pubescent; pappus of few and short bristles or scales, united at the base. Pappus of the disk-flowers of about 20 flattish denticulate-hispidulous tortuose bristles, some of them branching or irregularly paleaceous-concreted at the base.

1. *A. Fremontii* T. & G. A shrub 3-6 dm. high with rigid white branches; leaves obovate or spatulate, about 1 cm. long; heads sessile and glomerate; involucre campanulate, 4 mm. high; bracts 7-9, thin, oval, without green tips; ray-flowers 1 or 2, short; disk-flowers 3-6. *Amphiachyris Fremontii* A. Gray. Desert regions: s Calif.—Nev.—s Utah. *L. Son.*

9. **GRINDELIA** Willd. GUM-PLANT, RESIN-WEED.

Coarse biennial or perennial herbs (some western species even shrubby), usually with glabrous and glutinous foliage. Leaves alternate, usually spinulose-toothed. Heads relatively large, radiate or rarely discoid, often corymbose, many-flowered. Involucres hemispheric or depressed; bracts imbricate, usually with subulate spreading or recurved tips and mostly gummy; receptacle pitted. Ray-flowers pistillate, fertile, with yellow ligules, or rarely wanting. Disk-flowers hermaphrodite, usually fertile; corolla yellow. Stigmas narrow, flattened, with linear or lanceolate appendages. Achenes 4-5-ribbed, sometimes flattened; pappus of 2-8 awns or bristles, early deciduous.

Involucres not viscid.

1. *G. platylepis*.

Involucres more or less viscid.

Leaves all entire, the basal ones 3-4 dm. long; bracts narrowly linear-lanceolate, the outer nearly filiform, rather thin.

2. *G. oregana*.

Leaves, at least the basal ones, more or less dentate, the latter less than 2 dm. long; bracts lanceolate, with thick, rather fleshy tips.

Heads radiate.

Pappus-awns apparently smooth; barbules seen only under a compound microscope.

Tips of the outer bracts spreading, none reflexed.

Stem-leaves serrate.

3. *G. decumbens*.

Stem-leaves lacinate.

4. *G. laciniata*.

Tips of the bracts squarrose, those of the outer ones strongly reflexed.

Stem-leaves oval, ovate, or ovate-oblong with a broad base.

Leaves bluish green, spinulose-dentate; heads very broad and flat, its bracts broad and even the squarrose tips flattened.

5. *G. texana*.

Leaves yellowish green, merely dentate; heads hemispherical, its bracts narrow and with terete squarrose tips.

6. *G. squarrosa*.

Stem-leaves oblanceolate, rarely oblong.

Pappus-awns scarcely longer than the achenes, curved and twisted. Squarrose tips of the bracts short; leaves subentire.

7. *G. integerrima*.

Squarrose tips of the bracts long and slender; leaves serrate, with spreading teeth.

8. *G. Brownii*.

Pappus-awns decidedly longer than the achenes, straight.

Leaves all finely serrate, dentate or subentire.

9. *G. serrulata*.

Leaves finely and closely serrate.

Leaves rather remotely dentate or subentire.

10. *G. perennis*.

Leaves coarsely toothed, the basal ones sublacinate.

11. *G. subincisa*.

Pappus-bristles distinctly barbellate; barbules distinctly seen with a common pocket-lens.

Stems tall, 4-8 dm. high, usually solitary; stem-leaves broadly oblong or obovate; bracts broad, only the outer ones squarrose-reflexed.

12. *G. erecta*.

Stems low, about 3 dm. high, usually several from the base; stem-leaves oblanceolate or oblong; all bracts squarrose.

13. *G. subalpina*.

Heads discoid.

Stem-leaves oval or obovate.

14. *G. inornata*.

Stem-leaves oblanceolate or oblong.

Outer bracts strongly recurved, the inner not squarrose.

15. *G. fastigiata*.

All bracts squarrose.

Bracts long and loose, but not strongly recurved.

16. *G. aphanactis*.

Bracts short, strongly recurved-curved.

17. *G. columbiana*.

1. *G. platylepis* Greene. Perennial; stem about 5 dm. high, glabrous; leaves oblanceolate or oblong; involucres hemispheric, subtended by one or two leafy bracts; bracts oblong, abruptly herbaceous-tipped, not viscid; ligules broad, oblong, obtuse; pappus-bristles subulate, barbulate. Hills: Wyo. Submont.

2. *G. oregana* A. Gray. Perennial; stem 3-10 dm. high, sparingly puberulent or glabrous; basal leaves narrowly oblanceolate, entire or slightly denticulate, 1-2 dm. long, glabrous; stem-leaves lanceolate, oblong or oblanceolate; involucre about 15 mm. high and 15-20 mm. broad; ligules numerous, 15-20 mm. long; pappus-bristles 3-4 mm., smooth, curved. Dry grounds: B.C.—Ida.—Ore. Submont. Jl—Au.

3. *G. decumbens* Greene. Perennial, with a caespitose caudex; stem 2-5 dm. high, more or less decumbent at the base; basal leaves oblanceolate, obtuse, serrate towards the summit; stem-leaves oblong, acute, entire or denticulate;

involucres 8 mm. high, 10-12 mm. broad; bracts subulate; ligules 8 mm. long; pappus-bristles straight, 4 mm. long, barbellate above. Plains: Kans.—Colo.—N.M. *Plain*—*Submont.* JI—Au.

4. *G. laciniata* Rydb. Low perennial; stems slender, several, 3-5 dm. high; lower leaves narrowly linear-ob lanceolate, 1 cm. long, 3-5 mm. wide, sparingly dentate; stem-leaves irregularly pinnately lobed or laciniate, with narrow lanceolate divisions; involucre hemispheric, 10-12 mm. broad; bracts lanceolate, with short subulate spreading tips; ligules 5-8 mm. long, numerous; pappus-bristles curved, 3 mm. long. Mesas: se Utah. *Son.*—*Submont.* JI—Au.

5. *G. texana* Scheele. Perennial; stem stout, 4-10 dm. high, glabrous or nearly so, straw-colored; basal leaves oblanceolate; stem-leaves obovate or oval, 3-8 cm. long; involucre 1 cm. high, 2 cm. wide; ligules 12-15 mm. long; pappus-bristles straight, slender, 5 mm. long. *G. squarrosa grandiflora* A. Gray, in part. Plains: Colo.—Tex.—N.M. *Plain*—*Submont.* Au—O.

6. *G. squarrosa* (Pursh) Dunal. Biennial or perennial; stem 3-6 dm. high, corymbosely branched; basal leaves oblanceolate; stem-leaves oval, oblong-ovate, or ovate, broad at the base; involucres 8-10 mm. high, 15-20 mm. broad; ligules 8-10 mm. long. Prairies and plains: Sask.—Ia.—Kans.—Ariz.—Ida. *Plain*—*Submont.* Au—S.

7. *G. integerrima* Rydb. Perennial, with a caespitose base; stems about 3 dm. high, glabrous, somewhat angled; leaves narrowly oblanceolate, 2-4 cm. long, acute, strongly resinous-dotted; heads numerous, corymbose; involucre about 7 mm. high and 1 cm. wide; ligules 6-7 mm. long. Sandy soil: Ida. JI.

8. *G. Brownii* Heller. Perennial, with a caespitose caudex; stems 3-6 dm. high, red or purplish, glabrous; leaves spatulate or oblanceolate, acute, 3-5 cm. long; involucres 8 mm. high, 10-12 mm. broad; ligules 6 mm. long. Plains: Ida. Ore. *Plain.* JI—S.

9. *G. serrulata* Rydb. Biennial or perhaps short-lived perennial; stem glabrous, about 6 dm. high; leaves sessile, oblanceolate or oblong, acutish, very viscid, 3-5 cm. long; involucre very viscid, about 15 mm. broad; ligules 7-8 mm. long, 1-1.5 mm. wide. Plains and hills: N.M.—Wyo.—Utah. *Plain*—*Submont.* JI—S.

10. *G. perennis* A. Nels. Perennial, sometimes caespitose at the base; stem paniculately branched, 3-5 dm. high, glabrous; leaves entire or remotely dentate, oblanceolate, 4-7 cm. long, the upper sessile and clasping; involucres nearly 1 cm. high, 12-20 mm. broad; ligules 8-10 mm. long. Plains and hills: Sask.—Colo.—Ida.—Alta. *Submont.* JI—S.

11. *G. subincisa* Greene. Perennial, with caespitose base; stems decumbent below, glabrous; basal leaves narrowly oblanceolate, 8-12 cm. long, glabrous or nearly so, pinnately cleft or incised; stem-leaves oblong-lanceolate, sessile, coarsely toothed; heads few; involucres about 1 cm. high and 2 cm. broad; ligules 8-10 mm. long. Hills: Colo.—N.M.—Ariz. *Submont.* JI—S.

12. *G. erecta* A. Nels. Biennial; stem glabrous throughout; leaves ample, serrate, the lower oblanceolate, 6-10 cm. long; heads many; involucres about 1 cm. high and 1.5 cm. wide; bracts lanceolate, only the outer with squarrose, terete tips; ligules 14-18 mm. long. Mountains: Wyo.—Colo. *Submont.*—*Mont.* Au—S.

13. *G. subalpina* Greene. Low perennial; stem 2-4 dm. high; basal leaves oblanceolate, coarsely and remotely toothed, scabrous-puberulent; involucres 8 mm. high, 12-15 mm. wide; rays many, 8-10 mm. long. (?) *G. Eldorae* Daniels. Mountains: Mont.—N.M.—Utah—B.C. *Submont.*—*Mont.* JI—S.

14. *G. inornata* Greene. Perennial; stems several from the woody root, low and stout; basal leaves oblanceolate, short-petioled, all saliently toothed all around; involucres hemispheric, large; bracts all squarrose; pappus-bristles barbellate below the very acute apex. Cañons: Colo.

15. *G. fastigiata* Greene. Perennial, sometimes suffruticose; stem 6-10 dm. high, glabrous; basal leaves oblanceolate, acute, remotely serrate; stem-

leaves similar, but sometimes entire; heads small, rayless; involucre nearly 1 cm. high and broad; pappus-bristles barbellate. Hills: w Colo.—N.M.—Utah. *Son.* Au-S.

16. *G. aphanactis* Rydb. Apparently perennial; stem 3-4 dm. high, glabrous and striate; leaves very viscid, oblanceolate, acute, 4-7 cm. long, sharply dentate and sessile, or the lower more or less pinnatifid and petioled; heads about 15 mm. broad; bracts very viscid, subulate; awns of the pappus apparently smooth. Sandy soil: sw Colo.—se Utah—N.M. *Son.* Jl.

17. *G. columbiana* (Piper) Rydb. Perennial, caespitose at the base; stems about 3 dm. high, glabrous; leaves oblanceolate, denticulate, 3-6 cm. long; heads numerous, rayless; involucre 8-10 mm. high, 10-15 mm. broad; pappus-bristles curved and twisted. *G. discoidea* Nutt., not H. & A. Sandy places: Wash.—Ida.—Ore. *Son.* Au.

10 VANCLEVÆA Greene.

Low tufted desert shrubs, with white shreddy bark and entire leaves. Heads discoid. Involucre turbinate; bracts squarrose, acuminate, very gummy. Disk-flowers hermaphrodite and fertile; corollas yellow, club-shaped, with 5 erect teeth. Style elongate; branches long, sub-terete, papillose-puberulent. Achenes prismatic, villous-hirsute. Pappus of about 12 narrowly linear acute squamellae, ciliate on the margins, persistent.

1. *V. stylosa* (Eastw.) Greene. Stems 6-10 dm. high, bushy; leaves 3-nerved, linear-lanceolate, acuminate, 2-3 cm. long, 2-3 mm. wide, vertical by a twist at the base; heads corymbose, 15 mm. high, 10 mm. wide; pappus-scales 3 mm. long, one-third mm. broad. *Grindelia stylosa* Eastw. Sandy wastes: Utah. *Son.* Jl.

11. ACAMPTOPAPPUS A. Gray.

Low shrubs, glabrous or obscurely puberulent, neither glandular nor resinous. Leaves small, linear, entire, without lateral veins. Heads terminal at the ends of the branches, discoid or radiate; involucre globose; bracts closely imbricate in 3 series, rounded-oval to oblong, scarious-margined, erose-fimbriate. Disk-corollas yellow, funnelform; style-branches with thickish subulate appendages. Achenes round-turbinate, densely long-villous. Pappus equalling the corollas, of 15-18 flattened, rigid awns, slightly dilated at the end, and as many shorter setiform awns or bristles.

1. *A. sphaerocephalus* (Harv. & Gray) A. Gray. Shrub 3-10 dm. high, with white striate bark; leaves oblanceolate, sessile, about 1 cm. long, minutely puberulent; heads discoid, depressed-globose, 8-10 mm. high; bracts straw-colored, with pale green spots, with scarious erose margins. Desert regions: Ariz.—s Utah—Calif. *L. Son.* My-Je.

12. CHRYSÓPSIS Nutt. GOLDEN ASTER.

Biennial or perennial (ours perennial with a caespitose caudex), caulescent herbs, usually conspicuously pubescent. Leaves alternate. Heads showy, golden yellow, radiate, or rarely discoid, mostly corymbose, many-flowered; bracts narrow, in several series, more or less imbricate; receptacle pitted. Ray-flowers many, pistillate. Disk-flowers hermaphrodite and fertile. Stigmas with linear or subulate appendages. Achenes flattened. Pappus double, the outer series of small scales or bristles, the inner of numerous scabrous bristles.

Heads radiate.

Involucre strigose.

Heads sessile or subsessile, subtended by foliage-leaves.

Leaves narrowly linear-oblanceolate, hirsute.

Leaves oblanceolate, obovate, elliptic, or lanceolate, strigose at least when young, except in *C. imbricata*.

Plant about 1 dm. high or less; heads usually solitary.

Involucre 5-8 mm. broad; leaves less than 1 cm. long.

Involucre 10-12 mm. broad; leaves 2-3 cm. long.

Plant 2-6 dm. high; heads corymbose.

1. *C. angustifolia*.

2. *C. caespitosa*.

3. *C. alpicola*.

- Leaves oblong or lanceolate, decidedly acute, those subtending the heads narrowly linear. 4. *C. foliosa*.
 Leaves oblanceolate or obovate, those of the inflorescence elliptic or oval.
 Disk of the heads about 15 mm. broad; leaves strigose.
 Inner bracts with subulate, usually brownish and spreading tips. 5. *C. caudata*.
 Inner bracts merely acute. 6. *C. amplifolia*.
 Disk of the heads 10–12 mm. broad; leaves hirsutulous. 7. *C. imbricata*.
 Heads peduncled, naked or rarely subtended by one small leaf.
 Plant less than 1 dm. high; heads solitary at the ends of the branches. 8. *C. depressa*.
 Plant 2–3 dm. high; heads more or less corymbose. 9. *C. pedunculata*.
 Heads long-peduncled; peduncles 2–7 cm. long.
 Heads short-peduncled.
 Plant finely silvery-canescens, scarcely at all hirsute. 10. *C. mollis*.
 Plant usually grayish-green, conspicuously hirsute on the stem; leaves hirsute-ciliate towards the base.
 Most of the leaves sessile.
 Leaves oblanceolate or obovate, obtuse or merely apiculate; disk of the heads 15–20 mm. broad. 11. *C. villosa*.
 Leaves narrowly oblanceolate, decidedly acute; disk 10–12 mm. broad. 12. *C. hirsutissima*.
 Most of the leaves distinctly petioled; disk 10–12 mm. broad.
 Involucre more than 1 cm. high and broad; leaves oblanceolate. 13. *C. Bakeri*.
 Involucre scarcely 1 cm. high and broad; leaves linear-oblong-ovate. 14. *C. floribunda*.
 Involucre hirsute or both hirsute and resinous-granuliferous.
 Leaves lanceolate, acute or acuminate, sessile; plant densely hirsute with long white hairs. 15. *C. barbata*.
 Leaves oblanceolate, oblong, obovate or oval; plant not conspicuously long-hairy.
 Involucre densely hirsute, scarcely at all resinous-granuliferous.
 Leaves short, 1–2 cm. long, obovate, nearly all sessile. 16. *C. Butleri*.
 Leaves oblanceolate, the lower petioled.
 Plant 1–2 dm. high; heads usually solitary and sessile. 17. *C. pumila*.
 Plant 2–3 dm. high; heads peduncled and corymbose.
 Disk of the heads 8–10 mm. broad; leaves densely hirsute, not resinous, only the lower petioled. 18. *C. columbiana*.
 Disk of the heads 12–18 mm. wide; leaves distinctly resinous-granuliferous, nearly all petioled. 19. *C. grandis*.
 Involucre sparingly hirsute, copiously resinous-granuliferous.
 Upper leaves obovate, oval, only rarely oblong or broadly oblanceolate, sessile.
 Heads sessile, subtended by oblong or obovate leaves.
 Leaves numerous, ascending, 3–5 cm. long; involucre about 1 cm. high. 20. *C. resinolens*.
 Leaves scattered, spreading, 1–2 cm. long; involucre 8–9 mm. high. 21. *C. fulcrata*.
 Heads peduncled, naked or subtended by small linear leaves.
 Leaves densely hispid, not conspicuously granuliferous. 22. *C. horrida*.
 Leaves conspicuously granuliferous, only sparingly hispidulous. 23. *C. viscida*.
 Upper leaves as well as the lower oblanceolate, most of them petioled.
 Leaves broadly oblanceolate; heads peduncled.
 Leaves decidedly hairy, sparingly granuliferous. 24. *C. asprella*.
 Stem simple to near the top. 14. *C. floribunda*.
 Stem profusely branched.
 Leaves sparingly hairy, conspicuously granuliferous. 25. *C. hispida*.
 Leaves narrowly linear-oblong-ovate; heads subsessile. 26. *C. stenophylla*.
 Heads discoid; leaves lanceolate, hispid-ciliate, otherwise glabrous, minutely granuliferous. 27. *C. oregana*.

1. *C. angustifolia* Rydb. Stems erect, 2–4 dm. high, canescent and more or less hirsute; leaves 2–5 cm. long, 2–5 mm. wide, acute, grayish-strigose, hispid-ciliate; involucre turbinate-campanulate, 8–10 mm. high; bracts narrow and linear, acute; ligules about 1 cm. long. *C. stenophylla* Britt. & Brown, not Greene. Sandy places: Alta.—Kans. Plain. Au-S.

2. *C. caespitosa* M. E. Jones. Cespitose from a woody root, forming a mat; stems spreading, 5–8 cm. long, villous-hirsute; leaves spatulate, villous-canescens, apiculate; heads sessile; involucre 6 mm. high; bracts ashy-strigose,

the inner with purplish margins; ligules golden yellow, 5-6 mm. long, 1-1.5 mm. wide. Hills: s Utah. *Son.* My.

3. *C. alpicola* Rydb. Stems silky-villous, numerous; leaves oblanceolate, about 3 cm. long, nearly all petioled, white-silky, strigose or the pubescence more spreading on the petioles; bracts linear-lanceolate, strigose or silky, acute; ligules about 8 mm. long and 2 mm. wide. *C. Cooperi* A. Nels. *C. pumila* Coult. & Nels., not Greene. High peaks: Colo.—Wyo. *Subalp.*—*Alp.* JI-Au.

4. *C. foliosa* Nutt. Stem 3-6 dm. high, very leafy, canescent, strigose and hirsute; lower leaves oblanceolate, acute, 3-5 cm. long, white silky-strigose on both sides, subsessile; heads subtended by linear bract-like leaves, about 1 cm. high; bracts linear, acute, strigose. Sandy soil: Minn.—Kans.—Utah—Wash. *Plain*—*Submont.* JI-Au.

5. *C. caudata* Rydb. Stems many, erect, hirsute with long white hairs; lower leaves oblanceolate, silky-strigose on both sides, 3-5 cm. long; heads congested in small clusters at the end of the branches; bracts linear-lanceolate, hirsute-strigose; ligules bright yellow, about 12 mm. long. Hills and mountains: Colo. *Submont.*—*Mont.* JI-Au.

6. *C. amplifolia* Rydb. Stem 3-5 dm. high, often branched, pubescent and sparingly hirsute; lower leaves spatulate, strigose, obtuse or slightly mucronate, the uppermost cordate or truncate at the base, 3-4 cm. long, 12-15 mm. wide; inflorescence corymbiform; bracts hirsute-strigose, linear-lanceolate, acute; ligules about 12 mm. long. Mountains: Colo.—Wyo. *Submont.* JI-Au.

7. *C. imbricata* A. Nels. Stems 3-4 dm. high, subcanescent and with some long hairs; leaves numerous, the lower oblanceolate or spatulate, petioled, the upper broadly oblong or oblong-oblanceolate, sessile and mostly obtuse or apiculate, grayish hirsutulous; involucre 8-10 mm. high; bracts lance-linear, hirsute-strigose. Mountains: Colo.—Utah—Mont. *Submont.* JI.

8. *C. depressa* Rydb. Stems intricately branched; leaves seldom over 1 cm. long, obovate or spatulate, the lower short-petioled, the upper sessile, densely silky-strigose canescent; involucre about 7 mm. high and 1 cm. broad; bracts linear, acute, puberulent-strigose. Geyser formations: Mont.—Wyo. *Mont.* Au.

9. *C. pedunculata* Greene. Stems short, decumbent, about 2 dm. high, strigose-canescens; leaves oblanceolate, silvery canescent, 2-3 cm. long; heads solitary, on peduncles 2-8 cm. long; involucre 8 mm. high, 1-1.5 cm. broad; bracts linear, acute, strigose-canescens. Dry hillsides: Colo. *Submont.* JI.

10. *C. mollis* Nutt. Stems decumbent to erect, 2-4 dm. high, finely strigose-canescens; leaves spatulate or oblanceolate, obtuse or apiculate, or the upper oblong and more acutish, 2-4 cm. long; heads corymbose, peduncled; involucre about 8 mm. high and as wide; bracts linear, acute. Sandy places: Wash.—Utah—Wyo.—Mont. JI-Au.

11. *C. villosa* (Pursh.) Nutt. Stem 2-5 dm. high, strigose and more or less hirsute; leaves 2-4 cm. long, obovate, elliptic or oblong, appressed silky, hirsute-ciliate, usually sessile; heads peduncled, sometimes subtended by a small leaf; involucre about 1 cm. high. Dry hills: Sask.—Minn.—Tex.—N.M.—Ida. *Plain*—*Mont.* JI-S.

12. *C. hirsutissima* Greene. Stem 1-3 dm. high, densely long-hirsute as well as hirsutulous; leaves oblanceolate, somewhat spreading, the lower short-petioled, the upper sessile, densely grayish-strigose; heads fastigiate-corymbose; involucre 8 mm. high. Sandy soil: Sask.—N.D.—N.M.—Ariz. *Plain*—*Submont.* Je-Au.

13. *C. Bakeri* Greene. Stems 2-4 dm. high, often purplish, strigose and only sparingly hirsute; leaves mostly acute, strigose, only slightly resinous-granuliferous; heads few, peduncled; involucre about 8 mm. high; bracts often purplish-margined. Hills: Wyo.—Ida.—N.M.—Utah. *Submont.*—*Mont.* JI-Au.

14. *C. floribunda* Greene. Stem about 3 dm. high, sparingly strigose and with a few long spreading hairs; heads paniculate, small; involucre 7-8 mm.

high and about as broad; bracts linear, acute, rather sparingly hirsute. Sandy soil in cañons: Colo. *Submont.* Au.

15. *C. barbata* Rydb. Stems about 3 dm. high, more or less tinged with purplish or red, hirsute with long white hairs; leaves sessile, 3-5 cm. long, long-hirsute and somewhat resinous-granuliferous; heads sessile; involucre 1 cm. high and 12-15 mm. broad; bracts linear, acute; ligules about 7 mm. long. Sandy plains: Ida. JI.

16. *C. Butleri* Rydb. Stem decumbent at the base or erect, grayish-hispidulous and slightly hirsute; leaves 1-3 cm. long, obtuse or apiculate, grayish-hirsute with short hairs; heads peduncled; involucre 8 mm. high, 10-15 mm. broad; bracts linear, acute; ligules about 8 mm. long. Plains and hills: Mont.—Utah. *Plain.* Au-O.

17. *C. pumila* Greene. Stems decumbent at the base; leaves oblanceolate, 1-3 cm. long, mostly petioled, hirsute but not viscid; involucre about 8 mm. high and 1 cm. broad; bracts linear, hirsute but not viscid; ligules about 6 mm. long. Cañons and mountain sides: Neb.—Colo.—Ida. *Plain—Subalp.* Je-S.

18. *C. columbiana* Greene. Stems ascending or decumbent at the base; leaves oblanceolate or the uppermost linear-lanceolate, 2-3 cm. long, hispidulous on both sides, scarcely at all resinous; heads corymbose; involucre 8 mm. high. Hills and sandy places: B.C.—Mont.—Ore. Je-S.

19. *C. grandis* Rydb. Stems about 3 dm. high; leaves spatulate or oblanceolate, 3-5 cm. long; involucre 8 mm. high; ligules about 1 cm. long. Sandy places: Mont.—Wyo. *Plain—Submont.* Je-Au.

20. *C. resinolens* A. Nels. Stems 2-4 dm. high, sparingly hirsute and resinous-granuliferous; leaves hirsute and resinous-granuliferous; hispid-ciliate, the lower oblanceolate, the upper oblong or oblong-oblanceolate, sessile, 3-5 cm. long, obtuse or apiculate; heads crowded, corymbose; involucre 1 cm. high, 1-1.5 cm. broad. Sandy soil: Mont.—Colo.—Ariz.—Utah. *Submont.—Mont.* JI-S.

21. *C. fulcrata* Greene. Stem 2-6 dm. high, hirsute, hispidulous and resinous-granuliferous; leaves oblong, elliptic or the lower oblanceolate, hirsute, hispidulous and granuliferous; heads corymbose, sessile; involucre 8-9 mm. high. Mountains: N.M.—Tex.—Wyo. *Submont.—Mont.* JI-S.

22. *C. horrida* Rydb. Stems 2-3 dm. high, hirsutulous and hispid; leaves obovate, broadly oblanceolate, or oblong; heads corymbose, peduncled, about 8 mm. high; disk 1 cm. or less wide; bracts sparingly strigose-hirsute. Hills: Neb.—Wyo.—N.M.—Tex. *Plain—Son.* JI-S.

23. *C. viscida* (A. Gray) Greene. Stem 1-3 dm. high, resinous-granuliferous and hispidulous; lower leaves spatulate and petioled, the upper obovate, elliptic, or ovate, sessile, 1-2 cm. long; heads few or solitary; involucre 8 mm. high and 10 mm. wide; bracts resinous-granuliferous and hispidulous. *C. villosa viscida* A. Gray. Mountains and dry ledges: Colo.—Tex.—Ariz. *Plain—Mont.* My-N.

24. *C. asprella* Greene. Stem erect, 2-4 dm. high, hispidulous and sparingly hirsute, simple up to the inflorescence; head corymbose; involucre 7-8 mm. high and broad. *C. compacta* Greene. *C. arida* A. Nels. Dry hills and mountains: Mont.—N.M.—Ariz. *Submont.—Subalp.* JI-S.

25. *C. hispida* (Hook.) DC. Stems 2-3 dm. high, hirsute and resinous-granuliferous; lower leaves oblanceolate and petioled, the upper lanceolate, sessile, 1-3 cm. long; heads corymbose and peduncled; involucre 7-8 mm. high and 8-12 mm. wide. *C. villosa hispida* A. Gray. Sandy river valleys: Sask.—N.M.—Ariz.—Calif.—B.C. *Plain—Submont.* Je-Au.

26. *C. stenophylla* (A. Gray) Greene. Perennial, with caespitose caudex; stem 2-4 dm. high, very hispid, stiff; leaves 2-3 cm. long, spreading, early deciduous, hispid and resinous-granuliferous, the hairs with pustulate bases; heads subtended by a few narrow leaves; involucre 8 mm. high and 1 cm. broad; bracts granuliferous and sparingly hirsute. *C. villosa stenophylla* A. Gray. Dry plains: Tex.—Colo.—Ark. *Plain.* Au-S.

27. *C. oregana* Nutt. Stem 3-6 dm. high, branched, sparingly hirsute; leaves lanceolate, 2-4 cm. long, sessile; heads corymbose, discoid, peduncled, 10-12 mm. high, 12-18 mm. wide; bracts lance-linear, scarious-margined, resinous-granuliferous and sparingly hirsute. Sandy banks: Wash.—w Ida.—n Calif. *Son.* Jl—Au.

13. *ERICAMÈRIA* Nutt.

Very leafy shrubs or undershrubs, with resinous-dotted heath-like foliage. Heads small, paniculate or corymbose; involucre oblong or campanulate; bracts well imbricate, chartaceous or thinner, appressed, wholly destitute of herbaceous tips or some of the outer looser, slightly foliaceous. Ligules yellow, few, sometimes solitary or wanting. Disk-corollas somewhat widening upwards, deeply 5-toothed, yellow. Appendages of the style-branches filiform or slender-subulate. Achenes slender, usually pubescent. Pappus of fine and soft bristles.

Heads radiate; bracts not in distinct ranks.

Leaves linear-filiform or linear-oblanccolate.

Leaves linear-oblanccolate, rarely 15 mm. long, curved; flowers yellow.

1. *E. nana*.

Leaves linear-filiform, mostly 15-20 mm. long, divaricate; flowers ochroleucous.

2. *E. resinosa*.

3. *E. cervina*.

Leaves oblong-oblanccolate, short-cuspidate.

Heads discoid; bracts distinctly 5-ranked.

4. *E. paniculata*.

1. *E. nana* Nutt. Low shrub, 1-3 dm. high, densely branched, somewhat glutinous, glabrous; leaves pointed, channelled; heads solitary or 1 or 2 together; involucre about 6 mm. long; bracts linear-lanceolate, in 4 or 5 series; ray-flowers about 4; disk-flowers 8; achenes hirsute. *Aplopappus nanus* D. C. Eat. *Chrysoma nana* Greene. Rocky hills: Wash.—Utah—Ore. *Submont.* Au—S.

2. *E. resinosa* Nutt. Shrub about 3 dm. high, branched, very glutinous; heads solitary at the ends of the short branches; involucre 6-7 mm. high, subtended by numerous small leaves; bracts linear-lanceolate, in 4 or 5 series; ray-flowers about 6 and disk-flowers about 12; achenes hirsute. *Aplopappus resinosus* A. Gray. Rocky hills: Wash.—Ida.—Ore. *Son.* Jl—S.

3. *E. cervina* (S. Wats.) Rydb. Low shrub about 1.5 dm. high; leaves 8-12 mm. long, entire, 3-nerved; heads in corymbs of 3-5, 6-8 mm. high; outer bracts linear, acuminate, the inner chartaceous, acutish, with scarious margins; rays few. *Aplopappus cervinus* S. Wats. Cañons: Utah.

4. *E. paniculata* (A. Gray) Rydb. Shrub 3-6 dm. high; branches densely punctate; leaves numerous, involute-filiform, resinous-punctate and glabrous, 1-5 cm. long; heads paniculate; involucre about 6 mm. high, turbinate; bracts linear. *Chrysoma paniculata* Greene. *A. paniculatus* A. Gray. Desert regions: s Calif.—s Utah. *Son.*

14. *CHRYSOThÁMNUS* Nutt. RABBIT BRUSH.

Shrubs or undershrubs, with narrow leaves. Inflorescence mostly paniculate-cymose. Heads discoid; flowers all alike, 5-15; corollas yellow or in one species nearly white. Bract coriaceous or chartaceous, in distinct (usually 5) vertical rows, without herbaceous tips. Corollas 5-toothed, slender. Style-branches with exerted, subulate or setaceous-filiform appendages. Achenes slender, terete or slightly angled. Pappus of numerous slender bristles, white.

Bracts of the involucre acuminate.

Achenes glabrous.

Leaves oblanceolate or spatulate, scabrous-puberulent; plant less than 2 dm. high.

1. *C. depressus*.

Leaves narrowly linear, slightly tomentulose or glabrous.

Bracts thick, strongly carinate, glabrous.

3. *C. pulchellus*.

Bracts thin, not strongly carinate, arachnoid-ciliate.

2. *C. Bigelovii*.

Achenes pubescent, usually strigose.

Bracts 4-6 in each vertical row.

3. *C. pulchellus*.

Bracts 2-3 in each vertical row.

Outer bracts long-acuminate, produced and more or less foliaceous.

Leaves linear, more or less distinctly 3-nerved.

4. *C. Parryi*.

Leaves very narrowly linear, 1-nerved.

Leaves and branches green, or the latter slightly tomentulose.

5. *C. attenuatus*.

- Leaves and branches white-tomentose.
 Leaves mostly erect, the upper reduced, not exceeding the heads.
 6. *C. Newberryi*.
- Leaves arcuate-spreading, the upper longer than the heads.
 7. *C. Howardii*.
- Outer bracts short, neither produced nor foliaceous.
 Heads 5-8 mm. high; bracts thin, glabrous.
 Leaves 2-3 cm. long, over 1 mm. wide, light green.
 8. *C. Greenei*.
- Leaves 1-2 cm. long, less than 1 mm. wide, dark green.
 9. *C. filifolius*.
- Heads about 1 cm. long; bracts thicker.
 Leaves less than 1 mm. wide; bracts glabrous.
 10. *C. albidus*.
- Leaves 1 mm. broad or broader; bracts arachnoid-ciliate.
 Leaves 1-2 cm. long; involucre lanate as well as arachnoid.
 11. *C. collinus*.
- Leaves 3-6 cm. long; involucre somewhat viscid, merely arachnoid-ciliate on the margin.
 12. *C. wyomingensis*.
- Bracts not acuminate.
 Bracts 6-7 in each vertical row.
 Bracts 3-5 in each vertical row.
 Achenes pubescent; bracts acute or obtuse.
 Branches, at least when young more or less whitened with a pannose tomentum; style-appendages longer than the stigmatic portion; corolla 7-12 mm. long.
 Bracts and mature leaves perfectly glabrous.
 Bracts ovate, or the outer triangular; involucre about half as long as the flowers.
 14. *C. virens*.
- Bracts lanceolate to linear; involucre more than half as long as the flowers.
 Leaves nearly erect or strongly ascending, straight, 1-2 mm. wide.
 15. *C. graveolens*.
- Leaves scarcely 1 mm. wide.
 Leaves spreading or reflexed, more or less falcate; lobes of the corollas lanceolate, mostly acute.
 16. *C. patens*.
- Leaves erect, about 0.5 mm. wide; lobes of the corolla ovate, obtuse, about 0.5 mm. long, erect in age.
 17. *C. pinifolius*.
- Bracts erose-ciliate on the margin, or tomentose, or both.
 Inflorescence elongate-thyrsoid.
 18. *C. concolor*.
- Inflorescence corymbiform, flat or round-topped.
 Bracts lanceolate, acute; leaves less than 2.5 mm. wide.
 Bracts more or less erose-ciliate on the thin margins.
 Mature leaves glabrous or nearly so, about 1 mm. wide, erect.
 19. *C. oreophilus*.
- Mature leaves more or less densely white-tomentose; bracts lanceolate.
 Leaves 1 mm. wide or less, spreading.
 20. *C. plattensis*.
- Leaves 1-2.5 mm. wide.
 Bracts narrow, linear-lanceolate, strongly carinate, almost glabrous, except the erose-ciliate margins.
 21. *C. pulcherrimus*.
- Bracts usually broader, more or less densely tomentose and viscid as well as ciliate.
 Stems equally leafy throughout; leaves all alike, strongly ascending; bracts strongly carinate.
 22. *C. frigidus*.
- Stems more leafy towards the ends; upper leaves much shorter; bracts slightly carinate.
 23. *C. pallidus*.
- Bracts not at all ciliate on the thicker margin, but white-tomentose on the back.
 Bracts scarcely carinate; older branches not densely and thickly woolly.
 24. *C. speciosus*.
- Bracts strongly carinate; older branches densely and thickly woolly.
 25. *C. nauseosus*.
- Bracts elliptical, nearly glabrous, the thinner ones obtuse; leaves 3-4 mm. wide.
 26. *C. salicifolius*.
- Branches without tomentum; style-appendages shorter than the stigmatic portion; corolla 5-7 mm. long.
 Leaves and the white or straw-colored stem glabrous or nearly so, except the hispidulous-ciliate margins of the former.
 Leaves narrowly linear, 2 mm. wide or less.
 Bracts neither strongly carinate nor with conspicuous green tips.
 Leaves less than 1 mm. wide, 1-nerved.
 Bracts linear, the innermost rounded at the apex.
 27. *C. stenophyllus*.
- Bracts ovate-lanceolate, acute.
 28. *C. laricinus*.
- Leaves 1-2 mm. wide, 3-nerved; bracts lanceolate.
 29. *C. pumilus*.

- Bracts strongly carinate and with conspicuous green tips.
 Bracts acute; upper leaves not much reduced.
 Bracts obtuse; upper leaves much reduced.
 Leaves linear to lance-linear or oblanceolate, 2–8 mm. wide.
 Bracts linear, oblong, or lanceolate.
 Bracts at least the outer ones with thick green tips.
 Bracts comparatively thin, not green-tipped.
 Bracts linear-lanceolate, very acute.
 Bracts oblong or lanceolate, the inner obtuse.
 Involucre not viscid; leaves hispidulous ciliate-dentate.
 Inflorescence densely viscid; leaves minutely denticulate.
 Bracts ovate, oval, or the inner broadly elliptic, abruptly short-cuspidate.
 Leaves and stems decidedly puberulent.
 Leaves 3–6 mm. wide, rarely twisted.
 Leaves 1–2.5 mm. wide, usually twisted.
 Leaves 3-nerved; inner bracts linear, acute; branches green or yellowish.
 Leaves 1-nerved, thick; inner bracts spatulate-oblong, rounded at the apex; branches white.
 Achenes glabrous.
 Bracts acutish; leaves filiform.
 Bracts rounded at the apex; leaves linear.
 Branches white-tomentose when young; corolla 7–10 mm. long.
 Leaves linear, more or less involute; corolla-lobes deltoid-lanceolate.
 Leaves linear-oblanceolate, not involute; corolla-lobes linear-lanceolate.
 Branches not tomentose; corolla 5–6 mm. long.
 Plant glabrous.
 Leaves linear-oblanceolate.
 Leaves filiform, the upper much reduced.
 Plant decidedly puberulent; leaves narrowly linear.
30. *C. elegans*.
 42. *C. turbinatus*.
 31. *C. linifolius*.
 32. *C. stenolepis*.
 33. *C. glaucus*.
 34. *C. viscidiflorus*.
 35. *C. latifolius*.
 36. *C. lanceolatus*.
 37. *C. puberulus*.
 38. *C. marianus*.
 9. *C. filifolius*.
 41. *C. Vaseyi*.
 42. *C. turbinatus*.
 38. *C. marianus*.

1. **C. depressus** Nutt. Undershrub, suffruticose at the base; stem 1–2 dm. high; leaves short, 0.5–1 cm. long, thick; inflorescence short and corymbiform; heads few, about 1 cm. high; bracts 5-ranked in 4–5 series, puberulent, lanceolate, gradually cuspidate. *Bigelovia depressa* A. Gray. Plains: Utah—Colo.—N.M. Plain—Submont. Jl–S.

2. **C. Bigelovii** (A. Gray) Greene. A shrub, 3–10 dm. high; branches white-tomentose at first, soon glabrate; leaves linear-filiform, 1–3 cm. long, white-tomentulose when young, soon glabrate; involucre 10–12 mm. high; bracts thin, lanceolate, tomentulose and arachnoid-ciliate, 5-ranked in 4 or 5 series. *B. Bigelovii* A. Gray. Dry plains: Colo.—Tex.—e Ariz.—Utah. Son.—Submont. Au–O.

3. **C. pulchellus** (A. Gray) Greene. A shrub 6–10 dm. high; branches glabrous, striate; leaves narrowly linear, 1–2 cm. long, glabrous or ciliate on the margins; involucre 10–15 mm. high; bracts 5-ranked in 5–6 series, lanceolate; achenes sparingly pubescent or glabrous. *B. pulchella* A. Gray. Dry hills: Kans.—Tex.—N.M.—Utah; n Mex. Son.—Submont. Au–S.

4. **C. Parryi** (A. Gray) Greene. Suffrutescent perennial; branches erect, 3–5 dm. high, white-tomentulous when young; leaves 3–7 cm. long, minutely puberulent or glabrate; heads racemose-thyrsoïd; involucre about 1 cm. high; bracts linear-lanceolate, attenuate. *C. affinis* A. Nels. *B. Parryi* A. Gray. Hills and dry valleys: Wyo.—Colo. Submont.—Mont. Au–S.

5. **C. attenuatus** (M. E. Jones) Rydb. Low shrub, 1–3 dm. high; leaves 2–3 cm. long, erect, green; heads in small corymbs; involucre about 1 cm. long; bracts narrowly lanceolate, gradually long-attenuate, arachnoid-ciliate on the margins; corollas 10–12 mm. long. *B. Howardii attenuata* M. E. Jones. *C. affinis attenuatus* A. Nels. Mountains: Utah. Submont.—Mont. Au–O.

6. **C. Newberryi** Rydb. Shrubby below, 2–4 dm. high; leaves slightly tomentulose when young, 2–3 cm. long; bracts narrowly lanceolate, attenuate into a long slender subulate spreading tip, carinate, slightly tomentulose and

webby; corolla narrowly tubular-funnelform, about 15 mm. long. Hills: N.M.—Colo. *Son.*—*Submont.* Au—S.

7. **C. Howardii** (Parry) Greene. Low shrub, 1–3 dm. high; branches white-tomentose, ascending; leaves linear-filiform, 3–5 cm. long; involucre 10–12 mm. high; bracts lanceolate-attenuate, tomentose as well as arachnoid; flowers scarcely 1 cm. long. *B. Howardii* A. Gray. Dry hills: Neb.—Wyo.—Colo. *Plain*—*Submont.* Jl—S.

8. **C. Greenei** (A. Gray) Greene. Perennial, with a woody caudex and deep taproot; stems 1–3 dm. high, glabrous and shining, with a white bark; leaves narrowly linear, glabrous, scabrous on the margins, more or less twisted; cyme flat-topped; heads numerous, 6–8 mm. high; bracts chartaceous, lanceolate. *B. Greenei* A. Gray. *C. scoparius* Rydb. Plains: Colo.—N.M.—Utah. *Submont.* S—O.

9. **C. filifolius** Rydb. Small shrub, about 3 dm. high, very bushy; leaves very narrow, linear-filiform, glabrous except the minutely scabrous-ciliate margins; cyme large, flat-topped; heads very numerous, 5–6 mm. high, turbinate; bracts lanceolate-acuminate, the outer with green tips. Plains: Colo.—N.M. *Submont.*—*Mont.* Jl—Au.

10. **C. albidus** (M. E. Jones) Greene. Shrub, 3–8 dm. high; stem slightly tomentulose and viscid; leaves filiform, 2–4 cm. long, about 1 mm. wide, very numerous, slightly if at all tomentulose; heads fastigate-corymbose; involucre 8–10 mm. high; bracts coriaceous, lanceolate, the outer subulate-acuminate, the inner merely acute; corollas straw-colored; achenes hirsutulous. *B. albida* M. E. Jones. Arid regions: Utah—Nev.—se Calif. *Son.* My—Au.

11. **C. collinus** Greene. Shrub, 2–4 dm. high, greenish, obscurely cinereous, tomentulose only when young; leaves linear-filiform, soon glabrate and gummy; heads few; bracts carinate, 3 or 4 in each series, the outer lanceolate, acuminate, the inner cuspidate-attenuate. *B. collina* A. Nels. Hills: Colo.—Wyo. *Submont.* Au.

12. **C. wyomingensis** A. Nels. Tufted shrub, 2–4 dm. high, bushy; branches yellowish green, slightly tomentulose when young; leaves narrowly linear, viscidulous; inflorescence thyrsoid, leafy; bracts somewhat indistinctly 5-ranked, lanceolate gradually short-acuminate. Saline soil and dry plains: Colo.—Wyo. *Submont.* Jl—Au.

13. **C. formosus** Greene. Low shrub, branched from the base, about 3 dm. high; stem white-tomentose; leaves linear, spreading, white-tomentose; bracts 6 or 7 in each vertical rank, glabrous, the outer ovate, the inner longer, oblong-linear, obtuse or acutish. Hills: w Colo. *Son.* Au.

14. **C. virens** Greene. Shrub, 1–2 m. high; leaves 4–6 cm. long, linear; heads many in large corymb; involucre 6–7 mm. long; bracts in 4 series; teeth of the corolla obtusish, one-fourth as long as the throat, not spreading. Plains: se Colo. *Son.* S.

15. **C. graveolens** (Nutt.) Greene. Shrub, 1–1.5 m. high, green, pannose only when young; leaves linear, 4–7 cm. long; heads numerous in a compound corymb; involucre about 8 mm. long; bracts lanceolate, in 4 series; lobes of the corolla lanceolate, more than half as long as the throat, spreading. *B. graveolens glabrata* A. Gray. *C. falcatus* Greene. *C. laetevirens* Greene. Cañons, badlands, and dry hills: Neb.—N.M.—Utah—Mont. *Plain*—*Submont.* Au—O.

16. **C. patens** Rydb. Shrubby, half a meter or so high; leaves 6–8 cm. long, about 1 mm. broad; bracts lanceolate, acute, earinate, glabrous; corolla lobes about 1 mm. long. Dry plains and hills: Colo. *Plain*—*Submont.* Je—Jl.

17. **C. pinifolius** Greene. Shrub, 3–5 dm. high; branches erect, yellowish green and soon glabrous, slightly resinous; leaves 4–5 cm. long, almost filiform; heads in small panicles; involucre about 8 mm. high; bracts in 3 series, narrowly lanceolate. Dry hills and plains: Colo.—N.M.—Nev.—Ore. *Son.*—*Submont.*

18. **C. concolor** (A. Nels.) Rydb. Shrub, 3–4 dm. high, woody at the base; branches yellowish green, pannose only when young; leaves linear, somewhat

spreading, 4-7 cm. long, 1-2 mm. wide, slightly pannose-tomentose; involucre 8-9 mm. long; bracts lanceolate, acutish, scarious-margined, erose, ciliate, the lower slightly tomentose. *C. frigidus concolor* A. Nels. Sandy alkaline soil: Wyo. *Submont.* S.

19. *C. oreophilus* A. Nels. Low shrub, 2-4 dm. high; branches grayish with a thin tomentum, yellowish green; leaves erect, linear-filiform, 3-5 cm. long; involucre 8 mm. long; bracts ovate-lanceolate or oblong-lanceolate, abruptly acute. Stony hills: Wyo.—Colo. *Submont.* Jl-O.

20. *C. plattensis* Greene. Low undershrub, 2-3 dm. high; branches more or less pannose-tomentose; leaves linear-filiform, tomentose, 3-5 cm. long; bracts in about 3 series, lanceolate, acute, glabrous except the erose-ciliate margins; achenes hirsute-strigose. Plains and hills: Mont.—S.D.—Colo. *Plain—Submont.* Jl-O.

21. *C. pulcherrimus* A. Nels. Shrub, 5-15 dm. high; branches yellowish, minutely lanate; leaves narrowly linear, 5-8 cm. long, 1-2 mm. wide, white-tomentose to nearly glabrate; bracts in 2 or 3 series; linear-lanceolate, ciliate on the margins; achenes softly strigose. Plains: Mont.—Colo.—Utah—Ida. *Plain.* Au-O.

22. *C. frigidus* Greene. Undershrub, 2-6 dm. high; branches white-tomentose; leaves narrowly linear, 3-5 cm. long, white-tomentose, rarely glabrate; bracts in 2 or 3 series, lanceolate, the outer acute, the inner obtuse. Plains: Sask.—Colo.—Utah—Alta. *Plain—Submont.* Jl-S.

23. *C. pallidus* A. Nels. Small tufted shrub, 2-5 dm. high; branches with close felted tomentum; leaves ascending or spreading, densely tomentose, the lower 4-5 cm. long; heads thyrsoid-paniculate; bracts ovate-lanceolate, subacute, ciliate on the margins and tomentose on the back. Alkaline flats: n Colo.—Wyo. *Submont.* Au-S.

24. *C. speciosus* Nutt. Shrub, 1-2 m. high; branches yellow, sparingly tomentose; leaves numerous, 3-4 cm. long, about 1 mm. wide, white-tomentose; bracts in 3 or 4 series, tomentose, but not ciliate, lanceolate, acute; achenes strigose. *B. graveolens* A. Gray, mainly. Plains: Ore.—Ida.—Calif. *Son.* Jl-S.

25. *C. nauseosus* (Pursh.) Britton. Shrub, 5-10 dm. high, permanently white-tomentose, almost cottony; leaves 3-6 cm. long, about 1 mm. wide, tomentose, often spreading; bracts lanceolate, acute, more or less tomentose, but not ciliate; achenes hirsute-strigose. *B. graveolens albicaulis* A. Gray. Hillsides: B.C.—Mont.—Wyo.—Utah—Ore. *Son.—Submont.* Je-Au.

26. *C. salicifolius* Rydb. Shrub, 3-10 dm. high; branches erect, finely pannose-tomentulose; leaves linear, 3-nerved, 4-6 cm. long, 3-6 mm. wide, minutely tomentulose; heads in a dense corymbiform cyme; involucre 7-8 mm. long; corollas about 1 cm. long; achenes coarsely strigose, angled. *B. graveolens latisquamea* A. Gray. Valleys: Utah. *Son.—Submont.* Au-S.

27. *C. stenophyllus* (A. Gray) Greene. Low shrub, 1-3 dm. high, much branched; bark white or straw-colored; leaves somewhat involute and twisted, spreading, 2-3 cm. long; bracts in three series, linear, thin, the outer acute, the innermost rounded at the apex; achenes strigose. *C. pumilus varus* A. Nels. *B. Douglasii stenophylla* A. Gray. Dry ridges and stony slopes: Nev.—Mont.—Wyo.—Ariz. *Submont.* Au-S.

28. *C. larinus* Greene. Low shrub, 2-3 dm. high, fastigiately branched; leaves filiform, 1-1.5 cm. long, scabrous-puberulent on the margins; heads few and corymbose; involucre about 5 mm. high; bracts ovate-lanceolate, somewhat keeled, acute with the apex slightly spreading; achenes densely strigose. Valleys: c Utah—Ariz. *Son.* Au-S.

29. *C. pumilus* Nutt. Low shrub, 1-3 dm. high; branches glabrous, whitish, shining; leaves narrowly linear, 2-4 cm. long, sometimes involute, rarely somewhat twisted; involucre about 5 mm. high; bracts mostly lanceolate, glabrous, acute or the inner obtuse; achenes sparingly strigose. *B. Douglasii pumila* A. Gray. Plains and foothills: Mont.—Colo.—Utah.—Ore. *Plain—Submont.* Jl-S.

30. *C. elegans* Greene. Low shrub, 1-3 dm. high, branched; branches glabrous, straw-colored; leaves narrowly linear, 1-3 cm. long, 1-2 mm. wide, 3-nerved, strongly twisted; involucre about 6 mm. high; bracts lanceolate, acute, glabrous; achenes sparingly strigose. Plains and dry valleys: Colo.—N.M. *Submont.* Jl—Au.

31. *C. linifolius* Greene. Shrub, 6-10 dm. high, fastigiately branched; branches glabrous, white, striate; leaves ascending, linear-lanceolate, acute, 3-nerved, 2-4 cm. long, 5-8 mm. wide; involucre about 7 mm. high; bracts oblong, obtuse; achenes densely hirsute-strigose. *B. linifolia* A. Nels. Dry plains and river bottoms: Wyo.—Colo. *Plain—Submont.* Au—S.

32. *C. stenolepis* Rydb. Low shrub, 2-3 dm. high, somewhat spinescent; branches short, erect, glabrous or finely puberulent above; leaves narrowly lance-linear, 1-2 cm. long, 2-4 mm. wide, somewhat twisted; involucre about 8 mm. long; achenes hirsute-strigose. Dry hills: Mont.—Wyo.—Utah—Ida. *Plain—Submont.* Au—S.

33. *C. glaucus* A. Nels. Shrub, 3-10 dm. high; leaves ascending, narrowly linear-lanceolate, acute, obscurely 3-nerved, 2-4 cm. long, usually somewhat twisted, bluish green; bracts subcarinate, membranous, glabrous; achenes silky-strigose. *C. serrulatus* (Torr.) Rydb. *B. Douglasii serrulata* A. Gray. *C. leucocladus* Greene. Dry plains and slopes: Wyo.—Colo.—Utah—Ariz. *Submont.*

34. *C. viscidiflorus* (Hook.) Nutt. Shrub, 6-12 dm. high; leaves linear, 3-5 cm. long, 3-nerved, 2-4 mm. wide; involucre about 7 mm. high; bracts thin, oblong; achenes strigose. *B. Douglasii* A. Gray. Dry plains: Mont.—Wyo.—Calif.—Wash. *Plain—Son.* Jl—S.

35. *C. latifolius* (D. C. Eat.) Rydb. Low shrub; leaves oblanceolate or oblong, acute, 3-5-nerved, glabrous, 2-4 cm. long, 5-8 mm. broad; involucre 6 mm. high. *Linowsyris viscidiflora latifolia* D. C. Eat. Mountains: Nev.—Ida.—Utah. *Submont.* S.

36. *C. lanceolatus* Nutt. Undershrub, 1-3 dm. high; branches straw-colored or gray, finely puberulent; leaves linear-lanceolate, 2-4 cm. long; involucre 7-8 mm. long; outer bracts lanceolate, acute, the inner oblong, obtuse, glabrous, or the outer puberulent; achenes hispid-strigose. *B. Douglasii lanceolata* A. Gray. *B. Douglasii spathulata* M. E. Jones, a form with short lower leaves. Dry plains and hills: Mont.—Colo.—Nev.—Wash. *Plain—Submont.* Au—S.

37. *C. puberulus* (D. C. Eat.) Greene. Undershrub, 1-3 dm. high; branches finely puberulent; leaves narrowly linear, 2-4 cm. long, densely puberulent; involucre 6-7 mm. long; bracts glabrous, lanceolate or the inner linear, acute, somewhat viscid; achenes sparingly strigose. *B. Douglasii puberula* A. Gray. Dry plains and hills: B.C.—Mont.—Colo.—Calif. *Son.—Mont.* Jl—S.

38. *C. marianus* Rydb. Undershrub, 1-2 dm. high, with a woody thick caudex; leaves linear or the lower linear-oblanceolate, acute, thick, 1-2 cm. long, 1-15 mm. wide; bracts yellowish, glutinous, erose-ciliate on the margins, the outer ovate, acutish, the inner spatulate-oblong, rounded at the apex; achenes sparingly strigose. Valleys: Utah. *Son.* Jl.

39. *C. leiospermus* (A. Gray) Greene. Shrub, 3-6 dm. high; branches white-tomentose, or in age glabrate; leaves sparse, involute-filiform (in var. *brevisata* about 1 cm. long or less); bracts oblong, or the inner linear-oblong, rounded at the apex; achenes glabrous. *B. leiosperma* A. Gray. Desert regions: s Utah—Nev. *L. Son.*

40. *C. glareosus* (M. E. Jones) Rydb. Undershrub, growing in dense clumps, about 3 dm. high; leaves linear-oblanceolate, the upper reduced, oblong, and bract-like; inflorescence corymbiform; bracts about 4 in each vertical row, sparsely lacerate on the margins and white-tomentulose, obtuse or rounded at the apex, the lower small, ovate, the upper with conspicuous thickened tips, linear; corolla fully 1 cm. long. *B. glareosa* M. E. Jones. Mesas: e Utah. *Submont.* O.

41. *C. Vaseyi* (A. Gray) Greene. Perennial, with a caespitose woody caudex, 1-2 dm. high, glabrous; leaves linear-oblanceolate, obtuse, thick, glabrous, 1-2.5

cm. long, 1-3 mm. wide; inflorescence fastigate-cymose; bracts oblong, rounded at the apex, all but the innermost with a thickened greenish tip; achenes glabrous or slightly puberulent. *C. Bakeri* Greene. Mountains: Wyo.—Colo.—Utah. *Submont.* JI-S.

42. *C. turbinatus* (M. E. Jones) Rydb. Shrub, about 1 m. high, bushy; leaves long and narrow, canaliculate, the uppermost much reduced, glabrous, or slightly viscid in the inflorescence; bracts 5 or 6 in each vertical row, the lowest minute, all obtuse, merely apiculate, with a darker center, the inner oblong to linear, 8 mm. long. *B. turbinata* M. E. Jones. Gravel: Utah. *Son.* S.

15. ISOCOMA Greene.

Herbaceous or shrubby plants, usually with viscid foliage. Leaves alternate, entire, toothed, or pinnately parted. Heads discoid. Involucres mostly campanulate, several- to many-flowered; bracts leathery, obtuse or acutish, well imbricate, with more or less thickened tips. Disk-flowers perfect; corolla yellow, the throat much inflated. Tips of the style-branches subulate, lanceolate or broader. Achenes short, broadened upwards, usually silky-strigose. Pappus of numerous barbellate bristles.

Bracts acute, linear-lanceolate.

1. *I. pluriflora*.

Bracts obtuse or obtusish, linear, oblong, or oblanceolate.

Leaves 1-ribbed, the lower often toothed.

Plant herbaceous, except the suffruticose base; bracts comparatively thin.

Plant shrubby; bracts much thickened, especially at the apex.

Leaves triple-nerved, entire.

2. *I. Wrightii*.

3. *I. acradenia*.

4. *I. scopulorum*.

1. *I. pluriflora* (T. & G.) Greene. Suffrutescent; stems angular, glabrous; leaves narrowly linear, obscurely 1-nerved, 3-6 cm. long; heads 8 mm. high, 5 mm. broad, 15-18-flowered, crowded at the ends of the branches in a fasciculate corymb; bracts smooth, shining, not thickened at the apex. *Bigelovia pluriflora* A. Gray. Plains: Colo. *Son.*

2. *I. Wrightii* (A. Gray) Rydb. Stems 3-6 dm. high, strict, glabrous; leaves thickish, narrowly linear, entire, or the lower toothed, somewhat scabrous; heads 5-6 mm. high, 4-5 mm. broad, 7-15-flowered, numerous in a large corymbiform cyme; bracts oblong or broadly lanceolate, obtuse. *Linosyris Wrightii* A. Gray. *B. Wrightii* A. Gray. Banks and saline soil: Tex.—Colo.—Utah—Ariz.; n Mex. *Son.* Au-S.

3. *I. acradenia* Greene. Low shrub, 3-6 dm. high, much branched, glabrous and glutinous; leaves narrowly oblanceolate, entire, 2-4 cm. long; heads 6-8 mm. high, 6-10-flowered, corymbose-clustered; bracts oblong, obtuse, with a conspicuous gland; achenes strigose. Desert regions: s Calif.—s Utah—Ariz. *L. Son.* S-O.

4. *I. scopulorum* (M. E. Jones) Rydb. Low shrub, about 5 dm. high, with straw-colored branches; leaves linear, 2-7 cm. long, acute, finely puberulent or glabrate, scabrous on the entire margins; heads few, corymbose; involucres turbinate, nearly 1 cm. high; bracts well imbricate in 6-7 series, elliptic to oblong, yellowish, with a green spot on the back; achenes hispid. *B. Menziesii scopulorum* M. E. Jones. *Hesperodoria scopulorum* Greene. Cañons: s Utah. *Son.*—*Submont.* Au-S.

16. PRIONOPSIS Nutt.

Annual or biennial, caulescent glabrous herbs. Leaves alternate, sessile, spinulose-toothed. Heads radiate, showy. Involucres broadly hemispheric; bracts well imbricate in several series, the outer spreading; receptacle naked. Ray-flowers numerous, pistillate; ligules yellow. Disk-flowers numerous, perfect; corolla yellow. Anthers obtuse at the base. Style-branches with linear-lanceolate appendages. Achenes glabrous, those of the rays broader. Pappus of few firm, hair-like bristles, the outer often shorter; all deciduous.

1. *P. ciliata* Nutt. Stem 8-15 dm. high, sparingly branched, glabrous; leaves numerous, oval, ovate, or oblong, saliently dentate, with spinulose-tipped teeth; heads few, corymbose; involucres about 1 cm. high, 2-2.5 cm. broad; bracts

linear-lanceolate, acuminate, squarrose; ligules numerous. 1-1.5 cm. long. *Aplopappus ciliatus* DC. River banks and hillsides: Mo.—Tex.—Colo. *Plain.*

17. *SIDERÁNTHUS* Nutt. IRON PLANT.

Perennial or annual herbs, rarely suffruticose at the base. Leaves alternate, with spinulose-tipped lobes or teeth. Heads radiate, or in two species discoid. Involucres campanulate or hemispheric, many-flowered; bracts well imbricate, in 3-5 series, appressed or with loose tips, green; receptacle flat, naked, usually pitted. Ray-flowers pistillate, or in two species wanting; ligules yellow. Disk-corollas yellow; tube scarcely dilated into a distinct throat. Anthers obtuse at the base. Style-branches flattened, with lanceolate appendages. Achenes obtuse, pubescent, mostly 8-10-nerved. Pappus of many unequal hair-like bristles in 1-3 series, persistent.

Leaves spinescent-toothed, not pinnatifid.

Heads discoid; perennials, with woody caudex.

Heads peduncled.

Heads sessile.

Heads radiate; annuals.

Leaves oblanceolate, spinulose-tipped; plant more or less viscid.

Leaves linear-oblanceolate, bristle-tipped; plant strigose.

Leaves pinnatifid; perennials, with a short woody base; achenes somewhat flattened.

Stem more or less floccose or cinereous, especially when young.

Plant cinereous pubescent, more or less glandular.

Plant more or less floccose, not at all glandular.

Plant neither floccose nor cinereous.

Plant perfectly glabrous or sparingly glandular-pubescent.

Plant finely puberulent, or hispid.

Heads hemispheric; bracts slightly glandular.

Heads somewhat turbinate; bracts densely glandular-pubescent.

1. *S. grindelioides*.

2. *S. aberrans*.

3. *S. annuus*.

4. *S. gracilis*.

5. *S. australis*.

6. *S. spinulosus*.

7. *S. glaberrimus*.

8. *S. puberulus*.

9. *S. turbinellus*.

1. *S. grindelioides* (Nutt.) Rydb. Low caespitose perennial; stems erect, 1-3 dm. high, somewhat pubescent; leaves thick, obovate or oblanceolate, spinulose-serrate, 1-3 cm. long, more or less crisp-hirsute or strigose; involucre hemispheric, 6-7 mm. high, 1 cm. broad; bracts lanceolate, puberulent; achenes somewhat flattened. *Eriocarpum grindelioides* Nutt. *Aplopappus Nuttallii* T. & G. Dry plains and hills: Sask.—Neb.—N.M.—Ariz.—Nev.—Alta. *Plain—Submont.* Je—Au.

2. *S. aberrans* (A. Nels.) Rydb. Perennial, with a creeping rootstock; stems erect, 5-10 cm. long, glandular-pubescent; leaves obovate or oblong, glandular-pubescent, or the lower ovate, 1-3 cm. long, sparingly cuspidate-toothed on the margins; heads 1-4, subsessile, 9-14 mm. high; bracts broadly linear, acute, green and glandular-viscid at the apex; achenes cylindric-fusiform, 3 mm. long. *Macronema aberrans* A. Nels. Mountains: Ida. *Mont.* Au.

3. *S. annuus* Rydb. Annual; stem simple below, branched above, more or less glandular-pubescent; leaves oblanceolate, spinulose-dentate, 3-6 cm. long; heads corymbose; involucre hemispheric, about 8 mm. high, viscid-pubescent; bracts linear-lanceolate, acuminate; ligules light yellow, 5-6 mm. long; achenes obtusely 5-angled. *Aplopappus rubiginosus* A. Gray, in part. Sandy places: Neb.—Colo.—Tex. *Plain.*

4. *S. gracilis* (Nutt.) Rydb. Annual, branched, becoming woody at the base; stems 2-4 dm. high, hispid-strigose; leaves linear-oblanceolate to spatulate in outline, coarsely dentate or somewhat pinnatifid; teeth tipped with long bristles; involucre 6 mm. high; bracts linear, spinulose-tipped, strigose; ligules 5-6 mm. long, light yellow. *Dieteria gracilis* Nutt. *A. gracilis* A. Gray. Dry hills: s Colo.—Tex.—Ariz.—Calif.; Mex. *Son.—Submont.* My—S.

5. *S. australis* (Greene) Rydb. Stem 2-4 dm. high; leaves pinnatifid, 2-7 cm. long; segments linear or oblong, spinulose-tipped, entire or toothed; involucre 6 mm. high; bracts linear, puberulent, spine-tipped; ligules 5-6 mm. long, yellow. *Eriocarpum australe* Greene. Dry soil: Colo.—Tex.—N.M.—Ariz.—e Utah; Mex. *Son.—Submont.* Ap—Je.

6. *S. spinulosus* (Pursh) Sweet. Stem 1-4 dm. high, branched; leaves 1-3 cm. long, pinnatifid; segments linear or oblong, usually toothed or pinnately

parted; involucre 6-8 mm. high; bracts linear-lanceolate, spinulose-tipped, villos-canescens; ligules 6-7 mm. long, bright yellow. *A. spinulosus* DC. Plains and prairies: Sask.—Minn.—Tex.—Ariz.—Alta.; n Mex. *Son.—Plain—Submont. Je-S.*

7. *S. glaberrimus* Rydb. Stems several, 1-3 dm. high; leaves rather rigid, about 2 cm. long, bluish green, glabrous, pinnatifid; segments oblong, spinulose-tipped; heads numerous, corymbose, depressed hemispherical, 8-15 mm. broad; bracts acute or spinulose-tipped; ligules 4-5 mm. long. Dry plains: S.D.—Ia.—Tex.—N.M.—Wyo. *Plain. Je-S.*

8. *S. puberulus* Rydb. Stems less than 1.5 dm. high; leaves pinnatifid or bipinnatifid; segments 1-5 mm. long, spinulose-tipped; heads 8-9 mm. high, 10-12 mm. broad; bracts narrowly linear-lanceolate, with small herbaceous tips, finely puberulent; ligules about 20, 8-9 mm. long. Hills: Colo. *Submont.—Mont.*

9. *S. turbinellus* Rydb. A low and bushy puberulent perennial, 1.5-2 dm. high; leaves pinnatifid or the upper reduced and merely toothed; segments narrow; heads numerous, small, 7-8 mm. high; bracts linear-lanceolate, acute, appressed; ligules 10-15, 7-8 mm. long. Dry plains: Ida. *Plain. Au.*

18. PYRROCÔMA Nutt.

Perennial herbs, with thick taproots. Leaves alternate, sometimes with spinulose teeth. Heads terminal, or in the axils of the upper leaves, radiate. Involucre hemispheric; bracts more or less foliaceous; receptacle flat, alveolar. Ray-flowers numerous, fertile or sterile; ligules yellow, sometimes not longer than the disk. Disk-flowers yellow, perfect; corollas cylindric, slightly if at all dilated upwards, with short, erect teeth. Appendages of the style-branches subulate-linear, longer than the stigmatic portion. Achenes linear, 3-angled, striate, usually glabrous. Pappus reddish brown or yellow, of numerous rigid bristles.

Heads apparently discoid, the sterile rays being concealed in the pappus.

Inner bracts recurved cuspidate.

1. *P. subsquarrosa.*

Bracts not recurved cuspidate.

Bracts oblong or oval; heads hemispheric.

Leaves and bracts more or less spinulose-toothed, the latter with a narrow scarious margin.

2. *P. carthamoides.*

Leaves and bracts not spinulose-toothed, the latter with a broad scarious erose margin.

Pappus sordid; plant almost glabrous.

3. *P. rigida.*

Pappus brownish red; plant villous.

4. *P. erythropappa.*

Bracts lanceolate; head campanulate-turbinate.

5. *P. Cusickii.*

Heads distinctly radiate.

Bracts except the innermost obtuse, obovate or oblong.

6. *P. crocea.*

Bracts mostly acute or acuminate.

Plant not glandular.

Heads large; disk 2 cm. or more in diameter; bracts in about 3 series.

Bracts almost of the same length.

7. *P. insecticruris.*

Outer bract decidedly shorter.

Involucre and upper part of stem decidedly villous; bracts wholly foliaceous.

Bracts oblanceolate, abruptly acute; achenes hirsute.

8. *P. Clementis.*

Bracts lanceolate, long-acute; achenes glabrous.

9. *P. villosa.*

Involucral bracts almost glabrous except the ciliate margins, chartaceous at the base with foliaceous tips.

Leaves and stem glabrous, or the latter slightly villous.

Basal leaf-blades broadly lanceolate.

10. *P. lapathifolia.*

Basal leaf-blades narrowly oblanceolate.

11. *P. integrifolia.*

Leaves hirtellous; stem hirsute-villous.

12. *P. scaberula.*

Heads smaller; disk less than 2 cm. in diameter.

Bracts in 2-3 unequal series.

Leaves 5-15 mm. wide; disk 1-2 cm. wide.

Inflorescence corymbiform; bracts long-acute.

13. *P. lanceolata.*

Inflorescence racemiform; bracts abruptly acute.

Stem and bracts more or less white-woolly.

14. *P. lagopus.*

Stem and bracts glabrous or nearly so.

15. *P. Vaseyi.*

Leaves 2-4 mm. wide; disk 1 cm. or less wide.

16. *P. tenuicaulis.*

Bracts nearly of the same length.

Stem-leaves oblanceolate; bracts long-acuminate.

17. *P. acuminata.*

Stem-leaves lanceolate; bracts acute or short-acuminate.

Plant villous.

18. *P. inuloides.*

Plant, except the upper parts, glabrate in age.

19. *P. uniflora.*

Plant hirsute-villous, decidedly glandular.

20. *P. hirta.*

1. *P. subsquarrosa* Greene. Stems several, more or less decumbent, 1-2.5 dm. high, canescent-tomentulose; leaves petioled; blades lanceolate, conspicuously spinulose-serrate; involucre about 2 cm. high, narrowly campanulate; outer bracts linear-lanceolate, spinulose-serrate, the inner spatulate, subscarious-margined and with a recurved cusp. Mountains: Wyo. *Mont.*

2. *P. carthamoides* Hook. Stems 2-4 dm. high, strict, more or less villous-puberulent; leaf-blades oblanceolate, or the upper linear, mostly spinulose-dentate, puberulent; bracts in 3 or 4 series, of the same height or the outer longer, 18-20 mm. long, acute or acuminate; pappus tawny or reddish. *Aplopappus carthamoides* A. Gray. Dry prairies: Alta.—Mont.—Ore.—B.C. JI-S.

3. *P. rigida* Rydb. Stems 1-3, erect or ascending, finely pubescent when young, glabrate in age, 2-4 dm. high; leaves pale bluish green, firm, oblanceolate, acute, finely puberulent, or glabrate; heads 15-20 mm. high; bracts very firm, imbricate in 3-4 series, acute or mucronate. Sandy places and meadows: Mont.—Ida.—Wash. *Son.*—*Submont.* JI-Au.

4. *P. erythropappa* Rydb. Stems 1.5-3 dm. high, with 1-4 heads; stem-leaves 3-6 cm. long, firm, subsessile, finely pubescent, or glabrate on the upper surface; heads very short peduncled, 10-15 mm. high; bracts imbricate in 4-5 series, pubescent, broadly oval or oblong, obtuse, mucronate, or the outer acute. Plains: Ida. *Son.*

5. *P. Cusickii* (A. Gray) Greene. Stem 1-2 dm. high, ascending or decumbent, puberulent; leaf-blades spatulate or oblanceolate, glaucous and puberulent, short-petioled, entire or sparingly spinulose-dentate; heads solitary, about 15 mm. high, 10-15 mm. broad; bracts in about 3 series, of nearly the same length. *Aplopappus carthamoides Cusickii* A. Gray. Stony places: Ore.—Ida. Je-JI.

6. *P. crocea* (A. Gray) Greene. Stems 3-6 dm. high, sparingly villous above; lower leaves petioled, 1-2 dm. long; blades spatulate, firm, glabrous; upper stem-leaves lanceolate and sessile; heads few; involucre 18-20 mm. high; ligules 2 cm. long, orange. *A. croceus* A. Gray. Mountains: Wyo.—N.M.—Utah. *Submont.* JI-Au.

7. *P. insecticruris* (Henders.) Heller. Stems 3-4 dm. high, more or less villous; basal leaves 8-10 cm. long, almost glabrous or villous on the midrib, sinuately serrate, oblanceolate; upper stem-leaves lanceolate or oblong, saliently serrate; heads 2-3 cm. wide; bracts loose, linear-lanceolate, acute or acuminate; ligules 1.5 cm. long. *Aplopappus insecticruris* Henders. *P. pratensis* Greene. Stony ground: Ida. *Son.* JI.

8. *P. Clementis* Rydb. Stems more or less villous, ascending or decumbent, 1-4 dm. high; lower stem-leaves linear-oblong, about 1 dm. long, glabrous except the ciliate margins, saliently dentate, the upper lanceolate or ovate-lanceolate; heads solitary; disk 2.5-3 cm. broad; outer bracts almost equalling the inner; ligules 10-12 mm. long, bright yellow. *P. calendulacea* and *P. subcaesia* Greene. (?) *P. cheiranthifolia* Greene, a depauperate form. Mountains: Wyo.—Colo.—Utah. *Submont.*—*Alp.* Je-Au.

9. *P. villosa* Rydb. Stems 1-3, ascending, 1-1.5 dm. high; basal leaves oblanceolate, 7-10 cm. long, somewhat glaucous and rigid, entire-margined or occasionally slightly spinulose-denticulate; stem-leaves linear-lanceolate, 2-4 cm. long; heads solitary; disk about 2 cm. broad; outer bracts fully as long as the inner; ligules about 1 cm. long. Mountains: Wyo. *Mont.* Au.

10. *P. lapathifolia* Greene. Stems several, 5-6 dm. high, reddish, somewhat villous above; basal leaves 1.5-2 dm. long, petioled; blades broadly lanceolate, often rounded, truncate or subcordate at base, light green and glabrous; cauline leaves lanceolate, sessile and dentate; heads rather numerous, corymbose; involucre 2-2.5 cm. broad; bracts narrowly linear, slightly villous; ligules 6 mm. long. Dry places: Utah.

11. *P. integrifolia* (Porter) Greene. Stems 1-4 dm. high, ascending or decumbent at the base; lower leaves oblanceolate, 1-2 dm. long; entire, glabrous, the upper linear or linear-lanceolate, sessile; heads solitary or few; involucre 15-18 mm. high; outer bracts often equalling or exceeding the inner; ligules 12-

15 mm. long. *Aplopappus integrifolius* Porter. Meadows: Sask.—Colo.—B.C. Plain—Submont. Jl—Au.

12. *P. scaberula* Greene. Stems erect, 3–6 dm. high, hirsute-villous; basal leaves 1–1.5 dm. long, lanceolate, entire, hirtellous, reticulate; stem-leaves lance-linear, sessile; involucre about 15 mm. high; bracts lanceolate, acute, scabrous-ciliolate and sometimes slightly puberulent; ligules about 1 cm. long. Hills: Ida. Submont. Jl.

13. *P. lanceolata* (Hook.) Greene. Stems 2–4 dm. high, glabrous or nearly so; basal leaf-blades lanceolate, usually more or less dentate, glabrous; stem-leaves narrowly lanceolate, sessile; heads several, corymbose; involucre 15–20 mm. broad; bracts lanceolate, linear-acute; ligules about 10 mm. long. *A. lanceolatus* T. & G. Meadows and flats: Sask.—Neb.—Wyo.—B.C. Plain. Jl—Au.

14. *P. lagopus* Rydb. Stems decumbent, 1–2 dm. long; basal leaves 6–10 cm. long, lanceolate or linear-lanceolate, firm, distantly serrate with almost spinulose teeth; stem-leaves narrowly linear-lanceolate, sessile; involucre about 12 mm. wide; bracts oblong, acute; ligules about 8 mm. long. Dry plains and alkali flats: Wyo.—Colo. Plain—Submont. Jl—Au.

15. *P. Vaseyi* (Parry) Rydb. Stems several, decumbent at the base, 1–3 dm. high, glabrous or nearly so; basal leaves 7–10 cm. long, lanceolate, sinuate-dentate or entire; stem-leaves linear or lance-linear, sessile, mostly entire; involucre about 1 cm. broad; bracts lanceolate or oblong, abruptly acute; ligules about 8 mm. long. *A. lanceolatus Vaseyi* Parry. Mountains: Sask.—Colo.—Utah. Submont.—Mont. Jl—S.

16. *P. tenuicaulis* (D. C. Eat.) Greene. Stems decumbent at the base, 1–3 dm. high, glabrous, but usually with a villous tuft at the base; leaves narrowly linear-lanceolate or linear, entire; inflorescence racemose; involucre somewhat turbinate, 6–7 mm. high; bracts acute; ligules 4–5 mm. long. *A. lanceolatus tenuicaulis* A. Gray. Alkaline meadows: Ore.—Nev.—Utah—Wyo. Son. Jl—Au.

17. *P. acuminata* Rydb. Stems several, slender, about 1 dm. high, monocephalous; leaves narrowly linear-ob lanceolate, with strong midrib, 2–4 cm. long, entire-margined, finely villous on both sides; heads on naked peduncles, about 1 cm. high and 12–15 mm. broad; bracts broadly lanceolate; ligules about 1 cm. long. Hills: Wyo.

18. *P. inuloides* (Nutt.) Greene. Stems 1–3 dm. high, ascending or decumbent, more or less white-villous; lower leaf-blades lanceolate, or oblanceolate, 1–1.5 dm. long, usually more or less dentate; stem-leaves lanceolate or linear, sessile; involucre 15–20 mm. wide; bracts linear, acuminate. *P. crepidinea*, *P. hololeuca*, and *P. sericea* Greene. Plains and meadows: Mont.—Colo.—Utah—Ida. Submont.—Mont. Je—Au.

19. *P. uniflora* (Hook.) Greene. Stems ascending or decumbent at the base, 1–3 dm. high; basal leaf-blades lanceolate, usually sharply dentate; heads usually solitary; involucre 15–20 mm. wide; bracts linear, acute, glabrous or slightly villous; ligules about 8 mm. long. *A. uniflorus* T. & G. *P. tuberosa* and *P. plantaginea* Greene. River valleys: Sask.—Colo.—Utah—Mont. Plain—Mont. Jl—S.

20. *P. hirta* (A. Gray) Greene. Stems ascending or decumbent at the base, 1–4 dm. high, hirsute-villous; basal leaves petioled, 1–2 dm. long, lanceolate, coarsely and saliently dentate; heads solitary or few; involucre 15–20 mm. broad; bracts linear, acuminate, glandular-pubescent, imbricate, but nearly equal. *A. hirtus* A. Gray. *P. foliosa* Greene. Hills: Ore.—Ida.—Wash. Plain—Submont. Jl.

19. STENOTÓPSIS Rydb.

Low shrubs, with fastigate branches, narrow fasciculate glandular-punctate leaves and large peduncled heads. Involucre broadly hemispherical; its bracts subequal, almost in a single series, linear-lanceolate, thin, scarious-margined, not at all herbaceous. Receptacle naked, alveolar. Ray-flowers about 12, pistillate and fertile; ligules yellow, large. Disk-flowers perfect; corollas tubular

trumpet-shaped, deeply 5-lobed. Anthers obtuse at the base. Style-branches stigmatic their whole length, with ovate to lanceolate-subulate appendages. Achenes densely silvery-villous. Pappus of white capillary bristles, rather deciduous.

1. *S. interior* (Coville) Rydb. Shrub 3-10 dm. high; branches green, slightly puberulent; leaves linear, fleshy, glandular-punctate, 1-2 cm. long; involucre hemispheric, about 1 cm. high; bracts linear, attenuate, glandular-granuliferous; ligules 9-11 mm. long, golden yellow. *Aplopappus interior* Coville. Hillsides in desert regions: s Calif.—s Utah—Ariz. Son. Ap-Jl.

20. OONÓPSIS Greene.

Perennial herbs with woody caudex or crown, and erect, leafy stems. Leaves linear or lanceolate, entire. Heads in terminal cymes or solitary. Involucres campanulate or hemispheric; bracts well imbricate, flat, cuspidate-acuminate. Ray-flowers pistillate or wanting; ligules yellow. Disk-corollas yellow, cylindric, with 5 short teeth. Tips of the style-branches ovate, shorter than the stigmatic part. Achenes glabrous or strigose, many-nerved. Pappus of rather few coarse bristles.

Dwarf; stem less than 1 dm. high; heads 6-10 mm. high.

Plant more or less villous; leaves flat; heads radiate.

Heads 6-8 mm. high; leaves 1-3 cm. long, not exceeding the stem.

Heads 8-10 mm. high; leaves 4-8 cm. long, often overtopping the stem.

Plant glabrous; leaves involute; heads discoid.

Plant robust, 1.5-3 dm. high; heads 15-20 mm. high.

Heads discoid.

Heads clustered, 10-15 mm. high; achenes glabrous.

Heads solitary, 15 mm. high or more; achenes glandular.

Heads radiate.

1. *O. multicaulis*.

2. *O. argillacea*.

3. *O. Engelmannii*.

4. *O. Wardii*.

5. *O. monocephala*.

6. *O. foliosa*.

1. *O. multicaulis* (Nutt.) Greene. Stems several, 1 dm. high or less, slightly villous; leaves narrowly linear, 1-3 cm. long, slightly villous, thick; heads corymbose; involucre turbinate; bracts ovate, lanceolate or oblong, cuspidate-acuminate; ligules 5-6, 4-5 mm. long. *Aplopappus multicaulis* A. Gray. Rocks: Wyo. Submont.

2. *O. argillacea* A. Nels. Stems numerous, 5-8 cm. long, sparingly villous; leaves entire, narrowly-linear, acute; involucre slightly villous, turbinate; bracts oblong-ovate or lanceolate, acuminate; rays about 10; ligules 5-6 mm. long. Clayey slopes: Wyo. Submont. Je-Jl.

3. *O. Engelmannii* (A. Gray) Greene. Stems 1-2 dm. high, glabrous, leafy; leaves narrowly linear, 3-5 cm. long, 2-3 mm. wide, rigid; heads rather many, in a congested cyme, about 12 mm. high; involucre turbinate-campanulate, shorter than the disk-flowers; bracts ovate or elliptic, short-cuspidate. *Bigelovia Engelmannii* A. Gray. Dry plains: Colo.—Kans. Plain. Au-O.

4. *O. Wardii* (A. Gray) Greene. Stems 1-2.5 dm. high, very leafy; leaves broadly linear or lanceolate, 1-nerved, or 3-nerved at the base, 6-12 cm. long; inflorescence dense, flat-topped; heads 15-25-flowered; bracts lanceolate, acuminate. *A. Fremontii Wardii* A. Gray. *O. condensata* A. Nels. Plains: Wyo. Submont. Jl-S.

5. *O. monocephala* A. Nels. Stems erect or ascending, 1-2 dm. high, leafy to the summit; leaves glabrous, linear-oblong, sessile, acute, 5-8 cm. long, about 1 cm. broad; bracts oblong, abruptly acuminate, glabrous or ciliate on the margins. Plains: Colo. Plain.

6. *O. foliosa* (A. Gray) Greene. Stems 2-3 dm. high, very leafy, glabrous; leaves lanceolate or oblong-lanceolate, 3-5-nerved, 5-10 cm. long; heads solitary or few together; involucre 15-20 mm. high; bracts glabrous, broadly lanceolate, acuminate; rays 12-15 mm. long; achenes glandular-puberulent. *Aplopappus Fremontii* A. Gray. Plains and rocky hills: Kans.—Colo. Submont. Je-S.

21. **MACRONÈMA** Nutt.

Undershrubs, never resinous-punctate, with short branches, leafy up to the heads. Involucre campanulate; its bracts imbricate, in a few series of more or less unequal length, linear or lanceolate, the inner thin, chartaceous or somewhat scarious, the outer more or less foliaceous and passing into the leaves. Receptacle naked, alveolar. Ray-flowers, when present, ligulate, pistillate and fertile; ligules yellow, conspicuous. Disk-flowers perfect; corollas tubular-trumpet shaped, 5-lobed. Anthers obtuse at the base. Branches of the style stigmatic their whole length, with very long and attenuate-filiform appendages. Achenes slender, compressed, 5-nerved, soft-pubescent. Pappus of numerous white soft bristles.

Heads radiate; branches glandular, not tomentose.

Heads small, fastigate-clustered; disk 5-8 mm. in diameter.

Leaves broadly obovate, mucronate-cuspidate.

Leaves oblanceolate, acute or pointed.

Heads larger, solitary; disk 1 cm. or more in diameter.

Leaves oblanceolate, acute.

Leaves spatulate, obtuse or mucronate.

Heads discoid; branches white-tomentose.

Leaves oblong-oblanceolate.

Outer bracts linear to oblong, acute.

Outer bracts broadly oblong, obtuse or mucronate.

Leaves linear.

1. *M. obovatum*.

2. *M. Watsoni*.

3. *M. suffruticosum*.

4. *M. grindelifolium*.

5. *M. discoideum*.

6. *M. obtusum*.

7. *M. lineare*.

1. ***M. obovatum*** Rydb. Glandular-puberulent undershrub, 2-3 dm. high; leaves 1-2 cm. long, 7-10 mm. wide; heads usually 2-3 together, about 10 mm. high; bracts firm, oblong-linear, abruptly acute, unequal, imbricate in about 4 series; ligules about 10, short, 4-5 mm. long. Canons and hillsides: Utah. *Submont.* Je-Au.

2. ***M. Watsoni*** (A. Gray) Greene. Glandular undershrub, 1-3 dm. high; leaves thin, 1-2 cm. long; heads fastigate-clustered, about 10 mm. high; bracts linear-lanceolate, attenuate, the outer 1 or 2, foliaceous; ligules 6-8 mm. long. *Aplopappus Watsoni* A. Gray. Mountains: Nev.—Utah—Ariz. *Submont.* Au-S.

3. ***M. suffruticosum*** Nutt. Undershrub, 1-2 dm. high; branches brown; leaves 2-3 cm. long, glandular-hirsute; heads solitary, 10-12 mm. high; bracts linear-lanceolate, acuminate or the outer foliaceous and attenuate; ligules 8-10 mm. long. *A. suffruticosus* A. Gray. Hills: Mont.—Wyo.—Ariz.—Calif. *Submont.*—Mont. Jl-S.

4. ***M. grindelifolium*** Rydb. Much branched undershrub, 1-2 dm. high; branches glandular-puberulent; leaves 1-2 cm. long, glandular-pubescent; margins more or less crisped; heads 1.5 cm. high; bracts few, linear-lanceolate or acute; ligules 6-12, conspicuous, often 1 cm. long. *M. grindelioides* Coult. & Nels. High mountains: Mont.—Wyo.—Ida.—Ore. *Submont.*—Mont. Jl-S.

5. ***M. discoideum*** Nutt. Low branched undershrub, 1-2 dm. high; leaves oblong to oblanceolate, 1-3 cm. long, glandular-puberulent; heads solitary, about 1.5 cm. high and broad; inner bracts few, linear-lanceolate, attenuate. *A. Macronema* A. Gray. Mountains: Colo.—Calif.—Ore. *Submont.*—Alp. Jl-Au.

6. ***M. obtusum*** Rydb. Dense glandular-pubescent undershrub, 2-4 dm. high; leaves oblong-oblanceolate, about 3 cm. long, obtuse or mucronate; heads about 18 mm. high, 10-18 mm. in diameter; inner bracts acute, scarcely more than half as long as the flowers. Mountains: Colo. *Mont.* Jl.

7. ***M. lineare*** Rydb. Low undershrub, woody only at the base, 1-2 dm. high; leaves numerous, linear, acute, glandular-puberulent, sometimes also more or less tomentose; heads 1-1.5 cm. high; bracts few, linear, acuminate, the outer foliaceous. Sandy or gravelly places: Wyo. *Submont.* Au.

22. **STENÒTUS** Nutt.

Low perennials, with cespitose woody caudices and narrow, entire, more or less coriaceous and evergreen (except in the last species), mostly basal leaves. Involucre hemispherical or nearly so; its bracts imbricated in a few rows, ap-

pressed, thin, lanceolate to oval, not herbaceous. Receptacle naked, alveolar. Ray-flowers ligulate, pistillate and fertile; ligules yellow, conspicuous. Disk-flowers perfect; corollas tubular, somewhat enlarged upwards, deeply 5-toothed. Anthers obtuse at the base. Style-branches stigmatic their whole length, with subulate appendages. Achenes grayish or white villous. Pappus of numerous white soft capillary scabrous bristles.

Plant glabrous or puberulent; leaves firm and evergreen.

Leaves linear to filiform, 1 mm. wide.

Leaves mostly oblanceolate.

Bracts lanceolate, acute.

Plant puberulent.

Bracts in 3 series, broad, with broad scarious margins.

Bracts in 2 series, narrow, with narrow scarious margins.

Plant glabrous, except the scabrous leaf-margins.

Bases of the basal leaves much enlarged, somewhat inflated and remaining for years on the short caudal branches; leaf-blades narrowly oblanceolate to linear.

Stem-leaves oblanceolate, 1-4 cm. long.

Stem-leaves linear, 4-7 cm. long.

Bases of the basal leaves neither much enlarged nor persistent; leaf-blades broadly oblanceolate or spatulate.

Bracts oval or oblong, very obtuse.

Plant floccose; leaves softer, not evergreen.

1. *S. stenophyllus*.

2. *S. acaulis*.

3. *S. Andersonii*.

4. *S. caespitosus*.

5. *S. falcatus*.

6. *S. latifolius*.

7. *S. armerioides*.

8. *S. lanuginosus*.

1. *S. stenophyllus* (A. Gray) Greene. Stems about 5 cm. high; leaves 1-2 cm. long, hirsutulous-scabrous; involucre 6-8 mm. high, puberulent; bracts linear, attenuate, with narrow scarious margins. *Aplopappus stenophyllus* A. Gray. Mountains and stony hills: Wash.—Ida.—Calif. *Submont.*—*Mont.* Ap-Je.

2. *S. acaulis* Nutt. Plant 2-10 cm. high; leaves oblanceolate or spatulate, 3-nerved; flowering stems scapiform; heads solitary, about 1 cm. high; bracts lanceolate or ovate-lanceolate; ligules 8 mm. long. *A. acaulis* A. Gray. Dry hills and bad lands: Sask.—Colo.—Calif.—Wash. *Plain*—*Submont.* My-Je.

3. *S. Andersonii* Rydb. Flowering stems about 1 dm. high, leafy at the base; leaves narrowly oblanceolate, not very rigid, distinctly 3-ribbed, 3-5 cm. long, 3-4 mm. wide; bracts narrowly lanceolate. Open dry hills: *Mont.* *Plain.* JI.

4. *S. caespitosus* Nutt. Stems 5-15 cm. high; basal leaves linear-oblanceolate, 3-nerved, glabrous except the scabrous-ciliate margins, 3-5 cm. long; heads about 1 cm. high; bracts lanceolate, acuminate; ligules 8 mm. long. *A. acaulis glabratus* A. Gray. Dry hills: Sask.—Wyo.—Nev.—*Mont.* *Plain*—*Submont.* Je-JI.

5. *S. falcatus* Rydb. Flowering stems 10-15 cm. high, leafy; basal leaves oblanceolate, rigid, obtuse or acute, 4-5 cm. long, 3-ribbed; stem-leaves linear, more or less falcate; heads about 1 cm. high; bracts lanceolate, acute, with scarious margin; ligules 6-7 mm. long. Dry hills: s Utah. *Son.* Je.

6. *S. latifolius* A. Nels. Flowering stems slender, leafy, 10-15 cm. high, striate; leaves spatulate or broadly lanceolate, 2-3 cm. long, more distributed along the stem than in the other species; heads solitary, 10-12 mm. high; bracts elliptic-lanceolate, abruptly short-acuminate; ligules 8 mm. long, orange. Rock-crevices: Utah. *Submont.* Je.

7. *S. armerioides* Nutt. Flowering stems 5-15 cm. high, glabrous or slightly scabrous-puberulent; leaves linear or linear-oblanceolate, 3-nerved, glabrous or nearly so, 3-7 cm. long; heads 10-13 mm. high; ligules 10-12 mm. long. *A. armerioides* A. Gray. Dry hills and badlands: Man.—Neb.—N.M.—Wyo.—Sask. *Plain*—*Submont.* Je-JI.

8. *S. lanuginosus* (A. Gray) Greene. Stem 1-2 dm. high, more or less floccose; leaves narrowly linear-oblanceolate, 3-6 cm. long; heads solitary, 1 cm. high; bracts linear-lanceolate, acute or acuminate, scarious-margined; ligules 8-10 mm. long. *A. lanuginosus* A. Gray. High ridges: Wash.—*Mont.*—*Ore.* *Submont.* My-JI.

23. **TONÉSTUS** A. Nels.

Dwarf herbaceous perennials, with woody taproots and short caudices. Leaves spatulate to linear, entire, alternate. Heads solitary, terminal, radiate. Involucres campanulate or hemispheric; bracts loosely imbricate, in 2-3 series, more or less foliaceous, the outer ones often leaf-like. Ray-flowers many, yellow, pistillate. Disk-corollas yellow, somewhat enlarged upwards, deeply 5-toothed. Appendages of the style-branches oblong to subulate. Pappus soft and white.

Basal leaves oblanceolate, spatulate, or oblong; bracts lanceolate or oblanceolate.

Bracts acute; plants glandular or viscid.

Bracts lacerate or ciliate; stem-leaves linear or linear-lanceolate, long-ciliate.

Bracts neither lacerate nor ciliate; stem-leaves oblanceolate, not ciliate.

Bracts obtuse; plant soft-pubescent or glabrate, scarcely viscid.

Leaves and bracts linear.

1. *T. laceratus*.

2. *T. Lyallii*.

3. *T. pygmaeus*.

4. *T. linearis*.

1. **T. laceratus** (Henders.) A. Nels. Stem 1 dm. high or less, glandular-puberulent; basal leaves spatulate to narrowly oblanceolate; involucres 1 cm. high and wide; bracts subequal in 2 or 3 series, lanceolate, hyaline-margined; achenes densely sericeous. *Aplopappus laceratus* Henders. Mountains, among rocks: Ida. *Subalp.*—*Alp.* Jl.

2. **T. Lyallii** (A. Gray) A. Nels. Stem 1 dm. high or less; leaves oblanceolate or spatulate, or the upper oblong; involucres about 1 cm. high and broad; bracts lanceolate, glandular-puberulent; achenes glabrous or nearly so. *A. Lyallii* A. Gray. High mountains: Alta.—Colo.—Ida.—Wash.—B.C. *Mont.*—*Alp.* Jl—Au.

3. **T. pygmaeus** (T. & G.) A. Nels. Stem 2-5 cm. high; leaves linear-spatulate to spatulate-oblong, 2-4 cm. long; heads 8-10 mm. high; bracts oblong to oval; achenes silky-strigose. *Stenotus pygmaeus* T. & G. *A. pygmaeus* A. Gray. High mountains: Wyo.—N.M. *Alp.*—*Subalp.* Je—Au.

4. **T. linearis** Nels. & Macbr. Stem about 1 dm. long; leaves all narrowly linear, 3-nerved, minutely crisp-pubescent, 2-4 cm. long; bracts about 1 cm. long, with narrow scarious margins, in 2 series; ligules broadly linear; achenes minutely pubescent. Mountains: Ida.

24. **OREOCHRYSUM** Rydb. MOUNTAIN GOLD.

Plants with slender horizontal rootstock, leafy, viscid-puberulent above. Involucral bracts oblong, pale, rather obscurely 1-ribbed, chartaceous or the outer foliaceous, in about three moderately unequal ranks. Rays several, short. Disk-corollas narrowly trumpet-shaped, deeply 5-toothed. Style-appendages lanceolate, longer than the stigmatic portion. Achenes angled. Pappus white or slightly tawny, of soft scabrous bristles.

1. **O. Parryi** (A. Gray) Rydb. Stem 1-4 dm. high, puberulent or somewhat viscid above; basal leaves petioled, 5-15 cm. long; blades spatulate or oblanceolate, glabrous; stem-leaves oval to oblong, sessile; heads 10-12 mm. high; ligules 5-6 mm. long, pale yellow, 1 mm. wide; achenes glabrous. *Aplopappus Parryi* A. Gray. Mountains: Wyo.—N.M.—Ariz.—Utah; Mex. *Submont.*—*Subalp.* Jl—S.

25. **SOLIDAGO** L. GOLDENROD.

Perennial caulescent herbs, mostly with rootstocks (all ours), rarely shrubby at the base. Leaves alternate, often toothed. Heads small, several-flowered, paniculate or thyrsoid, radiate. Involucres campanulate, turbinate, or cylindric; bracts in several series, well imbricate, ribless; receptacle small, alveolate. Ray-flowers pistillate; ligules yellow, short. Disk-flowers hermaphrodite, fertile; corolla usually yellow, tubular to narrowly campanulate, 5-lobed. Anthers obtuse at the base. Style-branches flattened; appendages lanceolate. Achenes terete, usually ribbed. Pappus of many rough hair-like bristles, in 1-2 series.

Leaves glabrous or slightly pubescent along the veins and on the margins.

Leaves not triple-veined; branches of the inflorescence not recurved-spreading; heads not secund.

- Bracts of the inflorescence lanceolate or linear-lanceolate, acute or acuminate.
 Leaves ciliate at the base. I. VIRGA-AUREAE.
 Leaves not ciliate at the base. IV. GLABERRIMAE.
- Bracts of the inflorescence oblong or linear-oblong, obtuse.
 Leaves, at least the basal ones, toothed; stem-leaves few; plants 1-4 dm. high. II. HUMILES.
- Leaves all entire; stem very leafy, 4-8 dm. high. III. SPECIOSAE.
- Leaves triple-veined; heads more or less secund, on recurved-spreading branches (except usually in Nos. 9 and 11).
 Plants slender, not very leafy, 2-4 dm. high; stem-leaves narrowly oblanceolate or linear. IV. GLABERRIMAE.
- Plant tall, leafy, 4-10 dm. high.
 Stem-leaves lanceolate. V. SEROTINAE.
 Stem-leaves obovate. VI. RADULAE.
- Leaves densely canescent.
 Bracts not squarrose. V. SEROTINAE.
- Leaves lanceolate; bracts narrowly linear-lanceolate. VII. INCANAE.
- Leaves, at least the lower ones, oblanceolate or obovate. VIII. WARDIANAE.
- Bracts squarrose; leaves numerous, entire, elliptic.

I. VIRGA-AUREAE.

- Plants low and slender, 1-3 dm. high; inflorescence corymbiform; branches with a single or a few corymbose heads.
- Heads 7-9 mm. high; inner bracts linear-lanceolate, of about the same length as the flowers and pappus; plant 2-3 dm. high. 1. *S. scopulorum*.
- Heads 5-7 mm. high; bracts lanceolate, the inner shorter than the flowers and the pappus; plant usually less than 2 dm. high. 2. *S. ciliosa*.
- Plants stout, 3-4 dm. high; inflorescence paniculate, but narrow; branches racemiform; heads 7-9 mm. high.
- Basal leaves broadly oblanceolate, acute; stem pubescent. 3. *S. rubra*.
- Basal leaves narrowly oblanceolate, obtuse; stem glabrous up to the inflorescence. 4. *S. laevicaulis*.

II. HUMILES.

- Plant low, 1-1.5 dm. high; inflorescence with few heads, short, congested. 5. *S. decumbens*.
- Plant taller, 2-4 dm. high; inflorescence with many heads, elongate.
 Leaves not ciliate; bracts oblong; inflorescence usually narrow. 6. *S. oreophila*.
 Leaves ciliate at the base; bracts linear; inflorescence open. 7. *S. dilatata*.

III. SPECIOSAE.

One species.

8. *S. pallida*.

IV. GLABERRIMAE.

- Heads less than 5 mm. high; stem slender.
 Inflorescence decidedly viscid; leaves indistinctly triple-veined. 9. *S. viscidula*.
 Inflorescence not viscid; leaves distinctly triple-veined.
 Plant glaucous; bracts thick, oblong, obtuse. 10. *S. glaucophylla*.
 Plant not glaucous; bracts not thick, linear-lanceolate to oblong-lanceolate.
 Inflorescence narrow, scarcely secund; bracts linear-lanceolate. 11. *S. missouriensis*.
 Inflorescence usually open and more or less secund; bracts oblong-lanceolate. 12. *S. glaberrima*.
 Heads 6-7 mm. high; stem stout. 13. *S. coccinea*.

V. SEROTINAE.

- Inflorescence narrowly rhombic in outline; branches ascending, almost straight, scarcely secund. 14. *S. elongata*.
- Inflorescence broad; branches recurved-spreading, distinctly secund.
 Leaves green, sparingly pubescent or glabrous; pubescence scabrous, mostly confined to the margins and the veins.
 Stem usually glabrous up to the inflorescence; leaves glabrous except on the margins and on the midveins.
 Veins of the leaves glabrous; heads 5-6 mm. high, in a short panicle with strongly curved branches. 15. *S. serotina*.
 Veins of the leaves pubescent below; heads 4-5 mm. high; panicle with long branches. 16. *S. scabrosa*.
- Stem more or less pubescent.
 Heads 5 mm. or more high; leaves pubescent. 17. *S. polyphylla*.
 Heads about 4 mm. high; plant comparatively slender.
 Leaves pubescent, at least on the veins. 18. *S. canadensis*.
 Leaves glabrous, except the scabrous-ciliolate margins. 19. *S. serra*.
- Leaves densely canescent, especially beneath.
 Leaves usually broadly lanceolate.
 Leaves scabrous above.
 Leaves softly puberulent on both sides.
 Leaves linear-lanceolate, finely and rather softly canescent on both sides, more or less yellowish gray. 20. *S. dumetorum*.
 21. *S. pruinosa*.
 22. *S. gilvocanescens*.

VI. RADULAE.

One species.

23. *S. Garrettii*.

VII. INCANAE.

Plant low, 1-2 dm. high; inflorescence corymbiform; branches not secund.

Bracts oval to oblong, obtuse.

24. *S. nana*.

Bracts lanceolate, acute.

25. *S. nivea*.

Plants tall, 2-6 dm. high; inflorescence narrow, or if open with distinctly secund branches.

Bracts oblong or linear, obtuse; stem-leaves scarcely triple-veined; inflorescence usually narrow.

Stem-leaves oblanceolate.

26. *S. pulcherrima*.

Stem-leaves spatulate or broadly oblanceolate.

27. *S. radulina*.

Bracts lanceolate or ovate, acute; stem-leaves distinctly triple-veined; inflorescence usually more open.

Stem-leaves oblanceolate or elliptic; bracts lanceolate.

28. *S. trinervata*.

Stem-leaves obovate, thick; bracts ovate.

29. *S. mollis*.

VIII. WARDIANAE.

One species.

30. *S. Wardii*.

1. *S. scopulorum* (A. Gray) A. Nels. Stem glabrous below, pilose above; basal leaves 5-15 cm. long; blades oblanceolate or spatulate, usually obtuse, crenate or serrate towards the apex; upper stem-leaves lanceolate or linear-lanceolate, sessile; bracts acute, ciliolate; achenes strigose. *S. corymbosa* Nutt., not Ell. *S. multiradiata scopulorum* A. Gray. Hills and mountains: Alta.—Colo.—Utah—B.C. *Mont.* Je—Au.

2. *S. ciliosa* Greene. Stem 1-2 dm. high, decumbent at the base, glabrous below, pilose above; basal leaves spatulate, serrate-crenate towards the apex, 2-5 cm. long, tapering into a short petiole; stem-leaves linear-lanceolate to linear-oblanceolate, entire, sessile, ciliolate; heads in a small dense thyrsus; achenes strigose. Higher mountains: Alta.—Colo.—Ariz.—B.C. *Mont.*—Alp. Je—S.

3. *S. rubra* Rydb. Stem about 3 dm. high, pubescent, reddish; basal and lower cauline leaves 6-12 cm. long, firm, bluish green, glabrous, serrulate and minutely scabrous on the margins; upper stem-leaves sessile and lanceolate; bracts narrowly linear-lanceolate, ciliolate; achenes strigose. Mountains: Colo. *Mont.* S.

4. *S. laevicaulis* Rydb. Stem rather tall, 4-7 dm. high, light-colored and shining; basal leaves rather thin, obtuse, 5-10 cm. long, entire or crenate, glabrous except the scabrous margin; upper stem-leaves narrowly lanceolate, sessile; branches nearly erect; bracts narrowly linear-lanceolate, acute, ciliolate on the margins; achenes sparingly strigose. Mountains: Colo.—Wyo. Jl—S.

5. *S. decumbens* Greene. Stem low, decumbent at the base, glabrous or nearly so; basal leaves spatulate or oblanceolate, obtuse or rounded at the apex, crenate-serrate towards the end; upper leaves narrower; bracts linear or oblong; heads 6-8 mm. high; achenes strigose-hirsute. *A. humilis nana* A. Gray. Higher mountains: Wyo.—N.M. *Subalp.*—*Alp.* Jl—S.

6. *S. oreophila* Rydb. Stem glabrous or nearly so, often tinged with red; lower leaves spatulate, rounded and serrate or crenate at the apex, 3-10 cm. long, glabrous; stem-leaves oblanceolate, entire or nearly so; panicle narrow; heads about 8 mm. high; bracts linear; achenes hirsute-strigose. *S. humilis* A. Gray, in part, not Nutt. Mountains: B.C.—Mack.—Colo. *Mont.*—*Subalp.* Jl—S.

7. *S. dilatata* A. Nels. Stem glabrous, 4-6 dm. high; basal leaves glabrous, scabrous-ciliolate, oblong-spatulate to elliptic, 1-1.5 dm. long, serrate; stem-leaves lanceolate, the upper sessile; heads numerous, in a rather open panicle, 6-8 mm. high; bracts linear, most of them obtuse; achenes slightly hirsute. Mountains: Mont.—Colo. *Submont.*—*Mont.* Jl—Au.

8. *S. pallida* (Porter) Rydb. Stem 4-8 dm. high, glabrous; leaves obovate-spatulate to lanceolate, 5-15 cm. long, acute, entire, pale; heads very numerous, in a dense, elongated-conic panicle; disk 5-6 mm. high; bracts oblong or linear-oblong, glabrous; achenes glabrous or nearly so. *S. speciosa pallida* Porter. Hills: S.D.—Neb.—Colo. *Plain*—*Submont.* Au—S.

9. *S. viscidula* Rydb. Stem low, about 2 dm. high, finely pubescent, reddish; lower leaves narrowly linear-ob lanceolate, finely puberulent and somewhat viscid, denticulate, obtuse or acutish; inflorescence paniculate but flat-topped; branches scarcely secund; heads numerous, small, about 5 mm. high; bracts linear, obtusish, viscid; achenes strigose. Mountains: Colo. *Mont.* Au.

10. *S. glaucophylla* Rydb. Stem slender, pale, glabrous; leaves glabrous, minutely ciliolate on the margins, rather thick, linear-ob lanceolate or the upper linear, 6-10 cm. long, entire, acute; inflorescence a round-topped panicle; heads about 5 mm. high; achenes slightly strigose-hirsute. Valleys: Mont.—Wyo. *Plain*—*Submont.* Jl-S.

11. *S. missouriensis* Nutt. Stem slender, 3-4 dm. high, glabrous; leaves linear-ob lanceolate, glabrous, scabrous-ciliolate, 5-15 cm. long, acute, the lower petioled and sometimes serrate, the upper sessile and entire; heads 4-5 mm. high; bracts acute, glabrous. *S. Tolmieana* A. Gray. Mountains: B.C.—Ore.—Colo.—S.D.—Alta. *Submont.* Jl-Au.

12. *S. glaberrima* Martens. Stem 2-4 dm. high, glabrous up to the inflorescence; lower leaves narrowly ob lanceolate, 3-15 cm. long, often serrate or entire, glabrous, ciliolate; inflorescence flat-topped or round-topped; heads about 5 mm. high; achenes sparingly hirsutulous. *S. missouriensis* A. Gray, not Nutt. Plains and hills: Mich.—Mo.—Tex.—Ariz.—Ida.—Alta. *Plain*—*Mont.* Jl-S.

13. *S. concinna* A. Nels. Stem glabrous, 2-4 dm. high, densely leafy; basal leaves ob lanceolate, 8-15 cm. long, serrate or entire; stem-leaves narrowly ob lanceolate or linear-oblong; panicle round-topped, usually open; bracts oblong, acute, thin-margined; achenes pubescent. *S. missouriensis extraria* A. Gray. Mountains: Alta.—Colo.—B.C. *Submont.*—*Mont.* Jl-S.

14. *S. elongata* Nutt. Stem 3-10 dm. high, glabrous below, finely puberulent above; leaves narrowly lanceolate, acuminate, 5-10 cm. long, distantly serrate, with sharp teeth, more or less puberulent; heads about 5 mm. high; bracts linear or linear-lanceolate, acute; achenes sparingly hirsutulous. Low ground: B.C.—Mont.—Nev.—Wyo.—Calif. *Submont.* Jl-S.

15. *S. serotina* Ait. Stem 5-20 dm. high; leaves lanceolate, 5-15 cm. long, sessile, usually sharply serrate; inflorescence short-pyramidal, dense; bracts linear or linear-lanceolate, obtuse or acutish; achenes hirsutulous. *S. Pitcheri* Nutt., the western form, with shorter inflorescence. Meadows, valleys, and along streams: Newf.—Ga.—Ark.—Colo.—B.C. *Plain*—*Submont.* Jl-S.

16. *S. salebrosa* (Piper) Rydb. Stem 5-20 dm. high; leaves narrowly lanceolate, sessile, sharply serrate, acuminate or the uppermost entire, 5-10 cm. long, thick; panicle large; bracts narrowly linear, acutish; achenes hirsutulous. *S. serotina salebrosa* Piper. Along streams: B.C.—Mont.—Ore. *Submont.* Jl-Au.

17. *S. polyphylla* Rydb. Stem tall, sometimes a meter high, strict, simple and puberulent up to the more hirsutulous inflorescence; leaves narrowly lanceolate, sessile, acuminate, serrate above the middle, thick and firm, green, scabrous above, more softly short-pubescent beneath; bracts linear, acute; achenes hispidulous. Perhaps not distinct from the eastern *S. altissima* L. Along streams: Wyo.—N.M. *Submont.* Au-S.

18. *S. canadensis* L. Stem 6-15 dm. high; leaves sessile, 5-10 dm. long, rarely 1.5 cm. wide, narrowly lanceolate, acuminate, serrate, puberulent on both sides or glabrous above; panicle large, broadly conic; bracts narrowly linear or lance-linear, acute or obtusish; achenes sparingly hairy. Among bushes: Lab.—W.Va.—Colo.—B.C. *Plain*—*Submont.* Jl-O.

19. *S. serra* Rydb. Stem about 6 dm. high, more or less pubescent, especially above; leaves lanceolate, about 8 cm. long, acuminate, sharply toothed, rather thin; heads numerous 3-4 mm. high; bracts linear or linear-lanceolate, acute; achenes hirsutulous. Along streams: Colo.—Wyo. *Mont.* Au.

20. *S. dumetorum* Lunell. Stem 5-10 dm. high, densely puberulent; leaves lanceolate, acute, thick, more or less serrate, strongly veined, revolute

and scabrous-ciliate on the margins, densely hispidulous-puberulent beneath; inflorescence short-conic; involucre about 3 mm. high; bracts linear-acute; achenes sparingly hispidulous. *S. scabriuscula* Rydb., in part. Dry soil: Sask.—Mo.—Tex.—Mont. *Plain.* Jl-S.

21. *S. pruinosa* Greene. Stem about 1 m. high; leaves ascending, about 5 cm. long, elliptic-lanceolate, acute or acuminate, lightly but evenly serrate, 3-ribbed, canescent on both sides, with a dense and soft pubescence; inflorescence short-pyramidal; outer bracts linear-subulate, the inner oblong, lance-obtuse. Plains: Sask. *Plain.* Au.

22. *S. gilvocanescens* (Rydb.) Smyth. Stem slender, 3-6 dm. high, puberulent; leaves 3-6 cm. long, sparingly serrate or entire, puberulent-canescant; inflorescence small and dense; heads 3-4 mm. high; bracts narrowly linear, acute; achenes sparingly hairy. Sandy soil: Minn.—Kans.—Utah.—Mont. *Plain.* Jl-Au.

23. *S. Garrettii* Rydb. Stem 2-3 dm. high, sparingly puberulent or glabrous; leaves obovate-spatulate or the upper oval, entire or the lower toothed towards the apex, rather thin, minutely and sparingly scabrous-puberulent, scabrous-ciliate, 3-6 cm. long; inflorescence more or less leafy, with a few second branches; heads 5-6 mm. high; bracts lanceolate, acute, yellowish; achenes sparingly hirsute. Cañons: Utah—Wyo. *Submont.* Au.

24. *S. nana* Nutt. Stem finely canescent-puberulent, 1-2 dm. (rarely 3 dm.) high; basal leaves 2-6 cm. long, petioled, canescent-puberulent, spatulate, rounded at the apex, entire or crenulate; stem-leaves oblanceolate; heads 5-7 mm. high; achenes strigose. High dry plains: Mont.—Colo.—Ariz. *Submont.* —Mont. Jl-S.

25. *S. nivea* Rydb. Stem 1-2 dm. high, canescent-puberulent; basal leaves 2-4 cm. long, short-petioled, obovate-spatulate, rounded at the apex, entire or nearly so, canescent-puberulent, almost velvety and almost white; stem-leaves oblanceolate; heads about 6 mm. high; achenes hirsute-strigose. Dry hillsides: Mont. *Submont.* Jl-Au.

26. *S. pulcherrima* A. Nels. Stem 3-8 dm. high, striate, cinereous-puberulent; lower leaves narrowly oblanceolate, entire, 6-12 cm. long; upper leaves oblong or linear; all cinereous-puberulent; heads about 6 mm. high; achenes puberulent. *S. diffusa* A. Nels. Dry plains: Sask.—Minn.—Neb.—Colo.—Ariz.—Alta. *Plain*—Mont. Jl-S.

27. *S. radulina* Rydb. Stem 3-4 dm. high, grayish-puberulent; lower leaves obtuse, crenate at the apex, finely puberulent; heads about 4 mm. high; bracts oblong, obtuse, or the inner linear; achenes hirsutulous. Mountains: Utah—Colo. *Submont.* Au.

28. *S. trinervata* Greene. Stem decumbent at the base, cinereous-puberulent, 3-6 dm. high; leaves oblanceolate, 5-10 cm. long, puberulent, scabrous-ciliate on the margins, entire or nearly so; heads about 6 mm. high; achenes hispidulous. Plains and hills: S.D.—N.M.—Ariz.—Utah. *Submont.*—Mont. Jl-S.

29. *S. mollis* Bartl. Stem 2-4 dm. high, cinereous-puberulent, strict, leafy; leaves obovate, oval, or broadly spatulate, or the upper elliptic, canescent, the lower more or less serrate; panicle usually dense and somewhat leafy; heads 5-7 mm. high; achenes sparingly hirsutulous. *S. nemoralis incana* A. Gray. Dry plains: Sask.—Tex.—Colo.—Mont. *Plain*—*Submont.* Jl-S.

30. *S. Wardii* Britton. Stem 4-10 dm. high, puberulent; leaves lanceolate or ovate-lanceolate, entire or with a few teeth, firm, 5-9 cm. long, pale, usually shining, scabrous-puberulent; panicle narrow, leafy; heads about 8 mm. high; bracts lanceolate, acute, canescent, squarrose. Plains and prairies: Mo.—Ark.—Okla.—w Neb. *Plain.* Au-O.

26. PETRADÒRIA Greene. ROCK GOLDENROD.

Low tufted perennial herbs, with a short branched caudex. Leaves alternate, entire, 3-nerved and punctate. Heads small, several, corymbose. Involucres cylindraceous; bracts in more or less distinct rows, rigid, somewhat carinate,

with green tips. Rays yellow, 1-3, short. Disk-flowers few, yellow. Achenes flattish and broad, 5-nerved.

1. **P. pumila** (Nutt.) Greene. Stem strict, erect, 1-2 dm. high, glabrous; leaves rigid, linear-oblancoolate, 3-nerved, somewhat punctate, resiniferous, 5-10 cm. long; cyme glomerate-fastigiate, flat-topped; heads 5-8-flowered, oblong, about 8 mm. high; ligules 1-3, 2 mm. long; achenes glabrous. *Solidago pumila* Nutt. Dry mountains: Wyo.—Tex.—Ariz.—Ore. *Son.*—*Submont.* Jl—Au.

27. EUTHAMIA Nutt. BUSHY OR FRAGRANT GOLDENROD.

Perennial caulescent herbs with elongated rootstocks. Leaves alternate, narrow, more or less triple-ribbed. Heads numerous, in broad corymbs. Involucres oblong; bracts imbricate, narrow, glutinous; receptacle pubescent or fibrillate. Ray-flowers pistillate, usually more numerous than the disk-flowers, with inconspicuous ligules. Disk-flowers perfect; corollas yellow. Style-branches with lanceolate appendages. Achenes broadened upwards, pubescent. Pappus of long equal bristles.

Outer bracts broader than the inner, which are obtuse.

1. *E. camporum*.

Outer bracts narrow, all acute; lateral ribs of the leaves rather prominent.

2. *E. occidentalis*.

1. **E. camporum** Greene. Stem 3-5 dm. high, puberulent-scabrous on the angles above; leaves linear, triple-veined, but the lateral veins often glabrous or nearly so on both sides, scabrous-puberulent on the margins; outer bracts ovate, acutish, the inner oblong-linear, more or less green-tipped; achenes strigose. Closely related to *E. graminifolia* (L.) Nutt., of the East. Low ground: Man.—Kans.—Colo.—Alta. *Plain.* Jl—O.

2. **E. occidentalis** Nutt. Stem 5-20 dm. high, glabrous, striate; leaves linear, triple-veined, glabrous, obsoletely scabrous on the margins; bracts narrowly lanceolate, thin, ciliolate; achenes sparingly hairy. *Solidago occidentalis* Nutt. Moist ground: Alta.—N.M.—Calif.—B.C. *Plain.* Je—N.

28. OLIGONEÛRON Small. ROUGH GOLDENROD.

Perennial caulescent, usually balsamic herbs. Leaves alternate. Heads corymbose, radiate. Involucres several-flowered, campanulate; bracts imbricate in several series, thickish, longitudinally few-ribbed; receptacle pitted. Ray-flowers pistillate; ligules yellow. Disk-flowers usually perfect; corollas yellow, the tube dilated into a short throat. Anthers obtuse at the base. Style-branches flat, with oblong appendages. Achenes several-nerved. Pappus of many capillary bristles.

1. **O. canescens** Rydb. Stem 5-7 dm. high; basal leaves long-petioled; blades oval, 7-12 cm. long, thick, yellowish canescent on both sides, crenulate; upper stem-leaves oval, sessile; inflorescence corymbiform but much congested; heads about 1 cm. high; bracts oblong, canescent; achenes slightly hairy above, otherwise glabrous. *S. rigida humilis* Porter. Prairies and river valleys: Sask.—Neb.—Colo.—Mont. *Plain*—*Submont.* Au—O.

29. MONÓPTILON T. & G.

Depressed dwarf annuals. Heads solitary, terminal. Involucres hemispheric; bracts narrow, numerous, in a single series, somewhat herbaceous. Ray-flowers numerous, pistillate and fertile; ligules white or violet. Disk-flowers numerous, perfect; corollas yellow. Style-branches with triangular appendages. Achenes oblong-obovate, compressed. Pappus of a short, cup-shaped, denticulate crown and a single awn, which is barbellate or plumose towards the apex.

1. **M. bellidiforme** T. & G. Stem branched at the base, 2-4 cm. high, villous-hirsute; leaves spatulate or linear-spatulate, 5-10 mm. long, hirsute; heads sessile; involucres 4 mm. high, 6-8 mm. wide; bracts linear, hirsute; ligules 3 mm. long. Desert plains: s Utah—Ariz.—s Calif. *L. Son.* Ap—Je.

30. **TOWNSÉNDIA** Hook.

Tufted scapose or caulescent plants, often with caudex-like stems or branches. Leaves alternate, entire, often crowded, usually broadest above the middle. Heads rather large, sessile or peduncled. Involucres hemispheric; bracts imbricate, in several series, herbaceous, with more or less scarious margins; receptacle broad, flat, alveolate. Ray-flowers pistillate; ligules white, rose, or purplish. Disk-flowers mostly perfect. Anthers obtuse and entire at the base. Style-branches flattened, with lanceolate appendages. Achenes various, those of the rays usually 3-angled and those of the disk flattened. Pappus of a single series of scales or awns, or that of the ray-flowers sometimes reduced to a crown of small scales.

Bracts acuminate.

Caulescent biennials or short-lived perennials.

Stems spreading, with branches from the base, which surpass them in length.

Stems erect or nearly so, simple or with short branches above. 1. *T. grandiflora*.

Stems over 3 dm. high, generally branched; basal leaves oblanceolate.

Involucre 1.5–2 cm. broad, naked. 2. *T. eximia*.

Involucre 2–3 cm. broad, generally subtended by leaves. 3. *T. Vreelandii*.

Stems 1–2 dm. high, generally simple and monocephalous, sometimes several from one root; basal leaves spatulate. 4. *T. Parryi*.

Acaulescent perennials, depressed, monocephalous.

Plant pilose or hirsute.

5. *T. alpina*.

Plant arachnoid-lanuginose.

6. *T. condensata*.

Bracts acute or obtuse.

Plant with evident leafy stems.

Stems 5–20 cm. high; mostly annuals and biennials.

Pappus of disk- and ray-flowers elongate bristles.

Leaves linear or oblanceolate; pappus of the rays nearly as long as that of the disk-flowers. 7. *T. florifer*.

Leaves spatulate; pappus of the ray-flowers much shorter than that of the disk-flowers. 8. *T. ambigua*.

Pappus of the rays reduced to a crown of short squamellae.

Bracts of the involucre in 3 series; pubescence of the stem appressed; leaves linear. 9. *T. Fendleri*.

Bracts in 2 series; pubescence of the stem not strictly appressed; earlier leaves spatulate. 10. *T. strigosa*.

Stem usually evident, but short, 1–5 cm. long; mostly caespitose perennials.

Leaves more or less cinereous.

Outer bracts rounded-obtuse at the apex; achenes almost glabrous.

11. *T. montana*.

Outer bracts acute; achenes pubescent.

Heads distinctly peduncled; hairs of the achenes not glochidiate-capitellate. 12. *T. scapigera*.

Heads subsessile; hairs of the achenes glochidiate-capitellate.

Stem-leaves oblanceolate or linear.

Pappus of the rays of bristles one-third to one-half as long as those of the disk-flowers; ray-flowers glandular-puberulent outside. 13. *T. incana*.

Pappus of the rays reduced to a crown of short squamellae; ray-flowers glabrous. 14. *T. strigosa*.

Leaves all decidedly spatulate; pappus-bristles of ray- and disk-flowers all alike. 15. *T. glabrella*.

Leaves glabrous or nearly so.

Plant acaulescent; heads sessile among the rosulate leaves.

Plant not lanate.

Plant glabrate, cinereous only when young; leaves oblanceolate or spatulate.

Bracts obtuse; ray-flowers with very short pappus. 16. *T. Rothrockii*.

Bracts acute; pappus of disk- and ray-flowers alike, of long bristles.

Leaves glabrous above.

Leaves strigose on both sides. 17. *T. Wilcoxiana*.

Head 12–15 mm. high; pappus twice as long as the achenes; bracts lanceolate.

Head less than 1 cm. high; pappus a little longer than the achenes; bracts linear. 18. *T. intermedia*.

Plant permanently cinereous; leaves linear or linear-oblanceolate. 19. *T. leptotes*.

Plant lanate. 20. *T. exscapa*.

21. *T. spathulata*.

1. *T. grandiflora* Nutt. Biennial, with a taproot; stem 2–10 cm. high, densely strigose; leaves narrowly linear-oblanceolate, strigose; involucre 10–15 mm. high, 15–20 mm. broad; bracts strigose, broadly lanceolate, acuminate, fimbriate; ligules rose-purple or pinkish, 15–20 mm. long; pappus of the ray-flowers reduced to a crown of short squamellae. Plains and hills: S.D.—Okla.—Colo.—Wyo. *Plain*—*Subalp.* Je—Au.

2. *T. eximia* A. Gray. Biennial, with a taproot; stem 1.5–4 dm. high, strigose-hirsute; leaves linear-spatulate or linear-ob lanceolate, strigose; bracts lanceolate, acuminate, the inner purplish, scarious and erose-ciliate on the margins; ligules bluish purple, 15–18 mm. long; pappus of a coroniform ring of small squamellae and in the disk-flowers besides these two stout awns. Mountain-sides: Colo.—N.M.—Ariz. *Son.* Je-S.

3. *T. Vreelandii* Rydb. A dark green biennial, branching near the base; stems 1.5–4 dm. high, sparingly villous; leaves numerous, all oblanceolate, glabrous, mucronate, 4–8 cm. long, 5–8 mm. wide; bracts lanceolate, acuminate, scarious, light green with dark green center; ligules bluish purple, 12–15 mm. long; pappus of 2 subulate bristles, with a few intermediate squamellae. Mountain-sides and valleys: Colo. *Mont.* Jl.

4. *T. Parryi* D. C. Eat. Biennial; stem simple or branched at the base, erect, 2–20 cm. high, strigose; leaves mostly basal, spatulate, thick, glabrous above, strigose beneath; stem-leaves few and small; involucre 2–3 cm. broad; bracts narrowly lanceolate, acuminate, sparingly striate, scarious and erose on the margins; ligules 12–15 mm. long, violet or bluish purple; pappus of long bristles. Mountains: Alta.—Wyo.—Ida. *Mont.*—*Alp.* My-Jl.

5. *T. alpina* (A. Gray) Rydb. Apparently perennial, rosulate-tufted, with a taproot, acaulescent; leaves basal, spatulate, about 1 cm. long, grayish strigose on both sides; involucre 12–18 mm. broad; bracts lanceolate, acuminate, strigose, scarious and erose on the margins; ligules pink, puberulent outside, scarcely 1 cm. long; pappus of long bristles. *T. Parryi alpina* A. Gray. High mountains: Wyo. *Alp.*

6. *T. condensata* Parry. Depressed stemless perennial; leaf-blades spatulate-obovate, 4–6 mm. long, petioled, lanuginous-arachnoid, rosulate, crowded; bracts linear, acuminate; rays 100 or more; ligules narrow; pappus of all flowers of many long bristles. High peak: Wyo. *Alp.* Jl.

7. *T. florifer* (Hook.) A. Gray. Biennial; stem 1 dm. high or less, strigose, branched at the base; leaves strigose; involucre 12–15 mm. wide; bracts linear-lanceolate, acute, slightly imbricate and nearly of the same length, strigose, narrowly scarious-margined and ciliate; ligules pink or rose-colored, about 1 cm. long; achenes hirsute. Stony hills and banks: Wash.—Mont.—Utah—Ore. My-Jl.

8. *T. ambigua* (A. Gray) Rydb. Stems several from the root, 8–10 cm. high, strigose, leafy, from a slender root; leaves spatulate, strigose; involucre about 15 cm. broad; bracts oblong-lanceolate, strigose on the back, with narrow scarious erose margins; ligules white, about 1 cm. long; pappus of the ray-flowers about half as long as that of the disk. *T. scapigera ambigua* A. Gray. Dry valleys: Utah. *Submont.*

9. *T. Fendleri* A. Gray. Perennial, with a slender taproot; stem 2 dm. high or less, branched both at the base and above, strigose-canescens; leaves 2–4 cm. long, 1–2 mm. wide, strigose; involucre 8–12 mm. broad; bracts ovate-lanceolate, acute, strigose, erose-ciliate; ligules rose-colored, 7–8 mm. long; pappus of the ray-flowers a short crown of squamellae and 1 or 2 short bristles. Gravelly hills: N.M.—Colo.—Ariz. *Son.* Ap-Au.

10. *T. strigosa* Nutt. Biennial or winter-annual; stems caespitose at the base, 2–10 cm. high, strigose; lower leaves spatulate, the upper linear-ob lanceolate, grayish-strigose; involucre 8–12 mm. wide; bracts lanceolate, strigose on the back, broadly scarious and erose on the margins, acute. *T. Watsoni* A. Gray. Gravelly hills: Wyo.—Utah—N.M.—Ariz. *Submont.*—*Mont.* My-Jl.

11. *T. montana* M. E. Jones. Caespitose perennial; leaves clustered, 2–3 cm. long, sparingly strigose, or glabrate, thick; peduncles 0.5–2 cm. long; involucre 10–12 mm. broad; bracts oblong, purple-tinged, narrowly scarious-margined and erose, in 5 series; ligules 6–8 mm. long, bluish purple, glabrous; achenes in age nearly glabrous; pappus of both ray- and disk-flowers of many bristles. *T. dejecta* A. Nels. High mountains: Utah. *Mont.*—*Subalp.* My-Jl.

12. *T. scapigera* D. C. Eat. Cespitose, almost acaulescent perennial; leaves 2-4 cm. long, sparingly strigose; blades spatulate; stem 2-5 cm. high, scapiform; involucre about 10-15 mm. wide; bracts oblong-lanceolate, in 3 series, acute, strigose on the back, with rather narrow, pinkish, scarious, erose margins; ligules bluish purple, about 1 cm. long; pappus of both ray- and disk-flowers of many bristles. High mountains: Mont.—Wyo.—Calif. *Submont.*—Mont. My—Jl.

13. *T. incana* Nutt. Cespitose perennial; stems 1-10 cm. high, canescent-hirsute; leaves linear-ob lanceolate, canescent-strigose, 2-3 cm. long; heads sessile; involucre 8 mm. high, about 1 cm. wide; bracts lanceolate, acute, densely strigose, scarious and erose on the margins; ligules lilac, 8 mm. long. Mountains and hills: Wyo.—N.M.—Ariz.—Utah. *Son.*—*Subalp.* My—Je.

14. *T. arizonica* A. Gray. Cespitose perennial, tufted; stems 3-8 cm. long, sericeous-canescant; leaves spatulate, 1-2 cm. long, long-petioled; involucre 10-12 mm. broad; bracts lanceolate, obtuse, strigose on the back, scarious and erose-ciliate on the margins; ligules 5-8 mm. long; pappus of all the flowers of the same length, rather rigid, about as long as the achenes. Hills: Utah—Ariz. *Son.*

15. *T. glabella* A. Gray. Cespitose perennial; stems 2-5 cm. high, sparingly strigose; leaves spatulate, 2-3 cm. long; involucre 10-12 mm. broad; bracts lanceolate, in 2 or 3 series, acute, green, only slightly scarious-margined, ciliate; pappus of the ray-flowers about one-fourth as long as that of the disk-flowers or less. *T. Bakeri* Greene. Mountains: Colo. *Subalp.*—Mont. My—Jl.

16. *T. Rothrockii* A. Gray. Acaulescent pulvinate perennial; leaves spatulate, 2-3 mm. long, rosulate; involucre 8 mm. high, 1-2 cm. broad; bracts oblong, obtuse, glabrous, purple-tinged, scarcely scarious-margined, ciliate. High mountains: Colo. *Submont.*—Mont. Jl.

17. *T. Wilcoxiana* Wood. Cespitose acaulescent perennial; leaves narrowly linear-ob lanceolate, 3-7 cm. long, glabrous above, sparingly pubescent beneath; involucre 1.5-3 cm. broad; bracts acute, lanceolate, tinged with purple, scarcely scarious-margined; ligules 10-15 mm. long. Plains and hills: Okla.—Colo. *Plain.* Ap—Je.

18. *T. intermedia* Rydb. Acaulescent cespitose perennial; leaves oblanceolate, mostly acute; involucre 1.5-3 cm. broad; bracts narrowly lanceolate, in 4 or 5 series. Dry soil: Neb.—Kans.—Ariz.—Wyo. *Plain.* Ap—My.

19. *T. leptotes* (A. Gray) Osterh. Cespitose perennial, mostly acaulescent; leaves linear-ob lanceolate, sparingly strigose; heads mostly sessile; involucre 1 cm. broad; bracts linear, rounded on the back, ciliate on the margins, but not scarious. *T. sericea leptotes* A. Gray. Mountains: Colo. Je.

20. *T. exscapa* (Richards.) Porter. Cespitose acaulescent perennial; leaves sericeous-strigose, 2-5 cm. long; involucre 1 cm. high, 1-3 cm. broad; bracts narrowly lanceolate, in 4 or 5 series; achenes hirsute; pappus-bristles of the disk-flowers twice as long as the achenes, those of the ray-flowers often shorter. *T. sericea* Hook. *T. mensana* M. E. Jones. Plains: Sask.—Tex.—N.M.—Alta. *Plain.*—Mont. Ap—Je.

21. *T. spathulata* Nutt. Cespitose, acaulescent, multicapital perennial; leaves crowded, spatulate, densely villous-lanate; heads sessile; involucre 8 mm. high; bracts oblong-lanceolate, acute; rays short, pinkish; pappus of the ray- and disk-flowers similar, of many bristles. High mountains: Wyo.

31. *BRACHYACTIS* Ledeb.

Leafy-stemmed annuals, with entire leaves. Heads rather small, numerous, paniculate. Involucre campanulate; bracts in 2-3 series, linear or oblong, almost equal in length, the outer foliaceous and loose. Ray-flowers in several series, more numerous than the disk-flowers, white, shorter than the pappus, with short or no ligule. Disk-flowers perfect, with slender, 4-5-toothed corollas. Style-branches with lanceolate appendages. Achenes narrow, not compressed, 2-3-nerved, appressed-pubescent.

Bracts oblong or oblong-linear, obtuse.
Bracts narrowly linear, acute.

1. *B. frondosa*.
2. *B. angusta*.

1. ***B. frondosa*** (Nutt.) A. Gray. Annual; stem 2-5 dm. high, glabrous or nearly so; leaves linear or lance-linear, 3-8 cm. long, glabrous, ciliolate on the margins; involucre about 8 mm. high, fully 1 cm. broad; bracts in 3 distinct series; ligules about 2 mm. long, pinkish. *Aster frondosus* T. & G. Saline soil and along streams: Wyo.—Colo.—Calif.—Ore. *Plain*. Au-O.

2. ***B. angusta*** (Lindl.) Britton. Annual; stems erect, branched, glabrous, 2-6 dm. high; leaves narrowly linear, 3-10 cm. long, glabrous, slightly ciliolate on the margins; involucre 6-8 mm. high, 8-10 mm. broad; bracts in 2 series, almost equal; ray-flowers reduced to the tube or with rudimentary ligules. *A. angustus* T. & G. Saline ground: Sask.—Wis.—Mo.—Utah—Alta. *Plain*—*Son.* Jl-S.

32. **EREMIASTRUM** A. Gray.

Dwarf, depressed winter annuals. Leaves entire. Heads solitary. Involucres hemispheric or broader; bracts numerous, linear, nearly in a single series, herbaceous, with hyaline-scarious fimbriate margins; receptacle flat. Ray-flowers numerous, in a single series, pistillate; ligules white. Disk-flowers numerous, perfect and fertile. Achenes obovate-oblong, compressed, 2-nerved. Pappus of very unequal bristles, the outer setulose and scarcely longer than the pubescence of the achenes.

1. ***E. bellioides*** A. Gray. Winter annual; stem diffusely branched at the base; branches decumbent, 3-10 cm. long, hispid; leaves linear-spatulate, entire, 5-15 mm. long, hispid; heads subtended by rosulate leaves; involucre 5-6 mm. high, 8-10 mm. broad; bracts linear-lanceolate, hispid; ligules white or violet, about 5 mm. long, dentate at the apex. Deserts: s Utah—Ariz.—Calif. *L. Son.* Ap-Je.

33. **LEUCOSYRIS** Greene. SPINY ASTER.

Rush-like spiny plants, often woody at the base, with small linear or subulate, often deciduous leaves. Involucres hemispheric; bracts well imbricate, in 3 series, subulate. Ray-flowers pistillate and fertile, with short white ligules. Disk-flowers perfect; corollas yellow. Style-branches with triangular-subulate appendages, much shorter than the stigmatic portion. Achenes glabrous.

1. ***L. spinosa*** (A. Gray) Greene. Perennial, usually shrubby at the base; stems 1-2.5 m. high, usually more or less spiny, striate, glabrous; cauline leaves linear or oblong, deciduous; involucre 5-6 mm. high, about 8 mm. broad; bracts subulate, in about 3 series, scarious-margined, shorter than the disk; ligules white, 3-4 mm. long; achenes glabrous. *Aster spinosus* A. Gray. Banks of streams: Tex.—s Utah—Calif.; Mex. *L. Son.* Je-S.

34. **XYLORRHIZA** Nutt. HOLLY-LEAVED ASTER.

Perennial caulescent herbs, with thick woody taproots and short caudices. Leaves many, spinulose-tipped, entire or spinulose-toothed. Heads large, solitary at the ends of the branches, radiate. Involucres hemispheric; bracts mostly in 2 or 3 series, acuminate, herbaceous, carinate below. Ray-flowers pistillate; ligules showy, white or pinkish. Disk-flowers perfect. Appendages of the style-branches lanceolate, acute. Achenes oblong, compressed. Pappus fulvous, simple, of rather few coarse bristles.

Leaves not spinulose-toothed.

Glabrous or nearly so.

More or less villous.

Bracts only slightly unequal, linear-lanceolate.

Leaves linear-ob lanceolate, acute.

Leaves spatulate, cuspidate.

Bracts very unequal, the outer ovate or ovate-lanceolate.

Leaves spinulose-toothed.

Plant 1 dm. or less high, with a short caudex.

Ligules 8-10 mm. long.

Ligules 15-20 mm. long.

Plant tall, shrubby.

1. *X. glabriuscula*.

2. *X. villosa*.

3. *X. venusta*.

4. *X. Parryi*.

5. *X. coloradensis*.

6. *X. Brandegei*.

7. *X. lanceolata*.

1. **X. glabriuscula** Nutt. Stems 1-2 dm. high, glabrous; leaves linear-ob lanceolate, 2-5 cm. long, glabrous; involucre 8-10 mm. high, 10-15 mm. wide; bracts linear-lanceolate, acuminate, glabrous, erose on the margins; ligule rose-colored, 10-12 mm. long. Alkali plains: Wyo. Je-Jl.

2. **X. villosa** Nutt. Stems 1-2 dm. high; leaves 2-5 cm. long, or linear-ob lanceolate, villous, tipped with a callous point; involucre 8-10 mm. high, 10-15 mm. broad; bracts linear-lanceolate, attenuate at the apex, villous on the back, erose on the margins; ligules pale red, 8-12 mm. long. *Aster Nylorrhiza* T. & G. Rocky places and clayey soil: Colo.—Wyo. My-Je.

3. **X. venusta** (M. E. Jones) Heller. Stems 2-5 dm. high; leaves entire, spatulate or oblanceolate, villous, 4-6 cm. long, spinulose-tipped; involucre about 1.5 cm. high, 3 cm. broad; bracts linear-lanceolate, attenuate, villous on the back, scarcely erose; ligules white or purple, 15-20 mm. long. *A. venustus* M. E. Jones. Dry places: Colo.—Utah. Son. My-Je.

4. **X. Parryi** (A. Gray) Greene. Stems tomentose-villous, about 1 dm. high; leaves spatulate, obtuse with a callous point, 2-3 cm. long, villous; involucre 8 mm. high, 15-18 mm. broad; bracts well imbricate, villous on the back, erose on the margins; rays about 1 cm. long, white. *A. Parryi* A. Gray. Flats: Wyo. Son.

5. **X. coloradensis** (A. Gray) Rydb. Stems less than 1 dm. high, canescent; leaves spatulate or oblanceolate, 2-4 cm. long, spinulose-dentate, hirsute-canescens; involucre about 8 mm. high, 15 mm. broad; bracts lance-subulate, attenuate, canescent; ligules 8-10 mm. long, violet-purple. *A. coloradensis* A. Gray. Higher mountains: Colo. Alp.

6. **X. Brandegei** Rydb. Stem almost 1 dm. high; leaves spatulate or the upper oblanceolate, 3-4 cm. long, firm, closely and sharply serrate with bristle-tipped teeth; disk about 3 cm. wide; bracts narrowly linear-lanceolate, attenuate; rays rose-purple. High mountains: s Colo. Subalp.—Alp. S.

7. **X. lanceolata** Rydb. Shrubby perennial, with white stems; branches more or less villous; leaves 4-6 cm. long, more or less villous, reticulately veined, dentate with spinulose-subulate teeth; involucre fully 1 cm. high, 15-20 mm. broad; bracts lance-subulate, villous and slightly glandular, attenuate and spinulose-tipped; ligules purple, about 2 cm. long. Arid places: s Utah. L. Son.

35. HERRICKIA Woot. & Standl.

Perennial herbs, with thick rigid, spinulose-toothed, reticulate, sessile leaves. Heads solitary at the ends of the branches, subsessile. Involucre turbinate-campanulate; bracts in several series, conspicuously keeled, green and foliaceous above, with callous points, the outer more foliaceous and passing into the leaves; receptacle naked. Ligules purple. Disk-flowers perfect; corollas yellow, turning purplish, with short ovate lobes. Style-branches with lanceolate, acute tips. Achenes compressed, striate, glabrous. Pappus simple, of long barbellate bristles.

1. **H. horrida** Woot. & Standl. Stems 3 dm. high or less, hirsute-glandular; leaves rigid, oblong to broadly ovate or oval, 2-4.5 cm. long, sessile or somewhat cordate-clasping, reticulate, spinose-dentate, pubescent; ligules 8 mm. long. Mountains: N.M.—s Colo. Au.

36. UNAMIA Greene. SNEEZEWORD ASTER.

Perennial, caulescent herbs with horizontal rootstocks. Leaves alternate, narrow, entire. Heads rather small, corymbose, radiate. Involucre turbinate-campanulate; bracts narrow, not foliaceous, more or less keeled. Ray-flowers pistillate; ligules white or ochroleucous. Disk-flowers yellow, perfect, numerous. Appendages of the style-branches lanceolate-subulate. Achenes 4-5-angled, not compressed, glabrous. Pappus of white rigid bristles, somewhat clavate at the ends.

Inner bracts ovate-lanceolate, acute, the outer lance-subulate; ligules white.

1. *U. alba*.

Inner bracts oblong or elliptic, obtuse or rounded at the apex; ligules yellowish, the outer lanceolate, obtusish.

2. *U. lutescens*.

1. **U. alba** (Nutt.) Rydb. Stems 2-5 dm. high, smooth, scabrous, or hispidulous; lower leaves linear-ob lanceolate, 3-5-ribbed, 5-15 mm. long, firm, the upper linear; involucre about 5 mm. high, 5-8 mm. broad; ligules 5-6 mm. long. *Inula alba* Nutt. *Aster ptarmicoides* T. & G. Rocky banks and bluffs: Vt.—N.Y.—Colo.—Sask. Plain—Submont. Jl-S.

2. **U. lutescens** (Lindl.) Rydb. Stem 2-4 dm. high, scabrous, at least above; leaves similar to those of the preceding species; involucre 5-6 mm. high, 6-8 mm. broad; ligules about 8 mm. long. *Diplopappus lutescens* Lindl. *Aster ptarmicoides lutescens* A. Gray. Banks and plains: Ill.—Wis.—Sask. Plain. Au-S.

37. EUCÉPHALUS Nutt.

Cauliscent leafy perennials, with rootstocks. Leaves alternate, sessile, from ovate to linear. Heads corymbose, radiate, middle-sized. Involucre campanulate; bracts regularly imbricate in several series, ovate to lanceolate, not foliaceous or in one species with foliaceous tips, dry and chartaceous with a distinct keel or midrib. Ray-flowers pistillate; ligules violet or purplish. Disk-flowers numerous, perfect; corollas yellow. Style appendages subulate, acute, or rarely oblong and obtuse. Achenes flat, hirsute or glabrate in age. Pappus of white capillary bristles.

Bracts all thin and acute, villous-ciliate on the margins; style-appendages subulate.

Leaves ovate-oblong or broadly lanceolate; heads 10-15 mm. high. 1. *E. Engelmannii*.
Leaves lanceolate; heads 8-10 mm. high. 2. *E. elegans*.

Bracts firmer, merely ciliate, the outer obtuse.

Bracts with more or less foliaceous tips; involucre and branches of inflorescence decidedly glandular, the leaves less so. 3. *E. wasatchensis*.

Bracts without foliaceous tips; plant not glandular or very rarely so. 4. *E. glaucus*.
Inner bracts acute. 5. *E. formosus*.

All bracts obtuse or rounded and mucronate at the apex.

1. **E. Engelmannii** (D. C. Eat.) Greene. Stem robust, 5-15 dm. high, glabrous or slightly puberulent; leaves thin, 5-10 cm. long, loosely veined; involucre hemispheric; bracts ovate, acute or acuminate, purple-tinged, in 5 series, puberulent on the back and ciliate on the margins; ligules white, fully 1 cm. long. *Aster Engelmannii* D. C. Eat. Mountains: Alta.—Colo.—Nev.—Wash.—B.C. Submont.—Mont. Jl-S.

2. **E. elegans** Nutt. Stem 3-10 dm. high, leafy, puberulent; leaves pale, lanceolate, 3-5 cm. long, scabrous-puberulent; involucre campanulate; bracts ovate, acute, purple-tinged, puberulent on the back, villous-ciliate on the margins; ligules about 8 mm. long, white. *Aster elegans* T. & G. Woody mountain slopes: Mont.—Wyo.—Utah—Neb.—Ore. Submont.—Mont. Jl-S.

3. **E. wasatchensis** (M. E. Jones) Rydb. Perennial with a rootstock; stem glabrous up to the inflorescence; leaves lance-oblong, acute, sessile, 4-6 cm. long, rather pale, glandular-puberulent; involucre 10-12 mm. broad; bracts lanceolate, acute; rays fully 1 cm. long. *A. glaucus wasatchensis* M. E. Jones. Mountains: Utah. Mont. Au.

4. **E. glaucus** Nutt. Stem branched, glabrous, 3-5 dm. high; leaves glabrous, glaucous, lanceolate, linear or oblong, acute, 3-7 cm. long, reticulate-venose; involucre about 6 mm. high and 8 mm. broad; bract ovate, glabrous, slightly ciliate on the margins; ligules violet or white, 8-10 mm. long. *A. glaucus* T. & G. Mountains: Wyo.—Colo.—Utah. Submont.—Mont. Jl-S.

5. **E. formosus** Greene. Stem glabrous, 3-5 dm. high; leaves linear, glaucous, glabrous, scabrous on the margins; involucre about 6 mm. high and 8 mm. broad; bracts ovate or oval, strongly purple-tinged, minutely ciliate; ligules deep blue, about 1 cm. long. Mountains: Colo. Mont. Au.

38. ÁSTER (Tourn.) L. ASTER.

Perennial herbs, usually with a rootstock, rarely with a woody caudex. Leaves alternate, various. Heads corymbose, paniculate, racemose, or rarely solitary, radiate. Involucre hemispheric or campanulate, or turbinate; bracts imbricate in several series, herbaceous or with herbaceous tips; receptacle flat or

convex, alveolate and often fimbriate. Ray-flowers pistillate; ligules purple, pink, or white. Disk-flowers perfect; corollas tubular with a bell-shaped throat and short 5-lobed limb, yellow, changing into red, brown, or purplish. Anthers obtuse at the base. Style-branches flattened, their appendages subulate, lanceolate, or ovate, acute. Achenes more or less flattened, nerved, or ribbed, glabrous or pubescent. Pappus of numerous, slender, white bristles in a single series.

Involucres and peduncles glandular.

Leaves ovate, oval, or the lower obovate, sharply and coarsely serrate; bracts well imbricate, very unequal, broadly lanceolate, not thick. I. CONSPICUI.

Leaves lanceolate, oblong, or linear, entire or, if slightly toothed, bracts linear-lanceolate, almost equal in length.

Lower leaves petioled.

Stems stout, 3-5 dm. high, leafy; bracts lanceolate, firm, ascending.

Stem-leaves lanceolate to ovate; disk of heads 1.5-2 cm. broad.

II. INTEGRIFOLII.

Stem-leaves narrowly linear; disk of heads about 1 cm. broad.

III. PAUCIFLORI.

Stem low, slender, few-leaved, 0.5-2 dm. high; bracts narrowly linear-lanceolate, with reflexed tips.

IV. KINGIANI.

Leaves all sessile.

Bracts narrowly linear, almost equal in length, attenuate.

Leaves broadly lanceolate or oblong.

V. MODESTI.

Leaves linear.

VI. CAPESTRES.

Bracts thick, oblanceolate, well imbricate; leaves oblong or lanceolate.

VII. OBLONGIFOLII.

Involucres and peduncles not glandular.

Outer bracts neither foliaceous nor equalling or surpassing the inner.

Bracts more or less pubescent on the back.

Bracts not bristle-pointed.

Heads solitary; plant less than 3 dm. high; leaves oblanceolate or the upper linear. VIII. ALPINI.

Heads corymbose or paniculate; plant over 3 dm. high.

Upper leaves more or less clasping and auricled at the base.

IX. MOLLES.

Upper leaves neither auricled nor clasping.

Leaves obovate, broadly oblanceolate, oval or lanceolate, usually more or less toothed; bracts lanceolate, often tinged with purple.

X. RADULNI.

Leaves narrowly oblanceolate or linear, entire; bracts linear or oblanceolate, green-tipped.

Pubescence villous.

XI. ANDINI.

Pubescence hirsute or strigose.

XII. GRISEI.

Bracts bristle-pointed, squarrose.

XIII. MULTIFLORI.

Bracts glabrous, except the ciliate margins.

Bracts linear, oblong or lanceolate, all acute or acutish.

Lower leaves long-petioled; blades cordate or ovate (rarely broadly lanceolate), usually more or less serrate. XIV. SAGITTIFOLII.

Lower leaves oblanceolate, linear, or lanceolate.

Plants perfectly glabrous throughout.

Bracts whitish-coriaceous below and with a distinctly rhombic green tip above; upper leaves clasping. XV. LAEVES.

Bracts linear-subulate, green nearly throughout; leaves narrowly linear, not clasping. XVI. PORTERIANI.

Upper part of the stem and peduncles with at least pubescent lines.

Heads usually numerous in a leafy panicle or compound corymb.

Stem only with pubescent lines.

XVII. SALICIFOLII.

Stem, at least above, pubescent on all sides.

XVIII. LONCHOPHYLLI.

Heads few in a naked small corymb.

XIX. OCCIDENTALES.

Bracts oblanceolate, the outer obtuse.

XX. ASCENDENTES.

Outer bracts foliaceous, equalling or surpassing the inner.

Heads rather numerous in an open leafy panicle.

XXI. FULCRATI.

Heads few, in a usually simple, racemose, or corymbose inflorescence with nearly erect branches.

XXII. FOLIOSI.

I. CONSPICUI.

One species.

1. *A. conspicuus*.

II. INTEGRIFOLII.

Stem almost glabrous below; auricles of the thinnish leaves small; bracts narrowly linear, lanceolate.

2. *A. integrifolius*.

Stem hirsute-villous throughout; auricles of the thick leaves broad; bracts oblong or lanceolate.

3. *A. amplexifolius*.

III. PAUCIFLORI.

One species.

4. *A. pauciflorus*.

IV. KINGIANI.

One species.

5. *A. Kingii*.

V. MODESTI.

Stem not hispid; heads distinctly peduncled; leaves slightly if at all auricled at the base, thin.

Stem, especially upwards, with scattered long silky hairs; leaves not auricled, usually somewhat hairy. 6. *A. major*.

Stem glandular-puberulent or glabrous below, not long-hairy.

Leaves and lower part of the stem glabrous, the former not auricled.

Leaves short-pubescent, somewhat scabrous above; stem usually puberulent throughout; leaves with small auricles. 7. *A. modestus*.

Stem short-hispid; heads crowded, often subsessile, subtended by bract-like leaves; leaves thick, strongly auricled at the base. 8. *A. Sayianus*.

9. *A. Novae-Angliae*.

VI. CAMPESTRES.

One species.

VII. OBLONGIFOLII.

Leaves scabrous-hirsutulous, mostly spreading or reflexed.

Leaves glabrous, except the bristly-ciliate margins, ascending.

10. *A. campestris*.

11. *A. Kumleini*.

12. *A. Fendleri*.

VIII. ALPINI.

One species.

13. *A. alpinus*.

IX. MOLLES.

One species.

14. *A. Jessicae*.

X. RADULINI.

Upper part of the stem and the involucre long-villous.

Upper part of the stem and involucre short-pubescent.

15. *A. Richardsonii*.

16. *A. meritus*.

XI. ANDINI.

Stems decumbent or ascending, about 1 dm. high; leaves glabrate.

Stems erect, about 3 dm. high; leaves finely villous.

17. *A. andinus*.

18. *A. Williamstii*.

XII. GRISEI.

Leaves rather copiously and permanently appressed-hirsutulous.

Inflorescence falsely racemose; lower leaves triple-nerved.

Inflorescence corymbiform or paniculate; leaves all 1-nerved.

Plant 3-4 dm. high; stem retrorse-hirsute below.

Plant 1-1.5 dm. high; hairs of the stem not retrorse.

Leaves sparingly strigose and glabrate in age, or perfectly glabrous, except the hispidulous-ciliate margins.

Bracts with a green tip and midvein.

Stem stout; leaves oblanceolate, the lower often triple-nerved.

Stem slender; leaves narrowly linear-oblanceolate or linear, 1-nerved.

Outer bracts green almost throughout.

40. *A. subracemosus*.

19. *A. subgriseus*.

20. *A. griseolus*.

61. *A. Underwoodii*.

64. *A. Nelsonii*.

21. *A. violaceus*.

XIII. MULTIFLORI.

Inflorescence very leafy, not corymbiform.

Pubescence of the stem spreading or reflexed, hirsutulous.

Heads less than 5 mm. high.

Heads 6-8 mm. high.

Pubescence of the stem appressed or ascending.

Bracts very unlike in length, well imbricate, the outer much shorter; heads racemously arranged, each at the end of a short leafy branch (except in no. 25).

Bracts narrowly oblanceolate, the inner especially acutish; heads less than 5 mm. high.

Stem much branched; heads racemously disposed on the more or less diverging branches.

Stem simple below; heads few at the ends of the erect branches.

Bracts broadly oblanceolate or the outer spatulate, very obtuse; heads over 5 mm. high.

Bracts almost equal in length or the outer sometimes longer; heads few or solitary at the ends of the main branches.

Bracts thick, very squarrose, the outer spatulate, rounded at the apex; leaves thick, densely strigose.

Bracts thin, slightly squarrose, oblanceolate, acute; leaves sparingly strigose, in age often glabrate.

Inflorescence less leafy, corymbiform; leaves glabrous, merely hispid-ciliolate; disk 6-8 mm. wide; stem slender.

Stem glabrous.

Stem puberulent.

22. *A. exiguus*.

23. *A. crassulus*.

24. *A. multiflorus*.

25. *A. stricticaulis*.

26. *A. polycephalus*.

27. *A. commutatus*.

28. *A. falcatus*.

29. *A. denudatus*.

67. *A. Hallii*.

XIV. SAGITTIFOLII.

Basal leaf-blades cordate or broadly ovate; upper stem-leaves lanceolate; achenes glabrous.

Petioles, midribs, and usually also the stem pubescent with long white hairs.

30. *A. Wilsonii*.

- Plant glabrous or sparingly short-pubescent. 31. *A. Lindleyanus*.
 Basal leaf-blades lanceolate; upper stem-leaves narrowly lanceolate or those of the inflorescence lance-linear. 32. *A. MacCallae*.
 Heads few; involucre 8-9 mm. high; rays about 15 mm. long; achenes glabrous. 33. *A. Bulleri*.
 Heads numerous; involucre 5-6 mm. high; rays 8-10 mm. long; achenes hispidulous-strigose.

XV. LAEVES.

- Bracts much shorter than the disk. 34. *A. brevibracteatus*.
 Bracts about equalling the disk or only slightly shorter.
 Leaves merely scabrous-ciliate.
 Green tips of the bracts broadly rhombic; leaves of the branches much reduced. 35. *A. laevis*.
 Green tips of the bracts narrowly rhombic or rhombic-ob lanceolate; leaves of the branches gradually but not conspicuously reduced.
 Stem-leaves lanceolate or linear-lanceolate, auricled-clasping. 36. *A. Geyeri*.
 Stem-leaves narrowly linear, not auricled. 37. *A. subsalignus*.
 Leaves decidedly long-ciliate; bracts with oblong green tips. 38. *A. Scribneri*.

XVI. PORTERIANI.

- One species. 39. *A. Porteri*.

XVII. SALICIFOLII.

- Inflorescence falsely racemose; leaves linear to oblanceolate; leaves triple-nerved. 40. *A. subracemosus*.
 Inflorescence paniculate or corymbiform; leaves not triple-nerved.
 Inflorescence elongate, not flat-topped.
 Heads numerous in a much branched panicle; involucre well imbricate.
 Leaves distinctly toothed.
 Disk of the head about 1 cm. high and broad; leaves thickish. 41. *A. salicifolius*.
 Disk 6-8 mm. high and broad; leaves thin. 42. *A. paniculatus*.
 Leaves entire, rarely denticulate, with more or less clasping bases.
 Disk of the head nearly 1 cm. high and broad.
 Bracts linear-filiform, more or less squarrose. 43. *A. hesperius*.
 Bracts linear, erect.
 Ligules purple. 44. *A. fluriatilis*.
 Ligules white or sometimes pinkish.
 Bracts not with white midrib; leaves narrowly linear. 45. *A. Osterhoutii*.
 Bracts with white midrib; leaves lanceolate or oblong-lanceolate. 46. *A. laetivirens*.
 Disk of the head 6-8 mm. high and broad.
 Bracts linear, nearly of the same length; leaves narrowly linear. 47. *A. longulus*.
 Bracts oblong or linear-oblong, the outer shorter; leaves broadly linear. 48. *A. rosolus*.
 Heads rather few, often solitary on the leafy branches; bracts narrowly linear, nearly of the same length, the outer green. 49. *A. Franklinianus*.
 Inflorescence more or less flat-topped.
 Leaves lanceolate to linear-lanceolate, firm; heads numerous.
 Leaves narrowly linear, thin; heads few. 50. *A. corymbiformis*.
 51. *A. junciformis*.

XVIII. LONCHOPHYLLI.

- Stem softly pubescent; leaves lanceolate, not pale.
 Stem crisp-puberulent above; upper stem-leaves linear, sessile, but scarcely auricled. 52. *A. lonchophyllus*.
 Stem villous above; upper stem-leaves oblong-lanceolate, auricled-clasping. 53. *A. eriocaulis*.
 Stem hispidulous above; leaves linear, pale green. 54. *A. leucopsis*.

XIX. OCCIDENTALES.

- Bracts linear-subulate, acuminate, the inner almost caudate.
 Leaves linear-ob lanceolate, acuminate, or the upper linear-lanceolate. 55. *A. subcaudatus*.
 Leaves linear. 49. *A. Franklinianus*.
 Bracts linear, acute; lower leaves oblanceolate, the upper lanceolate, acute, usually auricled-clasping.
 Disk about 1 cm. broad; stem-leaves linear or lance-linear; basal-leaves linear-ob lanceolate; bracts distinctly imbricate in 3-4 series. 56. *A. occidentalis*.
 Disk 1.5 cm. or more wide; leaves lanceolate or oblanceolate, entire; bracts in about 2 series.
 Bracts, at least the outer ones, wholly green; plant 2-4 dm. high. 57. *A. Fremontii*.
 Bracts with more or less distinct white margins below, green-tipped above.
 Bracts with conspicuous rhombic-lanceolate green tips; dark green stem-leaves oblanceolate, all except the uppermost crenate and petioled; rays dark blue. 58. *A. Umbachii*.

- Bracts with less conspicuous lanceolate green tips; stem-leaves usually entire, light green and glaucous; rays light purple. 59. *A. ciliomarginatus*.

XX. ADSCENDENTES.

Heads few in a simple corymb.

- Heads less than 1 cm. high; upper leaves much reduced; stem 2-3 dm. high, slender. 60. *A. armeriaefolius*.

- Heads over 1 cm. high; leaves all ample; stems stout, 3-6 dm. high. 81. *A. diabolicus*.

Heads many in a leafy panicle.

Heads about 1 cm. high; stem-leaves lanceolate or oblanceolate.

Stems 2-3 dm. high; bracts usually more or less pubescent on the backs.

Bracts with green midvein and tips, puberulent.

61. *A. Underwoodii*.

Outer bracts wholly green, densely pubescent.

21. *A. violaceus*.

Stems 4-6 dm. high; bracts glabrous on the backs; stem-leaves thick, oblanceolate; panicle elongate.

62. *A. Tweedyi*.

Heads less than 1 cm. high; stem-leaves linear or narrowly linear-oblanceolate.

Bracts not spinulose-tipped.

Lower leaves oblanceolate; bracts glabrous, except the ciliate margins; plant 1-3 dm. high. 63. *A. adscendens*.

Lower leaves narrowly linear-oblanceolate.

Bracts more or less hairy on the back.

64. *A. Nelsonii*.

Bracts glabrous, except the ciliate margins.

Leaves of the floral branches elongate, narrowly linear, ascending.

65. *A. Nuttallii*.

Leaves of the floral branches reduced, short, oblong, spreading.

66. *A. halophilus*.

Bracts with short spinulose or callous tips.

Stem decidedly puberulent.

67. *A. Hallii*.

Stem glabrous.

29. *A. denudatus*.

XXI. FULCRATI.

Outer bracts oblanceolate.

Leaves broadly lanceolate with auriculate-clasping bases.

Outer bracts very squarrose or reflexed; leaves entire.

68. *A. proximus*.

Outer bracts appressed or slightly spreading; leaves distantly toothed.

Outer bracts obtuse.

85. *A. Burkei*.

Outer bracts acute.

69. *A. phyllodes*.

Leaves linear or linear-lanceolate.

70. *A. Mearnsii*.

Outer bracts linear, or subulate, or linear-oblanceolate.

Leaves, at least the lower ones, toothed; bracts loose.

71. *A. Douglasii*.

Leaves entire; bracts close.

Outer bracts much exceeding the disk; some twice as long.

Leaves narrowly linear, not auricled.

72. *A. fulcratus*.

Leaves linear to oblong-oblanceolate or lanceolate, auricled.

73. *A. cordalenus*.

Outer bracts seldom exceeding the disk.

Leaves glabrous above; disk of the head 8-10 mm. high.

74. *A. Eatonii*.

Leaves minutely scabrous-puberulent or pilosulous above.

Bracts linear-subulate; stem short-villous above.

75. *A. Hendersonii*.

Bracts linear-oblanceolate; stem short-pubescent with stiff hairs above.

Branches and leaves strongly ascending; disk 7-8 mm. high and broad.

76. *A. oreganus*.

Branches ascending-spreading; leaves spreading; disk 8-10 mm. high and over 1 cm. broad.

77. *A. microlonchus*.

XXII. FOLIOSI.

Plant tall, 4-8 dm. high.

Bracts mainly linear or linear-lanceolate.

Bracts and stem villous.

78. *A. Kootenayi*.

Bracts glabrous, except the ciliate margins.

Stem-leaves thick, scabrous above; stem rough-hispid, red.

79. *A. Forwoodii*.

Stem-leaves thinner, lanceolate to linear, acute; stem glabrous, or sparingly pubescent, not hispid.

Disk about 2 cm. wide; leaves sharply denticulate.

80. *A. amplus*.

Disk 1-1.5 cm. wide; leaves usually entire.

Stem-leaves nearly all sessile, linear-lanceolate, only slightly auriculate; plant slender.

81. *A. diabolicus*.

Lower stem-leaves with winged petioles, the upper sessile, clasping, with usually conspicuous auricles.

82. *A. frondeus*.

Outer bracts broadly lanceolate or oblanceolate.

Outer bracts mostly acute.

Leaves firm, broadly lanceolate; auricles of the upper leaves small; branches of the inflorescence crisp-hirsute.

83. *A. Canbyi*.

Leaves thin, oblong-lanceolate; auricles of the stem-leaves large; branches of the inflorescence villous.

84. *A. Cusickii*.

Outer bracts mostly obtuse.

85. *A. Burkei*.

Plant low, 1-2 dm. high; heads usually solitary.

86. *A. apricus*.

1. **A. conspicuus** Lindl. Stem 4-6 dm. high, scabrous-puberulent; leaves 1-1.5 cm. long, acute or short-acuminate, scabrous above, pubescent beneath; inflorescence corymbiform; involucre broadly campanulate, 1 cm. high, 1-1.5 cm. broad; rays violet, 1 cm. long. *A. MacDougali* Coult. & Fisch. Hillsides, open woods: Sask.—S.D.—Wyo.—Ore.—B.C. *Submont.*—*Mont.* Jl-S.

2. **A. integrifolius** Nutt. Stem 2-4 dm. high, puberulent below, glandular above; lower leaves 1-1.5 dm. long, tapering into a margined petiole, oblanceolate, entire; upper stem-leaves lanceolate, sessile, clasping; inflorescence racemiform; involucre hemispheric; bracts acute, often tinged with purple; ligules 1 cm. long, bluish purple. Open moist woods: Mont.—Wyo.—Calif.—Wash. *Submont.*—*Mont.* Jl-S.

3. **A. amplexifolius** Rydb. Stem stout, 3-4 dm. high; basal leaves oblanceolate, about 1.5 dm. long, tapering into a short winged petiole, entire, glabrate in age, ciliate on the margins; upper stem-leaves ovate or broadly lanceolate; inflorescence racemiform; involucre fully 1 cm. high; bracts sometimes more or less leafy; ligules 1 cm. long, bluish purple. Hills: Mont.—Wyo.—Utah. *Mont.* Au.

4. **A. pauciflorus** Nutt. Stem 1.5-5 dm. high, branched; leaves somewhat fleshy, entire, glabrous, the basal ones petioled, linear-oblanceolate, 3-10 cm. long; inflorescence glandular-puberulent, flat-topped; heads few; involucre 7-8 mm. high; bracts in 2 or 3 series, linear-lanceolate, acute; rays blue or whitish, 5 mm. long. *A. thermalis* M. E. Jones. *Erigeron paucipetalus* Osterhout. Saline soil: Sask.—Tex.—Ariz.—Utah—Alta. *Plain*—*Son.* My—Au.

5. **A. Kingii** D. C. Eat. Cespitose perennial, with a short woody rootstock or caudex; stem glabrous below, glandular above; basal leaves petioled, 4-8 cm. long, glabrous; blades spatulate or oblanceolate, entire; stem-leaves few and oblanceolate; involucre 1 cm. high and 12-15 mm. wide; bracts attenuate; ligules white, 8-10 mm. long. High mountains: Utah. *Submont.*—*Mont.* Jl—Au.

6. **A. major** (Hook.) Porter. Perennial, with a horizontal rootstock; stem 5-10 dm. high; leaves 5-10 cm. long, lanceolate, acuminate or attenuate, thin, entire or minutely denticulate; inflorescence flat-topped, peduncled; involucre 1 cm. high, 12-15 mm. broad; ligules fully 1 cm. long, bluish purple. *A. unalaschensis major* Hook. Moist woods: w Ont.—Ore.—Alaska. *Mont.* Au-S.

7. **A. modestus** Lindl. Stem 4-8 dm. high, often purplish; leaves lanceolate, 4-8 cm. long, glabrous or nearly so, distantly denticulate, acuminate, shining; heads few, in a corymbiform inflorescence; involucre 1 cm. high, 12-15 mm. wide; rays bluish purple, about 1 cm. long. Moist woods: Alta.—Mont.—Ida.—Wash.—B.C. *Mont.* Jl-S.

8. **A. Sayianus** Nutt. Stem 3-8 dm. high; leaves thin, lanceolate, 4-8 cm. long, entire or distantly denticulate; heads few, in a flat-topped inflorescence; involucre 1 cm. high and 10-15 mm. wide; rays bluish purple, nearly 1 cm. long. Wet places: Alta.—Mont.—Ore.—B.C. *Mont.* Jl-S.

9. **A. Novae-Angliae** L. Stem 4-25 dm. high; leaves lanceolate or oblong, 3-12 cm. long, entire, acute, firm, hispidulous on both sides, hispidulous-ciliate on the margins; inflorescence leafy, much branched, flat-topped; involucre 8-10 mm. high, about 15 mm. wide; rays reddish purple or rose-colored, nearly 1 cm. long. Low ground: Que.—S.C.—Colo.—Alta. *Plain*—*Submont.* Au-O.

10. **A. campestris** Nutt. Stem 2-4 dm. high, branched above or simple; leaves sessile, oblong or linear, 2-3 cm. long or the lower linear-oblanceolate, glandular-puberulent, or glabrate, obscurely triple-nerved; involucre 6-7 mm. high, about 1 cm. broad; ligules 8 mm. long, light violet or purplish. *A. Andrewsii* A. Nels. Valleys: Alta.—Colo.—Ore.—B.C. *Plain*—*Mont.*

11. **A. Kumleini** Fries. Stem 2-5 dm. high, branched above, often yellowish or straw-colored, scabrous-puberulent; leaves rigid, sessile, oblong, 2-3 cm. long, those of the branches reduced and more spreading; involucre 6-7 mm. high, 8-10 mm. wide; bracts in 3-4 series, imbricate, linear-oblanceolate, firm, squarrose; ligules bluish violet, 7-8 mm. long. *A. oblongifolius rigidulus* A. Gray. Plains: Wis.—Mo.—Tex.—Colo.—S.D. *Plain.* Au-O.

12. **A. Fendleri** A. Gray. Stem 1-3 dm. high, stiff, sparsely hispidulous; leaves linear, 1-nerved, 2-3 cm. long; heads few; involucre turbinate, 7-8 mm. high, fully 1 cm. broad; bracts acute, unequal, in 3 or 4 series; ligules violet, 8 mm. long. Plains and sand hills: Kans.—Tex.—N.M.—Colo. *Plain—Submont.* S.

13. **A. alpinus** L. Stem pilose throughout; basal leaves numerous, 2-5 cm. long, rounded at the apex, pilose; involucre about 1 cm. high, 2 cm. wide; bracts oblong or linear, obtuse, pilose, in 2 or 3 series, but nearly of the same length; rays fully 1 cm. long, violet. *A. culminis* A. Nels. Arctic-alpine situations: Mack.—Colo.—Alaska; Eurasia. *Alp.* Je-Jl.

14. **A. Jessicæ** Piper. Stem densely villous, almost tomentose, 4-15 dm. high; leaves obovate to oblanceolate, 5-10 cm. long, densely and softly grayish-pubescent on both sides, sessile; involucre hemispheric, about 15 mm. high and broad; bracts herbaceous, oblong, obtuse or acute, villous-pubescent; ligules numerous, bluish purple, about 1 cm. long. *A. latahensis* Henders. *A. mollis* Rydb. River banks: Wyo.—Wash. *Submont.—Mont.* Au-S.

15. **A. Richardsonii** Spreng. Stem 1-3 dm. high; leaves sparingly short-villous on both sides or glabrate above, 3-10 cm. long; heads few; involucre about 1 cm. high and 1.5 cm. wide; ligules purplish, nearly 1 cm. long. *A. montanus* Richards. *A. giganteus* (Hook.) Rydb. Arctic-alpine situations: Mack.—Alta.—B.C.—Alaska. *Alp.* Jl-Au.

16. **A. meritus** A. Nels. Stem ascending, 2-4 dm. high; leaves somewhat crenate-serrate or some entire, glabrous above, puberulent beneath, 3-7 cm. long; inflorescence corymbiform; involucre turbinate-campanulate, 8 mm. high, 1 cm. broad; bracts in 3-4 series, acute; ligules purple or violet. Mountains: Mack.—S.D.—Wyo.—B.C. *Submont.—Subalp.* Jl-Au.

17. **A. andinus** Nutt. Stem somewhat villous above; lower leaves oblanceolate or spatulate, 4-6 dm. long, ciliolate on the margins; upper stem-leaves linear, sessile; involucre about 10 mm. broad; bracts linear, acute or the outer obtuse, few, in 3 series, but only slightly unequal. High mountains: Mont.—Colo. *Mont.—Subalp.* Je-Au.

18. **A. Williamsii** Rydb. Stem erect, about 3 dm. high, more or less villous; leaves oblanceolate, 3-10 cm. long, finely villous on both sides; heads few, corymbose; involucre about 1 cm. broad; bracts linear or lance-linear, sparingly and finely villous on the back, imbricate in 3 series; ligules lilac, about 1 cm. long. Mountains: Wyo. *Mont.* Jl-Au.

19. **A. subgriseus** Rydb. Stem decumbent or ascending at the base; lower leaves oblanceolate, pale, 7-10 cm. long, the upper oblong or linear, sessile, entire, 1-nerved; involucre about 8 mm. high and 1 cm. broad; bracts linear or oblong, the outer obtuse, the inner acutish; ligules 8 mm. long, pale violet. *A. griseus* Greene, not Kuntze. Mountains: Wyo.—Colo.—e Utah. *Mont.* Jl.

20. **A. griseolus** Rydb. Stem 1-1.5 dm. high; leaves linear, 3-5 cm. long, sessile, acute, entire; heads 1-4 in a small corymb; involucre about 1 cm. wide; bracts oblanceolate or linear, the outer obtuse, the inner acute, green or the inner white on the sides below; ligules purple, about 8 mm. long. (?) *A. spithameus* Greene, not Kuntze. High mountains: Colo. *Mont.—Subalp.* Au.

21. **A. violaceus** Greene. Stem 3-4 dm. high, purple-tinged, strigose; lower leaves linear-oblanceolate, 10-12 cm. long, petioled, the upper sessile, linear, entire; inflorescence corymbose; involucre 15 mm. broad; bracts linear, the outer obtuse and wholly herbaceous; ligules violet, 1 cm. long. Dry places in the mountains: Colo. Au-S.

22. **A. exiguus** (Fern.) Rydb. Stem erect, branched and very leafy above; branches divergent; leaves linear or oblong, sessile, 0.5-3 cm. long, entire, densely hirsutulous; heads very numerous at the ends of short leafy branches; involucre about 4 mm. high and broad; ligules white, 3-4 mm. long. Prairies and plains: Vt.—Pa.—Tex.—Ariz.—Wash.; Mex. *Plain—Submont.* Au-O.

23. **A. crassulus** Rydb. Stem erect or ascending, branched above, 4-7 dm. high; stem-leaves linear, or oblong-linear, 3-6 cm. long, 2-3 mm. wide, sessile

and slightly clasping, those of the branchlets only 3–5 mm. long; heads numerous, borne at the end of leafy branchlets; involucre turbinate, 5–8 mm. high, 8–10 mm. broad; ligules numerous, white, 5–7 mm. long. *A. hebeciadus* Coult & Nels., not DC. *A. multiflorus* A. Gray, in part. Plains: Sask.—N.D.—Colo.—Calif.—Ida. Plain—Submont. JI–O.

24. *A. multiflorus* Ait. Stem much branched, 3–6 dm. high; branches mostly ascending-spreading; leaves linear, 1–5 cm. long, sparingly hirsute-strigillose, or above glabrate; involucre about 4 mm. high and broad; ligules white, 3–4 mm. long. Prairies and dry ground: Me.—Ga.—Mex.—Colo.—B.C. Plain. Au–O.

25. *A. stricticaulis* (T. & G.) Rydb. Stem 3–6 dm. high, slender; leaves narrowly linear, 1–5 cm. long, 1–2 mm. wide, sparingly strigose or glabrate; involucre 3–4 mm. high and nearly as broad; bracts in 3 series, narrowly oblanceolate, almost glabrous, rather thin; ligules white, 3 mm. long. Meadows and river valleys: Sask.—Neb.—Wash.—Alta. Plain. Au–S.

26. *A. polycephalus* Rydb. Stem with many ascending branches, 3–8 dm. high; leaves linear, 2–5 cm. long, hispidulous-strigose or in age glabrate; involucre 5–7 mm. high and as broad; ligules white, 4–6 mm. long. Plains and hills: Alta.—Neb.—Tex.—Ariz. Plain—Submont. JI–S.

27. *A. commutatus* T. & G. Stem branched above, with usually spreading branches, coarsely strigose; leaves linear, 1–4 cm. long, densely hispid-strigose; involucre 6–8 mm. high and fully as wide; ligules white, 4–5 mm. long. *A. adsurgens* Greene. *A. incanopilosus* Sheld. Plains and river banks: Sask.—Minn.—Kans.—N.M.—Ariz.—B.C. Plain—Submont. Au.

28. *A. falcatus* Lindl. Stem 3–4 dm. high, sparingly strigose; leaves linear, often falcate, 2–4 cm. long; heads more racemously arranged than in the preceding; involucre 5–6 mm. high and as broad; ligules white or pinkish, 4–5 mm. long. *A. Cordineri* A. Nels. Valleys: Mack.—Colo.—Alaska. Plain—Mont. JI–O.

29. *A. denudatus* Nutt. Stem 2–4 dm. high, glabrous or nearly so throughout, slender; leaves narrowly linear, 1–5 cm. long, the upper much reduced, rather firm; involucre 5–6 mm. high; outer bracts oblanceolate, rounded at the apex, the inner linear and more acute, all glabrous; ligules 5–8 mm. long. Dry plains: Utah—s Ida. Son. JI–Au.

30. *A. Wilsonii* Rydb. Stem 3–6 dm. high, often purplish, more or less pubescent with long white hairs; lower leaf-blades 5–10 cm. long, usually more or less hirsute on both sides, but in age glabrate, serrate, acuminate, the upper lanceolate, sessile, sub-entire; involucre 7–8 mm. high, scarcely 1 cm. wide; bracts subulate, attenuate, with green oblanceolate midrib; ligules 8–10 mm. long, bluish purple. River valleys: Mack.—B.C.—w Ont. Boreal. Au–S.

31. *A. Lindleyanus* T. & G. Stem 3–10 dm. high, with crisp hairy lines above; lower leaf-blades cordate to ovate, serrate, 5–15 cm. long, rather firm; middle leaves with winged ciliate petioles with clasping bases; the uppermost leaves lanceolate, sessile; involucre 7–8 mm. high, about 1 cm. broad; bracts linear-subulate, with a green oblanceolate midrib; disk-flowers reddish purple; ligules bluish purple, 10–12 mm. long. River banks: Lab.—N.H.—Ohio—Wyo.—B.C.—Yukon. Plain—Subalp.

32. *A. MacCallae* Rydb. Stems 3–6 dm. high, often purplish, glabrous up to the inflorescence, then slightly pubescent in lines; lower leaves with winged petioles; blades 8–15 cm. long, usually serrate, acute, glabrous or essentially so; involucre 8–9 mm. high, 1 cm. broad; bracts subulate, glabrous, with linear-lanceolate green tips; ligules blue or bluish purple, about 15 mm. long; disk-flowers red-purple. Along streams: Alta.—B.C. Mont. Au–S.

33. *A. Butleri* Rydb. Stem 4–10 dm. high, slender; lower leaf-blades about 1 dm. long, distantly serrate; involucre 5–6 mm. high, about 8 mm. wide; bracts subulate, with narrowly lanceolate green tips, attenuate, glabrous; ligules bluish purple, 8–10 mm. long. Along streams: Alta.—Mont.—B.C. Mont. Au–S.

34. *A. brevibracteatus* Rydb. Stem 5-6 dm. high, glabrous, tinged with purple; basal leaves about 1 dm. long, with short winged petioles; blades spatulate or oblanceolate, crenate-serrate, glabrous; upper stem-leaves lanceolate, half clasping; involucre 5-7 mm. high, nearly 1 cm. broad; bracts linear-lanceolate, firm, with a narrowly rhomboid green tip; ligules blue, 8 mm. long. Low ground: Wash.—Mont. *Submont.* Au-S.

35. *A. laevis* L. Stem 3-12 dm. high, rigid, glabrous, glaucous; basal leaves with winged petioles; blades ovate or lanceolate, more or less serrate, glabrous and glaucous; upper stem-leaves ovate, subcordate or auriculate-clasping; involucre 8-9 mm. high, about 1 cm. broad; ligules blue. Open woodlands: Ont.—La.—N.M.—B.C. *Plain—Mont.* Au-O.

36. *A. Geyeri* (A. Gray) Howell. Stem 5-10 dm. high, glabrous; lower leaves 1-2 dm. long, with winged petioles; blades oblanceolate, entire or sparingly serrate, glabrous, glaucous; involucre about 8 mm. high and 1 cm. wide; ligules blue, 8-10 mm. long; achenes glabrous. Valleys: Alta.—S.D.—Colo.—Wash. *Submont.—Mont.* Jl-S.

37. *A. subsalignus* Rydb. Stem 6-10 dm. high; leaves nearly erect, glabrous, glaucous, entire, clasping, 5-10 cm. long, 6-7 mm. wide; involucre about 7 mm. high and 8 mm. wide; ligules bluish or bluish purple, about 8 mm. long; disk-flowers dark, red-purple. Valleys: Colo. *Submont.* Au.

38. *A. Scribneri* Rydb. Stem 3-6 dm. high, glabrous; basal leaves 1-2 dm. long, with wing-margined petioles; blades thin, ovate, acute, sharply serrate-dentate, glaucous, glabrous; stem-leaves ovate or ovate-lanceolate, sessile and clasping; panicle small, with 5-10 heads; bracts glabrous; ligules about 8 mm. long. Valleys: Mont. *Submont.* Au.

39. *A. Porteri* A. Gray. Stems 2-4 dm. high, glabrous, simple or branched above; leaves linear, or the lower oblanceolate, 5-10 cm. long, divergent, glabrous, or the lower hirsute-ciliate; heads numerous; involucre 4-5 mm. high, 6-7 mm. broad; ligules white, 5-6 mm. long. Mountains: Colo. *Submont.—Mont.* Jl-O.

40. *A. subracemosus* Rydb. Stem 5-6 dm. high, simple, strict, sparingly strigose; leaves oblanceolate or the upper linear, sessile, 4-8 cm. long, more or less scabrous, scabrous-ciliate on the margins, entire; involucre about 8 mm. high and 1 cm. broad; bracts in 3-4 series, with oblanceolate green tips. Rocky hillsides: Mont. *Submont.* S.

41. *A. salicifolius* Lam. Stem 5-20 dm. high, paniculately branched; leaves lanceolate, firm, glabrous or scabrous, 6-10 cm. long, the lower more or less dentate; involucre 6-8 mm. high, 8-10 mm. broad; bracts with narrowly oblanceolate green tips or the outer nearly wholly green; ligules purple or violet, rarely white, 6-8 mm. long. Wooded banks: Me.—Fla.—Tex.—Colo.—B.C. *Plain—Submont.* Au-O.

42. *A. paniculatus* Lam. Stem 5-20 dm. high, paniculately branched; leaves oblong-lanceolate to narrowly linear-lanceolate, mostly attenuate, thin, glabrous, sharply denticulate or the upper entire; involucre 5-6 mm. high, 8-10 mm. wide; bracts with narrowly linear-lanceolate green tips; ligules white or rarely pink or pale lilac, 7-8 mm. long. Wooded banks: N.B.—Va.—Colo.—Sask. *Plain—Submont.* Au-O.

43. *A. hesperius* A. Gray. Stem 4-10 dm. high, paniculately branched; leaves lance-linear, entire or rarely denticulate, 5-15 cm. long, thin, glabrous or nearly so, hispid-ciliate on the margins; involucre 7-8 mm. high, nearly 1 cm. broad; outer bracts green, the inner ones with narrowly lanceolate green tips, of the same length or the outer slightly shorter; ligules violet or white, 7-8 mm. long. Along streams: N.M.—Colo.—Calif.; n Mex. *Son.* Au-O.

44. *A. fluviatilis* Osterh. Stem slender, 6-10 dm. high, leafy and branched; leaves lance-linear, sessile, somewhat clasping, the larger 1 dm. long, entire or nearly so; inflorescence paniculate; involucre 6-7 mm. high, nearly 1 cm. broad; bracts in 4 series, oblanceolate, acute, with oblanceolate green tips; ligules lilac to purple. *A. coerulescens* Rydb. (Fl. Colo.), not DC. Along streams: Wyo.—Utah—Colo.—La. *Plain—Submont.* S.

45. *A. Osterhoutii* Rydb. Stem branched and leafy, 5-10 dm. high; leaves 5-12 cm. long, 8 mm. wide or less, those of the branches much smaller; involucre 7-8 mm.; bracts linear to oblanceolate, apiculate; ligules white or rarely pinkish, nearly 1 cm. long. Along ditches and streams: Colo.—Sask.—Alta. *Plain.* Au-S.

46. *A. laetivirens* Greene. Stem erect, 3-6 dm. high, red or purplish; leaves lanceolate or oblong-lanceolate, thin, light green, somewhat glaucous; involucre 8 mm. high and about 1 cm. wide; ligules 8-10 mm. long, white or pinkish. Along streams: Colo.—Wyo.—Ida. *Submont.* Au-S.

47. *A. longulus* Sheld. Stem strict, branched above, 6-15 dm. high, hispid in lines; leaves narrowly linear, 3-10 cm. long, sessile, glabrous on both sides or scabrous above; inflorescence paniculate; involucre 4-5 mm. high, 6-7 mm. broad; bracts acute, the outer often wholly green; ligules 6 mm. long, white or lilac. Swampy ground: Sask.—Minn.—Neb.—Colo.—B.C. *Plain.* Jl-S.

48. *A. roseolus* Rydb. Stem 3-5 dm. high, often purple-tinged; leaves linear, glabrous or nearly so, 5-10 cm. long, 5-12 mm. wide; involucre about 5 mm. high, 8-9 mm. broad; bracts often wholly green, with broadly lanceolate tips; rays rose-colored, 5-6 mm. long. Meadows: Mont. *Submont.* Au.

49. *A. Franklinianus* Rydb. A perennial, with a horizontal rootstock; stems 4-10 dm. high, simple; leaves narrowly linear, entire, scarcely clasping, rather firm, dark green, glabrous, 7-15 cm. long, less than 1 cm. wide; involucre 8 mm. high, fully 1 cm. broad; bracts linear, attenuate; ligules purple, 8-10 mm. long. *A. salicifolius* Richards., not Lam. Wet meadows: Sask.—Mont.—Ida.—Mack. *Boreal*—Mont.

50. *A. corymbiformis* Rydb. Stem strict, about 3 dm. high, branched above; leaves linear, 5-8 mm. long, half-clasping; inflorescence leafy, corymbiform; involucre 6 mm. high, 8 mm. broad; bracts linear-lanceolate, with an oblanceolate green tip; ligules white or purplish, about 7 mm. long. Meadows: Colo. *Submont.* Au.

51. *A. junciformis* Rydb. Stem slender, 3-5 dm. high, simple below; leaves narrowly linear, 4-8 cm. long, 2-4 mm. wide; involucre about 6 mm. high, about 1 cm. broad; the inner bracts linear, acute, with green lanceolate tips, the outer oblong or oblanceolate, obtuse, often almost wholly green; ligules white, 6-8 mm. long. Meadows and swamps: Sask.—Wis.—Colo.—Wash.—B.C. *Plain.*

52. *A. lonchophyllus* Greene. Stem erect, 4-6 dm. high, reddish-purple; leaves 5-10 cm. long, narrowly lanceolate, acute, entire, sessile, firm, green and glabrous, 1-nerved; inflorescence paniculate; involucre about 7 mm. high and 1 cm. broad; bracts linear, acute, more or less tinged with purple; ligules rose-purple. Mountains: Colo. *Mont.* Au.

53. *A. eriocalis* Rydb. Stem about 8 dm. high, leafy, purplish; stem-leaves 3-7 cm. long, more or less auriculate-clasping; inflorescence a round-topped panicle; involucre 8 mm. high, 10-12 mm. broad; bracts linear, acute, more or less ciliate, the outermost almost wholly green; ligules purple, 8-10 mm. long. Mountain meadows: Ida. *Submont.* Au.

54. *A. leucopsis* Greene. Stem 3-6 dm. high, straw-colored, racemously paniculate above, hispidulous in the inflorescence, linear, 5-10 cm. long, 5-10 mm. wide, thick, pale green, strongly scabrous-ciliate on the margins; heads mostly solitary at the ends of the many short branches; involucre turbinate, about 8 mm. high and broad; bracts well imbricate, oblanceolate, with a narrowly rhombic green lip; ligules 8 mm. long, white or pale violet. Along ditches: Utah. *Son.* S.

55. *A. subcaudatus* Rydb. A perennial, with a creeping rootstock; stem 3-6 dm. high, more or less purple; lower leaves 1-2 dm. long, 4-10 cm. wide, often sparingly dentate with ascending sharp teeth, dark green; upper leaves sessile; panicle open, with rather few heads; involucre 7-8 mm. high, about 12 mm. broad; bracts only slightly white-margined below; rays purple, about 1 cm. long. Mountain meadows: Alta.—Wyo.—Ida.—B.C. *Submont.*—Mont. Je-Au.

56. *A. occidentalis* Nutt. Stem strict, 2-10 dm. high; lower leaves 1-2 dm. long, linear-lanceolate, entire or few-toothed, dark green; upper leaves lance-linear or linear, those of the corymbiform inflorescence much reduced; involucre 5-7 mm. high, 10-12 mm. broad; ligules 6-8 mm. long. Mountain meadows and plains: Ida.—Colo.—Calif.—B.C.—Yukon. *Plain*—Mont. Jl-S.

57. *A. Fremontii* (T. & G.) A. Gray. Stem 2-4 dm. high; lower leaves petioled, 3-10 cm. long, dark green, oblanceolate or spatulate, entire; upper leaves oblong-lanceolate or nearly linear, sessile and somewhat clasping; involucre 7-8 mm. high, about 1 cm. broad; bracts linear, acute or obtusish, the outer wholly green; ligules purple, 7-10 mm. long. Mountain valleys: Alta.—Colo.—Utah—B.C. *Mont.*—*Subalp.* Jl-Au.

58. *A. Umbachii* Rydb. Stem slender, erect, simple, 3-5 dm. high; lower leaves about 1 dm. long, petioled, broadly oblanceolate or lanceolate, dark green, more or less crenate, acute; middle stem-leaves similar but the petioles with dilated, clasping bases; upper stem-leaves lanceolate, sessile; involucre 8-9 mm. high, 12-15 mm. broad; bracts oblong-oblanceolate, acute; ligules dark bluish purple, fully 1 cm. long. River banks: Mont. *Mont.* Au.

59. *A. ciliomarginatus* Rydb. Stem 3-6 dm. high; lower leaves with wing-margined petioles, 1-2 dm. long, oblanceolate, acute; upper leaves lanceolate, sessile, more or less clasping; involucre 8-9 mm. high, 12-15 mm. broad; bracts linear or lance-linear, the outer rarely nearly wholly green; ligules light blue, 10-12 mm. long. *A. glastifolius* Greene. Along streams: Mont.—Colo.—Utah—B.C. *Submont.*—Mont. Jl-Au.

60. *A. armeriaefolius* Greene. Stem 2-3 dm. high, pubescent in lines above; lower leaves petioled, 5-10 cm. long, oblanceolate, entire, acute, deep green, glabrous, reticulate-venose; involucre 6-7 mm. high, about 1 cm. broad; bracts linear or linear-oblong, green or narrowly white-margined below; ligules violet or bluish purple, about 8 mm. long. Mountains: Colo.—Wyo.—Utah. *Mont.* Jl-Au.

61. *A. Underwoodii* Rydb. Stem 2-3 dm. high, often purplish, more or less hirsute-strigose; lower leaves spatulate or oblanceolate, tapering into a winged petiole; the other stem-leaves sessile and the uppermost linear-lanceolate; involucre about 8 mm. high and 1 cm. broad; bracts oblanceolate; ligules purple or bluish, about 1 cm. long. High mountains: Colo.—Wyo. *Mont.* Je-S.

62. *A. Tweedyi* Rydb. Stem simple, usually purplish, about 4 dm. high; leaves oblanceolate, acute, rather firm, often 1 dm. long, the lower with a winged petiole, the upper sessile and half clasping; heads about 1 cm. high; bracts linear or oblanceolate, not very unequal in length; ligules rose or purple, 8-10 mm. long. Valleys: Colo.—Alta. *Submont.* Jl-Au.

63. *A. adscendens* Lindl. Stem ascending or decumbent at the base, 2-8 dm. high, glabrous, slightly pubescent above; leaves firm and thick, the lower petioled, 6-12 cm. long, the upper linear, sessile; inflorescence paniculate; involucre 5-6 mm. high, nearly 1 cm. broad; bracts oblanceolate, with green tips; ligules bluish purple, 5-8 mm. long. *A. pratincola* Greene. (?) *A. oxyphyllus* Greene. Valleys: Sask.—Colo.—Nev.—Alta. *Submont.*—Mont. Jl-S.

64. *A. Nelsonii* Greene. Stem 3-6 dm. high, leafy, sparingly strigose; leaves linear, 5-7 cm. long, firm, entire, acute, 1-nerved; involucre about 8 mm. high, 10 mm. broad; bracts oblong or linear; ligules violet or lilac, 8 mm. long. *A. vallicola* Greene, a narrow-leaved form. Mountains: Colo.—Mont.—Wash.—Ore. *Submont.* Jl-S.

65. *A. Nuttallii* T. & G. Stem 2-6 dm. high, glabrous or sparingly pubescent, especially above; basal leaves linear-oblanceolate, somewhat glaucous, glabrous; stem-leaves narrowly linear; inflorescence paniculate; involucre 5-6 mm. high, less than 1 cm. broad; bracts oblanceolate, green-tipped; ligules bluish purple, 6-8 mm. long. *A. orthophyllus* Greene. Mountains: Neb.—Colo.—Utah. *Submont.* Jl-Au.

66. *A. halophilus* Greene. Stem about 3 dm. high, sparingly hirsutulous-strigose, especially above; stem-leaves linear, 5-8 cm. long, glabrous, except the

hispidulous-ciliolate margins, deflexed, firm; leaves of the floral branches less than 1 cm. long, spreading and becoming bract-like above; involucre turbinate, 7-8 mm. wide; bracts imbricate, coriaceous below, with green obovate or spatulate green tips, the outer rounded at the apex; ligules pale, 5 mm. long. Salt marshes: Utah. *Son.* S.

67. *A. Hallii* A. Gray. Stem strict, 2-5 dm. high; lower leaves linear, the upper linear-oblong, 2-5 cm. long, those of the branches much smaller, all entire; involucre 3-4 mm. high, 4-7 mm. broad; bracts imbricate, rather thick, spatulate or oblanceolate, rounded and callous, mucronate at the apex; ligules 4-6 mm. long, white or whitish. Dry places: Wash.—Mont.—Ore. *Submont.*—Mont. S.

68. *A. proximus* Greene. Stem 4-6 dm. high, glabrous below, sparingly pubescent above; leaves linear-lanceolate or lanceolate, entire, sessile, 5-10 cm. long, smooth beneath, scabrous above, light green, spreading; disk about 9 mm. high, 10-15 mm. broad; outer bracts obtuse, mucronate; ligules flesh-colored or rose, 8-10 mm. long. River banks: Wyo.—Mont. *Submont.*—Mont. Au-S.

69. *A. phyllodes* Rydb. Stem 5-10 dm. high, leafy, glabrous below, pubescent in lines above; leaves thin, the lower usually more or less serrate, with small distant teeth, all glabrous on both sides, auriculate-clasping; disk 8 mm. high, about 12 mm. broad; outer bracts oblanceolate, acute, foliaceous, usually slightly exceeding the disk; rays violet, 8-10 mm. long. Meadows: w Neb.—e Colo. *Plain.* Au.

70. *A. Mearnsii* Rydb. Stem 3-10 dm. high, leafy, branched, glabrous below, sparingly pubescent above; leaves 5-10 cm. long, ascending-spreading, sessile, entire, glabrous beneath, scabrous or glabrate above; disk about 8 mm. high and barely 1 cm. broad; bracts oblanceolate, acute, some longer than the disk; ligules about 8 mm. long, white or pinkish. River banks: Sask.—Wyo.—Ida.—B.C. *Submont.*—Mont. Jl-O.

71. *A. Douglasii* Lindl. Stem 4-10 dm. high, glabrous and shining below, pilose above; leaves linear-lanceolate or linear, 5-15 cm. long, glabrous or nearly so; involucre 8-10 mm. high, about 15 mm. wide; bracts linear, acute or acuminate, with often squarrose tips, the outer scarcely longer than the inner; ligules light blue, 10-12 mm. long. Moist places: Mont.—Wyo.—n Calif.—B.C. *Submont.* Au-S.

72. *A. fulcratus* Greene. Stem decumbent at the base, red-purple, more or less puberulent, 3-4 dm. high; leaves linear, 5-10 cm. long, entire, glabrous, scabrous-ciliolate; disk about 1 cm. high and broad; bracts in about 2 series, mostly green, the outer foliaceous, linear, 1-2 cm. long; ligules about 1 cm. long, rose-purple or rose-lilac. Valleys: Colo. *Mont.* Jl.

73. *A. cordalenus* Henders. Stem erect, 2-3 dm. high, pubescent above; leaves 5-8 cm. long, 5-10 mm. wide, entire or with a few distant serratures, strongly ciliate; disk 5-7 mm. high and 7-10 mm. broad; outer bracts linear, 1-2 cm. long, green, the inner with white margins and foliaceous tips; ligules blue or violet, 8-10 mm. long. Moist river bars: Ida. *Submont.* Au.

74. *A. Eatonii* (A. Gray) Howell. Stem 3-10 dm. high, glabrous; leaves narrowly linear or lance-linear, sessile, thin, entire; involucre about 7 mm. high, 7-10 mm. broad; bracts glabrous, linear or lance-linear, acute; ligules 7-10 mm. long, lavender, rose, or whitish. *Brachyactis hybrida* Greene. Mountains: Mont.—Colo.—Nev.—B.C. *Submont.*

75. *A. Hendersonii* Fernald. Stem 5-10 dm. high, villous especially above, branched above; leaves thin, ciliate on the margins, more or less short-hairy or in age glabrate; stem-leaves linear-lanceolate, 5-8 cm. long, the lower ones 1-1.5 cm. long, narrowed below, with clasping bases; involucre turbinate, 10-15 mm. broad; bracts linear, subulate, foliaceous, ciliate on the margins; ligules blue, 12-16 mm. long. Rich meadows: Ida. *Submont.* Jl-Au.

76. *A. oreganus* Nutt. Stem slender, branched, 3-6 dm. high, more or less pubescent; branches strongly ascending; leaves linear or lance-linear, 5-8 cm. long, entire, 6-8 mm. high, 7-8 mm. broad; bracts lanceolate or lance-linear, the outer about equalling the inner ones; ligules purplish or white, 7-8 mm. long.

Banks of streams and wet meadows: Mont.—Utah—Nev.—Ore.—B.C. *Submont.*—Mont. JI-S.

77. *A. microlonchus* Greene. Stem 5-8 dm. high, glabrous, or pubescent in lines, branched; leaves narrowly lance-linear, 5-8 cm. long, entire, sessile, thin, spreading and sometimes reflexed; involucre 7-8 mm. high, 10-15 mm. broad; bracts linear, acute, glabrous, the outer slightly longer than the inner; ligules pale violet or lilac, 7-8 mm. long. Valleys: B.C.—Mont. *Submont.* Au.

78. *A. Kootenayi* Nels. & Macbr. Stem villous, 8-10 dm. high, branched above; leaves oblanceolate, acuminate, often sharply serrate, clasping with auricled bases, 5-15 cm. long; disk fully 1 cm. high, 15-20 mm. broad; bracts numerous, linear-subulate, attenuate, green, sparingly villous, longer than the disk; ligules 10-12 mm. long, bluish purple. *A. foliaceus Lyallii* A. Gray. River valleys: Ida.—Wash. JI.

79. *A. Forwoodii* S. Wats. Stem 4-6 dm. high, rough-hispid, strict; leaves sessile, obovate, oblanceolate or lanceolate, narrowed to a broad auriculate base, hirsute on the veins beneath, 5-10 cm. long, serrate, or the upper entire; inflorescence corymbose-paniculate; disk 10-12 mm. high, 12-15 mm. broad; bracts linear, short-acuminate, equalling the disk; ligules 10-12 mm. long. Mountains: S.D.—N.D. *Submont.* Au.

80. *A. amplus* Lindl. Stem stout, about 1 m. high; leaves thin, the lower oblanceolate, 1-1.5 dm. long; blades tapering below into a winged petiole, the upper sessile, lanceolate, clasping; bracts glabrous, linear or narrowly linear-oblanceolate, about equalling the disk; ligules 12-13 mm. long. Mountains: [Canadian] "Rocky Mountains." Mont.

81. *A. diabolicus* Piper. Stem erect, 5-10 dm. high, leafy; leaves thin, narrowly oblanceolate, or the upper linear-lanceolate, entire or nearly so, the basal 10-15 cm. long, with winged petiole; stem-leaves 3-10 cm. long, sessile, somewhat clasping; disk about 1 cm. high, 10-12 mm. wide; bracts green, linear or linear-lanceolate, barely equalling the disk; ligules violet, 10-14 mm. long. *A. foliaceus* Coult., in part. Wet places: Ore.—Mont.—Alta.—B.C. Mont. JI-Au.

82. *A. frondeus* (A. Gray) Greene. Stem 3-10 dm. high; leaves thin, the lower 1-2 dm. long, oblanceolate, entire, glabrous; middle stem-leaves oblanceolate, with clasping auriculate bases, the upper lanceolate and also clasping; disk about 1 cm. high, 15-20 mm. broad; bracts foliaceous, narrowly oblanceolate, equalling or sometimes exceeding the disk; ligules about 1 cm. long, broad. Mountains: Alta.—Colo.—Utah—B.C. *Submont.*—*Subalp.* JI-S.

83. *A. Canbyi* Vasey. Stem 3-6 dm. high; lower leaves petioled, 1-2 dm. long; blades broadly oblanceolate; upper stem-leaves oblanceolate, sessile; disk about 1 cm. high, 15-20 mm. broad; outer bracts scarcely equalling the disk; ligules red-purple or rose-colored. Mountains: N.M.—Wyo.—Ida. Mont.—*Subalp.* JI-Au.

84. *A. Cusickii* A. Gray. Stem 3-6 dm. high; lower leaves with winged petioles, 1-1.5 dm. long; blades oblanceolate, thin, entire or sparingly dentate; upper stem-leaves lance-oblong, with auriculate-clasping bases; disk about 1 cm. high and nearly 2 cm. broad; outer bracts exceeding the disk; ligules 10-14 mm. long. Mountain meadows and along streams: Ore.—Ida.—B.C. JI-S.

85. *A. Burkei* (A. Gray) Howell. Stem 3-6 dm. high, glabrous below, villous above; lower leaves petioled; blades oblanceolate, glabrous, scabrous on the margins; upper leaves elliptic or lanceolate, broadly clasping at the base; heads few; disk 10-12 mm. high, 2-2.5 cm. broad; ligules 10-12 mm. long. *A. foliaceus Burkei* A. Gray. *A. majusculus* Greene, a luxuriant form with several heads. Mountains: Wyo.—N.M.—Ariz.—Wash.—B.C. Mont. JI.

86. *A. apricus* (A. Gray) Rydb. Stem 1-2 dm. high, sparingly cinereous-pubescent; leaves oblong or oblanceolate, 2-5 cm. long, glabrous, scabrous on the margins; the uppermost clasping; disk about 1 cm. high, 12-15 mm. broad; bracts spatulate or oblanceolate, acutish, glabrous, softly ciliate on the margins; ligules purple. *A. foliaceus apricus* A. Gray. *A. incertus* A. Nels. (?) *A. dis-*

tichophyllus Greene. Alpine peaks: Mont.—Colo.—Ore.—B.C. *Mont.*—*Subalp.* Jl—Au.

39. OREOSTÉMA Greene.

Subcaulescent perennials. Leaves narrow, entire, subcoriaceous. Heads solitary, terminating the scapiform stems. Involucre hemispheric; bracts subequal, in 2-3 series, herbaceous. Rays pistillate, numerous; ligules purple. Disk-flowers perfect, fertile. Style-branches with subulate or lanceolate acute appendages. Achenes narrow, cylindric. Pappus of brittle, barbellate deciduous bristles. [*Oreastrum* Greene.]

1. **O. Haydeni** (Porter) Greene. Low perennial, with thick woody root and caudex; stem 1 dm. high or less, glabrous; basal leaves many, linear, 5-10 cm. long, 2-3 mm. wide, glabrous; stem-leaves shorter; head solitary; involucre about 1 cm. high, 10-12 mm. broad; bracts linear, glabrous, slightly tinged with purple, with narrow scarious, ciliate margins; ligules blue, about 1 cm. long. *Aster pulchellus* A. Gray, in part, not Willd. *A. Haydeni* Porter. Mountain slopes: Mont.—Wyo.—Nev. *Mont.*—*Subalp.* Jl—S.

40. ASTERIGERON Rydb.

Low perennials, with caespitose rootstocks. Leaves alternate, the basal ones numerous, the cauline ones much reduced. Heads solitary, terminal, radiate. Involucres hemispheric; bracts imbricate in 3 series, those of the inner series broad, lanceolate, with reddish purple-tinged scarious margins, the rest linear. Ray-flowers pistillate; ligules purplish. Disk-flowers perfect, fertile. Style-branches with ovate or triangular, subulate-acuminate appendages. Achenes flat, appressed pubescent. Pappus of many hispidulous bristles. In general habit, involucre and fruit agreeing with *Erigeron*, but the style-tips more like those of *Aster*.

1. **A. Watsoni** (A. Gray) Rydb. Perennial, with a caespitose rootstock; stems slender, decumbent, 1 dm. long or less, glabrous or nearly so; basal leaves 2-3 cm. long, petioled, linear-spatulate, glabrous; stem-leaves very small, 4-10 mm. long; heads solitary, peduncled; involucre about 5 mm. high and 8 mm. broad; bracts oblong-lanceolate, acute, pruinose, and with some scattered hairs, with purplish membranous margins; ligules about 4 mm. long, white or purplish. *Aster Watsoni* A. Gray. Mountains: Nev.—Utah. *Mont.* Au.

41. DOELLINGERIA Nees. WHITE ASTER.

Perennial caulescent herbs, with rootstocks. Leaves alternate, ciliate, entire. Heads in corymbiform cymes, radiate. Involucres campanulate; bracts imbricate in 2-4 series, narrow, appressed, not herbaceous at the tips; receptacle pitted. Ray-flowers few or several, pistillate; ligules white. Disk-flowers perfect; corollas slender, expanded into a 5-lobed limb. Anthers obtuse at the base. Appendages of the style-branches subulate to ovate. Achenes slightly broader above. Pappus double, the outer of short bristles or squamellae, the inner of capillary bristles, usually clavellate at the apex, tawny.

1. **D. pubens** (A. Gray) Rydb. Stem 5-10 dm. high, finely puberulent; leaves lanceolate or ovate-lanceolate, 5-15 cm. long, entire, acute, green and scabrous above, pale and tomentulose beneath; involucres about 5 mm. high; bracts linear-lanceolate, slightly tomentulose; ligules white, 4 mm. long. *Aster umbellatus pubens* A. Gray. Meadows and open woods: Upper Mich.—Wis.—Neb.—Sask. *Plain.* Jl—S.

42. IONÁCTIS Greene.

Perennial caulescent plants, often ligneous at the base. Leaves alternate, narrow, entire. Heads radiate, solitary or corymbose. Involucres turbinate; bracts narrow, well imbricate, appressed, firm. Ray-flowers numerous; ligules violet. Disk-flowers perfect; corollas with campanulate throats. Style-branches with subulate appendages. Achenes pubescent, flat, with strong marginal nerves. Pappus double, the inner series of capillary bristles, the outer short, setulose.

Plant 2-3 dm. high; leaves linear, 1-2 cm. long.

Plant less than 2 dm. high; leaves oblong or lanceolate, 5-10 mm. long.

1. *I. stenomeris*.

2. *I. alpina*.

1. *I. stenomeris* (A. Gray) Greene. Stems erect, canescent or glabrate; leaves acute, mucronate, scabrous-puberulent; involucre hemispheric, 10-12 mm. high, 15-20 mm. broad; bracts linear, acute or acuminate, puberulent in 2 series, slightly unequal; ligules pale violet, 10-12 mm. long; outer pappus setulose. *Aster stenomeris* A. Gray. Mountain slopes: Mont.—Ida.—Wash.—B.C. *Submont.* Je-Jl.

2. *I. alpina* (Nutt.) Greene. Stems 1-2 dm. high, canescent, simple; leaves 5-12 mm. long, rigid, scabrous-puberulent; involucre hemispheric, 8-10 mm. high, 12-15 mm. broad; bracts in 3 series, linear-lanceolate, puberulent, acuminate; ligules about 1 cm. long, light violet; outer pappus sometimes distinctly squamellate. *Chrysopsis alpina* Nutt. *Aster scopulorum* A. Gray. Mountains: Mont.—Wyo.—Nev.—Ore. *Submont.* My-Jl.

43. LEUCELÈNE Greene. HEATH ASTER.

Suffrutescent perennials, diffusely branched. Leaves oblanceolate, linear, or subulate. Heads solitary at the ends of the branches. Involucre turbinate; bracts imbricate in several series, herbaceous with narrow scarious margins. Ray-flowers pistillate and fertile; ligules white, turning reddish. Disk-flowers perfect, white; corollas tubular-funnelform. Style-branches with ovate obtuse appendages. Achenes long and slender. Pappus of long slender white bristles.

Upper leaves strigose, slightly glandular and not conspicuously hispid-ciliate.

Lower leaves broadly spatulate, upper linear-subulate; branches long and slender.

Leaves all linear-spatulate, or the upper linear; branches short.

Upper leaves conspicuously hispid-ciliate, copiously glandular.

Upper leaves linear-oblanceolate, the lower spatulate.

Upper leaves linear-subulate, the lower linear or linear-oblanceolate.

Leaves of the branches 6-12 mm. long.

Leaves of the branches 2-5 mm. long.

1. *L. arenosa*.

2. *L. serotina*.

3. *L. hirtella*.

4. *L. alsinoides*.

5. *L. ericoides*.

1. *L. arenosa* Heller. Stems 1-3 dm. high, strigose, branched; lower leaves petioled, hispid, 1-1.5 cm. long; upper leaves 5-8 mm. long; involucre 6-7 mm. high and broad; bracts linear-lanceolate, hirsute, scarious-margined; ligules 3 mm. long. Dry hills: Tex.—Colo.—Ariz.; Mex. *Son.*—*Submont.*

2. *L. serotina* (Greene) Rydb. Stems erect, 1 dm. high or less; leaves 5-10 mm. long, strigose, or the lower hirsute-ciliate, scarcely glandular; involucre 5-6 mm. high; ligules about 3 mm. long. *L. ericoides serotina* Greene. Arid hills: Tex.—Colo.—Utah—Ariz. *Son.* Je—Au.

3. *L. hirtella* (A. Gray) Rydb. Stems 1 dm. high or less, decidedly glandular-puberulent; lower leaves about 1 cm. long; all leaves hispid-ciliate; involucre 5-6 mm. high and fully as broad; bracts linear-lanceolate, more or less glandular-puberulent, acute, scarious-margined; ligules 3-5 mm. long. *Diplopappus ericoides hirtella* A. Gray. Dry hills: Tex.—Wyo.—Utah—Ariz. *Son.*—*Submont.* Ap-Jl.

4. *L. alsinoides* Greene. Stems about 1 dm. high, strigose; lower leaves about 1 cm. long, the upper bristle-tipped and appressed; involucre 5-6 mm. high and broad; bracts strigose, slightly glandular-puberulent; ligules 5 mm. long. Dry hills: Tex.—Kans.—Colo.—N.M. *Plain*—*Submont.* Ap-Je.

5. *L. ericoides* (Torr.) Greene. Stems 1-1.5 dm. high; lower leaves about 1 cm. long; involucre barely 5 mm. high and broad; bracts less imbricate than in the other species, strigose; ligules white, 5 mm. long. *Inula ericoides* Torr. *A. ericaefolius* Rothrock. Plains: Kans.—Tex.—Colo. *Plain.* S.

44. MACHAERANTHÈRA Nees. TANSY ASTER, VISCID ASTER.

Annual, biennial, or short-lived perennial, leafy, caulescent herbs, with tap-roots, never with rootstocks. Leaves alternate, bristle-tipped, pinnatifid, serrate, or rarely entire, the teeth or lobes bristle-tipped. Heads corymbose or paniculate, radiate. Involucre hemispheric or turbinate; bracts with narrow

herbaceous tips, imbricate in several series; receptacle pitted, the pits with toothed or lacerate edges. Ray-flowers numerous, pistillate; ligules violet or purple. Disk-flowers perfect; corollas yellow, turning red or brown. Anthers rounded at the base. Style-branches with subulate or lanceolate, acute appendages. Achenes turbinate, pubescent or glabrate. Pappus of numerous firm rough bristles.

Leaves once or twice pinnatifid; root annual; achenes terete.

Green tips of the bracts short, not squarrose.

Heads 6-7 mm. high; plant 3-5 dm. high.

Heads about 1 cm. high; plant low, 1-2 dm. high.

Green tips of the bracts long, reflexed-squarrose.

Leaves spinulose-toothed; plant perennial or biennial; achenes compressed.

Bracts linear-subulate; green tips in most longer than the straw-colored lower portion, squarrose reflexed.

Stem and inflorescence distinctly viscid.

Stem-leaves lanceolate or oblong, usually distinctly triple-veined.

Leaves thin, coarsely but not saliently dentate; bracts over 1 mm. wide.

Leaves thick with salient teeth; plant very glandular; bracts less than 1 mm. wide.

Achenes glabrous or minutely pubescent; stem glabrous below.

Achenes strigose; stem glandular-hispid throughout.

Stem-leaves linear or oblanceolate, 1-nerved.

Plant 3-5 dm. high; heads numerous in a panicle or raceme.

Plant 1-2 (seldom 3) dm. high; heads solitary or few.

Stem strigose-puberulent; involucre slightly if at all viscid.

Leaves all saliently toothed; inflorescence narrow, racemiform; heads subsessile.

Leaves except the lowest entire or denticulate; inflorescence open; heads peduncled.

Stem-leaves narrowly linear.

Stem-leaves oblanceolate.

Bracts linear, with a lanceolate or rhombic green tip, which is usually much shorter than the straw-colored lower portion.

Leaves cinereous.

Bracts canescent, scarcely at all viscid or glandular.

Stem-leaves linear; plant erect.

Stem-leaves narrowly oblanceolate; plant diffuse.

Bracts densely viscid or glandular, especially the tips.

Bracts in but 3 series, not at all squarrose; the outer wholly greenish.

Bracts in 4-7 series with squarrose tips.

Stem 1-2 dm. high; upper stem-leaves ample, almost as large and broad as the lower ones.

Stem 2-4 dm. high; upper stem-leaves smaller and narrower than the lower ones.

Heads distinctly peduncled.

Leaves very thin; stem-leaves entire or nearly so.

Leaves thick.

Stem erect, rather simple; stem-leaves linear-oblanceolate

or oblanceolate, spinulose-toothed.

Stem divaricately branched, low; upper leaves small, linear

or some linear-oblanceolate.

Heads subsessile, racemously disposed; stem-leaves linear-oblanceolate, coarsely toothed.

Leaves glabrous, or glandular-hispid or scabrous, not cinereous.

Stem puberulent or glabrate, glandular only on the inflorescence.

Bracts slightly if at all squarrose.

Stem slender, with strongly ascending branches; leaves subentire.

Stem divaricately branched; lower leaves sharply toothed.

Bracts strongly reflexed-squarrose.

Leaves all, except those of the smaller branches, toothed; achenes strigose.

Leaves all entire; achenes glabrous.

Stem densely glandular-hispid.

Bracts more or less glandular-pubescent and with squarrose tips.

Bracts grayish puberulent; tips short, lanceolate, not squarrose.

Bracts grayish puberulent; tips short, lanceolate, not squarrose.

1. *M. parviflora* A. Gray. Annual; stem 3-5 dm. high, branched, glabrous or nearly so; leaves sparingly glandular, simply pinnatifid; lobes short, linear,

barely mucronate; involucre 8–10 mm. broad; bracts with lanceolate, acute, scarcely spreading tips; ligules about 6 mm. long. *Aster parviflorus* A. Gray. Canyons and arid places: N.M.—s Utah—Ariz. *Son.* Jl–Au.

2. ***M. humilis*** (A. Gray) Standl. Annual; stem erect, 1–3 dm. high, branched, glandular-puberulent; leaves once pinnatifid, glandular-puberulent; divisions oblanceolate or oblong, entire or toothed, spinulose-tipped; involucre 10–15 mm. broad; bracts linear, acute, glandular-puberulent; ligules rarely 1 cm. long. *A. canescens humilis* A. Gray. Plains: N.M.—Utah—Ariz. *Son.* My–O.

3. ***M. tanacetifolia*** (H.B.K.) Nees. Annual; stem branched, 1–4 dm. high, green, glandular-puberulent and somewhat villous; leaves once or twice pinnatifid, 1–4 cm. long, glandular-puberulent; divisions oblanceolate or linear, entire or toothed; involucre hemispheric, fully 1 cm. high, 15–20 mm. broad; bracts linear, attenuate, numerous; ligules 12–20 mm. long, blue-purple. *A. tanacetifolius* H.B.K. *M. coronopifolia* (Nutt.) A. Nels. Sandy soil, plains, and hills: Tex.—S.D.—Alta.—Ariz.; Mex. *Plain—Submont.* Je–O.

4. ***M. Bigelovii*** (A. Gray) Greene. Biennial; stem glandular-hirsute, 3–10 dm. high, robust; leaves oblong or lanceolate, thin, coarsely dentate, glandular-puberulent, the upper more or less clasping, the basal ones oblanceolate, petioled; involucre about 15 mm. high, 2–3 cm. broad; bracts glandular-puberulent; ligules about 1 cm. long. *A. Bigelovii* A. Gray. Plains and foothills: Colo.—N.M.—Ariz. *Submont.* S–O.

5. ***M. varians*** Greene. Biennial; stem erect, 6–10 dm. high, glandular-puberulent above; leaves lanceolate, 7–10 cm. long, sessile, more or less spinulose-serrate, glabrous or minutely puberulent; involucre hemispheric, 1 cm. high, 1.5–2 cm. broad; ligules 12–15 mm. long, purple. Plains and mountains: Colo.—N.M. *Submont.* Jl–S.

6. ***M. aspera*** Greene. Biennial; stem stout, 6–10 dm. high, glandular-hispid; lower leaves oblanceolate, petioled, the upper oblong-lanceolate, sessile, more or less clasping, spinulose-serrate, scabrous and glandular-pruinose; involucre about 1 cm. high, 1.5 cm. broad; ligules 8–10 mm. long, purple. Mountains: Colo. *Submont.—Mont.* Je–Au.

7. ***M. viscosula*** Rydb. Biennial, with a rosette of basal leaves; stems few, about 2 dm. high, viscid-puberulent; basal leaves oblanceolate, petioled, the upper similar or linear, but sessile, all saliently and coarsely toothed to nearly entire; heads about 1 cm. high; ligules reddish purple, 8–10 mm. long and fully 1 mm. wide. *M. viscosa* Greene, not *Dieteria viscosa* Nutt. Plains and mountains: Colo. *Submont.—Mont.* Jl–Au.

8. ***M. Pattersonii*** (A. Gray) Greene. Biennial, with a stout taproot; stem 1–2 dm. high, villous and glandular; basal leaves numerous, 4–6 cm. long, petioled, spatulate, toothed above, glabrous or nearly so; involucre fully 1 cm. high and nearly 2 cm. broad; bracts linear-attenuate, green except at the base, glandular-hispidulous; ligules 10–15 mm. long, purple. *A. Pattersonii* A. Gray. High mountains: Colo. *Mont.—Alp.* Jl–Au.

9. ***M. sessiliflora*** (Nutt.) Greene. Biennial, leafy, 3–5 dm. high; leaves linear, saliently toothed, 3–6 cm. long, scabrous-puberulent or nearly glabrous; involucre about 1 cm. high and 1.5 cm. broad; bracts subulate, canescent; ligules rose-purple. Hills and plains: Neb.—Wyo. *Plain.* Au–S.

10. ***M. rubricaulis*** Rydb. Biennial or perhaps perennial; stem erect or nearly so, simple below, branched above, 4–6 dm. high, usually tinged with red or purple; leaves entire or sparingly dentate, scabrous-ciliate on the margins, the largest 8 cm. long, and 8 mm. wide; involucre 10–12 mm. high, 12–15 mm. in diameter; ligules numerous, dark blue, about 12 mm. long and 1 mm. wide. Table-lands and hills: Colo.—e Utah. *Submont.* Au–S.

11. ***M. latifolia*** A. Nels. Biennial or perhaps perennial; stem erect, 1.5–2.5 dm. high; lower leaves petioled, the upper sessile; blades spatulate or oblanceolate, mostly 3-nerved, puberulent, or nearly glabrous above; inflorescence corymbiform; involucre hemispheric, about 8 mm. high and 12 mm. broad; bracts

glandular-puberulent; ligules blue or bluish violet. *M. paniculata* A. Nels., a large form. Mountains: Utah. *Mont.* Au.

12. *M. canescens* (Pursh) A. Gray. Biennial; stem profusely branched, 1-4 dm. high; lower leaves spatulate or oblanceolate, slightly toothed; stem-leaves linear, rarely narrowly oblanceolate, usually entire; heads numerous in an open panicle; involucre 7-8 mm. high, about 1 cm. broad; ligules 8 mm. long, dark bluish purple. *A. canescens* Pursh. *M. magna* A. Nels., a robust form. Sterile ground and sandy banks: Sask.—Colo.—Calif.—B.C. *Plain*—*Son.* Jl-S.

13. *M. superba* A. Nels. Biennial; stem branched at the base; branches ascending or decumbent, 8-15 cm. long; lower leaves oblong-oblanceolate, 4-6 cm. long, petioled; stem-leaves entire or remotely denticulate; involucre about 8 mm. high, 1 cm. broad; ligules deep blue or purple, 8-10 mm. long. Sandy hillsides: Wyo. *Mont.* Au.

14. *M. angustifolia* Rydb. Biennial or perhaps perennial; stem about 1.5 dm. high, more or less tinged with purple; leaves linear, 2-5 cm. long and about 2 mm. wide, finely strigose-puberulent, sinuose-denticulate; involucre 7-9 mm. high and broad; bracts oblong-lanceolate, acute, tinged with red or purple, comparatively thin; ligules 5-7 mm. long, rose or light purple. *M. linearis* Rydb., not Greene. Sandy places: Wyo. *Mont.* Au.

15. *M. commixta* Greene. Biennial; stem branched at the base; leaves all spatulate, 3-6 cm. long, serrate, at least above the middle, 3-ribbed; heads corymbose, large, about 1 cm. high and 12-15 mm. broad; ligules purple, about 9 mm. long. Mountains: Utah. *Submont.*—*Mont.* Jl-Au.

16. *M. leptophylla* Rydb. Biennial, caespitose at the base; stem slender, simple, 3-5 dm. high; lower leaves petioled, 2-5 cm. long, finely cinereous-puberulent, in age sparingly so; blades spatulate or oblanceolate, thin; upper leaves linear-oblanceolate or linear; involucre turbinate, 8 mm. high, 8-10 mm. broad; ligules rose-purple, about 8 mm. long. Hills: Utah. *Submont.* Au.

17. *M. viscosa* (Nutt.) Greene. Biennial; stem 3-5 dm. high; lower leaves petioled, 4-7 cm. long, entire or somewhat toothed, oblanceolate; middle leaves narrower and sharply serrate; involucre 8 mm. high, 10-12 mm. broad; ligules purple, 8 mm. long. Hills, slopes, and plains: Mont.—Wyo.—Utah. *Plain*—*Mont.* Je-S.

18. *M. pulverulenta* (Nutt.) Greene. Biennial; stem erect, 2-4 dm. high; leaves narrowly oblanceolate, or the upper linear, 2-5 cm. long, entire or sparingly denticulate; involucre 6-7 mm. high, 8-10 mm. broad, only slightly squarrose; ligules purple, 7-8 mm. long. (?) *M. subalpina* Greene. Dry plains: Mont.—Colo.—Utah—Ida. Au-O.

19. *M. divaricata* (Nutt.) Greene. Biennial; stem stout, about 3 dm. high; branches numerous, more or less spreading; involucre turbinate, about 8 mm. high, 10-12 mm. broad; ligules purple, nearly 1 cm. long. Hills and plains: Mont.—Wyo. *Plain*—*Submont.* Au-O.

20. *M. glabella* Greene. Biennial; stem 3-4 dm. high, glabrous; lower leaves petioled, narrowly oblanceolate, glabrous, entire or slightly denticulate; upper leaves narrowly linear; involucre turbinate, about 7 mm. high, 7-8 mm. wide; ligules bluish purple, about 8 mm. long. *M. pulverulenta vacans* A. Nels. Mountains: Colo. *Submont.*—*Mont.* Jl-S.

21. *M. ramosa* A. Nels. Biennial, branched at the base; stem ascending or spreading, 2-4 dm. high; leaves green, nearly glabrous, linear-oblanceolate or linear, the earlier sharply dentate; involucre hemispheric, about 7 mm. high and 1 cm. wide; bracts linear, acute or short-acuminate, glandular-puberulent; ligules purple, 8 mm. long. Mountains and plains: Wyo.—Colo. *Submont.*—*Mont.* Jl-S.

22. *M. Selbyi* Rydb. Biennial; stem often reddish, branched above; lower leaves linear-oblanceolate to oblanceolate, petioled, glabrous or rarely slightly puberulent, dentate; upper leaves linear; involucre hemispheric, 7-8 mm. high

and 1 cm. broad; bracts well imbricate; glandular green tips small, lanceolate. Cañons and meadows: Colo. *Submont.*—*Mont.* S.

23. *M. spectabilis* Greene. Biennial; stems several, 2–3 dm. high, glabrous or nearly so; lower leaves oblanceolate, petioled, the upper linear and sessile; involucre turbinate, about 1 cm. high and 12 mm. broad; bracts linear, acuminate; tips almost as long as the chartaceous portion, glandular-puberulent; ligules violet, 1 cm. long. Mountains: Colo. *Mont.* Au.

24. *M. cichoriacea* Greene. Biennial; stem stout, 3–6 dm. high; leaves pale green, glabrous, lanceolate, sessile, 3–5 cm. long, runcinate-dentate; involucre turbinate, about 7 mm. high and broad; bracts linear, acute; tips short, glandular-puberulent; ligules about 6 mm. long, violet. Hills and mountains: Colo.—e Utah—N.M.—Ariz. *Son.*—*Submont.* Au.

25. *M. Fremontii* Rydb. Biennial, with thick taproot; stems several, 4–5 dm. high; basal leaves oblanceolate, petioled, glandular-hispid and scabrous, sharply dentate; upper leaves sessile, linear or lanceolate; heads over 1 cm. high; bracts linear-lanceolate, cinereous; ligules purple, 8–10 mm. long. River bottoms: Colo. Jl.

45. *ERIGERON* L. FLEABANE.

Annual, biennial, or perennial herbs, caulescent or almost scapose. Leaves alternate, entire, toothed, or lobed. Heads solitary, corymbose, or paniculate, radiate or rarely discoid. Involucre hemispheric or saucer-shaped; bracts in 1–2, rarely 3 series, sub-equal or slightly imbricate; receptacle flat, naked. Ray-flowers pistillate, white, pink, or purple, rarely ochroleucous or yellow, or wanting. Disk-flowers perfect with yellow corollas. Anthers entire and obtuse at the base. Stigmas flattened, with mostly obtuse appendages. Achenes usually flattened, 2-nerved, in a few species subterete and several-nerved. Pappus in a single series of capillary scabrous bristles, or sometimes with a series of shorter bristles outside. [*Wyomingia* A. Nels.]

Bracts of the involucre in 1–2 series of almost equal length, not thickened on the back.

Rays inconspicuous, erect or ascending, usually involute and incurved, numerous; often inside them a series of rayless pistillate flowers; leaves entire.

I. ACRES.

Rays conspicuous, spreading, flat; no rayless pistillate flowers inside.

Plant without runners.

Perennials with rootstocks or woody caudices.

Leaves dissected or deeply cleft.

Leaves entire or merely toothed.

Stems low, less than 2 dm. high, scapiform, usually bearing only one head; stem-leaves usually reduced.

Involucre and peduncles villous with many-celled hairs; bracts comparatively broad.

Involucre and peduncles hirsute to glandular-puberulent or glabrate, not long-villous.

Stem leafy, 2–10 dm. high, if lower bearing several heads; stem-leaves ample.

Stems densely cespitose from a thick taproot; heads small, the disk rarely more than 1 cm. wide.

Pappus double; stem hirsute.

Pappus simple; stems strigose.

Stems usually solitary from the ends of distinct (sometimes branched) rootstocks; heads large, the disk more than 1 cm. wide.

Bracts with loose tips; rays broad; pappus simple; lower leaves broadly oblanceolate, the upper often reduced.

Bracts villous.

Bracts glandular-puberulent or glabrous.

Bracts appressed, except the very tips; rays narrow; pappus double; perennials with short rootstocks.

Upper stem-leaves ample, ovate to lanceolate, not much smaller than the lower, which are more or less distinctly 3-nerved; peduncles usually short, ascending.

Upper stem-leaves reduced, linear-lanceolate; none of the leaves 3-nerved; peduncles long and erect.

Annuals or biennials, or perennials by means of stolons and offsets.

Stem-leaves broad, cordate-clasping; perennials with offsets.

XI. PHILADELPHICI.

Stem-leaves not cordate-clasping.

Stems rather simple, with a few large heads; disks about 1 cm. broad or more. XII. ASPERI.

Stems much branched, leafy, with numerous small heads; disk 6-9 mm. wide.

Stems strigose or sparingly hirsute except at the base, or glabrous; pappus-bristles of the ray-flowers usually lacking; annuals.

XIII. RAMOSI.

Stems and leaves densely short-pubescent with spreading hairs; pappus-bristles of the ray-flowers present.

Annuals; pappus scant and simple.

XIV. BELLIDIASTRA.

Biennials (rarely perennials); pappus double, the outer of short subulate squamellae.

XV. DIVERGENTES.

Plants at first with a scapiform naked peduncle, later producing runner-like branches.

XVI. FLAGELLARES.

Bracts of the involucre in 3-4 series, more or less imbricate, thickened on the back, the outer usually successively shorter; perennials with caespitose caudices.

Rays bluish, purplish, or white.

Achenes terete or nearly so, several-nerved.

XVII. CANI.

Achenes flattened or quadrangular, 2-4-nerved.

Leaves more or less distinctly triple-nerved.

XVIII. CAESPITOSI.

Leaves not triple-nerved.

Plants low, 2 dm. or less high; basal leaf-blades from broadly oval to narrowly linear-oblanccolate; heads solitary to few.

Basal leaf-blades broadly oval or obovate.

XIX. ASPERUGINEI.

Leaves narrowly linear-oblanccolate.

Involucres glandular.

XX. ARENARIOIDES.

Involucres hirsute or strigose.

XXI. LADEVIRENTES.

Plant taller, 3-4 dm. high; leaves filiform or narrowly linear.

Leaves narrowly linear or linear-oblanccolate; achenes quadrangular, 4-nerved.

XXII. TETRAPLEURI.

Leaves filiform; achenes flat, 2-nerved.

XXIII. FILIFOLII.

Rays yellow or ochroleucous.

XXIV. LUTEI.

I. ACRES.

Bracts of the involucre linear, abruptly acute, never glandular; inner rayless pistillate flowers rare; inflorescence strictly racemiform, with almost erect branches.

Low, 1-2 dm. high, usually branched at the base; stem-leaves sessile; peduncles short, not exceeding the subtending leaves.

1. *E. minor*.

Taller, 3-6 dm. high, simple; lower stem-leaves petioled; basal leaves oblanccolate; peduncles elongate.

2. *E. lonchophyllus*.

Bracts of the involucre linear-subulate, long-attenuate, and except in *E. elatus* more or less glandular-puberulent; inflorescence inclined to be corymbiform or paniculate, branches ascending.

Plant tall, 3-8 dm. high, apparently only biennial; heads numerous, corymbose.

Bracts glandular-puberulent, rarely with a few hairs.

Base of the involucre merely glandular-puberulent; whole plant glabrous or the margins of the leaves sparingly ciliate; stem-leaves lanccolate.

3. *E. politus*.

Base of the involucre sparingly hirsute; leaves hairy, at least on the margins and veins beneath; stem-leaves linear or linear-oblanccolate.

4. *E. droebachensis*.

Bracts hirsute or both hirsute and glandular-puberulent.

Bracts both glandular-puberulent and hirsute; leaves more or less hairy.

5. *E. yellowstonensis*.

Bracts not glandular; leaves glabrous except the ciliate margins.

6. *E. elatus*.

Plant low, 1-3 dm. high, perennial; heads few or solitary.

Involucres not black-hairy.

Involucres glandular and hirsute.

Involucres villous, not glandular.

Involucre black-hairy.

7. *E. jucundus*.

8. *E. alpinus*.

9. *E. unalaschensis*.

II. UNIFLORI.

Ligules purple or white.

Ligules 0.5 mm. or less wide, erect; plant usually less than 1 dm. high; leaves and stem decidedly villous.

9. *E. unalaschensis*.

Ligules 1-1.5 mm. wide, spreading; plant about 1 dm. high; basal leaves glabrate; lower part of the stem strigose or glabrate.

Involucres and peduncles with black-purple hairs.

10. *E. melanocephalus*.

Involucres and peduncles white-hairy.

Basal leaves sparingly hairy or glabrate.

Basal leaves spatulate, obtuse.

11. *E. simplex*.

Basal leaves narrowly linear-lanccolate.

92. *E. Scribneri*.

Basal leaves densely villous.

Stem 1-2 dm. high, leafy; basal leaves oblanccolate, often acutish.

12. *E. grandiflorus*.

Stem 5-6 cm. high, scapiform; basal leaves cuneate-spatulate, often 3-toothed.

13. *E. lanatus*.

14. *E. aureus*.

Ligules yellow.

III. COMPOSITI.

Leaves divided into linear or spatulate divisions; plant with a caespitose caudex.

Leaves pinnately divided.

Heads radiate; leaf segments rather distant; peduncles 5–20 cm. long.

15. *E. pinnatisectus*.

Heads discoid; leaf segments crowded; peduncles 2–5 cm. long.

16. *E. mancus*.

Leaves once to thrice ternately divided.

Leaf-blades twice or thrice ternate.

17. *E. compositus*.

Leaf-blades cuneate, ternately or pedate-quinnately cleft at the apex; divisions spatulate.

Disk 10–15 mm. broad; bracts linear-subulate, scarcely scarious-margined; lobes of the leaves spatulate.

18. *E. trifidus*.

Disk 7–10 mm. broad; bracts linear-lanceolate, scarious-margined; lobes of the leaves linear.

19. *E. pedatus*.

Leaves flabelliform, lobed or twice 3-cleft at the apex; plant with a creeping rootstock.

20. *E. flabellifolius*.

IV. RADICATI.

Head radiate.

Involute glandular-puberulent or glabrate, not hirsute.

Stem and leaves glabrous or nearly so; involucre less than 12 mm. broad.

Basal leaves linear-oblancoolate.

21. *E. leiomerus*.

Basal leaves spatulate.

22. *E. spathulifolius*.

Stem and leaves pubescent; involucre 12–15 mm. wide.

Stem and leaves hirsute.

63. *E. viscidus*.

Stem strigose; leaves puberulent, especially on the margins.

23. *E. controversus*.

Involute more or less hirsute or strigose, in some also slightly glandular-puberulent.

Leaves and stem glandular scabrous as well as hirsute.

24. *E. glandulosus*.

Leaves and stem hirsute or strigose, rarely glandular.

Stem 1 dm. or more high, appressed-pubescent; disk over 1 dm. high; branches of the caudex or rootstock rather slender, often purplish.

Leaves narrowly linear-oblancoolate, 1–3 mm. wide, strigose.

Involute bracts with appressed pubescence; rays purple.

25. *E. gracilis*.

Involute bracts with spreading pubescence.

26. *E. Engelmannii*.

Rays white; bracts narrowly linear.

Rays usually purplish; bracts lance-linear.

Leaves oblancoolate to linear-oblancoolate, 3–8 mm. wide, glabrous above, except the margins.

27. *E. ursinus*.

Stem 4–7 cm. high; disk less than 1 cm. wide; caudex and its branches stout and short, not purplish.

Leaves linear-oblancoolate to spatulate.

Stem with appressed hairs, or glabrate.

Leaves and stem glabrous or nearly so; stem almost leafless.

28. *E. Evermannii*.

Leaves and stem distinctly strigose, the latter with several leaves.

29. *E. Peasei*.

Stem with more or less spreading hairs.

Stems decumbent or ascending; leaves spreading, either softly hairy or glabrate in age.

Pappus double; inner pappus of 10–12 bristles, 2 mm. long; outer pappus of small squamellae; rays white.

30. *E. radicans*.

Pappus simple or nearly so, consisting of many bristles, 3 mm. long; rays purple.

31. *E. velutinis*.

Stems and leaves almost erect; the latter coarsely hirsute.

Basal leaves narrowly linear-oblancoolate; stem-leaves linear.

32. *E. nanus*.

Basal leaves narrowly spatulate; stem-leaves oblancoolate.

38. *E. condensatus*.

Leaves linear-filiform.

33. *E. nematophyllus*.

Heads discoid; leaves narrowly linear.

34. *E. Bloomerti*.

V. PUMILI.

Pubescence of rather long hairs; branches of the stem almost erect.

Heads radiate.

Stems over 1 dm. high, when well developed, with more than one head each.

Ray-flowers white.

Outer pappus of small inconspicuous bristles; plant copiously hairy.

35. *E. pumilus*.

Outer pappus of broad squamellae; plant sparingly hairy.

36. *E. Brandegei*.

Ray-flowers blue or purplish; outer pappus conspicuous and squamellate.

37. *E. concinnus*.

Stems usually less than 1 dm. high and usually monocephalous.

Leaves spatulate.

38. *E. condensatus*.

Leaves narrowly linear-oblancoolate.

32. *E. nanus*.

Heads discoid.

39. *E. aphanactis*.

Pubescence very short; branches of the stems spreading.

72. *E. Wootonii*.

VI. DECUMBENTES.

- Leaves 1-nerved, linear-oblancoate; the lower usually obtusish. 26. *E. Engelmannii*.
 Leaves 3-nerved, at least at the base, equally long-acuminate at both ends.
 Pubescence of the leaves loose, hirsute and somewhat glandular-puberulent.
 Pubescence of the leaves appressed-strigose. 40. *E. decumbens*.
 41. *E. microlonchus*.

VII. ELATIORES.

- Bracts very densely villous, squarrose; leaves entire. 42. *E. elatior*.
 Bracts sparingly villous; leaves usually dentate.
 Ligules white; bracts scarcely squarrose; stem sparingly pubescent. 43. *E. Coulleri*.
 Ligules blue or purple; bracts squarrose; stem densely pubescent above. 44. *E. peregrinus*.

VIII. SALSUGINOSI.

- Rootstock thick; leaves thickish, acute; bracts narrowly linear-lanceolate, with strongly spreading tips.
 Peduncles mostly solitary, finely strigose; stem single from the rootstock. 45. *E. salsuginosus*.
 Peduncles usually more than one, scabrous; stems several from a caudex. 49. *E. eucephaloides*.
 Rootstock slender; leaves thin, with long mucronate tips; bracts narrowly linear-subulate, only slightly spreading. 46. *E. Howellii*.

IX. MACRANTHI.

- Basal leaf-blades broadly obovate-spatulate, often denticulate; stem-leaves distant, shorter than the internodes, not ciliate on the margins; bracts glandular-puberulent, seldom with a few hairs. 47. *E. superbus*.
 Basal leaf-blades oblanceolate, entire; stem-leaves usually longer than the internodes, usually ciliate on the margins.
 Bracts linear-subulate, glandular-puberulent, not at all hirsute; leaves glabrous.
 Leaves linear-lanceolate, minutely ciliate.
 Leaves dark green; bracts not with loose tips. 48. *E. salicinus*.
 Leaves light green; bract with spreading tips. 49. *E. eucephaloides*.
 Leaves not dark green, dull, strongly hirsute-ciliate. 50. *E. macranthus*.
 Bracts linear, more or less hirsute.
 Stem and leaves glabrous or nearly so; the latter ciliate only on the margin and the veins below; bracts glandular-puberulent and with scattered hairs. 51. *E. speciosus*.
 Stem and leaves hairy; bracts hirsute or both hirsute and glandular.
 Leaves hirsute.
 Pubescence scant, that of the stem long; leaves linear-lanceolate. 52. *E. conspicuus*.
 Pubescence of the leaves and the involucre dense, that of the stem short.
 Plant tall, green; upper stem-leaves ovate or ovate-lanceolate, distinctly triple-nerved. 53. *E. subtrinervis*.
 Plant low, canescent; upper stem-leaves lanceolate, scarcely triple-nerved. 54. *E. incanescens*.
 Leaves glandular-puberulent. 55. *E. Vreelandii*.

X. GLABELLI.

- Involucre hirsute or strigose, not at all glandular.
 Leaves glabrous, except the ciliate margins. 56. *E. glabellus*.
 Leaves more or less pubescent.
 Pubescence loose and spreading. 57. *E. fruticetorum*.
 Pubescence appressed. 58. *E. Earlei*.
 Involucres more or less glandular, sometimes also hirsute.
 Leaves glabrous, except the ciliate margins.
 Stem pubescent, especially above, only slightly glandular.
 Bracts narrowly linear-subulate; ligules usually bluish or pink.
 Involucre conspicuously hirsute as well as glandular; stem low, usually with a single head. 59. *E. rubicundus*.
 Involucre slightly if at all hirsute; stem 3 dm. high or more, usually with more than one head. 60. *E. erimius*.
 Bracts lance-subulate; ligules white. 43. *E. Coulleri*.
 Stem scarcely hairy, decidedly glandular above. 61. *E. Smithii*.
 Leaves and stem more or less pubescent.
 Involucres about 18 mm. broad; plant conspicuously long-hairy. 62. *E. formosissimus*.
 Involucres about 15 mm. broad; plant less conspicuously hairy, more glandular. 63. *E. viscidus*.

XI. PHILADELPHICI.

- Basal leaves crenate or dentate, with broad rounded or ovate teeth; upper leaves lanceolate, acute; rays white or pink. 64. *E. philadelphicus*.
 Basal leaves dentate, with sharp, triangular, salient teeth; upper stem-leaves triangular-lanceolate, acuminate; rays rose-colored or purple. 65. *E. purpureus*.

XII. ASPERI.

- Pubescence short, usually not dense.
 Pubescence appressed or rarely spreading; hairs not with pustulate bases.

- Heads small; disk 1 cm. or less wide; ligules white; basal leaves linear-ob lanceolate, entire. 66. *E. asper*.
 Heads larger; disk 1–1.5 cm. wide; ligules blue or purple; basal leaves usually more or less toothed, oblanceolate. 67. *E. oblanceolatus*.
 Pubescence spreading; hairs with pustulate bases; basal leaves narrowly oblanceolate; ligules white or rarely pale rose. 68. *E. consobrinus*.
 Pubescence long, dense, spreading or reflexed. 69. *E. Drummondii*.

XIII. RAMOSI.

One species.

70. *E. ramosus*.

XIV. BELLIDIASTRA.

One species.

71. *E. Bellidiastrum*.

XV. DIVERGENTES.

Stem simple below; rays usually white.

72. *E. Wootoni*.

Stem branched at the base; rays usually purplish.

73. *E. divergens*.

XVI. FLAGELLARES.

Leaves and stems appressed-hairy.

74. *E. flagellaris*.

Leaves and stem densely short-pubescent with spreading hairs.

Basal leaves oblanceolate, entire, or 3-lobed at the apex; leaves of the stolons linear; plant gray. 75. *E. commixtus*.Basal leaves obovate-spatulate, entire, or with several lateral lobes or teeth; leaves of the stolons oblanceolate; plant greener. 76. *E. nudiflorus*.

XVII. CANI.

Disk of the heads fully 1 cm. high and about 1.5 cm. wide; basal leaves spatulate, obtuse. Leaves canescent. 77. *E. Wyomingia*.

Leaves silvery white.

78. *E. argentatus*.Disk of the heads 7–8 mm. high and about 1 cm. wide; basal leaves oblanceolate, mostly acutish. 79. *E. canus*.

XVIII. CAESPITOSI.

Stem leafy; stem-leaves almost as broad as the basal ones.

Lower leaves narrowly linear-ob lanceolate; upper leaves narrowly linear; all acute and coarsely hairy; rays usually lilac or purplish. 80. *E. corymbosus*.

Lower leaves oblanceolate or linear-spatulate, usually obtusish; stem-leaves linear or oblong; all densely canescent; rays usually white.

Stem erect, about 3 dm. high, usually with several heads; stem-leaves linear.

81. *E. subcanescent*.

Stem decumbent at the base, 1–2 dm. high, with 1–3 (seldom more) heads; stem-leaves oblong.

Plant not conspicuously glandular.

82. *E. caespitosus*.

Plant conspicuously glandular.

83. *E. nauseosus*.

Stem more or less naked above, decumbent at the base; stem-leaves at least the upper ones reduced.

Stems about 2 dm. high; disk 10–12 mm. high and about 15 mm. wide.

84. *E. nevadensis*.

Stems about 1 dm. high; disks about 6 mm. high and less than 1 cm. wide.

85. *E. Eatonii*.

XIX. ASPERUGINEI.

Leaves with a spreading rough pubescence.

86. *E. asperugineus*.

Leaves strictly appressed-cinereous.

Disk 10–15 mm. wide; leaves finely and densely hairy; involucre bracts strigose.

87. *E. Tweedyi*.

Disk 5–10 mm. wide; leaves sparingly and coarsely hairy; involucre bracts hirsute and glandular-puberulent.

88. *E. tener*.

XX. ARENARIOIDES.

One species.

89. *E. arenarioides*.

XXI. LAETEVIRENTES.

Stems 1.5–2 dm. high, leafy.

Ligules blue or purple, scarcely more than 1 mm. wide.

90. *E. laetevirens*.

Ligules white, 1.5–2 mm. wide.

91. *E. montanensis*.

Stem 3–8 cm. high, scapiform, leafless or few-leaved.

Pubescence of the stem appressed or ascending; stems decumbent at the base.

Leaves grayish strigose, in age glabrate; bracts hirsute.

Bracts linear, acuminate; ligules mostly purple, 7–8 mm. long.

92. *E. Scribneri*.

Bracts lance-linear, acute; ligules mostly white.

30. *E. radicans*.

Leaves and bracts silvery strigose.

101. *E. pulvinatus*.

Pubescence of the stem spreading; stems erect; leaves densely hirsute; ligules white.

93. *E. Parryi*.

XXII. TETRAPLEURI.

Ligules fully 1 cm. long, white; involucre about 1 cm. broad.

94. *E. utahensis*.

Ligules 5–6 mm. long, sky-blue or pinkish; involucre 6–8 mm. broad.

95. *E. sparsifolius*.

XXIII. FILIFOLII.

Involucre hirsute.

96. *E. filifolius*.

Involucre strigose.

97. *E. linearis*.

XXIV. LUTEI.

Bracts strigose or hirsute; plant caespitose; leaves narrowly linear.

Stems scapiform, naked or with a few small leaves; bracts strigose.

Stems more or less leafy; bracts hirsute.

Petioles of the leaves hirsute-ciliate.

Petioles as well as the blades finely cinereous-strigose.

Bracts long-villous; leaves spatulate.

98. *E. luteus*.

99. *E. ochroleucus*.

100. *E. peucephyllus*.

14. *E. aureus*.

1. ***E. minor*** (Hook.) Rydb. Biennial; stem more or less hirsute; basal leaves spatulate or oblanceolate, petioled, 3–6 cm. long, ciliate or glabrate; stem-leaves linear, 3–10 cm. long, acute; peduncles erect, 1–5 cm. long; involucre 6–8 mm. high, 10–15 mm. wide; bracts hirsute; ligules about 2 mm. long, erect, rose-colored or whitish. *E. glabratus minor* Hook. *E. armeriaefolius* A. Gray, not Turcz. Damp places: Sask.—Colo.—Utah—B.C. *Submont.*—*Mont.* JI–S.

2. ***E. lonchophyllus*** Hook. Biennial; stem more or less hirsute; lower leaves petioled, narrowly oblanceolate, 6–15 cm. long, hirsute-ciliate or glabrate; peduncles usually elongate, 2–8 cm. long; involucre about 8 mm. high and 15 mm. broad; bracts hirsute; ligules 2–3 mm. long, erect. *E. racemosus* Nutt. Wet places: Sask.—Colo.—Nev.—Ida. *Submont.*—*Mont.* JI–Au.

3. ***E. politus*** Fries. Stem simple, erect, 4–8 dm. high, glabrous or nearly so; basal leaves oblanceolate, 5–10 cm. long, glabrous; stem-leaves lanceolate or linear-lanceolate, sessile; involucre 7–8 mm. high, 10–12 mm. broad; ligules 3–4 mm. long, erect, convolute-filiform. *E. glabratus* Hook., not Hoppe. Rocky mountains: Alta.—Ida.—B.C.; n Scandinavia. *Subalp.* JI–Au.

4. ***E. droebachensis*** Muell. Stem simple, glabrous or sparingly hirsute; basal leaves 5–10 cm. long, ciliate; stem-leaves narrowly oblanceolate to linear-lanceolate; involucre about 6 mm. high and 1 cm. broad; ligules about 3 mm. long, white. *E. acris droebachensis* Blytt. Woods: N.B.—Sask.—Colo.—Alaska; n Eu. *Submont.*—*Mont.* JI–Au.

5. ***E. yellowstonensis*** A. Nels. Stem mostly simple, stout, often purplish, hirsute and puberulent; lower leaves oblanceolate, petioled, 3–8 cm. long, hirsute; upper stem-leaves sessile, linear or linear-lanceolate; involucre 8 mm. high, 10–12 mm. broad; rays filiform, convolute, scarcely 2 mm. long. *E. lapiluteus* A. Nels. Mountains: Alta.—Colo.—B.C. *Submont.*—*Mont.* JI–Au.

6. ***E. elatus*** (Hook.) Greene. Stem mostly simple, 3–4 dm. high, sparingly hirsute; basal leaves spatulate, 2–7 cm. long; stem-leaves lanceolate to nearly linear; involucre hemispheric, 7–8 mm. high, 10–15 mm. broad; ligules about 3 mm. long, erect, convolute. *E. alpinus elatus* Hook. High mountains: Canadian Rockies. *Subalp.* JI–Au.

7. ***E. jucundus*** Greene. Stems often several, puberulent and sparingly hirsute; basal leaves spatulate or oblanceolate, petioled, 3–5 cm. long, sparingly hirsute-pilose; stem-leaves linear-lanceolate or oblong; heads solitary or few; involucre 6 mm. high, 8–10 mm. broad; bracts often purple-tinged; ligules erect, pink, 2–2.5 mm. long. *E. acris debilis* A. Gray. *E. debilis* Rydb. Wet places: Que.—Hudson Bay—Colo.—Utah—B.C. *Submont.*—*Subalp.* JI–Au.

8. ***E. alpinus*** L. Stem 1–3 dm. high, sparingly pubescent; basal leaves spatulate, petioled, 2–5 cm. long, hirsute; stem-leaves sessile, linear-lanceolate; heads usually solitary; involucre 8–10 mm. high, 1–2 cm. broad; ligules white, rose, or lilac, about 4 mm. long, erect, involute. High mountains: Canadian Rockies; subarctic Eurasia. *Alp.*

9. ***E. unalaschensis*** (DC.) Rydb. Low perennial, with a short, somewhat caespitose rootstock; stem 3–20 cm. high, villous with blackish hairs, somewhat thickened under the involucre; leaves mostly basal, 1–4 cm. long, spatulate, obtuse, hirsute; involucre 8–10 mm. high, 10–15 mm. broad; bracts black-purple; ligules 2–3 mm. long, 0.5 mm. wide, erect or ascending, often becoming involute. *E. uniflorus pulchellus* Fries. *E. pulchellus unalaschensis* DC. Arctic-alpine situations: Greenl.—Lab.—Mont.—Alaska. *Alp.* JI–Au.

10. ***E. melanocephalus*** A. Nels. Stem erect, 5–15 cm. high, monocephalous, villous with black-purplish hairs, especially above; leaves spatulate or

oblong-spatulate, 2-7 cm. long, glabrous or nearly so; stem-leaves linear; involucre 8-10 mm. high, 12-18 mm. wide; bracts linear-subulate; ligules white or pinkish, about 8 mm. long. High mountains: N.M.—Wyo. *Subalp.*—*Alp.* Jl—Au.

11. *E. simplex* Greene. Stem 5-20 cm. high, villous; basal leaves oblanceolate or spatulate, 3-5 cm. long; stem-leaves oblanceolate to linear, 1-2 cm. long; head solitary; involucre 8-10 mm. high, 10-15 mm. broad; bracts lanceolate, acuminate; ligules very numerous, about 6 mm. long, light purplish pink or white. *E. leucotrichus* Rydb. *E. uniflorus* Am. auth., not L. High mountains: Mont.—Colo.—Calif. *Mont.*—*Alp.* Jl—S.

12. *E. grandiflorus* Hook. Stem about 1 dm. high, white-villous; basal leaves 2-4 cm. long; stem-leaves lanceolate, acute, rather many; involucre fully 1 cm. high and 2 cm. wide, densely white-woolly; bracts linear, acuminate; ligules reddish purple or white, 8-10 mm. long. High mountains: Canadian Rockies. *Alp.* Au.

13. *E. lanatus* Hook. Leaves 1-2 cm. long, spatulate, some of them usually 3-toothed at the rounded apex; involucre 10-12 mm. high, 15-25 mm. broad, densely woolly, with long white hairs; bracts linear-subulate, attenuate; ligules 1 cm. long, reddish purple or white. High mountains: Alta.—Mont.—B.C. *Alp.* Jl.

14. *E. aureus* Greene. Stem scapiform, 3-10 cm. high, hirsute-villous; leaves mostly radical, spatulate, 2-4 cm. long, densely hirsute; stem-leaves few and small; heads solitary; involucre 5-6 mm. high, about 1 cm. broad, densely villous; bracts linear-lanceolate, acuminate, dark purple, loose and spreading, in 3 or 4 series, but nearly equal; achenes somewhat flattened, hirsute; pappus simple, scanty. *Aplopappus Brandegei* A. Gray. Mountain summits: B.C.—Alta. *Subalp.*—*Alp.* Jl—Au.

15. *E. pinnatisectus* (A. Gray) A. Nels. Leaves mostly basal, once or twice pinnatifid, with linear divisions, glandular-puberulent; stem-leaves linear and mostly simple; involucre 7-8 mm. high, 10-15 mm. broad; bracts linear-subulate, glandular-puberulent, often purplish; ligules 8-14 mm. long, bluish purple or violet. *E. compositus pinnatisectus* A. Gray. Higher peaks: Wyo.—Colo. *Subalp.*—*Alp.*

16. *E. mancus* Rydb. Perennial, with a caespitose caudex; leaves basal, 1-4 cm. long, pinnatifid, with linear-oblanceolate crowded segments, glabrous or nearly so; stem scapiform, with few small stem-leaves, decumbent at the base, 2-5 cm. high, glabrous; heads solitary; involucre hemispheric, 10-12 mm. broad; bracts in 2-3 series, linear-subulate, sparingly hirsute and glandular-puberulent; ligules wanting; achenes strigose. *E. pinnatisectus insolens* Macbr. & Payson. Mountain tops: se Utah. *Alp.* Jl.

17. *E. compositus* Pursh. Stem 3-20 cm. high, scapiform; leaves basal, crowded, usually twice ternate (or the earlier simply ternate), 2-8 cm. long, with linear or spatulate divisions, more or less hirsute and glandular-puberulent or almost glabrous (v. *nudus* Rydb.); head solitary; involucre about 7 mm. high, 10-18 mm. broad; bracts linear-subulate, hirsute and glandular-puberulent; ligules 5-8 mm. long, white or purplish or lacking [v. *discoidens*]. *E. multifidus* Rydb., a form with shorter leaf-segments. Mountains and rocky places: Greenl.—Sask.—Colo.—Calif.—Alaska. *Mont.*—*Alp.* Je—Au.

18. *E. trifidus* Hook. Peduncles 5-10 cm. long; leaves basal, 2-5 cm. long, more or less hirsute and glandular-puberulent, the earlier 3-cleft, the later often with the lateral divisions again 2-3-cleft; lobes oblanceolate or spatulate; involucre 6-7 mm. high, 10-15 mm. broad; bracts linear-subulate, often purple-tinged, more or less hirsute and glandular-puberulent; ligules about 5 mm. long, white or pinkish. *E. Gormanii* Greene. Stony crests: Alta.—Colo.—Yukon. *Alp.* My—Jl.

19. *E. pedatus* Nutt. Leaves crowded at the base, 1-3 cm. long, glabrous except the ciliate petioles, 3-cleft or pedately 5-cleft, with linear divisions; involucre 4-5 mm. high, 7-10 mm. broad; bracts slightly puberulent; linear-lanceo-

late; ligules 4 mm. long, pale rose or white. Stony hills: Wash.—Mont. *Submont.* Jl—Au.

20. *E. flabellifolius* Rydb. Stem 1–2 dm. high, glandular-puberulent above; basal leaves petioled, about 3 cm. long, slightly glandular-puberulent; stem-leaves cuneate or obovate, less divided; heads about 10 mm. high and 10–15 mm. in diameter; bracts linear, acuminate, glandular-puberulent; ligules 7–8 mm. long, light pink or white. Rocky slides: Wyo. *Alp.* Au.

21. *E. leiomerus* A. Gray. Stem 5–15 cm. high, often decumbent at the base; basal leaves spatulate, obtuse, 3–8 cm. long, glabrous or nearly so; stem-leaves few and small, linear or oblong; heads solitary; involucre 5–6 mm. high, 10–15 mm. broad; bracts linear, acute, purplish; ligules about 40, violet, 6–8 mm. long. *E. minusculus* Greene. *E. Garrettii* A. Nels. Alpine peaks: Wyo.—N.M.—Utah—Alta. *Submont.*—*Alp.* Jl—Au.

22. *E. spathulifolius* Rydb. Stem 5–8 cm. high, glabrous or slightly puberulent above; basal leaves 2–3 cm. long, glabrous, broadly spatulate; stem-leaves linear-oblong, obtuse; involucre about 1 cm. broad; bracts linear-lanceolate, acute, slightly glandular-puberulent; ligules light blue, in age white, about 8 mm. long. High mountains: Wyo. *Alp.* Jl—Au.

23. *E. controversus* Greene. Stem 5–15 cm. long, scapiform, strigose, especially above, monocephalous; basal leaves oblanceolate or oblong-spatulate, 3–6 cm. long, minutely puberulent or glabrate except the margins; stem-leaves few, linear, near the base; bracts linear, acute, glandular-puberulent, as well as sparingly strigose, purplish; ligules pale purple or white, 5–8 mm. long. Mountains: Utah. *Submont.*—*Subalp.* Je—Au.

24. *E. glandulosus* Porter. Stem 5–15 cm. high, glandular-scabrous; basal leaves numerous, 3–8 cm. long, oblanceolate or linear-oblanceolate, glandular-scabrous; stem-leaves small and linear; heads solitary; involucre 6–8 mm. high, 10–15 mm. broad; bracts linear, acute, glandular-puberulent and hirsute; ligules purple or blue, 8–10 mm. long. Hills and mountains: Wyo.—Colo. *Submont.*—*Alp.*

25. *E. gracilis* Rydb. Stem ascending, strigose, about 15 cm. high, monocephalous; basal leaves oblanceolate or linear-oblanceolate, 2–5 cm. long; stem-leaves narrowly linear, acuminate; involucre about 6 mm. high, 10–12 mm. broad; bracts narrowly linear, tinged with purple, strigose; ligules about 50, light purple, 7–10 mm. long. Meadows and hillsides: Wyo. *Submont.* Jl—Au.

26. *E. Engelmannii* A. Nels. Stem decumbent at the base, 3–20 cm. long; basal leaves numerous, linear or linear-oblanceolate, grayish-strigose, 3–10 cm. long; stem-leaves smaller; heads usually solitary; involucre about 5 mm. high and 1 cm. broad; ligules white or rarely lilac, about 40, 5–7 mm. long. *E. simulans* Greene. Stony slopes: Mont.—Colo.—Utah—Ida. *Submont.* Je—Jl.

27. *E. ursinus* D. C. Eat. Stem 1–2 dm. high, ascending, sparingly hairy or glabrous; basal leaves numerous, oblanceolate or linear-oblanceolate, 3–8 cm. long; stem-leaves linear or linear-lanceolate, acute; involucre 5–7 mm. high, 10–15 mm. wide; bracts hirsute and glandular-puberulent, linear, acute; ligules purple or violet, 8–10 mm. long. Mountains: Mont.—Colo.—Utah—Ida. *Submont.*—*Subalp.* Jl—Au.

28. *E. Evermannii* Rydb. Scapose perennial with a caespitose rootstock; leaves basal, narrowly spatulate, 2–4 cm. long, glabrous, obtuse; stem-leaves if present less than 5 mm. long; stem scapiform, 3–5 cm. long, slightly strigose above, otherwise glabrous; involucre hemispheric, about 1 cm. broad; bracts linear, abruptly acute, purple-tinged, sparingly hirsute-villous; ligules about 20, apparently white, 8 mm. long. Mountain tops: Ida. *Alp.* Au.

29. *E. Peasei* Rydb. Stem 5–8 cm. high, with 1–4 leaves; basal leaves about 2 cm. long, petioled, oblanceolate, acute, strigose; stem-leaves linear, sessile; heads solitary; involucre 4–5 mm. high, about 1 cm. wide; bracts linear-subulate, sparingly hirsute; ligules numerous, about 7 mm. long, pinkish. Mountains: Colo.—Utah. Je.

30. *E. radicans* Hook. Stem 3–6 cm. high, scapiform, hirsute-strigose; basal leaves oblanceolate to nearly linear, 1–4 cm. long, sparingly hirsute or gla-

brate; stem-leaves very few, linear; heads solitary; involucre about 5 mm. high and 10 mm. wide; bracts lance-linear, acute, hirsute; ligules white, 4-6 mm. long. Mountains and hills: Sask.—Wyo.—B.C. *Mont.—Alp.* My-Je.

31. *E. vetensis* Rydb. Stem 3-8 cm. high, hirsute, few-leaved; leaves linear or linear-oblongate, hirsute, 2-4 cm. long; heads solitary; involucre 4-5 mm. high, about 10 mm. broad; bracts linear, acuminate, hirsute; ligules purple, 8-10 mm. long. *E. radicans* Gray, not Hook. High mountains: Mont.—Colo.—Utah. *Submont.—Mont.* Je-Au.

32. *E. nanus* Nutt. Stem 5-10 cm. high, hirsute; leaves crowded, densely hirsute, linear-oblongate, 3-5 cm. long; heads solitary; involucre about 5 mm. high and 10 mm. broad, hirsute; bracts linear; ligules 20-50, purple, violet or white, about 6 mm. long. *E. polyspermus* A. Gray. *E. inamoenus* A. Nels. *E. wyomingensis* A. Nels. Hills: Mont.—Colo.—Utah. *Submont.* Je-Au.

33. *E. nematophyllus* Rydb. Stems several, strigose, about 5 cm. high, few-leaved; leaves linear-filiform, 2-4 cm. long, less than 1 mm. wide, strigose; heads solitary; involucre 4-5 mm. high, 8-10 mm. broad; bracts linear, acute, hirsute-strigose; ligules pinkish or white, 4-5 mm. long; outer pappus of short bristles. *E. Eatonii* Coult. & Nels., in part, not A. Gray. Rocky hills: Colo.—Wyo. *Submont.* My-Jl.

34. *E. Bloomeri* A. Gray. Stem scapiform, 5-15 cm. high, finely strigose; basal leaves numerous, 2-10 cm. long, 2-3 mm. wide, cinereous-strigose; involucre 7-8 mm. high, 10-12 mm. broad, softly villous; bracts linear; ligules wanting. Stony ground: Ore.—Ida.—Nev.—Calif. My-Je.

35. *E. pumilus* Nutt. Perennial, with a caespitose short caudex; stem erect, 1-3 dm. high, hirsute, leafy; lower leaves narrowly oblongate, 2-10 cm. long, hirsute, the upper linear; heads several; involucre 7-8 mm. high, 12-15 mm. broad; bracts narrowly linear, acute, hirsute; ligules 50-80, white, 7-10 mm. long, at length reflexed. Dry plains: Sask.—N.D.—Kans.—Utah—B.C. *Plain—Submont.* My-Jl.

36. *E. Brandegei* A. Gray. Stem 2-3 dm. high, sparingly hispidulous-hirsute; basal leaves linear-spatulate, sparingly hirsute; stem-leaves linear, the upper minute; bracts of the involucre linear, short, almost glabrous; ligules 30 or more; inner pappus rather scanty. Adobe plains: sw Utah. *Son.*

37. *E. concinnus* T. & G. Perennial, with a taproot and short caespitose caudex; stem erect, 1-3 dm. high, hirsute with long white hairs, lower leaves linear-oblongate, the upper linear, densely hirsute; heads corymbose; involucre 6-7 mm. high, 10-15 mm. broad; bracts narrowly linear, acute, densely hirsute; ligules 7-9 mm. long. *E. hispidissimum* Piper. Plains and hills: Mont.—N.M.—Calif.—B.C. *Plain—Submont.*

38. *E. condensatus* (D. C. Eat.) Greene. Perennial, with a caespitose caudex; stem usually less than 1 dm. high and monocephalous, hirsute; leaves narrowly spatulate, hirsute, 2-3 cm. long; involucre 5-6 mm. high, about 1 cm. broad; bracts linear, acute, hirsute; ligules white, rarely pinkish, 6 mm. long; pappus double, the outer of broad scales. *E. concinnus condensatus* D. C. Eat. Dry hills: Mont.—Ariz.—Nev. My-Jl.

39. *E. aphanactis* (A. Gray) Greene. Perennial, with a caespitose caudex; stem 1-2 dm. high, branched, short-hirsute; lower leaves spatulate, 3-5 cm. long, hirsute, the upper linear-oblongate; heads several, corymbose; involucre about 5 mm. high and 1 cm. broad, hirsute; bracts linear, acute, hirsute; rays wanting; pappus double, the outer squamellate. Arid regions: Utah—Nev.—Calif. *Son.* My-Jl.

40. *E. decumbens* Nutt. Perennial, with a taproot and short caudex; stems several, 15-30 cm. high, hirsute; basal leaves linear-oblongate, 6-10 cm. long, 3-nerved, hirsute as well as glandular-scabrous; stem-leaves narrowly linear; heads solitary or few; involucre 6-7 mm. high, 12-15 mm. broad, hirsute; bracts linear, in about 2 series; ligules 30-40, purplish or white, 7-8 mm. long. Plains and hills: Mont.—Wyo.—Calif.—Wash. *Plain—Submont.* Je-Au.

41. *E. microlonchus* Greene. Perennial, with a deep taproot, slightly caespitose; stems few, 1-3 dm. high, strigose; basal leaves 7-12 cm. long, linear-ob lanceolate, 3-nerved, strigose; stem-leaves narrowly linear; heads usually solitary; involucre 6-7 mm. high, 10-15 mm. wide; bracts narrowly linear, acute; ligules 30-40, light purplish, 5-7 mm. long. Grassy plains: Wyo.—Colo.—Ariz.—Ida. *Submont.* Je—Au.

42. *E. elatior* (A. Gray) Greene. Perennial, with a short woody rootstock; stem simple, leafy, 2-6 dm. high, hirsute-villous; leaves ovate-lanceolate, or lanceolate, acute or acuminate, entire, the lower oblanceolate, 3-6 cm. long, hirsute-villous; heads 1-3; involucre 10-13 mm. high, 15-25 mm. broad; bracts linear, attenuate; ligules lilac or purple, 12-15 mm. long. *E. grandiflorus elatior* A. Gray. Wet places: Colo.—Wyo. *Mont.*—*Subalp.* Jl—Au.

43. *E. Coulteri* Porter. Perennial, with a rather slender rootstock; stem 1.5-4 dm. high, sparingly hirsute or glabrate; basal leaves 5-15 cm. long, slender-petioled, lanceolate or ovate-lanceolate; lower stem-leaves with winged petioles, the upper ovate-lanceolate, sessile or somewhat clasping; heads usually solitary; involucre about 1 cm. high and 1.5 cm. broad; ligules numerous, white, about 15 mm. long. *E. leptophyllus* Greene. *E. leucanthemoides* Greene. *E. lucidus* Greene, an entire-leaved form. Mountains: Colo.—N.M.—Utah—Calif.—Wash. *Mont.*—*Subalp.* Jl—S.

44. *E. peregrinus* (Pursh) Greene. Perennial, with a rootstock; stem 2-5 dm. high, villous, densely so on the upper part; lower leaves oblanceolate, obtuse, 7-10 cm. long, petioled, the upper lanceolate or ovate-lanceolate, acuminate, more or less sharply few-toothed, sparingly villous, thin; heads solitary; involucre about 15 mm. broad or more; bracts linear-subulate, attenuate, villous, squarrose; ligules numerous, about 1 cm. long. Meadows: Alaska—B.C.—Alta. *Subalp.* Jl—Au.

45. *E. salsuginosus* (Richards.) A. Gray. Perennial, with a short thick rootstock; stem simple, erect, 1-5 dm. high; basal leaves spatulate or obovate, 5-10 cm. long, glabrous or nearly so, entire; upper stem-leaves ovate or lanceolate, sessile or partly clasping; involucre about 1 cm. high, 1.5-2 cm. broad; bracts linear, acuminate, glandular-puberulent; ligules 50-70, purple or violet, 10-15 mm. long. *E. callianthemum* Greene. *E. hesperocallis* Greene. (?) *E. membranaceus* Greene. *E. salsuginosus glacialis* (Nutt.) A. Gray, is a depauperate alpine form. Wet places: Sask.—N.M.—Calif.—Alaska. *Submont.*—*Subalp.*

46. *E. Howellii* A. Gray. Stem 3-5 dm. high, glabrous; peduncle puberulent; basal leaves membranous, glabrous, obovate, petioled; stem-leaves ovate, with broad clasping base; heads solitary; involucre 8-10 mm. high, 15-18 mm. broad, glandular-puberulent; ligules 30-35, about 15 mm. long, white or rose-colored. Wet places: Mont.—Ore.—Wash. *Submont.* Ap—Au.

47. *E. superbus* Greene. Stem 3-6 dm. high, nearly glabrous throughout; basal leaves and lower stem-leaves obovate or oblanceolate, petioled, 3-8 cm. long; upper stem-leaves sessile, ovate, acute; heads few, corymbose; involucre 7-8 mm. long and 12-18 mm. wide; bracts linear, acuminate; ligules 40-60, narrow, white, or rose-colored, 12-18 mm. long. Mountains: Colo.—Utah—Wyo. *Submont.*—*Subalp.* Jl—Au.

48. *E. salicinus* Rydb. Stem simple, 4-7 dm. high, glabrous; lower leaves petioled, about 1 dm. long, narrowly oblanceolate, dark bluish green, 3-nerved; upper leaves linear or linear-lanceolate, sessile and half-clasping; inflorescence corymbiform, leafy; involucre 6-7 mm. high, 12-15 mm. broad; bracts linear-subulate, acuminate; ligules numerous, fully 1 cm. long, purple. Mountains: Colo. *Mont.* Jl—Au.

49. *E. eucephaloides* Greene. Perennial, with a woody caudex; stem about 3 dm. high, glabrous; peduncles scabrous; leaves glabrous, scabrous-ciliate on the margins, the lower narrowly oblanceolate, 7-10 cm. long, the upper lanceolate and clasping; heads 1-3; bracts subulate, with spreading tips, glandular- or scabrous-puberulent; ligules bluish purple, 1 cm. long. Morains: Ida. *Mont.* Au.

50. *E. macranthus* Nutt. Stem 4-8 dm. high; basal leaves oblanceolate, petioled, 5-10 cm. long; upper stem-leaves sessile, ovate to linear-lanceolate, acuminate; inflorescence corymbiform; involucre 7-8 mm. high, 12-18 mm. broad; ligules very numerous, 10-12 mm. long, lilac or bluish purple. *E. leiophyllus* Greene, a broad-leaved form. Mountains: Alta.—N.M.—Ariz.—Ore.—B.C. *Submont.*—*Mont.* Je—Au.

51. *E. speciosus* DC. Stem 3-5 dm. high; basal leaves linear-oblanceolate, ciliate, 5-10 cm. long, petioled; upper leaves sessile, narrowly lanceolate; heads corymbose; involucre 7-8 mm. high, 12-18 mm. broad; ligules blue or violet, numerous, 12-18 mm. long. Mountains: Alta.—Colo.—Utah—Ore.—B.C. *Submont.*—*Mont.* Jl—S.

52. *E. conspicuus* Rydb. Stem 3-5 dm. high, hirsute with long hairs, very leafy; lower leaves oblanceolate, 5-10 cm. long, petioled; upper leaves lanceolate, sessile; heads corymbose; involucre 7-8 mm. high, 15-20 mm. broad; ligules bluish purple, very numerous, narrow, 10-12 mm. long. Mountains: Mont.—Colo.—Wash. *Mont.* Jl—S.

53. *E. subtrinervis* Rydb. Stem 3-6 dm. high, hirsute with short hairs; lower leaves oblanceolate, 5-10 cm. long, hirsutulous on both sides; inflorescence corymbiform; involucre 7-8 mm. high, 12-20 mm. broad; ligules numerous, violet, rose-colored or purplish, rarely white, about 1 cm. long. Wooded mountain sides: S.D.—N.M.—Utah—Wash. *Submont.*—*Mont.* Jl—Au.

54. *E. incanescens* Rydb. Stem simple, 1.5-3 dm. high, mostly ascending, densely pubescent, leafy; basal leaves oblanceolate or spatulate; stem-leaves about 5 cm. long and 1 cm. wide, oblong to lanceolate, sessile, and somewhat clasping; heads 1-4; involucre about 7 mm. high and 15 mm. broad; bracts cinereous; ligules pale blue or violet, about 15 mm. long. Mountains: Colo. *Mont.* Jl—Au.

55. *E. Vreelandii* Rydb. Stem 6-7 dm. high, simple, sparingly pubescent and puberulent; lower leaves petioled, oblanceolate, the rest sessile, lanceolate, somewhat clasping; inflorescence leafy, corymbiform; involucre 7-8 mm. high, 15-18 mm. broad; ligules fully 1 cm. long, very numerous, dark purple. Mountains: Colo. *Submont.* Jl.

56. *E. glabellus* Nutt. Stem decumbent at the base, 1.5-4 dm. high, glabrous or sparingly hirsute above; basal leaves oblanceolate, 5-10 cm. long, glabrous; stem-leaves narrowly linear-lanceolate, the upper often much reduced; heads 1-3; involucre 6-7 mm. high, 1-1.5 cm. broad; bracts linear, acuminate; ligules purple. Hills and mountains: Sask.—Wis.—N.M.—Mack. *Submont.*—*Alp.* Jl—Au.

57. *E. fruticetorum* Rydb. Perennial, with a caespitose rootstock; stem decumbent at the base, 2-4 dm. high, rather densely and finely hirsute; basal leaves narrowly oblanceolate, 4-10 cm. long, petioled, finely hirsute on both sides; stem-leaves sessile, lanceolate to linear; heads 1-4, long-peduncled; involucre 12-15 mm. broad; bracts linear, acute, softly hirsute, not glandular; ligules numerous, narrow, lilac or white, about 8 mm. long. Mountains among bushes: se Utah. *Mont.* Jl—Au.

58. *E. Earlei* Rydb. Stems several, simple, 3-4 dm. high; basal leaves 5-6 cm. long, narrowly oblanceolate, often callous-denticulate; stem-leaves linear and sessile; heads about 3, 6 mm. high; ligules numerous and very narrow, white, about 8 mm. long. *E. strigosus* Rydb. (Fl. Colo.). Meadows: Colo. Jl.

59. *E. rubicundus* Greene. Stem decumbent and reddish at the base, rarely 2 dm. high, usually monocephalous, hirsute throughout and glandular above; basal leaves spatulate or oblanceolate, 3-5 cm. long, glabrous except the ciliate margins and the midrib beneath; stem-leaves oblong or lance-oblong, sessile; involucre about 18 mm. broad; bracts linear, sparingly hirsute as well as glandular-puberulent; ligules pink, very numerous, 8-10 mm. long. Mountains: Colo. *Subalp.*—*Alp.* Jl—Au.

60. *E. eximius* Greene. Stem 2.5-5 dm. high, sparingly hirsute throughout, decumbent at the base; basal leaves petioled, linear-oblanceolate to spatulate,

glabrous except the ciliate margins, 3-10 cm. long; stem-leaves linear-lanceolate, sessile; heads 1-9; involucre about 15 mm. wide, glandular-puberulent, only with a few hirsute hairs below; bracts linear-subulate; ligules usually light purple, numerous, about 8 mm. long. Meadows: Wyo.—Colo.—e Utah. *Submont.*—*Jl-Au.*

61. *E. Smithii* Rydb. Stem simple, glabrous or nearly so below, glandular-puberulent above; basal leaves 6-10 cm. long, petioled, oblanceolate or spatulate; upper stem-leaves lanceolate, sessile, more or less clasping; heads 1-5; involucre about 6 mm. high; ligules purplish, 10-12 mm. long. Mountains: Colo.—Utah. *Submont.*—*Mont.*

62. *E. formosissimus* Greene. Stem stout, about 3 dm. high, rather densely long-hirsute; basal leaves oblanceolate, 5-10 cm. long, sparingly hirsute on both sides; stem-leaves lanceolate, sessile; heads 1-3; involucre about 18 mm. broad; bracts linear, usually copiously hirsute as well as glandular-puberulent; ligules lilac or rose-colored, fully 1 cm. long. Mountains: Colo.—N.M. *Submont.*—*Jl-Au.*

63. *E. viscidus* Rydb. Stem ascending, 1-5 dm. high, more or less hirsute and glandular-puberulent; basal leaves 3-5 cm. long, oblanceolate, dark green, sparingly hirsute and ciliate on the entire margins; stem-leaves lanceolate, sessile; heads few; involucre about 8 mm. high and 15 mm. broad; bracts very numerous, narrowly linear, acuminate; ligules very numerous, pale blue or rose-colored, about 8 mm. long and 5 mm. wide. *E. iodanthus* Greene. *E. hirtuosus* Greene, a less glandular form. Mountains: Colo.—N.M.—Utah—Ariz. *Mont.*—*Subalp.*—*Je-Au.*

64. *E. philadelphicus* L. Stem 3-10 dm. high, branched above, soft-hirsute; basal leaves oblanceolate, 5-15 cm. long, scarcely petioled, softly pubescent; lower stem-leaves oblong, the upper lanceolate, acute, half clasping; involucre 4-5 mm. high, 8-12 mm. broad, sparingly hirsute; bracts broadly linear, acute; ligules white or pinkish, 5-6 mm. long. Wet fields, meadows, and woodlands: Lab.—Fla.—Calif.—B.C. My—Au.

65. *E. purpureus* Ait. Stem 3-10 dm. high, sparingly hirsute or glabrate above; basal leaves 8-15 cm. long, oblanceolate, acute, sparingly pubescent; upper leaves triangular-lanceolate or ovate, with a broad cordate base, acuminate; involucre 5 mm. high, 10-12 mm. broad; bracts broadly linear; ligules rose or reddish purple, 8-10 mm. long. Wet meadows: Hudson Bay—Mont.—Wash.—Mack. *Je-Jl.*

66. *E. asper* Nutt. Stem strict, erect, 2-3 dm. high, shortly hirsute-strigose; lower leaves linear-oblanceolate, 3-6 cm. long, entire or rarely minutely denticulate, short-pubescent; upper stem-leaves linear-lanceolate, acuminate; heads 1-4; involucre 5-6 mm. high, about 1 cm. wide, hirsute; ligules white, 7-8 mm. long. *E. anicularum* Greene. Prairies and hills: Man.—N.D.—Alta. *Plain*—*Submont.*—*Je-Jl.*

67. *E. oblanceolatus* Rydb. Stem 3-5 dm. high, strigose; lower leaves oblanceolate, winged-petioled, 5-10 cm. long; upper leaves lanceolate or linear-lanceolate; heads 1-4; involucre 7-9 mm. high, 15-20 mm. broad; ligules numerous, pink or purple, 10-12 mm. long. Plains and meadows: Mont.—Wyo.—Utah—Ida. *Plain*—*Submont.*—*Je-Au.*

68. *E. consobrinus* Greene. Stem strict, 3-6 dm. high, hirsute with short spreading hairs; lower leaves oblanceolate, 5-8 cm. long, entire or denticulate, short-hirsute; stem-leaves linear-lanceolate, sessile; involucre 6-8 mm. high, 12-18 mm. broad; ligules numerous, white, turning pinkish, about 1 cm. long. *E. fraternus* Greene. Mountain valleys: Colo. *Submont.*—*Mont.*—*Je-Au.*

69. *E. Drummondii* Greene. Stem 2-4 dm. high, strict; lower leaves oblanceolate, short-petioled, densely hirsute, entire or denticulate; upper leaves lance-linear; heads 1-4, with long peduncles; involucre 6-7 mm. high, 10-15 mm. broad; ligules numerous, very narrow, about 1 cm. long, pink or lilac. *E. glabellus pubescens* Hook. Hillsides and mountains: Alta.—Mont.—B.C.—Yukon. *Plain.*—*Je-Au.*

70. *E. ramosus* (Walt.) B.S.P. Annual; stem erect, 3-6 dm. high, corymbosely branched, strigose; basal leaves petioled, 5-10 cm. long, spatulate or oblanceolate, often sparingly serrulate; stem-leaves linear, or nearly so; heads numerous; involucre hirsute, 3-4 mm. high, 6-8 mm. broad; bracts linear, acute; ligules white, numerous, about 5 mm. long; inner pappus of few bristles or in the rays lacking. *E. strigosus* Muhl. Dry places: N.S.—Fla.—Calif.—B.C.; the more hairy western form west of Minn. and Kans. Je-S.

71. *E. Bellidiastrum* Nutt. Stem corymbosely branched above, grayish-hirsutulous; leaves linear-spatulate or linear-ob lanceolate, obtuse, entire, densely hirsutulous; heads numerous; involucre 3-4 mm. high, 7-8 mm. broad; bracts linear, acute, hirsute; ligules light purple or white, 5-6 mm. long. Low ground: S.D.—Tex.—Ariz.—Wyo.—(? B.C.). *Plain—Mont.* Jl-O.

72. *E. Wootoni* Rydb. Biennial, with a taproot; stem 3-6 dm. high, finely and densely hirsutulous; basal leaves oblanceolate, petioled, 3-10 cm. long, hirsutulous; stem-leaves linear, sessile; heads numerous, corymbose; involucre hirsute, about 4 mm. high and 8 mm. broad; bracts linear, acute; ligules white, 6-7 mm. long. *E. cinereus* A. Gray. Sandy soil: Mont.—N.M.—Ariz. *Son.—Submont.* Je-Au.

73. *E. divergens* T. & G. Biennial or perennial, with a taproot, branched at the base; stems several, 2-4 dm. high, densely hirsute with short hairs; basal leaves spatulate or oblanceolate, petioled, 2-6 cm. long, entire or rarely somewhat lobed, hirsutulous; stem-leaves linear, sessile; heads numerous; involucre 4-5 mm. high, 8-10 mm. broad, hirsute; bracts linear, acute; ligules numerous, bluish purple or lilac, about 5 mm. long. Low plains and river banks: Mont.—Tex.—Calif.—B.C. *Son.—Submont.* My-Au.

74. *E. flagellaris* A. Gray. Branched at the base; stem decumbent, usually rooting at the ends and producing new plantlets, strigose; basal leaves spatulate or oblanceolate, 2-4 cm. long, strigose; stem-leaves linear; peduncles naked, 4-10 cm. long; involucre 4 mm. high and 8 mm. broad, hirsute; bracts linear, acute; ligules 5 mm. long, white or purplish. *E. stolonifer* Greene. *E. MacDougalii* Heller. Banks of streams and valleys: S.D.—N.M.—Ariz.—B.C.; Mex. *Submont.—Subalp.* Ap-Au.

75. *E. commixtus* Greene. Biennial; stem branched at the base, decumbent, hirsutulous, 1-3 dm. long; basal leaves narrowly oblanceolate, entire, or more or less lobed at the apex, densely canescent, 2-4 cm. long; stem-leaves narrowly linear; peduncles 5-10 cm. long; involucre hirsute, 4 mm. high and about 8 mm. broad; ligules about 5 mm. long, white or pink. *E. cinereus* A. Gray, not H. & A. *E. colo-mexicanus* A. Nels. River bluffs: Colo.—Tex.—Ariz.—Utah; Mex. *Son.—Submont.* Ap-Je.

76. *E. nudiflorus* Buckley. Biennial; stem at first erect, 1-2 dm. high, later producing spreading or decumbent branches, 1-3 dm. long, hirsutulous; basal leaves spatulate, 4-8 cm. long, petioled, hirsutulous; stem-leaves oblanceolate; heads solitary at the ends of peduncles often 1 dm. long; involucre hirsute, about 4 mm. high, 8-10 mm. broad; ligules numerous, white or pinkish, 7-8 mm. long. *E. divergens nudiflorus* A. Nels. Hills and river bluffs: Colo.—Tex.—Ariz.—Nev.; Mex. *Son.—Submont.* Mr-Au.

77. *E. Wyomingia* Rydb. Stem numerous, erect, 1-2 dm. high, striate, strigose-canescens; basal leaves linear-spatulate, 2-5 cm. long, strigose-cinereous; stem-leaves linear; heads solitary; involucre about 6 mm. high, 12-15 mm. broad; bracts linear, acute, pubescent; ligules about 30, white or pinkish, about 1 cm. long; achenes 3-5 angled. *Wyomingia cinerea* A. Nels.* Dry hillsides: Wyo.—Colo. *Plain—Submont.* My-Je.

78. *E. argentatus* A. Gray. Stem 1-3 dm. high; basal leaves linear-ob lanceolate, 2-4 cm. long, 2-4 mm. wide, silvery white; stem-leaves scattered and

*The genus *Wyomingia* seem to be well differentiated as far as the group CANI is concerned, but both the LAETEVIRENTES and TETRAPLEURI connect it with CAESPITOSI and the rest of the genus *Erigeron*.

small, linear; heads solitary; involucre 8-10 mm. high, 15-20 mm. broad, strigose; rays white, 8-10 mm. long. *W. argentata* A. Nels. Arid regions: Mont.—w Colo.—Utah—Nev. *Plain*—*Son.* Je—Jl.

79. *E. canus* A. Gray. Stem decumbent at the base, 1-2 dm. high, strigose-canescant; basal leaves narrowly linear-oblancoelate, 1-4 cm. long, canescant-strigose; stem-leaves narrowly linear; heads solitary; involucre 5-6 mm. high, 10-12 mm. broad; bracts lanceolate-linear, acute; ligules purplish or white, 6 mm. long. *W. cana* A. Nels. Dry plains and ridges: S.D.—Neb.—N.M.—Wyo. *Plain*—*Mont.* Jl—Au.

80. *E. corymbosus* Nutt. Stem 1-4 dm. high, corymbosely branched above, short-hirsutulous; basal leaves narrowly linear-oblancoelate, 3-nerved, 5-15 cm. long, densely hirsutulous; stem-leaves linear; involucre 5 mm. high, 8-12 mm. broad; bracts hirsute; ligules lilac or purplish, rarely white, 30-50, about 8 mm. long. *E. Nelsonii* Greene. Plains: Mont.—Wyo.—Calif.—B.C. *Plain.* Je—Au.

81. *E. subcanescens* Rydb. Stem erect, canescant-hirsutulous; basal leaves linear-oblancoelate, mostly obtuse, 6-10 cm. long, triple-nerved, densely canescant; involucre 5 mm. high, 10-12 mm. broad; bracts linear, acute, canescant-hirsutulous; ligules white or rarely pinkish, about 8 mm. long. *E. caespitosus laccolilicus* M. E. Jones. Stony slopes and plains: Sask.—Colo.—Utah—B.C. *Plain.* Jl—Au.

82. *E. caespitosus* Nutt. Stem 1-1.5 dm. high, canescant; basal leaves oblancoelate, 5-10 cm. long, less distinctly 3-nerved, obtuse, densely hirsutulous-canescant; involucre 6-7 mm. high, 10-15 mm. wide; bracts linear, hirsute-canescant, acute; ligules 40-50, white, 7-10 mm. long. Dry hills and plains: Sask.—Colo.—Utah—Yukon. *Plain*—*Mont.* Jl—Au.

83. *E. nauseosus* (M. E. Jones) A. Nels. Stem 1-1.5 dm. high, glandular-puberulent; basal leaves with winged petioles, 3-5 cm. long, spatulate, 3-nerved, glandular-puberulent and ciliate on the margins; stem-leaves spatulate or elliptic, sessile; heads solitary; involucre about 6 mm. high, 12-15 mm. wide; ligules white, 8-10 mm. long, 1 mm. wide. *E. caespitosus nauseosus* Jones. Hillsides: Utah. *Submont.* Je.

84. *E. nevadensis* A. Gray. Stem 1-3 dm. high, strigose-canescant; basal leaves narrowly linear-oblancoelate, 3-nerved, canescant, 5-10 mm. long; stem-leaves linear; heads solitary; involucre about 7 mm. high, 12-18 mm. broad, much shorter than the flowers; ligules white or pale blue, 8-12 mm. long. Dry hills and mountains: Utah—Nev.—Calif. *Submont.* My—Jl.

85. *E. Eatonii* A. Gray. Stem 1 dm. high or less, strigose; basal leaves narrowly linear-oblancoelate or linear, 3-nerved, strigose, 5-10 cm. long, 1-4 mm. broad; stem-leaves narrowly linear, often falcate; heads usually solitary; involucre 5-6 mm. high, 7-10 mm. broad; bracts rather few, linear, in about 3 series, but only slightly imbricate; ligules about 20, purplish or white, 6-7 mm. long. Mountains: Utah—Wyo.—Ore. *Submont.*—*Mont.* Jl—Au.

86. *E. asperugineus* (D. C. Eat.) A. Gray. Perennial, with a caespitose woody caudex; stem monocephalous, less than 1 dm. high, hirsutulous-canescant; basal leaves thick, spatulate, petioled, 1-3 cm. long, densely hirsutulous-canescant; stem-leaves small, oblong or oblancoelate; involucre 5-6 mm. high, 10-12 mm. broad, hirsute; bracts linear, slightly imbricate; ligules about 20, bluish or purple, about 8 mm. long. *E. elkoensis* Nels. & Macbr. Dry hills and mountains: Mont.—Wyo.—Nev. *Submont.*—*Mont.* Jl—Au.

87. *E. Tweedyi* Canby. Stem scapiform, 5-15 cm. long, canescant-strigose; basal leaves 2-5 cm. long, oval or obovate-spatulate, thick, silvery-canescant; stem-leaves few and small, linear-oblancoelate; heads solitary, or rarely 2 or 3; involucre 5-6 mm. high, 12-15 mm. broad; ligules purple, 5-7 mm. long. Dry mountains and hillsides: Mont.—Wyo. *Mont.*—*Subalp.* Je—Au.

88. *E. tener* A. Gray. Stem scapiform, 5-10 cm. long, strigose; basal leaves oblancoelate or spatulate, petioled, 2-4 cm. long, rather sparingly strigose; stem-leaves small and linear; heads solitary or rarely 2 or 3; involucre 4-5 mm.

high, 5–10 mm. broad; ligules purplish, 4–5 mm. long. Mountains: Ida.—Mont.—Nev.—Utah. *Submont.*—Mont. Au—S.

89. *E. arenarioides* A. Gray. Stem 1–2 dm. high, glabrous, filiform; basal leaves narrowly linear-oblancoolate to almost filiform, 2–4 mm. long, glabrous; stem-leaves linear-filiform, diminishing upwards; heads usually solitary; involucre 4–5 mm. high and nearly 1 cm. wide; bracts linear-subulate, acuminate, glandular-puberulent, slightly purplish; rays bluish purple or white, 5 mm. long; achenes flattened, hirsute; pappus simple. *Aster arenarioides* A. Gray. Mountains: Utah. *Mont.* Jl—Au.

90. *E. laetevirens* Rydb. Stems several, 1.5–2 dm. high, slender, erect or ascending, silky-strigose; basal leaves very narrowly linear-oblancoolate, acute, 5–10 cm. long, sparingly strigose; stem-leaves narrowly linear; heads solitary; involucre 6 mm. high, 12–15 mm. broad, grayish villous-hirsute; ligules numerous, blue or purple, 7–8 mm. long. Mountain slopes: Wyo. *Submont.*—Mont. Jl—Au.

91. *E. montanensis* Rydb. Stem 1–2 dm. high, softly strigose; basal leaves narrowly linear to linear-oblancoolate, sparingly strigose, 5–10 cm. long; stem-leaves narrowly linear; heads solitary; involucre about 7 mm. high and 12–15 mm. broad; bracts linear, acuminate, densely hirsute-villous; ligules white or pinkish, 5–7 mm. long, 1.5–2 mm. wide. *E. Tweedyanus* Canby & Rose. *Wyomingia Tweedyana* A. Nels. Dry hills and plains: Mont.—Wyo. *Plain*—Mont. My—Au.

92. *E. Scribneri* Canby. Stem 3–8 cm. high, grayish-strigose; basal leaves linear or narrowly linear-oblancoolate, strigose, 3–5 cm. long; heads solitary; involucre 5–6 mm. high, about 15 mm. wide; ligules 7–8 mm. long. *E. Macounii* Greene. Mountains: Alta.—Wyo. *Mont.*—*Subalp.* Jl—Au.

93. *E. Parryi* Canby & Rose. Stem scapiform, 3–5 cm. high, densely hirsutulous; leaves narrowly linear, 2–4 cm. long, densely hirsutulous; involucre densely hirsute, 5–6 mm. high, 10–12 mm. broad; ligules 6–7 mm. long. Dry hills: Mont. *Mont.* Jl.

94. *E. utahensis* A. Gray. Perennial, with a branched woody caudex, often suffrutescent; stem 3–4 dm. high, silvery-strigose, branched; leaves all narrowly linear, 5–10 cm. long, silvery strigose-canescens; heads solitary, on long peduncles; involucre 6–8 mm. high, 10–12 mm. broad; bracts lance-linear, acuminate, silky-strigose; ligules white, 12–15 mm. long. *E. tetrapleurus* (A. Gray) Heller. Arid regions: s Utah—Ariz. My—Je.

95. *E. sparsifolius* Eastw. Suffrutescent perennial; stem 3–4 dm. high, silvery strigose; lower leaves narrowly oblancoolate, 3–5 cm. long, 4–5 mm. wide, silvery-strigose, the upper narrowly linear or nearly so, the uppermost almost filiform and reduced; involucre hemispheric, 6–8 mm. broad; bracts linear, silvery-strigose; achenes quadrangular, strigose-hirsute. *Wyomingia vivax* A. Nels. Cañons: se Utah—Ariz. *Son.* Je—Au.

96. *E. filifolius* (Hook.) Nutt. Perennial, with a branched woody caudex, often more or less suffrutescent; stem 2–6 dm. high, cinereous-strigose; leaves linear-filiform or filiform, cinereous, 2–5 cm. long; involucre about 5 mm. high and 10 mm. broad; ligules about 8 mm. long, bluish, violet, or white. *E. linearis* Piper, in part. Rocky ground: Mont.—Ida.—Calif.—B.C. *Son.* Je—Au.

97. *E. linearis* (Hook.) Piper. Perennial, with a branched caudex; stem 1–3 dm. high, decumbent at the base, slender, cinereous-strigose; leaves all filiform, cinereous, 3–5 cm. long; involucre 5 mm. high, 10 mm. broad; ligules 7–8 mm. long, white or bluish. Dry or sandy places: Wash.—Ida.—Ore. *Son.* My—Jl.

98. *E. luteus* A. Nels. Perennial, with a caespitose, multicapital caudex; stem 1 dm. high or less, cinereous-strigose; leaves narrowly linear, cinereous-strigose, 3–5 cm. long; heads solitary; involucre about 5 mm. high and 1 cm. broad; ligules 30–40, yellow, 3–4 mm. long. Sandy hillsides and stream banks: Wyo. *Plain.* Jl.

99. *E. ochroleucus* Nutt. Perennial, with a caespitose caudex; stem 1-2 dm. high, cinereous-strigose; leaves narrowly linear, 3-7 cm. long, strigose and hispid-ciliate below; heads usually solitary; involucre about 5 cm. high, 10-12 mm. broad; ligules 40-60, ochroleucous or white. Gravelly hills: Ore.—Ida.

100. *E. peucephyllus* A. Gray. Perennial, with a densely caespitose caudex; stems 1-2 dm. high, cinereous-strigose, erect; leaves filiform, cinereous, 2-5 cm. long; heads usually solitary; involucre 4-5 mm. high, 8-10 mm. broad; bracts linear, acute, hirsute; ligules 5-6 mm. long. *E. filifolius* Piper, not Nutt. Dry hills: B.C.—Calif.—Ida.—Sask. *Son.*—*Mont.* My-Jl.

101. *E. pulvinatus* Rydb. Pulvinate caespitose perennial, with a very thick woody root and short caudex; leaves basal, densely clustered, linear, 1-2 cm. long, about 1 mm. broad, silvery-strigose; peduncles naked or with a single diminutive leaf, about 3 cm. high, silvery-strigose; involucre hemispheric, about 1 cm. broad; bracts linear, in 3 series, slightly thickened on the back, silvery-strigose, acute; ligules white, 6-7 mm. long; achenes (not mature) flat, hirsute on the margins; pappus of rather few scabrous bristles. Arid places: Utah. Jl.

46. **LÉPTILON** Raf. HORSEWEED, CANADA FLEABANE.

Annual or biennial, caulescent herbs. Leaves alternate, narrow. Heads small, paniculate. Involucre campanulate; bracts in 2-3 series; receptacle naked. Ray-flowers few, pistillate, with short white or purplish ligules, not exceeding the disk. Disk-flowers several, perfect, with usually 4-lobed corollas. Anthers obtuse at the base. Stigmas flat, with short, obtuse appendages. Achenes flattened, often pubescent. Pappus of many capillary brittle bristles in one series.

1. *L. canadense* (L.) Britton. Annual; stem erect, 5-30 dm. high, hirsute or glabrate; lower leaves spatulate or oblanceolate, petioled, 2-10 cm. long, hirsute or at least ciliate on the margins, incised to entire; upper stem-leaves linear, entire, sessile; heads numerous in an elongate panicle; involucre 3-4 mm. high and broad; ligules numerous, white. *Erigeron canadensis* L. Waste places and dry soil: Lab.—Fla.—Calif.—B.C.; Mex., W. Ind., and adv. or nat. in Eu. *Plain*—*Submont.* Je-N.

47. **ESCHENBACHIA** Moench.

Annual or perennial caulescent herbs. Heads paniculate or corymbose. Involucre campanulate or subcylindric; bracts narrow in 1-3 series. Marginal flowers pistillate, more numerous than the hermaphrodite central ones; corolla with a slender filiform tube, without any ligule; their styles truncate or toothed at the apex. Achenes compressed. Pappus in a single series of soft capillary bristles. [*Conyza* Less., not L.]

1. *E. Coulteri* (A. Gray) Rydb. Annual; stem erect, 3-6 dm. high, hirsute-villous and viscid; lower leaves spatulate or oblanceolate, dentate or lacinate, 2-5 cm. long, hirsute and glandular-puberulent; upper leaves oblong or linear-lanceolate; heads numerous in an elongated panicle; involucre about 3 mm. high and broad; bracts linear-subulate, viscid-hirsute; flowers whitish; pistillate flowers numerous, with an entire corolla-tube; hermaphrodite flowers 5-7. River bottoms: Tex.—Colo.—Calif.; Mex. *Son.*

48. **BÁCCHARIS** L. GROUNDSEL TREE.

Perennial caulescent herbs or shrubs, usually with glabrous resinous foliage. Leaves alternate, often leathery, entire or toothed. Heads discoid, dioecious, corymbose or paniculate. Involucre campanulate; bracts imbricate in several series, those of the pistillate heads often more numerous; receptacle flat, pitted, naked. Corollas mostly yellow, those of the staminate plant tubular, those of the pistillate heads filiform. Anthers entire and obtuse at the base. Pappus of filiform bristles, those of the pistillate heads usually elongating in fruit, very fine, those of the staminate heads shorter, scabrous and often tortuose.

Pappus copious, in fruit elongating and surpassing the styles.

Pappus-bristles in several series; plant 3-6 dm. high, herbaceous, with a woody base.

1. *B. Wrightii*.

Pappus-bristles in one series; plants 1-5 mm. high, shrubby.

Fertile heads hemispherical, 5-10 mm. broad; bracts all acute.

2. *B. salicina*.

Fertile heads deeply campanulate, 3-5 mm. broad; outer bracts obtuse.

3. *B. Emoryi*.

Pappus scant, little if at all elongating, in fruit not exceeding the styles.

Achenes 10-nerved; leaves less than 2 cm. long, subentire.

4. *B. sergiloides*.

Achenes 5-nerved; leaves 5-15 cm. long, serrate.

5. *B. glutinosa*.

1. *B. Wrightii* A. Gray. Herbaceous, with a woody base; stems diffusely branched, 3-6 dm. high, glabrous and angled; lower leaves linear, 2-4 cm. long, glabrous, the upper smaller and linear-subulate; involucre of the staminate heads about 7 mm. high, 10-12 mm. broad; bracts in 3 series, lanceolate, acute, erose-ciliate on the margins; involucre of the pistillate heads 8-10 mm. high, 12-15 mm. broad; bracts in 5-6 series, with more evident scarious margins; achenes oblong, 8-10-ribbed, scabrous, puberulent and cross-rugose; pappus brownish, 10-12 mm. long. Saline soil: Kans.—Colo.—Ariz.—Mex. *Son.* Ap-Je.

2. *B. salicina* T. & G. Shrub 1-4 m. high; branches green and glabrous, angled; leaves oblong or oblong-lanceolate, denticulate or entire, 3-5 cm. long; heads in small clusters; involucre of the staminate heads hemispheric, 4-5 mm. high and slightly broader; bracts in 4-5 series, ovate, yellowish green, glabrous, erose-ciliate on the margins; involucre of the pistillate heads 6-8 mm. high and broad, the inner bracts lanceolate; achenes 10-ribbed, glabrous; pappus white and soft, 10-12 mm. long. Saline soil: Kans.—Utah—N.M.—Tex. *Son.* Je-Jl.

3. *B. Emoryi* A. Gray. A shrub 1-5 m. high; branches very glutinous, glabrous, slightly angled; leaves linear-oblong, entire, 2-5 cm. long, or the larger broader, somewhat 3-ribbed and somewhat lobed, glabrous; heads more or less glomeruled; involucre of the staminate heads campanulate, 5-6 mm. high, 4 mm. wide; bracts ovate, acute, thick, in 6-7 series; involucre of the pistillate heads 6-8 mm. high, 4-5 mm. broad; bracts in 7-8 series; achenes glabrous, 10-ribbed; pappus tawny, nearly 1 cm. long. Along rivers: Tex.—s Utah—Calif. *Son.*

4. *B. sergiloides* A. Gray. A shrub 1-2 m. high; branches glabrous, strongly angled, and broom-like; leaves few, oblanceolate, 5-15 mm. long, soon caducous or wanting; heads paniculate; involucre of the staminate heads 3-4 mm. high and as broad, those of the pistillate heads 4-5 mm. high; bracts ovate to lanceolate, acute, glabrous in about 5 series, thick; achenes glabrous, 10-nerved, 1.25 mm. long; pappus tawny, 3-4 mm. long. Arid regions: Ariz.—s Utah—s Calif. *L. Son.*

5. *B. glutinosa* (R. & P.) Pers. Plant herbaceous above, woody below; stem 1-3 m. high; branches striate, glabrous; leaves elongate-lanceolate, 5-15 cm. long, 3-nerved, serrate, or the upper entire; heads numerous, corymbosely cymose; involucre both in the staminate and the pistillate heads 4-5 mm. high and broad, hemispheric; bracts ovate, acute, in 4-5 series, glabrous, erose-ciliate; achenes glabrous, 5-nerved; pappus white, 4 mm. long. Along streams: Tex.—Colo.—Calif.; Mex. and S. Am. *Son.* Mr-N.

49. BERTHELÛTIA DC.

Very leafy silvery-canescant shrubs. Heads glomerate. Involucre campanulate; bracts imbricate, chartaceous, the innermost narrowly linear and falling off with the flowers. Receptacle flat, naked and glabrous. Marginal flowers pistillate, numerous, their corollas with a filiform truncate tube, without ligules; style-branches without appendages. Central flowers perfect, but sterile; their corollas tubular, regularly 5-lobed; styles with entire tips. Achenes 4-5-angled. Pappus of the marginal flowers of a series of capillary bristles; pappus-bristles of the central flowers shorter and with clavellate tips.

1. *B. sericea* (Nutt.) Rydb. A shrub 2-3 m. high, much branched; branches silky tomentose; leaves entire, linear-lanceolate, sessile, acute at each end, 1-3

cm. long, silvery-canescens; heads conglomerate; involucre about 5 mm. high, 5-7 mm. broad; outer bracts broadly ovate, obtuse, the innermost linear, acute. *Polypappus sericeus* Nutt. *Tessaria borealis* T. & G. *Pluchea borealis* A. Gray. Along streams: Tex.—s Utah—Calif.—Mex. *L. Son.* N—Je.

50. STYLOCLINE Nutt.

Floccose woolly annuals, branched from the base, with alternate leaves. Heads glomerate, discoid. Involucres ovoid; bracts more or less scarious and imbricate; receptacle chaffy, the paleae subtending the pistillate flowers more or less boat-shaped, with at least hyaline tips, loosely enclosing the achenes and falling with them, those subtending the staminate flowers scarious-hyaline, deciduous. Marginal flowers pistillate and fertile, numerous, with filiform corollas, without ligules. Central flowers hermaphrodite, but sterile, their corollas tubular, 4-5-toothed. Anthers sagittate at the base. Achenes slightly compressed. Pappus of the pistillate flowers wanting, that of the hermaphrodite flowers of very few capillary bristles.

1. *S. micropoides* A. Gray. Stem 2-10 cm. high, branched from the base, white-tomentose; leaves linear or lance-linear, acute, 5-8 mm. long; paleae of the receptacle with a narrow oblong-ovate hyaline tip, densely long-woolly. Arid plains: N.M.—s Utah—s Calif. *L. Son.* Ap—My.

51. ANCISTROCÁRPHUS A. Gray.

Floccose annuals, branched at the base, with alternate leaves. Heads discoid. Bracts of the involucre boat-shaped, enclosing each a marginal flower, firm, with a hyaline tip. Central flowers subtended by 5 open paleae, these being coriaceous-herbaceous, ovate-lanceolate, ending in incurved hooked spines, persistent, and in age spreading. Marginal flowers 5-9, pistillate and fertile, with filiform corollas. Central flowers few, hermaphrodite and sterile. Achenes obovate-fusiform. Pappus wanting in all flowers.

1. *A. filagineus* A. Gray. Stem erect or diffuse, 2-5 cm. high, appressed lanate; leaves linear to spatulate, 1 cm. long or less, lanate; heads capitate-glomerate; paleae with the hook in fruit 4 mm. long. *Styloclene filaginea* A. Gray. Dry hillsides: Calif.—Ida.—Ore. *Son.* Ap—My.

52. PSILOCÁRPHUS Nutt.

Small diffuse, branched floccose annuals. Leaves mostly opposite. Heads small, solitary in the forks or ends of the branches. Involucres globose; bracts few; receptacle globose, chaffy; paleae or bractlets subtending the pistillate flowers cucullate-saccate, semi-ovate or semi-cordate in outline, rounded at the top, herbaceo-membranous, and with hyaline, porrect or erect appendages; paleae of the hermaphrodite flowers wanting. Marginal flowers pistillate and fertile, with filiform corollas, numerous. Central hermaphrodite and sterile flowers few, with tubular, 5-toothed corollas; achenes cylindric. Pappus wanting in all flowers.

Involucres with long loose wool; upper leaves not narrowed at the base.

1. *P. elatior*.

Involucres with very short wool; leaves all narrowed at the base.

2. *P. oreganus*.

1. *P. elatior* A. Gray. Stem erect or ascending, 5-15 cm. high, with spreading branches, densely tomentose; leaves oblanceolate or linear-spatulate, 1-2 cm long, loosely white-tomentose, those subtending the heads elliptic; heads 6-8 mm. broad; involucre densely woolly-tomentose. Banks: Ore.—Ida.—B.C. *Submont.* Je—Jl.

2. *P. oreganus* Nutt. Stem diffusely branched, 2-6 cm. high; leaves linear-spatulate, about 1 cm. long, finely silky-tomentose; heads 4-6 mm. broad; involucre finely short woolly; bracts in fruit 2 mm. long or less. Banks: Ore.—Ida.—Wash. *Son.* Jl.

53. DIAPÈRIA Nutt.

Low caulescent annuals. Leaves alternate, floccose. Heads globose, glomerate, discoid. Involucres woolly; bracts few, more or less scarious, in several

series. Receptacle convex, chaffy. Paleae of the pistillate flowers barely concave, scarious, deciduous, those of the central flowers similar or with woolly tips. Marginal flowers pistillate, fertile, with filiform corollas, and 2 style-branches. Central flowers 2-5, hermaphrodite and usually sterile, with undivided styles. Achenes obcompressed, smooth or very minutely papillose. Pappus wanting. [*Evax* DC., in part.]

1. D. prolifera Nutt. Stem erect, simple or with ascending branches from the base, loosely tomentose; leaves spatulate, 1 cm. long or less, loosely tomentose; heads in terminal glomerules, subtended by a rosette of leaves, from which later develop 1-4 branches bearing similar terminal glomerules; involucre cylindrical or oblong; paleae subtending the fertile flowers chartaceous-scarious, naked; those subtending the staminate flowers herbaceous and woolly-tipped. *Evax prolifera* Nutt. *Filago prolifera* (Nutt.) Britton. Dry ground: S.D.—Ark.—Tex.—Ariz.—Colo. *Plain.* My-Jl.

54. ÓGLIFA Cass.

Low tomentose erect annuals. Leaves alternate. Heads glomerate, discoid. Involucres oblong or campanulate; bracts scarious, in several series. Receptacle convex or conic, chaffy; paleae or bractlets of the marginal flowers boat-shaped, rather few, enclosing the achenes and stellate-spreading at maturity. Marginal flowers pistillate, with filiform corollas, each subtended by a palea and without pappus. Middle flowers surrounded by a series of open paleae; a few of the central ones hermaphrodite, the others pistillate, all fertile and with a pappus of capillary bristles. Anthers sagittate at the base. Achenes terete or slightly compressed, those of the marginal flowers oblique.

1. O. californica (Nutt.) Rydb. Annual; stem erect, 1-2 dm. high, more or less branched, with erect-ascending branches; leaves linear or linear-oblong, 1-2 cm. long; marginal flowers 8-10, their paleae ovate, very woolly; inner paleae oblong, concave, nearly glabrous; achenes oblong, subterete, minutely papillose-granular. *Filago californica* Nutt. Open dry grounds: Ariz.—s Utah—Calif. *L. Son.* Mr-My.

55. ANTENNÀRIA Gaertn. CATS-PAWS, EVERLASTING.

Woolly perennial herbs, usually stoloniferous or soboliferous. Leaves alternate, the basal ones in the stoloniferous species forming rosettes. Heads discoid, usually corymbose, dioecious.* Involucres many-flowered; bracts imbricate, in several series, those of the staminate heads often broader; receptacle flat, not chaffy. Pistillate flowers fertile, their corollas filiform, truncate. Styles with 2 branches; pappus-bristles capillary, united at the base and falling off together. Staminate or rather hermaphrodite flower with tubular, 5-lobed corollas, rudimentary styles and ovaries, and usually with pappus-bristles somewhat clavate at the apex. Anthers caudate at the base. Achenes terete or nearly so.

Pappus-bristles of the staminate heads with clavate or scarious-dilated tips.

Plants surculose-proliferous with prostrate leafy stolons.

Plant caulescent.

Heads racemose or paniculate, long-peduncled; involucre almost glabrous.

I. RACEMOSAE.

Heads in cymose clusters or rarely solitary; involucre woolly at the base.

Bracts of the involucre with green or brown upper portion.

II. ALPINAE.

Bracts of the involucre with white or pink upper portion.

Heads 5-8 mm. high.

Bracts usually with bright pink upper portion.

III. ROSEAE.

Bracts with white upper portion.

Leaves of the stolons narrowly oblanceolate, 1.5-5 cm. long;

bracts with dark spots.

IV. NARDINAE.

Leaves of the stolons rhombic to spatulate, 0.5-3 cm. long; bracts

with dark spots only in no. 23.

V. ARIDAE.

Heads 8-12 mm. high.

* The staminate plants are usually much less common than the pistillate ones (except in no. 13) and unknown to the author in nos. 5, 8, 9, 18, and 20. The pistillate flowers often produce seeds, without being fertilized by pollen.

- Leaves tomentose on both sides.
 Leaves glabrous above.
 Plant acaulescent; heads sessile among the rosettes of the basal leaves.
- Plants not surculose-proliferous; stolons erect.
 Heads 4-5 mm. high; bracts nearly glabrous, scarious throughout; leaves silky-tomentose.
 Heads 6-10 mm. high; bracts tomentose at the base, only tips scarious; leaves villous-tomentose.
- Pappus-bristles of the small staminate heads not clavate; achenes puberulent; hairs bifurcate at the apex; plant low and densely cespitose.
- VI. APRICAE.
 VII. CAMPESTRES.
 VIII. ROSULATAE.
 IX. ARGENTAE.
 X. PULCHERRIMAE.
 XI. DIMORPHAE.

I. RACEMOSAE.

- Leaves of the rosettes oval or spatulate; lower pedicels 2-5 cm. long.
 Leaves of the rosettes oblanceolate; lower pedicels 1 cm. long or less.
1. *A. racemosa*.
 2. *A. oblancifolia*.

II. ALPINAE.

- Leaves glabrous above.
 Leaves of the rosettes narrowly oblanceolate; heads usually several; bracts of the pistillate heads abruptly acuminate.
 Leaves of the rosettes broadly oblanceolate or spatulate; inner bracts acute or acuminate, the outer obtuse.
 Heads usually solitary.
 Heads 3-6 in a cluster.
- Leaves tomentose on both sides; bracts acute or obtuse.
 Leaves of the rosettes broadly obovate-cuneate, sessile.
 Heads 7-8 mm. high; leaves 8-10 mm. long; tips of bracts dark brown.
 Heads 5-6 mm. high; leaves less than 8 mm. long; tips of the bracts light brown.
- Leaves of the rosettes spatulate or oblanceolate, distinctly petioled.
 Heads 6-8 mm. high.
 Heads 5-6 mm. high.
- Bracts very dark, almost black at the base, but often with white tips.
 Inner bracts of the pistillate heads acute.
 Leaves narrowly oblanceolate, acute or short-acuminate; tomentum very fine and appressed.
 Leaves spatulate or broadly oblanceolate, obtuse; tomentum rather loose.
- Bracts obtuse or rounded.
 Bracts moderately dark, umber-colored to light brown.
 Inner bracts not rose-colored.
 Leaves appressed-tomentose, shining and yellowish.
 Bracts of the pistillate heads linear-lanceolate, acute.
- Bracts of the heads oblong, obtuse.
 Heads sessile; stolons decumbent.
 Heads peduncled; stolons ascending.
- Leaves white-tomentose, very rarely yellowish.
 Heads 2 or 3; leaves broadly obovate-spatulate.
 Heads several; leaves spatulate or oblanceolate.
 Bracts of the pistillate heads obtuse.
 Involucres more or less viscid; bracts with whitish tips.
 Involucres not viscid; bracts umber-colored.
- Bracts of the pistillate heads acute.
 Inner bracts rose-colored.
3. *A. alpina*.
 4. *A. monocephala*.
 5. *A. chlorantha*.
 6. *A. pulvinata*.
 7. *A. albens*.
 8. *A. fusca*.
 9. *A. acuta*.
 10. *A. media*.
 11. *A. mucronata*.
 12. *A. Sansoni*.
 13. *A. flavescentis*.
 14. *A. confinis*.
 15. *A. aizoides*.
 16. *A. umbrinella*.
 17. *A. Macounii*.
 18. *A. concinna*.

III. ROSEAE.

- Leaves cuneate-spatulate, obtuse, without distinction between blade and petiole.
 Leaves oblanceolate or spatulate, with distinct petioles.
 Leaves narrowly oblanceolate, acute.
 Leaves broadly spatulate, obtuse.
18. *A. concinna*.
 19. *A. rosea*.
 20. *A. imbricata*.

IV. NARDINAE.

- One species.
21. *A. corymbosa*.

V. ARIDAE.

- Stem-leaves 6-8 mm. wide, oblong or the uppermost lanceolate.
 Stem-leaves 2-5 mm. wide, linear or oblanceolate.
 Bracts with a large brown or green spot, more or less viscid.
 Bracts slightly if at all spotted, not viscid.
 Bracts of the pistillate heads obtuse; plant 1-2 dm. high.
 Bracts of the pistillate heads with oblong to linear upper portions.
22. *A. foliacea*.
 23. *A. sedoides*.
 24. *A. arida*.
 25. *A. scariosa*.

Bracts of the pistillate heads acute, at least the inner ones.

Inflorescence and upper leaves glandular-hairy; leaves of the inflorescence large, scarcely smaller than the upper stem-leaves; bracts greenish.

Leaves of the stolons 5-15 mm. long, rhombic-spatulate; tomentum very fine, appressed and silky. 26. *A. microphylla*.

Leaves of the stolons spatulate, usually rounded at the apex, 15-30 mm. long, tomentum looser. 27. *A. bracteosa*.

Inflorescence and upper leaves not glandular, the latter reduced; bracts brownish. 28. *A. oxyphylla*.

VI. APRICAE.

Plant tall, 2-3 dm. high; heads usually peduncled.

Leaves less than 2 cm. long and 5-8 mm. wide, usually not triple-nerved; heads 7-9 mm. high. 28. *A. oxyphylla*.

Leaves over 2 cm. long, 7-10 mm. wide, triple-nerved; heads about 1 cm. high. 29. *A. obovata*.

Plant low, usually less than 1 dm. high; heads subsessile.

30. *A. aprica*.

VII. CAMPESTRES.

Plant about 3 dm. high; basal leaves distinctly triple-nerved.

31. *A. Howellii*.

Plant 1 dm. or less; basal leaves not distinctly triple-nerved.

Inflorescence not glandular; bracts of the pistillate heads lanceolate or linear-lanceolate, acute; those of the staminate heads oblong, obtuse. 32. *A. campestris*.

Inflorescence more or less glandular-hairy; bracts in both heads ovate to lanceolate, acute or acutish, in the staminate broader. 33. *A. marginala*.

VIII. ROSULATAE.

Bracts with white upper portion; leaves white on both sides.

34. *A. rosulata*.

Bracts with brown upper portion; leaves glabrate above.

35. *A. Sierrae-Blancae*.

IX. ARGENTAE.

Basal leaves oblanceolate.

36. *A. oblanceolata*.

Basal leaves very narrowly linear-oblanceolate.

37. *A. luzuloides*.

X. PULCHERRIMAE.

Bracts with a large dark spot, those of the pistillate heads ovate to lanceolate, acute, those of the staminate heads ovate or oval, obtuse or acutish; pistillate heads 6-10 mm. high, turbinate at the base.

Plants 1-2 dm. high; ribs of the leaves not conspicuous; outer bracts wholly fuscous.

Plants 3-5 dm. high; leaves with conspicuous ribs; tips of the bracts brownish or white. 38. *A. lanata*.

Bracts with small dark spots or none; bracts of both staminate and pistillate heads with oblong or oval, obtuse tips, those of the staminate heads slightly broader. 39. *A. pulcherrima*.

40. *A. anaphaloides*.

XI. DIMORPHAE.

Plant without filiform stolons.

Fruiting heads not over 1.5 cm. high; leaves oblanceolate; stem 1-3 cm. high.

41. *A. dimorpha*.

Fruiting heads about 2 cm. high; leaves spatulate, loosely tomentose; stem 3-5 cm. high.

42. *A. macrocephala*.

Plants with filiform ascending stolons.

43. *A. flagellaris*.

1. *A. racemosa* Hook. Stem of the pistillate plant 2-5 dm. high, glabrous or puberulent; leaves of the rosettes 3-ribbed, petioled, 3-7 cm. long, white-tomentose beneath, glabrate above; stem-leaves lanceolate or linear, sessile; heads many; involucre 6-8 mm. high and about as broad; bracts ovate to lanceolate, acute, light greenish yellow; stem of staminate plant 1-3 dm. high; involucre more hemispheric, 5 mm. high; bracts elliptic, obtuse, the inner slightly white-tipped. Woods and hillsides: Alta.—Wyo.—Calif.—B.C. *Submont.*—*Mont.* Je—Au.

2. *A. oblancifolia* E. Nels. Stem of the staminate plant 1-2 dm. high; basal leaves oblanceolate, 2-3 cm. long, sparingly tomentose or glabrate above, appressed, white-tomentose beneath; stem-leaves narrowly oblanceolate or linear, acute or acuminate; heads 4-13; involucre 4-5 mm. high, sparsely woolly; bracts oval, obtuse, or rounded, light brownish green below, often with a purplish spot and white tips. Wooded slopes: w Wyo. *Mont.* Jl.

3. *A. alpina* (L.) Gaertn. Stem 5-15 cm. high, floccose; leaves of the stolons silky-tomentose, 8-20 mm. long, 2-4 mm. wide; heads usually 3-5, conglomerate; involucre about 5 mm. high and 8 mm. broad; bracts of the very rare staminate head pale, elliptic, obtuse, those of the pistillate heads dark greenish brown, lanceolate, long-acuminate. Arctic-alpine situations: Greenl.—Lab.—Alta.—B.C.; n Eur. *Alp.* Jl—Au.

4. **A. monocephala** DC. Stem 5–10 cm. high; leaves of the rosettes cuspidate-mucronate, 8–15 mm. long, silky-tomentose beneath; stem-leaves linear, 5–10 mm. long; involucre about 5 mm. high and 8 mm. broad; bracts of the (rare) staminate heads broadly ovate, obtuse or acutish, those of the pistillate heads lanceolate, the outer obtuse, the inner acute or acuminate. Arctic-alpine situations: Alaska—B.C.—Alta. *Alp.* JI.

5. **A. chlorantha** Greene. Stem 7–15 cm. high; basal leaves and those of the rosettes mucronate or acutish, loosely floccose, densely and permanently so beneath, 1.5–2.5 cm. long; stem-leaves oblong-linear; heads 3–6, somewhat conglomerate; involucre about 7 mm. high; bracts of the pistillate heads with dark olive-green tips, the outer obtuse, the inner acute or acuminate. Mountains: B.C. *Mont.* JI—Au.

6. **A. pulvinata** Greene. Stem 5–10 cm. high, densely white-tomentose; leaves of the rosettes densely white-tomentose on both sides, with loose villous tomentum; stem-leaves oblanceolate or oblong, acute; heads 5–8, in a dense cluster; bracts of the staminate heads brown, oblong and obtuse, those of the pistillate heads similar, but the inner more lanceolate and acute. Mountains: Alta.—Mont.—B.C. *Mont.*—*Alp.* Je—Au.

7. **A. albescens** (E. Nels.) Rydb. Stem 1 dm. or less high, tomentose; leaves of the stolons 4–8 mm. long, densely and closely white-tomentose, obovate; stem-leaves oblanceolate; heads 3–5 in a dense subcapitate cluster; bracts elliptic, obtuse, light brown or yellowish. *A. pulvinata albescens* E. Nels. Mountains: Alta.—Mont.—Ida. *Submont.*—*Subalp.* Je—JI.

8. **A. fusca** E. Nels. Stem 1–1.5 dm. high, tomentose; leaves of the rosettes 15–22 mm. long, white-tomentose, with a close silky pubescence; stem-leaves linear or linear-oblanceolate; heads 3–13, pedicellate, corymbose; bracts of the pistillate heads elliptic or oblong, obtuse, greenish brown. Open woods: Wyo.—Ida. *Mont.* Au.

9. **A. acuta** Rydb. Stem slender, 5–12 cm. high; leaves of the rosettes 15–25 mm. long, 2–4 mm. wide; stem-leaves narrowly linear or linear-oblanceolate; heads 3–5, conglomerate, sessile; bracts of the pistillate heads lanceolate to linear-lanceolate, dark greenish brown with slightly lighter tips, the inner acute. Mountains: Alta. *Subalp.*—*Alp.* JI—Au.

10. **A. media** Greene. Stem 5–10 cm. high, loosely tomentose; leaves of the rosettes 1–2 cm. long; heads 4–7, densely conglomerate; bracts of the staminate head elliptic and obtuse, very dark green, or the innermost sometimes with whitish tips; outer bracts of the pistillate head oblong, obtuse, the inner lanceolate, acute. *A. austromontana* E. Nels. Higher peaks: Alta.—Colo.—Calif.—B.C. *Alp.*—*Subalp.* JI—Au.

11. **A. mucronata** E. Nels. Stem 5–12 cm. high, tomentose; leaves of the rosettes oblanceolate or narrowly spatulate, 1–2 cm. long; stem-leaves oblong-linear, acute; heads 4–8, conglomerate; bracts in both the pistillate and the staminate heads oblong or elliptic, obtuse, dark brownish green, the inner bracts, especially in the staminate heads, often with whitish tips. Mountains and rocky slopes: Alta.—Wyo.—B.C. *Alp.*—*Subalp.*

12. **A. Sansoni** Greene. Stem 1–2.5 dm. high, slender; leaves of the rosettes linear-spatulate or oblanceolate, 1–2 cm. long; stem-leaves linear, acute or acuminate, erect; heads 8–10, cymose and peduncled; involucre 6–7 mm. high and nearly as wide; bracts of the pistillate heads oblong or lanceolate, the inner acute, brownish below, dirty white, yellowish or pinkish towards the apex, those of the staminate heads oblong, obtuse. Hills and mountains: Alta.—Mont.—B.C. *Submont.* Je—JI.

13. **A. flavescens** Rydb. Stem about 1 dm. high; leaves of the stolons broadly spatulate, about 1 cm. long, acute, densely tomentose on both sides; stem-leaves oblong or linear; heads 4–8, in a dense subcapitate cluster; involucre 4–5 mm. high, 5 mm. broad; bracts isabel-colored or yellowish, in the staminate heads broadly elliptic, in the pistillate heads oblong, in both obtuse. *A. reflexa* E. Nels., in part. Dry hills: Mont.—Colo.—Wash. *Submont.*—*Mont.* My—JI.

14. *A. confinis* Greene. Cespitose, somewhat suffrutescent perennial; stem 1-2 dm. high, tomentose; leaves of the rosettes oblong-spatulate, about 1 cm. long, tomentose on both sides; tomentum loose; heads usually peduncled, numerous, in a corymbiform inflorescence; involucre about 5 mm. high; bracts of the pistillate ones oval to oblong, obtuse, brownish or yellowish, those of the staminate heads somewhat broader. Mountains: Ida.—Ariz.—Calif.—Ore. Mont. Je-Jl.

15. *A. aizoides* Greene. Stolons ascending; stem 3-8 cm. high; leaves of the stolons thick, 10-15 mm. long, with a very fine silvery-white shining tomentum; stem-leaves linear or linear-oblong; heads 2 or 3, sessile; involucre 4-5 mm. high, densely tomentose at the base; bracts of the staminate heads ovate to obovate, dark brown, rounded at the apex. Barren hills and mountains: Sask.—B.C. Plain. Je-Au.

16. *A. umbrinella* Rydb. Stem about 1 dm. high; leaves of the rosettes spatulate, 1-1.5 cm. long, densely white-tomentose; stem-leaves linear-oblong; heads 3-8, conglomerate; involucre about 5 mm. high; bracts of the staminate heads elliptic, obtuse, isabel-colored (dirty yellowish), those of the pistillate heads similar, but darker, usually light umber-colored, and the inner narrower. Higher mountains: Mont.—Colo.—B.C. Mont.—Alp.

17. *A. Macounii* Greene. Stem 5-15 dm. high; leaves of the stolons obovate or spatulate, 1-1.5 cm. long, sometimes yellowish; heads 3-8 in a close glomerate cluster; bracts of the staminate heads brown, elliptic or oval, very obtuse, more or less spreading; outer bracts of the pistillate heads oblong, obtuse, the inner ones linear-lanceolate, acute. *A. reflexa* E. Nels., mainly. Mountains: Alta.—Wyo.—B.C. My-Au.

18. *A. concinna* E. Nels. Stem slender, 10-15 cm. high; leaves of the rosettes spatulate or obovate, scarcely petioled, abruptly acute, about 1 cm. long, 2-4 mm. broad, white-tomentose with rather loose tomentum; stem-leaves linear-oblong or linear; heads 6-15, conglomerate or in more open clusters; bracts of the pistillate heads elliptic, obtuse, the outer brownish, the inner pinkish. Hills: Wash.—Ore.—Colo.—Wyo. Submont.—Mont. Je-Jl.

19. *A. rosea* (D. C. Eat.) Greene. Stem 2-4 dm. high, slender, tomentose; leaves of the rosettes acute, 15-20 mm. long, white-tomentose, with close tomentum; heads usually many; involucre about 5 mm. high and broad; bracts of the rare staminate head broadly elliptic, pale pink, those of the pistillate heads elliptic to linear-oblong, obtuse, rose or rarely dull white. *A. dioica rosea* D. C. Eat. *A. parvifolia* [? Nutt., in part] Rydb. *A. sordida* Greene. Meadows: Alta.—S.D.—Colo.—Calif.—Yukon. Plain—Subalp. Je-Au.

20. *A. imbricata* E. Nels. Stem 1-3 dm. high; leaves of the rosettes mucronate, petioled, about 2 cm. long, grayish-tomentose, with appressed tomentum; stem-leaves ample, oblong or oblanceolate; heads in a close cluster; involucre hemispheric, about 7 mm. high and broad; bracts of the pistillate heads pinkish, elliptic, obtuse or the inner rarely acutish. *A. rosea imbricata* E. Nels. Hills: Alta.—Colo. Je-Jl.

21. *A. corymbosa* E. Nels. Stem 2-3 dm. high; leaves of the rosettes thin, sparsely tomentose, with appressed tomentum, 3-3.5 cm. long; stem-leaves linear, acuminate; heads peduncled, corymbose; involucre 4-5 mm. high; bracts of the pistillate heads elliptic and obtuse or the innermost lanceolate and acute, those of the staminate plant broadly oval and rounded at the apex. *A. nardina* Greene. Meadows: Mont.—Colo.—Ida.—Ore. Submont.—Subalp.

22. *A. foliacea* Greene. Stem 3-4 dm. high; leaves of the rosettes cuneate-obovate or broadly spatulate, 1-2 cm. long, white-tomentose on both sides, with rather loose tomentum; stem-leaves ample, 2-3 cm. long; heads many, pedicelled, corymbose; involucre about 6 mm. high; bracts of the pistillate heads dirty white, the outer oblong or elliptic, obtuse, the inner linear-lanceolate, acute; staminate plant unknown. Mountains: Mont. Submont. Au.

23. *A. sedoides* Greene. Stem about 1 dm. high; leaves of the rosettes spatulate, less than 1 cm. long, densely and finely white-tomentose on both sides;

heads 4-6, conglomerate, sessile; involucre 5-6 mm. high; lower portion of the pistillate bracts brownish or greenish; tips dirty white, oblong, obtuse or acutish. *A. arida viscidula* E. Nels. *A. viscidula* Rydb. High mountains: B.C.—Colo.—Man. *Mont.—Alp.* Jl.

24. *A. arida* E. Nels. Stem 1-2 dm. high, slender; leaves of the rosettes spatulate, acutish, 8-12 cm. long, densely and finely appressed-tomentose on both sides, often conduplicate; stem-leaves often twisted or curved; heads 6-10, sessile, conglomerate; involucre 5-6 mm. high; bracts of the pistillate heads oblong, obtuse, milky-white, those of the staminate heads rounded oval. Dry plains and hills: *Mont.—N.M.—Utah—Ida.* *Submont.—Mont.* Je—Jl.

25. *A. scariosa* E. Nels. Stem 1 dm. high or less; basal leaves spatulate, obtuse or acutish, 1-1.5 cm. long, white-floccose on both sides; stem-leaves oblong or linear-oblong; heads several, somewhat congested; involucre 7-8 mm. high; bracts of pistillate and staminate heads with obovate or oval, obtuse, white tips. Hills: Wyo. *Submont.* Je.

26. *A. microphylla* Rydb. Stem slender, strict, 2-3 dm. high; stem-leaves linear-oblong, small; heads 5-30, conglomerate, 5-6 mm. high and broad; bracts of the pistillate heads linear-oblong to lanceolate, greenish straw-colored, the inner acute, those of the staminate heads oval or elliptic, rounded at the apex. *A. parvifolia* Greene, not Nutt. *A. formosa* Greene, a large form. *A. solstitialis* Lunell., is the staminate plant, which is smaller. Dry hills and plains: Sask.—Neb.—N.M.—B.C.—Yukon. *Plain—Subalp.* Je—Jl.

27. *A. bracteosa* Rydb. Stem 3-4 dm. high, strict; leaves of the rosettes spatulate, petioled, about 2 cm. long, acutish or mucronate, white-tomentose, with a fine, silky tomentum; stem-leaves about 3 cm. long, oblong or narrowly oblanceolate; heads corymbose; involucre 7-8 mm. high, 5-6 mm. broad; bracts of the pistillate heads oblong or lanceolate, acute, or the inner acuminate, those of the staminate heads oval and obtuse or rounded at the apex. *A. parvifolia bracteosa* A. Nels. Mountain meadows: *Mont.—Colo.* *Submont.—Subalp.* Je—Jl.

28. *A. oxyphylla* Greene. Stem 2-4 dm. high; leaves of the rosettes spatulate-obovate or broadly oblanceolate, densely white-tomentose beneath, less so above; heads many in a rounded corymb; involucre 6-7 mm. high; bracts of the pistillate heads with dull white tips, the outermost ovate, obtusish, the rest lanceolate to linear-lanceolate, acute; staminate plant unknown. Hills and mountains: *Mont.—Ida.—Wyo.—Neb.—S.D.* *Plain—Submont.* My—Jl.

29. *A. obovata* E. Nels. Stem 2-3 dm. high; leaves of the rosettes about 3 cm. long, obovate-cuneate, permanently tomentose on both sides; stem-leaves small, oblong-linear; heads 3-7, corymbose; involucre about 8 mm. high; bracts of the pistillate heads oblong to linear-lanceolate, with a purplish brown spot, acute or acuminate, or the outermost obtusish. Hills and mountains: *Man.—S.D.—Colo.—Alta.* *Plain—Submont.* Je—Jl.

30. *A. aprica* Greene. Stem low, less than 1.5 dm. high; leaves of the rosettes spatulate or cuneate-oblanceolate, 1-2 cm. long, densely tomentose on both sides; stem-leaves linear, 1 cm. long, acute; heads 3-6, sessile or nearly so, conglomerate; involucre of the pistillate head 7-9 mm. high; bracts numerous, usually with a brown spot and white or pinkish tips, oblong, obtuse, or acutish; involucre of the staminate heads 6-7 mm. high; bracts oval or elliptic-obtuse. (?) *A. parvifolia* Nutt. *A. Holmii*, *A. obtusa*, *A. modesta*, and *A. pumila* Greene. Plains, hills, and mountains: *Man.—Neb.—N.M.—Utah—B.C.* *Plain—Subalp.* My—Jl.

31. *A. Howellii* Greene. Stem 2-4 dm. high; leaves of the rosettes cuneate-obovate, acute or acutish, 3-5 cm. long, glabrous above, closely silky-tomentose beneath, petioled; stem-leaves small and linear; heads several, corymbose; involucre of the pistillate heads 8-10 mm. high and nearly as broad; outer bracts oblong, the inner linear-lanceolate, very acute, all more or less brownish below. Hillsides and open woods: *Alta.—Mont.—Ida.—Wash.—B.C.* *Submont.—Mont.* My—Jl.

32. *A. campestris* Rydb. Stem low, about 1 dm. high or less; leaves of the rosettes obovate-cuneate, 2-4 cm. long and about 1 cm. wide, glabrate above, tomentose beneath; stem-leaves small, linear, acute; heads 3-6, sessile, conglomerate; involucre of the pistillate heads 8-9 mm. high, outer bracts oblong, obtuse, the inner linear-lanceolate, acute or acuminate; staminate involucre 6-7 mm. high; bracts elliptic or obovate, rounded. *A. Lunellii* and *A. alhabascensis* Greene. Prairies: Man.—Mich.—Mo.—Kans.—Sask.—(? B.C.). Plain. My-Je.

33. *A. marginata* Greene. Stem 1-2 dm. high; leaves spatulate or oblanceolate, obtuse or mucronate, 1-2.5 cm. long, glabrate above, densely but loosely white-tomentose beneath; heads 4-8, conglomerate, but short-pedicelled; involucre of the pistillate plant 8-10 mm. high; outer bracts oblong, obtuse, the inner linear-lanceolate, acute; involucre of staminate heads 6-7 mm. high; bracts obovate or rhombic-obovate, obtuse, acutish or abruptly short-acuminate. Hills and mountain sides: N.M.—s Colo.—Utah—Ariz. Submont.—Mont. Je-Jl.

34. *A. rosulata* Rydb. Plant almost acaulescent; stem 1 cm. long or less; leaves of the rosettes 5-10 mm. long, spatulate or spatulate-obovate, densely and closely silvery-tomentose; heads 1-3 together, sessile; involucre bracts of the pistillate heads lanceolate, acute, milky white, those of the staminate ones oval or obovate, rounded. *A. Bakeri* Greene. Mountains: Colo.—Utah—Ariz. Submont.—Mont. My-Jl.

35. *A. Sierra-Blancae* Rydb. Rosulate, almost stemless; leaves broadly spatulate, less than 1 cm. long, abruptly acute; heads subsessile in the rosettes, 6-7 mm. in diameter; bracts broadly oblong to almost obovate, with a scarious brown upper portion. High mountains: s Colo. Alp.

36. *A. oblancoolata* Rydb. Stem 2-4 dm. high, slender; basal leaves 3-6 cm. long, evidently 3-ribbed, densely white-tomentose; upper stem-leaves linear; heads corymbose; involucre 4-5 mm. high; bracts brownish, with white or straw-colored tips, those of the pistillate heads oblong to linear, the outer obtuse, the inner acute, those of the staminate heads oval and rounded. Mountain sides: Mont.—Colo.—Calif.—B.C. Submont.—Mont. Je-Au.

37. *A. luzuloides* T. & G. Stem 2-4 dm. high; leaves 5-7 cm. long, 1-4 mm. wide, densely silky white-tomentose; heads numerous, corymbose; involucre 4-5 mm. high, nearly glabrous throughout; bracts of the pistillate heads brownish and shining, the outer ovate, the inner linear-oblong, mostly obtuse; those of the staminate heads broader, rounded and white-tipped. Valleys and hillsides: Mont.—Wyo.—Ore.—B.C. My-Jl.

38. *A. lanata* (Hook.) Greene. Basal leaves narrowly oblanceolate, 4-8 cm. long, loosely white-tomentose; stem-leaves linear; heads several, conglomerate; involucre densely tomentose below, those of the pistillate heads 6-8 mm. high, those of the staminate 5-6 mm. high; bracts of the former in 5 or 6 series, dark brown or almost black with light brown tips. High mountains: Alta.—Mont.—Ore.—B.C. Mont.—Alp. Je-Au.

39. *A. pulcherrima* (Hook.) Greene. Stem 3-5 dm. high; basal leaves oblanceolate, 8-12 cm. long; stem-leaves narrower; heads several, corymbose; involucre of the pistillate heads nearly 1 cm. high, more or less turbinate; bracts in 6 or 7 series, the outer broadly ovate, obtusish, the inner narrowly lanceolate, acuminate, all with dark brown bases and light brown or dirty white tips; staminate involucre 5-6 mm. high; bracts with rounded obovate tips. *A. carpathica pulcherrima* Hook. Hillsides and mountains: Sask.—Colo.—Wash.—Yukon. Submont.—Subalp.

40. *A. anaphaloides* Rydb. Stem 3-4 dm. high, stout; basal leaves narrowly oblanceolate, 10-15 cm. long, acute; heads many in an open corymb; involucre of the staminate and pistillate heads much alike, 6-8 mm. high; bracts in 3-4 series, with white tips, in the pistillate heads obtuse or acutish, in the staminate heads rounded or truncate at the apex. *A. pulcherrima* Coult. & Nels., not Greene. Hillsides: Mont.—Colo.—Ore.—B.C. Submont.—Subalp. My-Au.

41. *A. dimorpha* (Nutt.) T. & G. Pulvinate-cespitose perennial; stem 1-3 dm. high; leaves 1-2 cm. long; heads solitary; involucre of pistillate heads 1-1.5 cm. high, turbinate, tomentose at the base only; outer bracts ovate, acute, the inner narrowly linear-lanceolate, attenuate; involucre of the staminate heads more hemispheric, 6-7 mm. high; bracts oblong, obtuse, darker brown. Dry plains: Mont.—Neb.—Colo.—Calif.—B.C. *Plain—Submont.* Ap-Jl.

42. *A. macrocephala* (D. C. Eat.) Rydb. Pulvinate-cespitose perennial; stem 2-5 cm. high; leaves 1.5-3 cm. long; involucre of the pistillate heads turbinate, 18-20 mm. high; outer bracts ovate, the inner narrowly linear-lanceolate, scarious-margined, brownish on the back; involucre of the staminate heads about 8 mm. high; bracts elliptic to ovate, often acutish. *A. dimorpha macrocephala* D. C. Eat. Bench-lands: Utah. *Son.—Submont.* Ap-My.

43. *A. flagellaris* (T. & G.) A. Gray. Pulvinate perennial with a small caudex, producing filiform ascending stolons, 5-10 cm. long, which bear at their apex a rosette of small leaves; basal leaves narrowly linear, grayish-tomentose; stem 1-2 cm. long, few-leaved; heads solitary; involucre of the staminate heads 6-7 mm. high, tomentose at the base; bracts dark brown, oblong-obtuse; involucre of the pistillate heads 8-10 mm. long; bracts lanceolate to linear-lanceolate, acute. Mountains: n Wyo.—Wash.—Ore. *Submont.—Subalp.* Je-Jl.

56. *ANÁPHALIS* DC. PEARLY EVERLASTING.

Tomentose, perennial, caulescent herbs with rootstocks. Leaves alternate, narrow, sessile. Heads discoid, polygamo-dioecious. Involucre hemispheric; bracts imbricate in several series, pearly-white; receptacle convex, not chaffy. Pistillate heads usually with a few hermaphrodite flowers in the center. Pistillate corollas filiform, their pistils with distinct style-branches. Hermaphrodite flowers with tubular, 5-toothed corollas, and undivided styles, sterile. Pappus-bristles capillary, falling off separately. [*Nacrea* A. Nels., based on a staminate plant.]

Leaves narrowly linear, 1-nerved; heads about 5 mm. high.

1. *A. angustifolia*.

Leaves linear-lanceolate to oblong-lanceolate, 3-nerved; heads 6-7 mm. high.

2. *A. subalpina*.

Leaves comparatively thin, less tomentose above.

3. *A. lanata*.

Leaves comparatively thick, almost equally white-tomentose on both sides.

3. *A. lanata*.

1. *A. angustifolia* Rydb. Stem slender, strict, 3-6 dm. high; leaves 5-10 cm. long, 2-5 mm. wide, densely white-tomentose beneath, less so above, glabrate in age; inflorescence small, corymbose; bracts elliptic, obtuse or acutish. Wooded slopes: Mont.—B.C. *Submont.* Jl-Au.

2. *A. subalpina* (A. Gray) Rydb. Stem 3-4 dm. high; leaves 3-8 cm. long, 5-15 mm. wide, densely white-tomentose beneath; inflorescence corymbiform; bracts pearly-white, broadly ovate, mostly acute. *A. margaritacea subalpina* A. Gray. Open mountain woods: Alta.—S.D.—Colo.—Utah—B.C. *Submont.—Subalp.* Je-Au.

3. *A. lanata* (A. Nels.) Rydb. Stem strict, 2-4 dm. high; leaves densely lanate on both sides, ascending, sessile and clasping, oblong-lanceolate, 4-6 cm. long, 10-15 mm. wide, mucronate; inflorescence corymbiform, high; bracts pearly white, ovate or obovate, obtuse or acutish. *Nacrea lanata* A. Nels. Mountains: Wyo. *Mont.* Jl-S.

57. *GNAPHÁLIIUM* L. CUDWEED, EVERLASTING.

Annual, biennial, or perennial caulescent herbs, with woolly or sometimes glandular foliage. Leaves alternate, entire, narrow. Heads discoid, glomerate or paniculate in our species. Involucre campanulate or hemispheric; bracts scarious, imbricate in several series; receptacle not chaffy, usually pitted. Marginal flowers pistillate, fertile, in several series, with filiform corollas. Central flowers hermaphrodite, few, with tubular corollas. Pistils in all the flowers with 2 distinct stigmas. Anther sagittate at the base. Achenes terete or slightly flattened. Pappus of capillary bristles, distinct or united at the base, deciduous.

Bristles of the pappus not united at the base, falling off separately.

Heads not leafy-bracted; involucre bracts well imbricate, scarious, white or tinged with brownish, rose, or yellow; plants mostly tall.

Leaves tomentose on both sides; plants little if at all glandular; involucre tomentose at the base.

Stem-leaves narrowed at the base, neither decurrent nor clasping.

Perennial or biennial; stem 3-5 dm. high; inflorescence open; bracts white.

1. *G. Wrightii*.

Annual; stem 1-2 dm. high; inflorescence dense; bracts yellowish.

2. *G. thermale*.

Stem-leaves not narrowed at the base, more or less decurrent, or at least auricled-clasping.

Leaves with short broad adnate auricles at the base; bracts obtuse.

Heads 5-6 mm. high, numerous, in glomerules ending the short spreading branches; bracts slightly if at all yellowish; plant tall; stem-leaves lanceolate or oblong, with rounded bases, cuspidate.

3. *G. proximum*.

Heads 4 mm. high, few, in small glomerules, ending the stem or few erect branches; bracts decidedly yellowish when young; plant low; leaves oblong to linear, merely acute or obtuse.

Stem erect, strict; lower stem-leaves oblong-oblancheolate.

4. *G. sulphurescens*.

Stem decumbent at the base; lower stem-leaves spatulate.

5. *G. lagopodioides*.

Leaves distinctly decurrent; bracts acutish; heads 4-5 mm. high.

Bracts broadly ovate; inflorescence corymbiform.

6. *G. Williamsii*.

Bracts lance-ovate; inflorescence narrow.

7. *G. microcephalum*.

Leaves on the upper surface green and decidedly glandular, decurrent; involucre glabrous.

8. *G. Macounii*.

Heads leafy-bracted; involucre bracts little imbricate, brown or greenish; plant low; involucre floccose at the base.

Plants loosely floccose; leaves broad, spatulate, oblong or oblanceolate.

9. *G. palustre*.

Plants appressed-tomentose; leaves except the lowest narrowly oblanceolate or linear.

Stem diffusely branched; glomerules crowded, cymosely disposed.

Upper leaves narrowly oblanceolate.

10. *G. uliginosum*.

Upper leaves narrowly linear.

11. *G. exilifolium*.

Stem mostly simple, erect; glomerules spicately disposed.

12. *G. Grayi*.

Bristles of the pappus united in a ring at the base and falling off together; leaves oblanceolate or spatulate.

13. *G. ustulatum*.

1. ***G. Wrightii*** A. Gray. Biennial or perennial, with a taproot; stem upright, much branched above, white-floccose throughout; leaves oblanceolate or spatulate, 2-4 cm. long, the uppermost linear; heads numerous in a rather open panicle; involucre 5-6 mm. high; bracts white, oblong, abruptly pointed, pearly white. *G. albatum* Osterh. Dry grounds: Colo.—N.M.—Calif. *Submont.* Au—O.

2. ***G. thermale*** E. Nels. Annual; stem low, branched from the base, grayish-tomentose; basal leaves oblanceolate, about 3.5 cm. long; stem-leaves narrowly oblanceolate to linear, 1-3 cm. long; heads sessile in small glomerules, terminating the branches; involucre 4-5 mm. high; bracts dull white or yellowish, the outer ovate, the innermost linear, abruptly apiculate. *G. Wrightii* Coult. & Nels., not A. Gray. Hot-spring formations: n Wyo. *Mont.* Jl.

3. ***G. proximum*** Greene. Biennial or annual, with a taproot, branched at the base; stem 3-6 dm. high, very leafy; basal leaves spatulate or oblanceolate, 3-4 mm. long; inflorescence closely paniculate, leafy-bracted; involucre villous, 5-6 mm. high; bracts straw-colored or ochroleucous, obtuse. Perhaps scarcely distinct from *G. Chilense* Spreng. Wet places: Wyo.—Utah—Nev.—Wash. *Submont.*—*Mont.* Jl—Au.

4. ***G. sulphurescens*** Rydb. Annual or biennial; stem usually simple, 2-4 dm. high, often yellowish above; basal leaves spatulate, 2-3 cm. long, white-woolly; stem-leaves linear or the lower oblong-spatulate, mostly erect; heads sessile in small glomerate cymes; involucre 4-5 mm. high; bracts elliptic or oval, very obtuse, yellow, glossy. *G. luteo-album* Hook., not L. Wet sandy soil: *Mont.*—*Tex.*—*N.M.*—*Wash.* Jl—N.

5. ***G. lagopodioides*** Rydb. Biennial, usually branched at the base; stem about 1 dm. high, densely woolly-tomentose; basal leaves spatulate, 1-1.5 cm. long, loosely woolly; stem-leaves oblong-spatulate or the lower obovate-spatulate; heads in small conglomerate cymes; involucre about 4 mm. high; bracts oblong

or elliptic, sulphur-yellow, glossy. Perhaps scarcely distinct from the preceding. Geyser formations: n Wyo. *Mont.* Au-S.

6. *G. Williamsii* Rydb. Probably biennial; stem 3-6 dm. high, branched above, loosely floccose; leaves linear or linear-lanceolate, decurrent, 5-10 cm. long; inflorescence large, corymbosely paniculate; involucre 6 mm. high, only slightly tomentose at the base; bracts broadly ovate, acute, light straw-colored or white. Woods: *Mont.* *Mont.* Au.

7. *G. microcephalum* Nutt. Perennial, with a taproot; stem slender, 3-5 dm. high, simple below; leaves linear or the lower oblanceolate, densely floccose; inflorescence a narrow panicle; involucre campanulate, 4-5 mm. high; bracts straw-colored to pearly-white, lance-ovate, acute. Along streams: Calif.—Ida.—B.C.

8. *G. Macounii* Greene. Biennial, with a taproot; stem 5-8 dm. high, corymbosely branched above, glandular-pubescent, loosely tomentose above; leaves numerous, lanceolate to linear, white-tomentose beneath, 5-10 cm. long; heads numerous; involucre hemispheric, glabrous, about 5 mm. high; bracts ovate or the inner lanceolate, all acute, white or straw-colored, turning rusty. *G. decurrens* Ives, not L. *G. Ivesii* Nels. & Macbr. Open ground: N.S.—Pa.—N.M.—Ariz.—B.C. *Plain—Submont.* Jl-S.

9. *G. palustre* Nutt. A low spreading annual; stem at first erect, later diffusely branched, with spreading branches, 5-20 cm. high; leaves 1-2 cm. long; involucre 3-4 mm. high; bracts oblong to linear, brown, or the inner with white tips. Wet places: Alta.—Neb.—N.M.—Calif.—B.C. *Plain—Submont.* My-Au.

10. *G. uliginosum* L. Annual; stem at first simple, erect, later diffusely branched, with ascending or spreading branches, 5-20 cm. long; leaves 2-4 cm. long, 3-4 mm. wide; bracts oblong to linear, mostly acute, brown. Wet places: Newf.—Va.—Colo.—Utah—Ore.—B.C.; n Eu. *Plain—Mont.* Jl-Au.

11. *G. exilifolium* A. Nels. Low annual; stem branching at the base; branches decumbent or adsurgent, 8-12 cm. long, sparingly floccose; leaves 2-4 cm. long; involucre about 3 mm. high; bracts lanceolate, acute, brown below, white-tipped. *G. angustifolium* A. Nels., not Lam. Wet places: Colo.—Wyo. *Submont.—Mont.* Jl-S.

12. *G. Grayi* Nels. & Macbr. Strict and simple annual; stem 1-3 dm. high, appressed-tomentose; leaves all linear, appressed-tomentose, 1-4 cm. long; involucre about 3 mm. long; bracts oblong to linear, wholly brown, or the innermost with lighter tips, obtuse. *G. strictum* A. Gray, not Moench. Wet places: Wyo.—N.M.—Ariz. *Submont.—Mont.* Au-S.

13. *G. ustulatum* Nutt. Perennial, with a short rootstock; stem 1-3 dm. high, loosely floccose; leaves 2-8 cm. long, rather loosely floccose on both sides, white beneath, greener above; glomerules of the heads arranged in a narrow dense spike-like panicle; involucre about 5 mm. long; bracts ovate, abruptly short-cuspidate, brown, shining. Closely related to *G. purpureum* of the Atlantic States. In saline soil: B.C.—Mont.—Calif. Ap-Jl.

58. *ADENOCAULON* Hook.

Perennial herbs, with rootstocks. Leaves alternate, with winged petioles and dilated blades. Inflorescence paniculate, the peduncles beset with stalked glands. Heads many-flowered, discoid. Involucre turbinate of few thin herbaceous bracts. Marginal flowers pistillate, 4-lobed or somewhat 2-lipped. Central flowers hermaphrodite, sterile, broadly funnelform, deeply 4-5-cleft, all white. Anther sagittate and the auricles minutely caudate. Achenes obovoid or clavate, very obtuse, with stipitate glands above. Pappus none.

1. *A. bicolor* Hook. Stem erect, 3-10 dm. high, more or less floccose; leaf-blades deltoid-cordate, 5-10 cm. long, sinuate-dentate or somewhat lobed, soon green and glabrate above, densely white-tomentose beneath; involucre 2.5-3 mm. high, turbinate; bracts 4 or 5, ovate, acute, reflexed in fruit; achenes 4-6,

clavate, 7-8 mm. long. Damp woods: B.C.—Calif.—Mont.—Lake Superior. *Mont.* Je—Au.

59. MELAMPÓDIUM L.

Annuals or perennial herbs or shrubs. Leaves opposite, often narrow, entire, toothed or pinnatifid. Heads radiate. Involucres double, the outer of 4-5, partially united flat bracts, the inner of a series of bracts, each embracing an achene, and deciduous with it. Receptacle convex or conic. Ray-flowers in one series, pistillate, white or yellow. Disk-flowers hermaphrodite, but sterile. Anthers entire at the base. Achenes broadened upwards, somewhat incurved. Pappus wanting.

1. *M. leucanthum* T. & G. Perennial, with a taproot and short caudex; stems several, branched below, 1-3 dm. high, cinereous-strigose; leaves linear or the lower oblanceolate, 3-5 cm. long, entire or sinuately lobed; involucres about 5 mm. high and fully 1 cm. broad, cinereous; ligules white, about 1 cm. long and 5 mm. wide. Dry plains: Tex.—Colo.—Ariz. *Plain—Submont.* Mr—O.

60. SÍLPHIUM L. ROSINWEED, COMPASS PLANT.

Large perennial herbs, often with resinous sap. Leaves alternate. Heads radiate. Involucres hemispheric or campanulate; bracts broad, in few series. Receptacle flat, with numerous paleae. Ray-flowers pistillate, in 2 or 3 series, fertile; ligules yellow, rarely white. Disk-flowers hermaphrodite but sterile; corollas yellow. Anthers 2-toothed at the base or entire. Achenes flat and broad, 2-winged, notched at the apex. Pappus wanting or of 2 small awns.

1. *S. integrifolium* Michx. Stem 8-15 dm. high, rough-pubescent, 4-angled; leaves mostly sessile, ovate to lanceolate, entire or dentate, 7-12 cm. long, scabrous; involucre 1-1.5 cm. high; bracts triangular-ovate to lanceolate, acute, or the inner obtuse; ligules 15-23, yellow, 2-3 cm. long. ROSINWEED Prairies: Mich.—Miss.—Tex.—Colo.—Minn. *Plain.* Au—S.

61. ENGELMÁNIA T. & G.

Perennial herbs, with alternate pinnatifid leaves. Heads radiate. Involucres hemispheric, or campanulate; bracts of 2 or 3 series, the outer narrow, the inner broad. Receptacle flat, chaffy. Ray-flowers 8-10, pistillate, fertile; ligules yellow. Disk-flowers hermaphrodite, but sterile, partly embraced by the paleae. Anthers 2-toothed at the base. Achenes flat, broader upwards, 1-ribbed on each side. Pappus an irregular crown.

1. *E. pinnatifida* T. & G. Stem 3-7 dm. high, hirsute or hispid; leaves 5-15 cm. long, pinnatifid, the upper sessile; outer bracts linear, the middle ones sub-orbicular, with linear tips, and the inner oval or obovate, ciliate; ligules 8-10, golden yellow, 1 cm. long. Plains and hillsides: La.—Kans.—Colo.—Ariz. *Son.*

62. BOLÓPHYTA Nutt.

Acaulescent caespitose herbs. Leaves all basal, crowded, entire. Heads solitary, subsessile among the leaves, discoid. Involucres hemispheric; bracts few, broad, in about 2 series, herbaceous. Marginal flowers pistillate, few, without ligules; corollas truncate at the apex. Central flowers hermaphrodite and sterile, their corollas tubular-funneliform; anthers entire at the base; styles dilated, truncate and pubescent at the summit. Pappus a pair of oblong-lanceolate membranous scales.

1. *B. alpina* Nutt. Tufted, subacaulescent perennial, with a caespitose caudex, 2-5 cm. high; leaves basal, crowded, silvery-canescant, spatulate-linear, 2-3 cm. long, entire; heads solitary, subsessile, 7-8 mm. wide. *Parthenium alpinum* A. Gray. Among rocks: Wyo. *Submont.*

63. PARTHÉNICE A. Gray.

Annual herbs, with alternate leaves. Heads paniculate, discoid. Involucres hemispheric, double, the outer of 5 somewhat herbaceous broad bracts, the inner of 6-8 somewhat larger orbicular bracts more or less scarious, and subtending the

pistillate flowers. Receptacle convex, with a series of linear-oblong or spatulate paleae, subtending the outer series of the central flowers. Marginal flowers 6-8, pistillate and fertile, with an obliquely cleft corolla-tube. Central flowers hermaphrodite but sterile, 40-50, with funnellform corollas. Anthers entire at the base. Achenes oblong-obovate, glabrous, wingless, but acutely angled, with an incurved apiculation. Pappus wanting.

1. **P. mollis** A. Gray. Annual, with the odor of *Artemisia*; stem 1-2 m. high, paniculately branched; leaf-blades rhombic-ovate or the lower subcordate, 8-15 cm. long, acuminate, sinuately and often doubly dentate, cinereous-puberulent; involucre hemispheric, 3 mm. high and 4-5 mm. broad; corollas greenish white. Hillsides along streams: s Colo.—N.M.—Ariz. *Son.* Au-S.

64. CRASSINA Scepín.

Annual or perennial herbs or shrubby plants. Leaves opposite, commonly narrow, entire or sparingly toothed. Heads radiate. Involucre campanulate to nearly cylindric; bracts in 3-5 series, firm, appressed, rather dry. Receptacle conic to nearly cylindric, chaffy. Ray-flowers pistillate, fertile; their ligules red, purple, or yellow, or variegated, in ours yellow, persistent and becoming papery. Disk-flowers hermaphrodite, fertile, enveloped in the paleae. Achenes various, those of the rays 3-angled, those of the disk-flowers flattened. Pappus of one to several teeth or awns, or lacking. [*Zinnia* L.]

Ligules large, much longer than the disk.
Ligules scarcely longer than the disk.

1. *C. grandiflora*.
2. *C. anomala*.

1. **C. grandiflora** (Nutt.) Kuntze. Perennial, with a woody root and short caudex; stem 1-2 dm. high, branched, puberulent; leaves linear, more or less distinctly 3-nerved, impressed-punctate, scabrous-hispidulous, 2-3 cm. long; heads solitary, short-peduncled; involucre 6-9 mm. high; ligules yellow, turning whitish, 12-15 mm. long; disk-corollas dark brick-red. *Zinnia grandiflora* Nutt. Plains: Tex.—Kans.—Colo.—Ariz. *Son.*—*Submont.* My-S.

2. **C. anomala** (A. Gray) Kuntze. Perennial, with a woody rootstock and short caudex; stems numerous, 1-1.5 dm. high, puberulent; leaves linear, 2-3 cm. long, one-nerved or 3-nerved at the base, punctate and hispidulous-scabrous; involucre fully 1 cm. high, 5-7 mm. broad; ligules short and rounded, 5 mm. long or less, yellow or orange, often lacking; disk dark brick-red. Plains: Tex.—Colo.—n Mex. *Son.* Ap-Au.

65. HELIOPSIS L. OX-EYE.

Perennial or rarely annual, leafy-stemmed herbs. Leaves opposite, petioled, toothed. Heads radiate, corymbose or solitary. Involucre hemispheric or campanulate; bracts nearly equal, in 2-3 series, the outer herbaceous. Receptacle conic or convex, chaffy. Ray-flowers pistillate, fertile, with oblong yellow ligules, more or less persistent on the fruit. Disk-flowers numerous, hermaphrodite, fertile, enveloped by paleae. Stigmas with short conic hirsute appendages. Achenes 3-4-angled, truncate. Pappus none or reduced to a short, 1-4-toothed annular border.

1. **H. scabra** Dunal. Perennial, with a short crown and a fascicle of fibrous roots; stem 5-15 dm. high, more or less hispidulous-scabrous; leaf-blades ovate or subcordate, 5-10 cm. long, scabrous-hispidulous, strongly veined, triple-nerved, coarsely dentate; involucre 8-12 mm. high, 15-25 mm. broad, canescent; bracts oblong, obtuse, in 2 series, the outer usually longer; ligules 15-25 mm. long. Dry soil and river banks: Me.—N.Y.—N.M.—B.C. *Plain*—*Submont.*

66. BRAUNERIA Neck. PURPLE CONE-FLOWER.

Perennial caulescent herbs. Leaves mostly alternate, entire or toothed. Heads radiate, solitary or few, mostly long-peduncled. Involucre rather flat; bracts in 2-4 series, narrow, herbaceous, squarrose. Receptacle hemispheric, chaffy. Ray-flowers several, neutral, with rudimentary styles; ligules spreading

or drooping, purple or rose, seldom yellow or white. Disk-flowers hermaphrodite, fertile. Paleae awned, surpassing the flowers, persistent. Achenes acutely 4-angled. Styles with acute or obtuse, hispid appendages. Pappus a crown produced into a small tooth at each angle. [*Echinacea* Moench.]

1. **B. angustifolia** (DC.) Heller. Perennial, with a taproot; stem 3-6 dm. high, erect, hispid; lower leaves petioled, the upper subsessile; blades lanceolate to nearly linear, 3-ribbed, scabrous-hispidulous; involucre about 1 cm. high, 2-3 cm. wide; bracts lanceolate, hispid; ligules about 2-2.5 cm. long, light purple, spreading. *E. angustifolia* DC. Prairies: Sask.—Minn.—Tex.—Colo.—Mont. *Plain*. Je-Au.

67. GYMNOLOMIA H.B.K.

Annual or perennial, caulescent herbs, or rarely shrubby plants. Leaves alternate or opposite, narrow, entire or toothed. Heads radiate, corymbose or paniculate. Involucres hemispherical; bracts narrow, herbaceous, in 2-3 series. Receptacle more or less conic, chaffy; paleae strongly concave or conduplicate, enclosing the disk-flowers. Ray-flowers neutral; ligules yellow. Disk-flowers hermaphrodite, fertile; corollas yellow or brownish. Achenes 4-angled, sometimes somewhat flattened, truncate. Pappus a denticulate crown or wanting.

Perennials.

Leaves lanceolate; caudex thick, lignescent.

Leaves linear; caudex slender.

Annals; leaves linear.

Plant finely strigose.

Plant hispid.

1. *G. multiflora*.

2. *G. linearis*.

3. *G. annua*.

4. *G. ciliata*.

1. **G. multiflora** (Nutt.) Benth. & Hook. Perennial, with a taproot; stems several, 2-12 dm. high, striate and strigose; leaves lanceolate or linear-lanceolate, acutish, or some oblong and obtuse, 4-7 cm. long, 4-20 mm. wide, finely scabrous-puberulent; involucre 12-15 mm. broad; bracts linear-lanceolate, hirsute; ligules golden yellow, 10-15 mm. long; achenes smooth. Prairies and banks of streams: Mont.—N.M.—Calif.—Ida. *Plain—Mont*. JI-S.

2. **G. linearis** Rydb. Perennial, with a rootstock or slender caudex; stem 3-4 dm. high, terete, strigose; leaves narrowly linear, 3-4 cm. long, 2-4 mm. wide, entire, hirsutulous, sparingly hispid-ciliate at the base; involucre about 6 mm. high, 12-15 mm. broad; bracts linear-lanceolate, canescent-strigose; ligules 10-12 mm. long, 3-4 mm. wide. Sandy soil: sw Utah. *L. Son*.

3. **G. annua** (M. E. Jones) Robins. & Greenm. Annual, with a taproot; stem branched from the base, 3-5 dm. high, copiously branched above; leaves linear, somewhat canescent, 4-7 cm. long, 2-3 mm. broad, those of the branches smaller; involucre 5 mm. high, 7-10 mm. broad; ligules yellow, 4-8 mm. long. *G. multiflora annua* M. E. Jones. Dry regions: Tex.—se Utah—Ariz.; n Mex. *L. Son*. S-N.

4. **G. ciliata** (Robins. & Greenm.) Rydb. Annual, with a slender taproot, usually branched from the base; stem 3-5 dm. high, sparingly hirsute; leaves linear, green, conspicuously hirsute-ciliate throughout; involucre about 5 mm. high, 8-10 mm. broad; bracts linear-lanceolate, hirsute-ciliate on the margins and midvein; ligules golden yellow, about 8 mm. long. *G. hispida ciliata* Robins. & Greenm. Dry regions: N.M.—s Utah—s Calif. *L. Son*.

68. RUDBECKIA L. CONE-FLOWER, GOLDEN GLOW, NIGGER-HEADS.

Perennial, or rarely annual or biennial, caulescent herbs. Leaves alternate, entire, toothed, or pinnatifid, petioled or sessile. Heads radiate or discoid, many-flowered. Involucres hemispheric; bracts imbricate in 2 or more series, more or less foliaceous, loose and spreading. Receptacle convex, conic, or in fruit cylindrical, chaffy; paleae not spinescent. Ray-flowers neutral; ligules yellow, or partly or rarely wholly brown-purple or crimson, or none. Disk-flowers hermaphrodite, fertile; corollas with a short but manifest tube, 5-lobed. Style-branches with blunt or subulate pubescent tips. Achenes 4-angled, obtuse or truncate. Pappus a 4-toothed crown, a low border, or wanting.

Heads radiate; disk in fruit spherical or oblong.

Leaves entire or merely toothed; plant hispid.

Leaves except the uppermost 3-5-cleft or pinnatifid; plant glabrous or nearly so.

1. *R. hirta*.

2. *R. ampla*.

Heads discoid; disk in fruit cylindraceous.

Leaves pinnately parted.

Leaves undivided, toothed or entire.

3. *R. montana*.

4. *R. occidentalis*.

1. *R. hirta* L. Perennial; stem erect, usually straw-colored, 3-5 dm. high, usually purple-dotted, hirsute; lower leaves long-petioled; blades oblong-lanceolate or oblanceolate, 5-10 cm. long, entire or remotely denticulate, obtuse, 3-ribbed, hirsute; upper stem-leaves linear and subsessile; peduncles 5-15 cm. long; involucre 15-18 mm. high, 3-3.5 cm. broad; bracts oblong-linear, hispid; ligules yellow, 1.5-3 cm. long. *R. flava* T. V. Moore. Hillsides and plains: Que.—Fla.—Neb.—Colo.—B.C. *Plain—Mont.* JI—Au.

2. *R. ampla* A. Nels. Perennial, with a rootstock and thick crown; stem 1-2 m. high, glabrous, striate, branched above; basal leaves large, long-petioled, pinnately 3-7-divided; divisions ovate or lanceolate, 2-3-cleft, and coarsely serrate, glabrous and slightly paler beneath, somewhat hairy above; upper stem-leaves 3-parted or entire, toothed, acuminate; involucre about 1 cm. high and 3 cm. wide; bracts very unequal, oblong or ovate-oblong, mostly obtuse, reflexed in age, 8-12 mm. long; ligules 3-5 cm. long, 8-15 mm. wide; disk ovoid in fruit; pappus coroniform, sometimes 4-toothed. Closely allied to the eastern *R. laciniata* L. Wet places: Sask.—N.M.—Ariz.—Ida. *Plain—Mont.* JI—Au.

3. *R. montana* A. Gray. Perennial; stem 1-2 m. high, glabrous; lower leaves 2-3 dm. long, petioled, pinnately parted into 3-9 oblong-lanceolate divisions, glabrous, ciliolate on the margins; upper stem-leaves ovate or lanceolate, acuminate, entire; peduncles 3 dm. long or more; involucre bracts linear, foliaceous, acute, 2-4 cm. long; disk cylindric, at length 5-6 cm. long, purplish black; pappus coroniform. Mountains: Colo. *Mont.* JI.

4. *R. occidentalis* Nutt. Perennial; stem 5-20 dm. high, glabrous, striate; leaves ovate or ovate-lanceolate, acuminate, entire or dentate, the upper sessile with a cordate base, the lower with winged petioles, more or less hairy; peduncles 1-3 dm. long; bracts oblong or lanceolate, 1-2 cm. long; disk brownish black, oblong, becoming 3-5 cm. long; pappus coroniform. Shaded banks: Mont.—Wyo.—Utah—e Calif.—Wash. **NIGGER-HEADS.** *Submont.—Mont.* JI—S.

69. RATIBIDA Raf. CONE-FLOWER.

Annual, biennial, or perennial caulescent herbs. Leaves alternate, pinnatifid with narrow divisions. Heads radiate, long-peduncled. Involucres many-flowered, rather flat. Ray-flowers neutral; ligules yellow, or partly brown at the base, rarely wholly brown-purple, spreading or drooping. Disk-flowers hermaphrodite, perfect, usually enveloped by the paleae; corollas gray or yellowish, almost without a tube. Style-branches with blunt or lanceolate tips. Achenes flattened, broad-margined or winged, deciduous with the scale. Pappus 1 or 2 teeth, or wanting. [*Lepachys* Raf.]

Disk in fruit oblong, about 1 cm. long; pappus of 1-2 awn-like teeth, without intermediate squamellae.

Disk in fruit cylindraceous, 2-4 cm. long; pappus with a series of squamellae.

1. *R. Tagetes*.

2. *R. columnifera*.

1. *R. Tagetes* (James) Barnh. Perennial, with taproot; stems several, branched, 2-4 dm. high, grayish-strigose; leaves pinnately divided, with 3-7 linear divisions, hispidulous; heads rather short-peduncled; bracts reflexed, oblong, 3-5 mm. long; ligules 7-10 mm. long; receptacle about 1 cm. high in fruit. *L. Tagetes* A. Gray. Plains: Tex.—Kans.—Colo.—Ariz. *Plain—Submont.* JI—Au.

2. *R. columnifera* (Nutt.) Woot. & Standl. Perennial, with a taproot; stems often several, 3-6 dm. high, hispidulous-strigose, angled; leaves pinnately divided, hispidulous; divisions of the stem-leaves 5-9, oblong to linear, entire or rarely 2-3-cleft; heads long-peduncled; involucre bracts oblong, 5-8 mm. long, soon spreading; ligules yellow or in the variety *pulcherrima* partly or wholly

brown-purple, 1-3 cm. long; receptacle in fruit 2-4 cm. long. *L. columnaris* (Sims) T. & G. Plains: Sask.—Tenn.—Tex.—Ariz.—B.C. Plain—Submont. My-S.

70. GALINSOGA R. & P.

Annual leafy-stemmed herbs. Leaves opposite, petioled, toothed. Heads radiate, small. Involucre campanulate or hemispheric; bracts imbricate in 2 series, thin. Receptacle conic, chaffy. Ray-flowers few, pistillate, fertile; ligules short, white. Disk-flowers hermaphrodite, fertile. Anthers sagittate at the base. Style-branches with acute appendages. Achenes 4-5-angled or those of the rays slightly flattened. Pappus of the ray-flowers of several bristles or wanting, that of the disk-flowers of lacerate or fimbriate squamellae.

1. *G. parviflora* Cav. Stem 1-7 dm. high, branched; leaf-blades hispidulous or glabrous, ovate or ovate-lanceolate, 2-5 cm. long, dentate or undulate; involucre 2-2.5 mm. high; bracts ciliate, ovate; ligules 4 or 5, only 1-1.5 mm. long; pappus-squamellae in the disk-flowers 8-15. Waste places: Mass.—Ga.—Mex.—Ore.; nat. from S. Am.

71. BALSAMORRHIZA Hook. BALSAM-ROOT.

Low perennials, with almost scapose stems, numerous petioled basal leaves, and a thick edible root, its bark exuding a terebinthine balsam. Involucre mostly hemispherical; bracts in several series, more or less foliaceous, especially the outer ones. Receptacle almost flat, beset with concave paleae, which loosely embrace the disk-flowers. Ray-flowers present, fertile; ligules yellow. Disk-flowers hermaphrodite, fertile. Anthers not caudate. Style-branches with filiform or slender subulate hispid appendages. Achenes mostly glabrous, those of the disk-flowers quadrangular with intermediate nerves, those of the ray-flowers flattened. Pappus none.

Leaves entire or bluntly toothed, never pinnatifid.

Plant white-tomentose.

Leaves with entire margins or slightly undulate, oblong-cordate to hastate.

1. *B. sagittata*.

Leaves more or less distinctly toothed, ovate-lanceolate, with subcordate base.

2. *B. tomentosa*.

Plant hirsute-puberulent; basal leaves cordate.

Ligules linear, deciduous; achenes glabrous.

3. *B. deltoidea*.

Ligules oval, becoming papery, and more or less persistent; achenes puberulent.

4. *B. Careyana*.

Leaves mostly pinnatifid or at least incisedly toothed.

Plant canescent or white-tomentose.

Plants loosely white-tomentose.

Stem 1-3 dm. high; segments of the leaves 1-3 cm. long, ovate, entire or slightly toothed.

5. *B. incana*.

Stem 3 dm. or more high; segments of the leaves 3-5 cm. long, lanceolate, coarsely toothed.

6. *B. floccosa*.

Plant finely canescent, tomentose only on the involucre; some of the leaves merely toothed.

7. *B. terebinthacea*.

Plants more or less hispid, neither canescent nor tomentose.

Disk 3-4 cm. broad; segments of the leaves mostly entire.

8. *B. macrophylla*.

Disk 2-2.5 cm. broad; segments of the leaves mostly toothed.

9. *B. hirsuta*.

1. *B. sagittata* (Pursh) Nutt. Leaves mostly basal, long-petioled; blades from cordate to hastate or sagittate, mostly entire, white-tomentose on both sides, 1-2 dm. long; peduncles 3-5 dm. high, tomentose; involucre floccose, about 2 cm. high and 2.5 cm. broad; bracts lanceolate or linear-lanceolate, usually all appressed; ligules 2-3 cm. long, 8-10 mm. broad, oblong. Hillsides: Sask.—S.D.—Colo.—Calif.—B.C. Submont.—Mont. Ap.

2. *B. tomentosa* Rydb. Basal leaves with long petioles; blades about 12 dm. long, ovate-lanceolate, with subcordate bases, 15-20 cm. long, acute, coarsely toothed; stem 3-4 dm. high; involucre densely floccose, over 2 cm. broad; outer bracts usually half longer than the inner, and reflexed; ligules about 3 cm. long and 1 cm. wide. Hills: Wyo. Submont.—Mont. Jl—Au.

3. *B. deltoidea* Nutt. Basal leaves numerous, long-petioled; blades cordate, hastate or deltoid, green, more or less pubescent, but not tomentose, 8-15 cm. long and almost as wide, coarsely dentate-crenate or sinuate or entire; heads

1-3; involucre 1.5-3 cm. high, slightly tomentose; bracts lanceolate, the outer foliaceous, exceeding the disk; ligules 2-4 cm. long, 4-8 mm. wide. Hills: B.C.—Ida.—Calif. *Submont.* Ap-Je.

4. **B. Careyana** A. Gray. Basal leaves long-petioled; blades cordate, entire, somewhat grayish scabrous-puberulent, subcoriaceous, reticulate, 1-1.5 dm. long; involucre 10-15 mm. high; bracts oblong-lanceolate or a few of the outer lanceolate and longer, all firm and puberulent; ligules broadly oval, 15-18 mm. long, 8-9 mm. wide, becoming papery and persistent; style-branches of the disk-flowers subulate and very hispid; achenes pubescent. Sandy plains: Ida.—Wash. *Son.* My.

5. **B. incana** Nutt. Leaves all basal, 1-1.5 dm. long, short-petioled, tomentose, pinnately divided into ovate, entire or slightly toothed divisions 1-3 cm. long; scape 1-2 dm. high; involucre floccose, 15-20 mm. high, 20-25 mm. broad; bracts lanceolate, appressed or the outer with spreading tips; ligules 2-2.5 cm. long, about 5 mm. wide. Dry hills: Wash.—Mont.—Wyo.—Calif. *Plain—Submont.* My-Jl.

6. **B. floccosa** Rydb. Leaves mostly basal, floccose on both sides, 2-3 dm. long, regularly pinnately divided to near the midrib or some sometimes only coarsely toothed; segments lanceolate, acute, 3-5 cm. long, coarsely toothed; stem scapiform, 3-5 dm. high, villous, the upper portion densely floccose; involucre about 3 cm. broad; bracts numerous in several series, lanceolate, the outer often spreading with recurved tips; ligules 3-4 cm. long, about 1 cm. wide. Hill-sides: Mont.—Wyo.—Ida. *Plain—Mont.* My-Jl.

7. **B. terebinthacea** (Hook.) Nutt. Leaves mostly all basal, short-petioled; blades 1-2 dm. long, lanceolate in outline, some of them only incised-toothed, others pinnately divided, hirsutulous-pubescent or glabrate; scape 1-3 dm. high; involucre 15-20 mm. high; bracts lanceolate, almost equal. In stony grounds and open woods: Ida.—Wash.—Ore. *Submont.* My-Je.

8. **B. macrophylla** Nutt. Stem 4-6 dm. high, sparingly villous-hirsute; basal leaves 2-5 dm. long, petioled, most of them pinnately divided into lanceolate divisions, but some occasionally only toothed; involucre 25 mm. high and 2.5-4 cm. broad; bracts linear-lanceolate, loose and the outer reflexed; ligules 3-5 cm. long, about 1 cm. wide. On dry hillsides: Utah—Wyo. *Submont.* My-Je.

9. **B. hirsuta** Nutt. Stem scapiform, sparingly villous-hirsute; leaves short-petioled, lanceolate in outline, pinnately divided; divisions ovate or lanceolate, coarsely toothed or again pinnatifid, strongly veined and rigid; involucre about 1.5 cm. high and 2 cm. broad; bracts linear-lanceolate, spreading, hirsute; ligules 15-20 mm. long, 4-6 mm. wide. On dry ground: Utah—B.C.—Calif. *Submont.* My-Je.

72. WYËTHIA Nutt. MULE-EARS.

Stout and low perennial herbs, with thick taproot, balsamic juice, and alternate, commonly entire, pinnately veined leaves. Heads solitary or few. Involucres hemispheric or flat; bracts more or less imbricate, the outer often foliaceous. Ray-flowers pistillate and fertile; ligules yellow. Disk-flowers hermaphrodite and fertile; styles with slender, subulate hispid appendages. Paleae of the receptacle lanceolate, partly embracing the achenes. Achenes prismatic, 4-angled, somewhat flattened in the disk-flowers, or 3-angled in the ray-flowers. Pappus a lacerate chaffy crown or of almost distinct squamellae.

Involucral bracts nearly equal, in 2-3 series; stem not white.

Rays pale yellow or white; plant hispid.

Rays bright yellow.

Plant glabrous.

Plant pubescent.

Plant sparingly hirsute or scabrous.

Plant densely pubescent.

Involucral bracts unequal, the outer much shorter, in 5-6 series; stem white.

1. *W. helianthoides*.

2. *W. amplexicaulis*.

3. *W. robusta*.

4. *W. arizonica*.

5. *W. scabra*.

1. **W. helianthoides** Nutt. Stem 2-4 dm. high, more or less hirsute; leaves with margined petioles, more or less hirsute; blades of the basal leaves oval or

elliptic, 1-2 dm. long, those of the stem-leaves oblanceolate; heads solitary; involucre 2-2.5 cm. high, 5-6 cm. broad; bracts numerous, linear-lanceolate, acute or acuminate, hirsute-ciliate on the margins and back; ligules 2-4 cm. long; pappus coroniform or cleft into several teeth. Hills: Mont.—n Wyo.—Ore.—Wash. *Submont.* My-Jl.

2. *W. amplexicaulis* Nutt. Stem 3-6 dm. high, glabrous; basal leaves petioled, 3-4 dm. long; blades oblong, elliptic or lanceolate, denticulate or entire, glossy, reticulate, glabrous; upper stem-leaves lanceolate or ovate, sessile or somewhat clasping; involucre 2 cm. high, 2-4 cm. wide; bracts rather few, broadly lanceolate, acute, glabrous, firm; ligules 3-4 cm. long; pappus coroniform, but cleft into distinct teeth. Moist valleys: Mont.—Colo.—Utah—Ore.—B.C. *Submont.*—Mont. My-Au.

3. *W. robusta* Nutt. Stem decumbent at the base, 3-4 dm. high, sparingly hirsute; basal leaves 2-3 dm. long, short-petioled; blades oblanceolate, acute, sparingly hirsutulous or scabrous; stem-leaves lanceolate and sessile; involucre 1.5-2 cm. high, 3-4 cm. broad; bracts lanceolate, hirsute-ciliate on the margins and back; ligules 3-4 cm. long; pappus of a toothed crown and 1-4 stout awns. Valleys: Wash.—Ida.—Calif. *Son.* My-Jl.

4. *W. arizonica* A. Gray. Stem 3-5 dm. high, rather copiously hirsute-villous; basal leaves 2-4 dm. long, petioled; blades oblanceolate or oblong-oblanceolate, densely pubescent; upper stem-leaves sessile, ovate or lanceolate; involucre about 2 cm. high, 3-4 cm. wide; bracts oblong-lanceolate, acute, hirsute and finely puberulent; ligules 3-5 cm. long; crown of pappus with teeth, and 1 or 2 awns. Mountains, along streams: N.M.—Colo.—Utah—Ariz. *Submont.* My-Au.

5. *W. scabra* Hook. Stem leafy, hispidulous-scabrous, soon turning straw-colored or white; leaves linear, very scabrous, 5-8 cm. long, 6-12 mm. wide; involucre about 2 cm. high and 3 cm. broad; bracts linear-subulate, attenuate, hispid-ciliate and hirsute; ligules 2.5-4 cm. long; pappus of 3-4 blunt teeth. Dry plains: Wyo.—N.M.—Utah. *Son.*—*Submont.* Je-S.

73. *HELIANTHUS* L. SUN-FLOWER, GROUND ARTICHOKE.

Erect, mostly branched annuals or perennials, with simple leaves and large, peduncled, corymbose or solitary heads. Involucre hemispherical or depressed; its bracts imbricated in several series. Receptacle flat or convex, rarely conic, with paleae subtending the disk-flowers. Ray-flowers neutral; ligules yellow, spreading, mostly entire. Disk-flowers perfect, fertile; their corollas tubular, yellow, brown or purple. Anthers entire or minutely 2-toothed at the base. Style-branches with hirsute appendages. Achenes more or less 4-angled and somewhat compressed. Pappus of 2 scales or awns, sometimes with a few additional smaller intermediate ones, deciduous.

Annuals; leaves broad, ovate or cordate or lanceolate; disk purple or dark brown.

Bracts ciliate, hispid, ovate or obovate, abruptly acuminate.

Lower leaves at least ovate or cordate, distinctly toothed.

Leaves lanceolate or narrowly deltoid, minutely toothed or entire.

Bracts not ciliate, canescent-strigose, lanceolate.

Perennials.

Disk dark brown or purple.

Leaves linear.

Leaves rhombic-ovate.

Disk yellow or light brownish.

Bracts broadly lanceolate, acute, appressed.

Bracts narrowly lanceolate, acuminate, more or less spreading or squarrose.

Leaves ovate.

Leaves lanceolate.

Leaves rounded or obtuse at the base, subsessile.

Leaves tapering at the base, petioled.

Stem more or less scabrous or hispid; upper leaves subsessile.

Leaves and stem very scabrous.

Leaves scabrous above, hirsute beneath; stem more or less hirsute.

Upper leaves mostly alternate and indistinctly triple-nerved.

10. *H. giganteus*.

1. *H. lenticularis*.

2. *H. aridus*.

3. *H. petiolaris*.

4. *H. orgyalis*.

5. *H. subrhomboides*.

6. *H. pumilus*.

7. *H. tuberosus*.

8. *H. divaricatus*.

9. *H. Maximiliani*.

Leaves usually all opposite, distinctly triple-nerved.

Leaves lanceolate, thick, often toothed, yellowish green, the lower distinctly petioled.

Leaves linear-lanceolate, dark green, entire, all subsessile.

11. *H. subtuberosus*.

12. *H. Cusickii*.

Stem, except the upper portion, glabrous and glaucous; leaves mostly all petioled.

Lower leaves coarsely toothed; bracts hirsute ciliate.

13. *H. grosse-serratus*.

All leaves distantly and minutely denticulate or subentire; bracts not ciliate or ciliate merely at the base.

Leaves lanceolate, often somewhat triple-ribbed.

Leaves all opposite; bracts ciliate on the margins.

11. *H. subtuberosus*.

Leaves mostly alternate; bracts ciliate only below the middle.

14. *H. fascicularis*.

Leaves narrowly linear-lanceolate, not triple-ribbed.

15. *H. Nuttallii*.

1. *H. lenticularis* Dougl. Stem 1-2 m. high; leaves mostly alternate, the lower long-petioled; blades ovate, 1-2 dm. long, sometimes cordate at the base, dentate, hispidulous-scabrous, the upper more lanceolate, subentire; involucre 1.5-2 cm. high, 4-5 cm. broad; achenes grayish strigose, about 6 mm. long. Closely related to the cultivated *H. annuus*, which has larger, more nodding heads, looser bracts, more salient teeth to the leaves and larger achenes, often 1 cm. long. Plains and alluvial soil, also in waste places and cultivated ground: Sask.—Tex.—Calif.—Wash. *Plain—Submont.* Je-S.

2. *H. aridus* Rydb. Stem 3-8 dm. high, more or less hispid; leaves all petioled; blades lanceolate, 4-7 cm. long, entire or crenate, acute, hispid-scabrous on both sides; disk 1.5-2 cm. wide; ligules oblong to oval, 15-20 mm. long, 6-8 mm. wide; achenes cuneate, almost black, finely strigose, about 5 mm. long. Arid soil: Sask.—Neb.—N.M.—Ariz.—B.C. *Plain—Submont.* Je-S.

3. *H. petiolaris* Nutt. Stem 3-10 dm. high, hirsute-strigose; leaves petioled; blades lanceolate or ovate-lanceolate, mostly cuneate at the base, 5-8 cm. long, hispidulous-scabrous; involucre about 1 cm. high, 2-3 cm. broad; ligules golden yellow, 1.5-2 cm. long; achenes about 5 mm. long, strigose. Dry plains and waste places: Sask.—Mo.—Tex.—Calif.—B.C. *Plain—Mont.* Je-S.

4. *H. orgyalis* DC. Stem smooth and glabrous, 5-30 dm. high, very leafy; leaves mostly alternate, narrowly linear, 2-4 dm. long, 4-8 mm. wide, scabrous-puberulent; involucre fully 1 cm. high and about 2 cm. wide; bracts linear-subulate, long-attenuate, ciliate on the margins; rays 15-18 mm. long. Dry plains: Mo.—Tex.—e Colo. *Plain.* Au-S.

5. *H. subrhomboides* Rydb. Perennial, with a rootstock; stem 3-6 dm. high, terete, tinged with red, sparingly hirsute; leaves opposite; blades firm, very scabrous, triple-veined, serrate, the lower ovate or obovate-spatulate, the upper rhombic-ovate or rhombic-lanceolate, 5-10 cm. long; heads solitary, rarely 2 or 3; involucre 10-12 mm. high and 1.5-2 cm. broad; bracts in 4 or 5 series, oblong, acutish, white-ciliate; ligules about 1.5 cm. long. Plains: Man.—Ark.—N.M.—Alta. *Plain—Submont.* JI-S.

6. *H. pumilus* Nutt. Perennial, with a woody crown; stem 3-6 dm. high, hispid; leaves opposite, short-petioled; blades ovate or lanceolate, entire or nearly so, acute or obtuse, 3-10 cm. long, very scabrous, hispid on the veins, 3-ribbed; involucre nearly 1 cm. high and about 2 cm. broad; ligules 15-20 mm. long. Plains and mountains: Wyo.—Colo. *Plain—Submont.* Je-Au.

7. *H. tuberosus* L. Perennial, with tubers; stem 1-3 m. high, branching at the summit, more or less hirsute; lower leaves usually opposite, the upper alternate, petioled; blades ovate or subcordate, acuminate, firm, 3-ribbed, scabrous above, pubescent beneath, 5-30 cm. long, usually dentate; involucre about 1.5 cm. high, 2-3 cm. broad; bracts lanceolate, attenuate, hirsute at least on the margins; ligules 12-20, 2.5-3.5 cm. long. Alluvial soil: N.S.—Ga.—Ark.—Neb.—Sask. *Plain.* Au-O.

8. *H. divaricatus* L. Perennial, with a rootstock; stem 3-10 dm. high, simple, smooth below, hispidulous-scabrous above; leaves opposite, subsessile,

divaricate, lanceolate or elongate-deltoid, 5-15 cm. long, gradually attenuate above, rounded at the base, 3-ribbed, scabrous on both sides; involucre about 1 cm. high and 2 cm. broad; bracts narrowly lanceolate, acuminate, hirsute-ciliate on the margins, hirsutulous on the back; ligules 8-12, about 2 cm. long. Dry ground: Que.—Fla.—La.—Sask. *Plain.* Jl-S.

9. *H. Maximiliani* Schrad. Perennial, with a thick rootstock; stem 5-30 dm. high, scabrous-hispidulous; leaves mostly alternate and subsessile, lanceolate to linear, entire or denticulate, 5-15 cm. long, 1-ribbed, very scabrous on both sides; heads many in a narrow panicle; involucre about 1.5 cm. high and 3 cm. wide; bracts lanceolate-subulate, long-attenuate, strigose-canescens or somewhat hispidulous; ligules golden yellow, 15-30 mm. long. Prairies, plains, and river banks: Man.—Mo.—Tex.—Wyo.—B.C. *Plain—Submont.*

10. *H. giganteus* L. Perennial, with a rootstock, some of the roots often becoming fusiform; stem 1-3 m. high, more or less hirsute; leaves lanceolate or oblong-lanceolate, 5-15 cm. long, scabrous above, hirsutulous beneath, short-petioled or subsessile, serrulate or denticulate, rarely entire; heads in an open panicle; involucre 12-15 mm. high and about 3 cm. broad; bracts linear-lanceolate, attenuate, hirsute-ciliate; ligules pale yellow, 1.5-2 cm. long. Low ground: Me.—Fla.—La.—Colo.—B.C. *Plain.* Au-S.

11. *H. subtuberosus* Bourgeau. Perennial, with tubers; stem 3-6 dm. high, glabrous or nearly so; leaves short-petioled, opposite; blades narrowly lanceolate, acute at both ends, finely serrate, scabrous-hispidulous above, hirsutulous beneath, 5-8 cm. long; involucre about 1.5 cm. high, 2.5-3 cm. wide; bracts linear-lanceolate or subulate, attenuate, hirsute, the outer spreading; ligules about 3 cm. long; disk yellow. Valleys and plains: Sask.—Minn.—Wyo.—Mont. *Plain.* Jl-Au.

12. *H. Cusickii* A. Gray. Perennial, with thick fleshy root; stem 3-6 dm. high, usually several; leaves subsessile, linear-lanceolate, hirsutulous, triple-veined; heads solitary; involucre 12-15 mm. high; bracts linear-lanceolate, attenuate, rather loose, hirsute; ligules about 2.5 cm. long. Dry sandy soil: Ore.—Wash.—Ida.—B.C. *Son.* My-Jl.

13. *H. grosse-serratus* Martens. Perennial; stem 1-3 m. high, glabrous and often purplish; leaves alternate, or some opposite, short-petioled; blades elongate-lanceolate, 1-2.5 dm. long, gradually acuminate, sharply serrate, slightly scabrous above, paler and short-pubescent beneath; heads in an open panicle; involucre about 1.5 cm. high, 2.5-3 cm. wide; bracts linear-subulate, attenuate; ligules golden yellow, 2-3 cm. long. Plains and prairies: N.Y.—Pa.—Tex.—N.M.—Utah—Sask. *Plain.* Au-S.

14. *H. fascicularis* Greene. Perennial, with a rootstock and fusiform thickened roots; stem glabrous and somewhat glaucous, 5-10 dm. high; leaves alternate or the lower opposite, 7-15 cm. long, short-petioled; blades lanceolate or linear-lanceolate, scabrous on both sides; heads in an open panicle; involucre about 1.5 cm. high and 3 cm. broad; bracts linear-subulate, attenuate; ligules 14-18, deep yellow, 2.5-3 cm. long; disk yellowish brown. *H. giganteus utahensis* D. C. Eat. *H. utahensis* A. Nels. (?) *H. coloradensis* Cockerell. Closely related to *H. subtuberosus* and *Nuttallii*. Mountain valleys: Sask.—N.M.—Ariz.—Alta. *Plain—Submont.* Au-S.

15. *H. Nuttallii* T. & G. Perennial; stem glabrous, strict, 3-8 dm. high; leaves alternate or opposite, linear or narrowly linear-lanceolate, 5-10 cm. long, entire or denticulate, scabrous-hispidulous on both sides; branches of the panicle erect; involucre about 1.5 cm. high, 2.5 cm. wide; bracts narrowly linear-subulate, attenuate, grayish hirsutulous, sparingly, if at all, ciliate at the base; ligules 2-2.5 cm. long. Dry plains: Alta.—Wyo.—Utah—Ida. *Plain.* Jl-S.

74. *ENCËLIA* Adans.

Annual or perennial herbs or shrubby plants, ours shrubs with white branches. Leaves alternate or opposite, mostly ovate. Heads radiate or rarely discoid, peduncled. Involucre hemispheric or flattened. Receptacle convex, chaffy.

Ray-flowers neutral, yellow, or none. Disk-flowers hermaphrodite, fertile; corollas yellow or brown. Anthers slightly sagittate at the base. Style-branches with elongated pubescent appendages. Achenes flattened, wingless. Pappus wanting (in ours) or a small awn at each angle of the achenes.

Leaves densely white-tomentose.
Leaves hispidulous-canescens.

1. *E. farinosa*.
2. *E. virginensis*.

1. ***E. farinosa*** A. Gray. Shrub, 5–15 dm. high; leaves petioled; blades ovate, obtuse, 2–5 cm. long, triple-nerved, entire; heads nodding; involucre about 8 mm. high, 1–1.5 cm. wide; bracts lanceolate or linear-lanceolate, sparingly pilose or nearly glabrous, the outer reflexed; ligules 6–10, yellow, 8–12 mm. long; achenes obovoid, with a deep notch. Dry hills: Ariz.—s Utah—s Calif.; Mex. *L. Son.* N-My.

2. ***E. virginensis*** A. Nels. Shrub 3–10 dm. high; leaves alternate, short-petioled; blades broadly rhombic- or deltoid-ovate, triple-nerved at the base, 1–3 cm. long, hispidulous as well as canescent-puberulent; involucre 8 mm. high, 10–15 mm. broad; bracts hirsute-canescens, lanceolate, acute or acuminate; ligules 12–20, deeply 2- or 4-toothed, 15–20 mm. long; achenes linear-cuneate, slightly depressed at the apex, ciliate on the margins. Dry hills: s Utah—s Calif. *L. Son.* Ap-My.

75. **ENCELIÓPSIS** (A. Gray) A. Nels.

Silvery or canescent, often acaulescent scapose perennials. Heads radiate or in an anomalous species discoid. Involucre flat; bracts imbricate in 2–3 series. Receptacle chaffy. Ray-flowers neutral or lacking. Disk-flowers numerous, hermaphrodite and fertile; corollas yellow. Achenes flat, oblong-cuneate, villous, with narrow callous margins at the summit, bordered between the short subulate teeth by a short fringe of membranous confluent squamellae.

Plant white-tomentose; heads radiate.

Stem scapiform; leaf-blades orbicular or spatulate; ligules 1–2.5 cm. long.

Stem leafy; leaf-blades rhombic-obovate; ligules 3.5–4 cm. long.

Plant hispid-scabrous; heads discoid.

1. *E. nudicaulis*.
2. *E. argophylla*.
3. *E. nutans*.

1. ***E. nudicaulis*** (A. Gray) A. Nels. Acaulescent perennial, with a thick caudex; leaves all basal, petioled; blades thick, orbicular or rounded, spatulate, 1–5 cm. long and as broad, 3–5-ribbed; scape naked, 3–5 dm. high; involucre about 1.5 cm. high and 3 cm. wide; bracts lanceolate, white-tomentose; ligules 20 or more, 1–2.5 cm. long; pappus-awns scarcely exceeding the hairs. *Helianthella nudicaulis* A. Gray. *E. tula* A. Nels. Dry rocky ridges and alkaline soil: Ida.—Utah—Nev. *Son.* My-Je.

2. ***E. argophylla*** (S. Wats.) A. Nels. Perennial, with short leafy stem; leaves with winged petioles, 5–10 cm. long; blades rhombic-obovate, thick, 3–5-ribbed; involucre about 1.5 cm. high, 2.5–3 cm. wide; bracts tomentose, ovate-lanceolate, acuminate; ligules about 2.5 cm. long, 3–4 mm. wide; pappus-awns nearly as long as the corolla-tube. *Tithonia argophylla* S. Wats. *Helianthella argophylla* A. Gray. Alkaline soil: Nev.—s Utah. *L. Son.* Ap.

3. ***E. nutans*** (Eastw.) A. Nels. Subacaulescent perennial, with an erect woody caudex; leaves basal, petioled, clustered; blades oval or obovate, 3–5-ribbed, 2–4 cm. long, hispid-scabrous; heads deflexed in fruit; involucre about 18 mm. high, 2.5–3 cm. broad; bracts lanceolate, densely hispid; pappus none. *Encelia nutans* East. *Verbesina scaposa* M. E. Jones. Dry mesas: Colo.—Utah. *Son.* My.

76. **HELIANTHÉLLA** T. & G.

Caulescent perennials, with taproots. Leaves alternate or opposite, more or less distinctly triple-ribbed. Involucre hemispheric or flat; bracts more or less imbricate, often foliaceous; receptacles chaffy. Ray-flowers neutral, showy; ligules yellow. Disk-flowers hermaphrodite and fertile; tube of the corollas half as long as the throat; lobes short, ovate, puberulent. Appendages of the style-branches obtuse, short, spatulate or oblong. Achenes flat, cuneate-obovate, emarginate or orbiculate. Pappus of several squamellae between the awns or paleaceous teeth.

Paleae of the receptacle soft and scarious.

Disk 2-3 cm. in diameter; leaves ovate to lanceolate, thin, not strongly reticulate.

Disk less than 2 cm. wide; leaves oblanceolate to linear, strongly reticulate.

Disk about 1.5 cm. wide, yellow; bracts linear-lanceolate, subequal, in about 2 series.

Disk about 1 cm. broad, purple; bracts unequal, in 3-4 series.

Ligules 5-6 mm. long.

Ligules more than 1 cm. long.

Paleae of the receptacle firm-chartaceous.

Stem more or less hirsute, rarely glabrous; leaves thin, not strongly reticulate.

Stem more or less scabrous-puberulent; leaves rather firm and reticulate.

6. *H. uniflora*.

1. ***H. quinquenervis*** (Hook.) A. Gray. Stem 5-15 dm. high, glabrous or sparingly hirsute; leaves mostly opposite; blades ovate-lanceolate or elliptic-lanceolate, acuminate, 1-2.5 dm. long, usually with two pairs of the lateral veins prominent, sparingly hirsute; heads long-peduncled, nodding; involucre about 2 cm. high and 4-5 cm. broad; bracts lanceolate, acuminate, hirsute-ciliate; ligules 15-20, pale yellow, 2.5-3 cm. long. Mountains, along streams: S.D.—N.M.—Utah—Ida.—Mont. *Submont.*—Mont. JI-Au.

2. ***H. Parryi*** A. Gray. Stem slender, about 3 dm. high, hirsute; the lower leaves opposite, petioled, the upper subsessile, mostly alternate; blades oblanceolate or elliptic, 2-10 cm. long, rigid, triple-veined; heads rather short-peduncled; involucre 10-12 mm. high, 15-20 mm. broad; bracts linear-lanceolate, attenuate, hirsute-ciliate; ligules about 15 mm. long. Mountains: Colo.—N.M.—Ariz. *Mont.* JI-Au.

3. ***H. microcephala*** A. Gray. Stem 2-4 dm. high, paniculately branched, scabrous-hispidulous; leaves ridged, all but the lower alternate; basal leaves petioled, spatulate, scabrous; stem-leaves linear or nearly so, sessile; involucre about 1 cm. high and broad; bracts lanceolate, obtuse, hirsute; ligules 5-6 mm. long. Dry plains and cañons: sw Colo.—Utah—N.M. *Son.*

4. ***H. scabra*** Payson. Stems several, 6-8 dm. high, cymosely branched; leaves dark green, coriaceous, linear-lanceolate to linear, the lower 1.5-2.5 dm. long, petioled; bracts lanceolate, acute; paleae truncate, ciliate at the apex; ligules 8-10, orange, more than 1 cm. long; pappus of two awns and several lacerate squamellae. Ravines: w Colo. Au.

5. ***H. Douglasii*** T. & G. Stem 4-10 dm. high, more or less hirsute or glabrous below; leaves mostly opposite, the lower oblanceolate, petioled, triple-veined, hirsute, 8-12 cm. long, the upper lanceolate, sessile; involucre about 15 mm. high and 3 cm. broad; bracts linear-lanceolate, attenuate, hirsute-ciliate; ligules 2.5-3 cm. long. Hillsides and pine-land: Mont.—w Wyo.—Ore.—B.C. *Submont.* Je-JI.

6. ***H. uniflora*** (Nutt.) T. & G. Stem 3-6 dm. high, puberulent; leaves mostly opposite, petioled or the uppermost sessile, oblong-lanceolate, 5-12 cm. long, scabrous, obtuse; involucre 12-15 mm. high, 2.5-4 mm. broad; bracts lanceolate, acute, hirsute-ciliate on the margins; ligules 2-3 cm. long. *H. multicaulis* D. C. Eat. Hills and mountains: Mont.—N.M.—Nev.—Ida. *Submont.*—Mont.

77. XIMENÈSIA Cav.

Annual caulescent herbs, ours canescent. Leaves alternate or sometimes opposite, toothed or lobed. Heads solitary or few, radiate, peduncled. Involucres rather flat; bracts narrow, spreading, foliaceous, nearly equal. Ray-flowers pistillate, fertile; ligules yellow. Disk-flowers numerous, hermaphrodite, fertile. Anthers somewhat sagittate at the base. Style-branches with slender pubescent appendages. Achenes flat, winged. Pappus of short awns, without intermediate scales.

1. ***X. exauriculata*** (Robins. & Greenm.) Rydb. Annual, with a taproot; stem 3-6 dm. high, white-tomentose; leaf-blades ovate or rhombic-lanceolate, saliently dentate, minutely strigose but green above, densely white-strigose

beneath, 3-7 cm. long; heads few, paniculate; involucre scarcely 1 cm. high, 1.5 cm. broad; ligules orange, 12-15 mm. long. *Verbesina encelioides exauriculata* Robins. & Greenm. Mountain valleys: Mont.—Tex.—Ariz. Son.—Mont. Je—O.

78. COREÓPSIS L. TICKSEED.

Annual or perennial herbs. Leaves various. Heads on long peduncles, radiate. Involucre campanulate, their bracts in two series, all more or less united at the base, the outer ones usually narrow and foliaceous, the inner broad, variously colored, in ours orange or brown, scarious or with scarious margins. Ray-flowers neutral; ligules yellow. Disk-flowers fertile. Receptacle flat or slightly convex. Achenes flat or more or less convex on the back. Pappus of two fimbriate squamellae, two awns or minute teeth, or none.

Leaves pinnatifid.

Achenes winged.

Achenes wingless.

Leaves simple.

1. *C. Atkinsoniana*.

2. *C. tinctoria*.

3. *C. lanceolata*.

1. ***C. Atkinsoniana*** Dougl. Annual or perennial (?), with a taproot; stem 4-10 dm. high, glabrous; leaves opposite, pinnately or bipinnately divided into linear divisions, glabrous; involucre about 6 mm. high, 15 mm. broad; outer bracts oblong, obtuse, the inner broadly ovate; ligules orange, 12-15 mm. long. River banks: B.C.—N.D.—Ore. Plain. Jl—Au.

2. ***C. tinctoria*** Nutt. Annual, with a taproot; stem 4-10 dm. high, glabrous; lower leaves bipinnately, the upper ones pinnately divided into linear divisions, glabrous; involucre about 7 mm. high, 10-15 mm. wide; outer bracts oblong, in fruit reflexed; inner bracts ovate or lance-ovate, acute; ligules 8-12 mm. long, orange, with or without purple base. Low ground: Man.—Va.—Tex.—Ariz.—e B.C. Plain. Je—Au.

3. ***C. lanceolata*** L. Perennial, with a short rootstock; stem 2-5 dm. high, glabrous; leaves opposite, the lower spatulate or oblanceolate, petioled, the upper linear-lanceolate or linear, obtuse; involucre 8 mm. high and 12-15 mm. broad; outer bracts lanceolate, only slightly shorter than the ovate-lanceolate inner ones; ligules orange, 12-25 mm. long, coarsely toothed; achenes broadly wing-margined; pappus obsolete. Rich soil: Ont.—Fla.—La.—N.M.—Colo. Plain. My—Au.

79. BÍDENS L. BEGGAR-TICKS, BUR-MARIGOLD.

Caulescent herbs, ours all annual. Leaves mostly opposite, simple or pinnatifid. Heads numerous, radiate or discoid. Involucre campanulate or turbinate, of two series of bracts, distinct or united only at the very base, the outer foliaceous, the inner scarious and appressed. Receptacle flat, chaffy. Ray-flowers neutral; ligules yellow or white, or none. Disk-flowers hermaphrodite and fertile. Achenes flat, 4-angled, or rarely almost terete, beakless. Pappus of 2-4 (in ours retrorsely) barbed awns or teeth, rarely none.

Achenes flat, obovate or cuneate; leaves or segments broad.

Leaves pinnately 3-5-foliolate.

Outer bracts 4-8; achenes nearly black.

Outer bracts 10-16; achenes brown.

Leaves simple.

Heads discoid, erect; corolla 4-toothed; achenes not tubercled.

Heads usually radiate, nodding; corolla 5-toothed.

Outer bracts not much longer than the inner; achenes not corky on the angles.

Outer bracts surpassing the rays; achenes with corky angles.

1. *B. frondosa*.

2. *B. vulgaris*.

3. *B. comosa*.

4. *B. prionophylla*.

5. *B. glaucescens*.

6. *B. Bigelovii*.

7. *B. tenuisecta*.

Achenes linear, tetragonal; leaf-segments small.

Divisions of the leaves oblong or lanceolate.

Divisions of the leaves linear.

1. ***B. frondosa*** L. Annual; stem 3-10 dm. high; leaves pinnately 3-5-foliolate, glabrous or nearly so, scabrous on the margins; leaflets 3-8 cm. long, lanceolate or oblong-lanceolate, sharply serrate, acuminate; involucre 10-15 mm. high and broad; outer bracts 4-8, spatulate-linear, entire, ciliate; ligules usually

present, golden-yellow, equalling the disk; achenes black, tuberculate. Wet places: N.B.—Fla.—Utah—B.C. *Plain.* JI-O.

2. *B. vulgata* Greene. Annual; stem 5-10 dm. high, glabrous; leaves pinately 3-5-foliolate, glabrous or nearly so; leaflets lanceolate, acute, serrate, short-stalked; involucre 10-12 mm. high, 15-25 mm. broad; outer bracts 8-16, linear or linear-ob lanceolate, ciliate, entire, rarely exceeding the disk; ligules usually present, equalling the disk; achenes brown or olivaceous, smooth or merely papillose. Wet ground: Ont.—N.C.—Calif.—B.C. *Plain.* Au-S.

3. *B. comosa* (A. Gray) Wiegand. Annual; stem 3-8 m. high, glabrous; leaves simple, 5-10 cm. long, narrowly elliptic or lance-elliptic, acuminate, serrate; involucre about 12 mm. high and 12-18 mm. broad; outer bracts 6-8, linear or linear-lanceolate, mucronate, entire, 2-5 times as long as the disk, nearly erect; achenes olive-green or brownish, smooth; awns 3. Wet ground: Mass.—Va.—Colo.—Neb. *Plain.* Au-O.

4. *B. prionophylla* Greene. Annual; stem slender, 3-5 dm. high, more or less pubescent; leaves linear or linear-lanceolate, sharply serrate, 5-10 cm. long, sessile; heads nodding, about 1 cm. high, and 2 cm. broad; achenes greenish; awns 3 or 4, very unequal. Water and wet places: Ont.—N.Y.—S.D.—(? Colo.)—Mont. *Plain.* Au-S.

5. *B. glaucescens* Greene. Annual; stem 3-7 dm. high, glabrous or sparingly hairy; leaves linear-lanceolate, 5-15 cm. long, serrate, sessile, somewhat paler beneath; heads nodding, 1 cm. high, 2-3 cm. wide; ligules often 1 cm. long; awns 4. *B. cernua* of western reports. In water and wet grounds: Sask.—Kans.—Utah—Ida.—Alta. *Plain—Submont.* JI-S.

6. *B. Bigelovii* A. Gray. Annual; stem 4-6 dm. high, glabrous or sparingly pubescent; leaves bipinnate, 4-10 cm. long; blades deltoid in outline, primary divisions broadly ovate, the secondary ones oblong or oblong-ovate, obtuse or acutish; involucre about 6 mm. high and 1 cm. broad; outer bracts linear, obtuse, shorter than the inner; outer achenes 5-6 mm. long, terete, striate, their awns less than 2 mm. long; central achenes 10-15 mm. long, their awns over 3 mm. long. Along streams: Tex.—Colo.—Ariz. *Son.—Submont.* JI-S.

7. *B. tenuisecta* A. Gray. Annual; stem 3-6 dm. high, branched from the base, glabrous; leaves twice or thrice ternately or pinnately dissected into linear lobes; heads about 1 cm. high and broad; bracts linear, hirsute, the outer usually slightly longer than the inner; achenes glabrous, the outer 6-8 mm. long, the inner 10-12 mm. long; awns fully 3 mm. long, those of the outer achenes shorter. Along streams: Tex.—Colo.—Ida.—Ariz.; Mex. *Son.—Submont.* Au-S.

80. THELESPERMA Less.

Glabrous perennial, or annual, with finely dissected or rarely linear entire leaves and long-peduncled heads. Involucre hemispheric or campanulate, of two distinct series of bracts, the outer narrow, short, often spreading, the inner broad, united to about the middle into a cup, their free lobes scarious-margined. Receptacle flat, with a broad, 2-nerved, white-scarious palea subtending each disk-flower. Ray-flowers present, neutral, or none; ligules, if present, yellow, mostly toothed. Disk-flowers perfect, fertile; corolla-tube slender; limb 5-toothed. Anthers obtuse and entire at the base. Style-tips acute. Achenes oblong or linear, terete or slightly compressed. Pappus of 2 retrorsely hispid awns, or sometimes none.

Heads radiate.

Leaf-segments linear-filiform, 1 mm. or less wide.

Annual or biennial; outer bracts subulate-linear, more than half as long as the inner. 1. *T. trifidum.*

Perennial from a rootstock; outer bracts linear-lanceolate, half as long as the inner or less. 2. *T. tenue.*

Leaf-segments linear, over 1 mm. wide; plant perennial or the first only biennial. 3. *T. intermedium.*

Plant with a taproot, leafy throughout.

Plant with a creeping rootstock or woody caudex, leafy only near the base.

Involucre not cleft below the middle; throat of the disk-flowers campanulate, shorter than the lobes. 4. *T. ambiguum.*

Involucre cleft below the middle; throat of the disk-flowers cylindraceous, longer than the lobes. 5. *T. subnudum*.

Heads discoid; perennials, with a rootstock or woody caudex.

Plant less than 2 dm. high; involucre with very broad scarious margins.

6. *T. marginatum*.
Plants 3-6 dm. high; involucre with very narrow scarious margins. 7. *T. gracile*.

1. ***T. trifidum*** (Poir.) Britton. A slender annual or biennial; stem branched. 3-9 dm. high, leafy; leaves bipinnately divided; inner bracts united not higher than the middle, with broad scarious margins; ligules 12-15 mm. long; awns of the pappus rather short, not longer than the width of the achenes. In dry soil: Neb.—Tex.—N.M.—e Colo. *Plain—Submont.* Je—Au.

2. ***T. tenue*** Rydb. Stem 1-3, slender, less than 2 mm. in diameter, mostly simple, 1.5-4 dm. high; leaves twice pinnately dissected; inner bracts united to the middle, broadly scarious-margined; ligules 8-12 mm. long; awns of the pappus very short, about half as long as the width of the achenes. Plains and mountain valleys: Colo. *Submont.—Mont.*

3. ***T. intermedium*** Rydb. A glabrous bushy biennial or perhaps perennial; stems several, 2-6 dm. high; leaves once or twice pinnately divided; involucre about 1 cm. broad; outer bracts very narrowly linear-lanceolate, about half as long as the inner, these united to about the middle, scarious-margined; ligules 10-12 mm. long; teeth of the pappus longer than the width of the achenes. On plains in dry or sandy soil: Neb.—Wyo.—Colo. *Plain—Submont.* Je—Au.

4. ***T. ambiguum*** A. Gray. Stem 2-4 dm. high; leaves once or twice pinnately divided; upper stem-leaves much reduced, often simple; outer bracts very short, ovate or elliptic, 1-2 mm. long, obtuse, the inner very broadly scarious-margined. In dry soil: N.M.—Colo. *Son.* Je—Jl.

5. ***T. subnudum*** A. Gray. Stem subscapose, 1-3 dm. high; leaves pinnately or bipinnately divided into linear or linear-lanceolate divisions; outer bracts short, oblong, about one-fourth as long as the inner, these broadly scarious-margined; pappus a minute 4-5-toothed crown or obsolete. In dry soil: N.M.—Colo.—Utah—Ariz. *Son—Submont.* My—Je.

6. ***T. marginatum*** Rydb. Stem 1-2 dm. high, leafy mostly at and near the base; leaves pinnately or bipinnately divided into linear divisions, 1-2 mm. wide; peduncles mostly solitary, 7-10 cm. long; heads about 1 cm. broad; outer bracts oblong, about one-third as long as the inner, these united to the middle; teeth of the pappus minute. On dry plains: Sask.—Mont. *Plain.* My—S.

7. ***T. gracile*** (Torr.) A. Gray. Stem 3-9 dm. high, branched and leafy; leaves as in the preceding, the upper reduced and often simple; heads 12-15 mm. broad; outer bracts oblong, obtuse, one-fourth as long as the inner, the latter united to the middle or beyond; awns of the pappus longer than the width of the achenes. On plains and prairies: Neb.—Tex.—Ariz.—Wyo. *Plain—Mont.* My—Au.

81. PTILONÉLLA Nutt.

Loosely branched annuals. Leaves alternate, narrowly linear, entire. Heads radiate. Bracts of the involucre narrow, subequal, in two series. Receptacle convex; paleae thin or scarious, narrow. Ray-flowers 3-6, pistillate and fertile; ligules white, 3-cleft. Disk-flowers 7-12, hemaphrodite, fertile, or the central one sterile; corollas white, 5-cleft. Style of the fertile disk-flowers with two short branches, that of the infertile central one entire. Pappus of many narrow, linear or aristiform, fimbriate-lacerate squamellae, sometimes wanting. [*Blepharipappus* Hook., in part.]

1. ***P. scabra*** (Hook.) Nutt. Annual; stem 1-3 dm. high, branched, puberulent, sometimes also sparingly hispid, more or less glandular above; leaves alternate, narrowly linear, entire, scabrous; heads short-peduncled; involucres 6-7 mm. high, 7-10 mm. broad; bracts oblong, glandular-puberulent; ligules white, 6-7 mm. long; disk white. *Blepharipappus scaber* Hook. Dry plains and mountains: Wash.—Ida.—Nev.—Calif. *Son.—Submont.* Ap—Jl.

82. *MĀDIA* Molina.

Glandular-viscid, heavy-scented annuals. Leaves alternate, entire, narrow. Heads radiate. Involucre campanulate; bracts in a single series, strongly inflexed on the margins enclosing the ray-achenes; paleae in a single series enclosing the disk-flowers as an inner involucre inside the rays. Ray-flowers pistillate, fertile; ligules inconspicuous, cuneate, 3-lobed. Disk-flowers hermaphrodite and fertile. Achenes angled, those of the ray-flowers laterally flattened, very oblique. Pappus wanting.

Ray-flowers 5-12; heads not glomerate.

Heads on short branches, racemously disposed.

Heads on long branches, more corymbose.

Ray-flowers 2-5, or none; heads glomerate.

1. *M. racemosa*.

2. *M. dissitiflora*.

3. *M. glomerata*.

1. *M. racemosa* T. & G. Stem 3-6 dm. high, pilose, glandular above; leaves linear, 8-15 cm. long, pilose on both sides; branches of the inflorescence short; involucre 8-10 cm. high and broad; ligules 5-8; disk-achenes flat, indistinctly nerved. *M. sativa racemosa* A. Gray. Rocky or sandy places: B.C.—Ida.—Utah—Calif. *Son.* My-Jl.

2. *M. dissitiflora* (Nutt.) T. & G. Stem slender, pilose, 3-6 dm. high; leaves linear or lance-linear, finely pilose, entire; heads scattered, solitary at the ends of rather slender branches; involucre about 6 mm. high and broad, glandular; ligules 5-8; achenes all flat, not at all angled. Hillsides and valleys: B.C.—Mont.—Utah—Calif. *Submont.* Je—Au.

3. *M. glomerata* Hook. Stem 3-5 dm. high, leafy, hirsute, glandular in the inflorescence; leaves linear, pilose and hirsute-ciliate; heads more or less glomerate; involucre about 6 mm. high and 4 mm. wide; rays 2-5, sometimes none; achenes of the rays somewhat curved, 1-nerved on each face, those of the disk 4- or 5-angled. Open places in the mountains: Sask.—Colo.—Calif.—B.C. *Son.*—Mont. Jl—S.

83. *HARPAECÁRPUS* Nutt.

Slender annuals, with narrowly linear leaves. Heads ligulate. Involucre campanulate; bracts 4-8, in a single series, boat-shaped, each enclosing a ray-achene; paleae of the receptacle united into a 3-5-toothed cup, surrounding the single disk-flower. Ray-flowers 4-8, fertile; ligules inconspicuous, cuneate. Disk-flower single, hermaphrodite and fertile. Ray-achenes compressed laterally, lunate, but broader above; disk-achene obliquely obovate. Pappus wanting.

1. *H. exiguus* (Smith) A. Gray. Stem slender, 1-3 dm. high, hirsute as well as glandular-puberulent, paniculately branched; heads on filiform peduncles; involucre about 3 mm. high and broad; bracts 4-8, hirsute-glandular. *Madia filipes* A. Gray. Open ground: B.C.—Ida.—L. Calif. *Son.* My-Jl.

84. *HEMIZONĒLLA* A. Gray.

Hirsute pubescent and glandular annuals, with linear, mostly opposite leaves. Heads radiate, small. Bracts of the involucre 4 or 5, broad, infolded, enclosing each a ray-achene; paleae united into a 3-5-toothed cup, surrounding the disk-flowers. Ray-flowers 4 or 5, pistillate and usually fertile; ligules minute. Disk-flowers solitary or rarely 2-4, hermaphrodite and fertile. Achenes somewhat dorso-ventrally compressed, those of the disk-flowers straight, those of the ray-flowers incurved.

1. *H. minima* A. Gray. Annual; stem 3-10 cm. high, pilose; leaves 1 cm. long or less, linear, pilose; peduncles shorter than the heads; involucre about 3 mm. high and broad; ray-achenes obovate, slightly curved, strongly obcompressed. Dry sterile soil: B.C.—Ida.—Nev.—Calif. *Son.* Je-Jl.

85. *LAGOPHÝLLA* Nutt.

Slender herbs, with alternate entire leaves and small heads in leafy-bracted clusters. Heads radiate. Bracts of the involucre about 5, thin, herbaceous, with the margins at the base, infolded and each enclosing an achene, with which

they fall; paleae in a single series surrounding the disk-flowers. Ray-flowers pistillate and sterile; ligules cuneate, 3-cleft. Disk-flowers about 5, hermaphrodite and fertile. Ray-achenes obovate-oblong or clavate, obcompressed.

1. *L. ramosissima* Nutt. Stem 2-8 dm. high, at least diffusely branched, glabrate or slightly pilose when young; lower leaves spatulate, the upper linear or nearly so, softly silky-canescens; head about 6 mm. high; bracts silky-ciliate; ligules short, purplish, clavate, carinate along the upper side, about 3 mm. long. Dry ground: Wash.—Ida.—Nev.—Calif. *Son.* Je-S.

86. BLEPHARIPAPPUS Hook.

Annuals, with mostly alternate leaves. Heads radiate. Bracts of the involucre broad, flattened on the back below, with thin, infolded margins, enclosing the ray-achenes; paleae in a series between the disk- and ray-flowers and occasionally some among the latter. Ray-flowers 8-20, pistillate and fertile; ligules conspicuous, various-colored. Disk-flowers hermaphrodite and mostly sterile; corollas yellow; lobes pubescent. Achenes of the ray-flowers obcompressed, without pappus. Pappus of the disk-flowers of 5-20 bristles or awns.

1. *B. glandulosus* Hook. Annual; stem 1-4 dm. high, diffusely branched, more or less hirsute, glandular at the summit; leaves lanceolate or linear, hirsute, the lower lacinate-pinnatifid or lobed, the upper entire; involucre 7-8 mm. high, 12-15 mm. broad; bracts lance-linear, acute, hispidulous and with some black glands below; ligules 8-13, white, about 1 cm. long, 3-lobed; pappus white. *Layia glandulosa* Hook. & Arn. Sandy places: B.C.—Ida.—w N.M.—s Calif. *Son.* Mr-Je.

87. PSILÓSTROPHE DC. PAPER FLOWER.

Tomentose or woolly perennial (all ours) or rarely biennial herbs, or low shrubs. Leaves alternate, entire or lobed. Involucre cylindric or campanulate; bracts in a single series, equal, connivent, sometimes with 1-4 scarious ones within; receptacle naked. Ray-flowers few, pistillate and fertile; ligules broad, 3-lobed, yellow, becoming papery, persistent. Disk-flowers hermaphrodite and fertile; corollas yellow. Style-branches truncate at the apex. Achenes linear, striate. Pappus of lacerate or ciliate squamellae. [*Riddellia* Nutt.]

Stem merely sparingly villous or floccose, not densely white-pannose.

Squamellae of the pappus one-third as long as the disk-corollas, ovate, mostly obtuse; leaves broadly spatulate; ligules 8-12 mm. long, indistinctly nerved.

1. *P. Bakeri*.

Squamellae of the pappus one-half as long as the disk-corollas, lanceolate, acute or acuminate; ligules 5-8 mm. long, distinctly veined.

Leaves oblanceolate, loosely villous; heads short-peduncled.

Upper leaves linear or linear-oblanceolate, glabrate; heads slender-peduncled.

3. *P. sparsiflora*.

4. *P. Cooperi*.

Stem densely white-pannose.

1. *P. Bakeri* Greene. Stem much branched, 1-2 dm. high, loosely floccose; basal leaves 5-10 cm. long, petioled; blades spatulate, more or less distinctly 3-5-ribbed; involucre 7-10 cm. high and nearly as broad; ligules 5, 10-15 mm. long; achenes glabrous, striate. *P. pumila* (M. E. Jones) A. Nels. Dry plains and hills: Colo.—Utah. *Submont.* My-Je.

2. *P. Tagetinae* (Nutt.) Greene. Stem 1-3 dm. high, diffusely branched, loosely villous; lower leaves spatulate, 2-5 cm. long, entire or lobed; upper leaves narrowly oblanceolate; heads numerous, paniculate; involucre 6-8 mm. high and a little less broad; ligules 3-5, 5-8 mm. long. *Riddellia tagetina* T. & G. Dry plains: Tex.—Colo.—Ariz.; n Mex. *Son.* Je-S.

3. *P. sparsiflora* (A. Gray) A. Nels. Stem 1-3 dm. high, green, but sparingly hirsute; leaves linear, 5-8 cm. long, usually entire, hirsute; heads corymbose-paniculate; involucre about 6 mm. long, 4-5 mm. wide; ligules usually 3, 7-8 mm. long and still broader. *R. tagetina sparsiflora* A. Gray. Arid places: Ariz.—Utah. *Son.*

4. *P. Cooperi* (A. Gray) Greene. Undershrub, 2-5 dm. high; branches densely and finely white-pannose; leaves linear, 2-7 cm. long, tomentose; heads

paniculate; involucre 7-9 mm. high, 5-6 mm. broad; ligules mostly 5, 8-15 mm. long; pappus-squamellae oblong or lanceolate, erose at the summit, less than half as long as the disk-corollas. Gravelly plains: Ariz.—s Utah—s Calif.; L. Calif. *L. Son.* Ap—My.

88. *BAILEYA* Harv. & Gray. WILD MARIGOLD.

Annual or perennial floccose herbs. Leaves alternate, pinnatifid or the upper entire. Heads radiate. Involucre hemispheric; bracts equal, woolly, in two series; receptacle flat, naked, alveolate. Ray-flowers pistillate and fertile; ligules oval or oblong, yellow, 7-nerved, becoming papery, persistent. Disk-flowers hermaphrodite and fertile; corollas yellow. Anthers minutely sagittate at the base. Style-branches short, truncate. Achenes linear, truncate, many-ribbed. Pappus none.

Plant leafy throughout; annual.

Plant naked above, almost scapose; biennial.

1. *B. pleniradiata*.

2. *B. multiradiata*.

1. *B. pleniradiata* Harv. & Gray. Stem 2-4 dm. high, floccose, leafy and branched; lower leaves incise-pinnatifid, with oblong or linear divisions, loosely floccose, the upper merely toothed or entire; heads solitary at the ends of the branches; peduncles 5-10 cm. long; involucre about 6 mm. high and 12 mm. broad; ligules 25-40, about 1 cm. long, 5 mm. wide. *B. multiradiata* A. Gray, not Harv. & Gray. Plains: Ariz.—Utah—s Calif.; n Mex. *Son.* Ap—N.

2. *B. multiradiata* Harv. & Gray. Stem decumbent at the base, and leafy only below, very floccose; leaves pinnately or ternately pinnatifid; divisions again cleft with obovate or elliptic divisions; peduncles 1-2 dm. long; involucre about 8 mm. high, 15-20 mm. broad; ligules about 50, 12-15 mm. long, golden-yellow. *B. multiradiata nudicaulis* A. Gray. Dry plains: w Tex.—s Utah—Nev.—Ariz.; n Mex. *Son.* Ap—O.

89. *MONÓTHRIX* Torr.

Low scabrous undershrubs. Leaves mostly alternate, small, punctate, mostly ovate. Heads radiate or discoid. Involucre hemispheric; bracts in two equal series, boat-shaped, double-ribbed, partly enclosing the marginal achenes; receptacle flat, alveolate. Ray-flowers, if present, pistillate and fertile. Disk-flowers many, hermaphrodite and fertile. Achenes flat, with a thick margin. Pappus of 1 barbellate awn or wanting.

1. *M. Stansburii* (A. Gray) Rydb. Stems 1-2 dm. high, diffusely branched; lower leaves opposite, the upper alternate, petioled; blades ovate or rhombic-ovate, dentate, 1 cm. long or less, scabrous, triple-veined; involucre 5-6 mm. high and fully as broad; bracts linear, acute; ligules 6-10, oblong, 3-4 mm. long; pappus-bristle present, shorter than the disk-corollas. *Laphamia Stansburii* A. Gray. Among rocks: Utah. *Son.* Je—Jl.

90. *PERICÔME* A. Gray.

Tall, strong-scented perennial herbs. Leaves opposite, petioled; blades hastate or triangular. Heads discoid in large cymes. Involucre turbinate-campanulate; bracts in a single series, more or less united below, hyaline-margined, with thick midrib. Flowers hermaphrodite and fertile; corollas pale yellow, 4-toothed. Anthers subsagittate at the base. Style-branches filiform, obtuse. Achenes linear-oblong, compressed, hispid-ciliate on the margins. Pappus a crown of fimbriate-lacerate squamellae, sometimes with two marginal awns.

1. *P. caudata* A. Gray. Widely branching perennial, 1 m. high or more; leaf-blades thin, green, minutely resinous-granuliferous, triangular-hastate, 5-15 cm. long, sparingly sinuate-dentate, caudately long-acuminate; involucre about 5 mm. high and 6 mm. wide. Rocky cañons: N.M.—Colo.—Calif.; n Mex. *Submont.* Jl—O.

91. *PICRADENIÓPSIS* Rydb.

Low perennial caulescent herbs, more or less woody at the base. Leaves opposite, pedately 3-5-divided, with linear divisions, or the upper entire. Heads radiate, corymbose. Involucre campanulate; bracts subequal, in two series,

3-nerved, the outer more or less keeled. Ray-flowers few, pistillate and fertile; ligules yellow, short. Disk-flowers many, hermaphrodite and fertile; corollas yellow. Achenes elongate-obpyramidal, glandular or hispidulous. Pappus of a crown of 8 ovate or lanceolate squamellae.

1. **P. oppositifolia** (Nutt.) Rydb. Stem 1-2 dm. high, branched below, strigose-puberulent; leaves 1-5 cm. long, impressed-punctate and strigose-puberulent; involucre 5-7 mm. high and 7-10 mm. broad; ligules 3-4 mm. long; achenes glandular. *Bahia oppositifolia* A. Gray. Alkaline soil and dry plains: N.D.—Tex.—Ariz.—Mont. *Plain—Submont.* Je-S.

92. AMAURIOPSIS Rydb.

Glandular-pubescent annuals. Leaves alternate, twice or thrice ternately divided. Heads radiate, in leafy corymbs. Involucre hemispheric; bracts 16-20, herbaceous, in 3 series; receptacle flat, alveolate. Ray-flowers 16-20, pistillate, fertile; ligules cuneate, 3-cleft. Disk-flowers hermaphrodite and fertile; corollas yellow. Achenes elongate, narrowly obpyramidal, 4-angled, striate. Pappus wanting.

1. **A. dissecta** (A. Gray) Rydb. Stem 3-10 dm. high, puberulent or glabrate below, glandular above; leaves with oblong or linear obtuse divisions, more or less puberulent; involucre 6-7 mm. high, about 1 cm. broad, glandular-puberulent; bracts oblong-ob lanceolate to obovate-oblong, abruptly acuminate. *Bahia chrysanthemoides* A. Gray. *Villanova dissecta* Rydb. Along streams: N.M.—Wyo.—Ariz.; n Mex. *Son.—Mont.* Jl-S.

93. PLATYSCHKÛRIA (A. Gray) Rydb.

Perennial grayish puberulent herbs, woody at the base. Leaves alternate, petioled, entire. Heads radiate, corymbose. Involucre hemispheric; bracts herbaceous in 2 series, oblong; receptacle flat, glabrous. Ray-flowers pistillate and fertile; ligules yellow, oblong, slightly 3-toothed. Disk-flowers fertile; corollas glandular, yellow. Achenes elongate, 4-angled, tapering downward, sparingly hairy on the angles. Pappus of 10-16 lanceolate squamellae, with the distinct midrib extending beyond the apex.

Stem scapiform or nearly so; leaves firm, oval to lanceolate.
Stem leafy; leaves thin, oblong.

1. *P. integrifolia*.
2. *P. oblongifolia*.

1. **P. integrifolia** (A. Gray) Rydb. Stem 1.5-4 dm. high, almost scapiform; basal leaf-blades cinereous-puberulent, oval to lanceolate, 2-7 cm. long, 3-ribbed, thick; upper stem-leaves much reduced, linear-lanceolate; involucre 8-10 mm. high, 12-20 mm. broad; ligules 8-10 mm. long; pappus-squamellae lanceolate, erose, 2 mm. long. *Bahia integrifolia* A. Gray. *B. nudicaulis* A. Gray. *B. desertorum* M. E. Jones. Dry plains: Wyo.—Colo.—Utah. *Son.—Submont.* My-Je.

2. **P. oblongifolia** (A. Gray) Rydb. Stem leafy, 2-3 dm. high, strigose-puberulent; leaf-blades oblong or lanceolate, obtuse, 2-5 cm. long, 3-ribbed; involucre about 8 mm. high and 12 mm. wide; pappus-squamellae linear-lanceolate, entire, fully 4 mm. long. *Bahia oblongifolia* A. Gray. Arid regions: N.M.—sw Colo.—se Utah—Ariz. *Son.* Jl-S.

94. HULSEA T. & G.

More or less fleshy villous or viscid perennials, biennials, or annuals. Leaves alternate, sessile or with winged petioles. Heads radiate, large. Involucre hemispheric; bracts in 2 or 3 series, narrow; receptacle flat, alveolate-dentate with minute horny teeth. Ray-flowers pistillate and fertile; ligules elongate, yellow or purplish. Disk-flowers fertile; corollas yellow, glandular-viscid. Style-branches obtuse. Achenes linear-cuneate, compressed, villous especially on the margins. Pappus of 4 hyaline nerveless squamellae.

1. **H. carnosa** Rydb. Perennial, with a thick root and creeping subterranean stems, caespitose; overground stems 1.5-3 dm. high, very leafy throughout, pubescent, more or less viscid; leaves very fleshy, linear, sinuately lobed, viscid-pubes-

cent, 5-8 cm. long; head solitary, 1.5-2 cm. high; bracts linear-lanceolate, viscid-pubescent and more or less villous; rays light yellow, less than 1 cm. long. Among rocks: Mont.—Wyo.—Ida. *Subalp.*—*Alp.* JI—Au.

95. CEPHALOBÉMBIX Rydb.

Slender glandular-hirsute annuals. Leaves impressed-punctate, pinnately dissected into linear-filiform divisions, the lower opposite, the upper alternate. Heads discoid, corymbose. Involucres turbinate or obconic; bracts 5-8, obovate, scarious and more or less colored around the margins. Flowers hermaphrodite and fertile; corollas light yellow, glandular on the tube. Style-branches with short acute appendages. Achenes elongate-obpyramidal, 4-angled, hispidulous on the angles below. Pappus of 8 scarious squamellae.

1. *C. neomexicana* (A. Gray) Rydb. Stem branched, 1-2 dm. high, sparingly strigose or glabrate; leaves pinnately divided into 3-5 linear divisions, which are entire or the lowest 2-3-cleft; involucres about 6 mm. high and 8 mm. broad; bracts about 10, striate. *Bahia neomexicana* A. Gray. Sandy soil: N.M.—Colo.—Ariz.; Mex. *Son.*—*Submont.* Au—O.

96. HYMENOPÁPPUS L'Her.

More or less tomentose-floccose perennials or biennials, with mostly 1-2-pinnately divided leaves. Heads corymbose or rarely solitary, discoid. Involucre hemispheric, or nearly so; bracts 6-12, in 1-2 series, subequal, appressed, more or less colored and scarious-margined. Receptacle naked. Disk-flowers all perfect and fertile; corollas yellow. Styles with short conic appendages. Achenes mostly obpyramidal, 4-5-angled, the faces 1-3-nerved. Pappus of 10-20 hyaline obtuse scales without costa, or none.

Throat of the corolla campanulate, 1-2 mm. long, not over twice as long as the lobes.

Pappus over 1 mm. long, equalling the corolla-tube or nearly so.

Stem 3-6 dm. high, leafy throughout; heads numerous.

Plant sparingly and loosely floccose; leaves glabrate in age. 1. *H. tenuifolius*.

Plant densely tomentose; leaves permanently tomentose. 2. *H. tomentosus*.

Stem less than 3 dm. high.

Stem-leaves much reduced; stem white-tomentose or nearly so; heads few.

3. *H. scaposus*.

Stem-leaves not much reduced; stem sparingly grayish-tomentose.

5. *H. cinereus*.

Pappus 1 mm. or less long, much shorter than the corolla-tube; stem-leaves and heads few.

Pappus not hidden by the hairs of the achenes.

Stem permanently densely white-tomentose; achenes silky. 4. *H. arenosus*.

Stem sparingly grayish-tomentose, glabrate in age; achenes loosely villous.

5. *H. cinereus*.

Pappus hidden by the hairs of the achenes, or sometimes none.

Leaflets glabrate in age, at least above; ultimate segment 5-30 mm. long.

6. *H. filifolius*.

Leaves permanently densely white-tomentose; ultimate segments short, 1-5 mm. long.

7. *H. luteus*.

Throat of the corolla cylindro-campanulate, 1.5-4 mm. long, 3-4 times as long as the lobes.

Pappus equalling the corolla-tube; plant dwarf.

Heads less than 1 cm. high and broad; corolla-tube 1.5-2 mm. long; stem not woolly at the base.

8. *H. parvulus*.

Heads over 1 cm. high and 1.5 cm. broad; corolla-tube 3-4 mm. long; stem woolly at the base.

Bracts more or less rose- or purple-tinged.

9. *H. lugens*.

Bracts yellow-tinged.

3. *H. scaposus*.

Pappus shorter than the corolla-tube; throat 3-4 mm. long; plant 2-4 dm. high.

Stem leafy at least half its height, decidedly woolly at the base. 10. *H. eriopodus*.

Stem leafy only at the base, not conspicuously woolly. 11. *H. macroglottis*.

1. *H. tenuifolius* Pursh. Biennial or short-lived perennial, slightly tomentose, in age often glabrate, 3-6 dm. high, branched and leafy; leaves except the uppermost 1-3 pinnately divided into linear divisions, 5-30 mm. long; heads numerous, 8-12 mm. broad; corollas dirty white or cream-colored; achenes densely pubescent. Plains and dry prairies: N.D.—Wyo.—N.M.—Tex.—Ark. *Plain.* Je—S.

2. *H. tomentosus* Rydb. Biennial; stem 3-4 dm. high, leafy and branched above; leaves 5-7 cm. long, bipinnately divided into linear segments, 4-10 mm. long; involucre densely woolly, somewhat turbinate, 8 mm. high and broad; flowers yellow; corolla throat a little over 1 mm. long, broadly campanulate, of about the same length as the lobes. Dry plains: s Utah. *Son.*

3. *H. scaposus* Rydb. Perennial; stem almost naked, with 1-2 reduced leaves, more or less densely tomentose; leaves mostly basal, 5-7 cm. long, bipinnately divided into linear segments, 3-10 mm. long, densely tomentose, especially at the base; heads about 1 cm. high and broad; bracts obovate, with yellowish or purplish scarious margins; corollas yellow; throat nearly 2 mm. long, campanulate and longer than the lobes; squamellae of the pappus fully 2 mm. long, longer than the tube of the corolla. Dry hills: N.M.—Utah—Nev.—Ariz. *Son.* My-Jl.

4. *H. aeneosus* Heller. A white-tomentose perennial, with branched woody caudex; stems several, 2-4 dm. high, densely tomentose, especially at the base, 2-4-leaved; leaves mostly basal, twice pinnately divided into linear-filiform divisions 3-15 mm. long, 1 mm. wide; heads about 8 mm. high, 8-10 mm. broad; bracts oblong, with narrow scarious margins, tomentose; corollas yellow; throat nearly 2 mm. long; achenes long-silky; pappus rather short, about 1 mm. long, but not hidden by the hairs. On dry hills: N.M.—Colo.—Ariz. *Son.*—*Submont.* My-Jl.

5. *H. cinereus* Rydb. Perennial, with a caespitose caudex; stems about 2 dm. high, branched; leaves bipinnately divided into linear segments 1-2 cm. long and about 1 mm. wide, sparingly grayish tomentulose; heads 8-10 mm. high, 10-12 mm. broad; bracts oblong-obovate, with narrow scarious margins; corollas yellow; throat about 1.5 mm. long, broadly campanulate, longer than the lobes; achenes loosely villous. *H. ochroleucus* Greene. Dry hills and plains: Colo.—Utah. *Submont.*—*Subalp.* My-Jl.

6. *H. filifolius* Hook. Perennial; stem 2-3.5 dm. high, sparingly branched; leaves similar to those of *H. tenuifolius*; heads few, 10-15 mm. broad; bracts obovate-oblong, with broad scarious margins, tomentose; corollas bright yellow; throat about 1.5 mm. long; achenes densely villous, the long hairs hiding the small pappus; squamellae less than 1 mm. long. On plains and prairies: Alta.—Sask.—Kans.—N.M.—Nev.—Wash. *Plain*—*Submont.* Je-S.

7. *H. luteus* Nutt. Perennial; stem 1-2 dm. high, with a few reduced leaves and few heads; basal leaves 2-7 cm. long, twice pinnately divided into short lobes 1-5 mm. long; heads about 1 cm. high, 10-15 mm. broad; bracts oblong, broadly scarious-margined; corolla yellow; throat about 1 mm. long; achenes densely villous-hirsute; scales of the pappus short, about 0.5 mm. long. Bad-lands and clay-hills: Wyo. *Submont.*—*Mont.* My-Jl.

8. *H. parvulus* Greene. Perennial; stem 1-2 dm. high, scapiform, slightly tomentose; basal leaves 5-8 cm. long, bipinnatifid, with narrowly linear-filiform divisions, 5-12 mm. long, grayish-tomentose; stem-leaves few and small; involucre turbinate, 6-7 mm. high and broad; bracts oblong-obovate, greenish yellow, sparingly tomentulose; corollas brownish yellow; throat cylindro-campanulate, 1.5-2 mm. long, about 3 times as long as the teeth; achenes short villous. Dry hills: Colo. *Submont.* Jl-Au.

9. *H. lugens* Greene. Perennial; stem scapiform, 2-3 dm. high, white-tomentulose; leaves bipinnatifid with filiform divisions, permanently white-tomentose, 5-10 cm. long; stem-leaves small and few; involucre nearly 1 cm. high, 12-15 mm. broad; bracts elliptic, the outer usually with purple-tinged margins; corolla-throat cylindraceous, 3-4 mm. long, 3-4 times as long as the lobes; pappus-scales oblong-obovate, as long as the corolla-tube. Dry ridges: s Calif.—Utah—Ariz. *Son.*—*Submont.* My-Au.

10. *H. eriopodus* A. Nels. Perennial; stem 3-10 cm. high, leafy; leaves numerous, bipinnately divided into filiform divisions, sparingly tomentulose or glabrate; involucre about 1 cm. high and 12-15 mm. broad; bracts elliptic, scarious-margined, sometimes purplish; corolla-throat about 3 mm. long, cylindro-

campanulate, about 3 times as long as the lobes; pappus-scales linear-oblong, about half as long as the corolla-tube. Rocky places: Utah—Nev. *Son.* My.

11. *H. macroglottis* Rydb. Perennial; stems several, 3–4 dm. high; leaves mostly basal, about 1 dm. long, bipinnately divided into linear lobes 8–25 mm. long; stem-leaves simply pinnate or simple; heads few, 12 mm. high and 12–15 mm. broad; bracts oblong, with very narrow yellowish scarious margins; corolla yellow; throat deeply campanulate, 3–4 mm. long, 3–4 times as long as the lobes; squamellae of the pappus about 1 mm. long. Dry hills: Tex.—Colo.—Utah—Ariz. *Son.* Au-S.

97. *LEUCÁMPYX* A. Gray. WILD COSMOS.

More or less floccose perennials. Leaves alternate, bi- or tripinnatifid into linear divisions. Heads corymbose, radiate. Involucres hemispheric; bracts subequal, in 2–3 series, with scarious colored tips and margins; receptacle convex, with broad membranous paleae, half enclosing the achenes. Ray-flowers pistillate and fertile; ligules broad, 3-toothed, white or cream-colored. Disk-flowers fertile; corollas yellow. Style branches penicillate, with short appendages. Achenes of the ray-flowers cuneate, 3-angled, those of the disk-flowers 5-angled, all more or less curved, striate and muriculate. Pappus a minute crown.

1. *L. Newberryi* A. Gray. Stem stout, 3–6 dm. high; involucres about 8 mm. high, 10–15 mm. wide; bracts obovate, obtuse; ligules 10–15 mm. long. Cañons: Colo.—N.M. *Submont.*—*Mont.* Je-Au.

98. *OTHÀKE* Raf.

Erect glandular annual herbs. Leaves alternate, mostly entire. Heads corymbose or paniculate, radiate or discoid. Inflorescence campanulate to obconic; bracts narrow, in 1–2 series, herbaceous, usually colored, at least at the tips. Receptacle small, flat, naked. Ray-flowers, when present, pistillate, fertile; ligules pink or rose-colored, broad, 3-cleft. Disk-flowers fertile; corollas pink or rose, 5-divided almost to the tube. Style-branches filiform, pubescent throughout. Achenes linear to narrowly obpyramidal, 4-angled. Pappus of 6–12 lanceolate, strongly ribbed squamellae.

Heads radiate; leaves lanceolate to linear-lanceolate.
Heads discoid; leaves narrowly linear.

1. *O. sphacelata*.
2. *O. macrolepis*.

1. *O. sphacelata* (Nutt.) Rydb. Stem stout, branched, hispid, glandular-pubescent and viscid above, 2–6 dm. high; leaves petioled, lanceolate or linear-lanceolate, scabrous on both sides, indistinctly 3-veined; involucre 10–15 mm. high; ligules 8–10, rose-purple, 1–2 cm. long; pappus-scales of the disk-flowers 6–8, lanceolate, more than half as long as the achenes. *Polypteris Hookeriana* A. Gray, in part, not *Palafoxia Hookeriana* T. & G. Sandy plains: Tex.—Neb.—Colo.—N.M.; n Mex. *Son.*—*Submont.*

2. *O. macrolepis* Rydb. Stem 3–4 dm. high, strigose-puberulent, and glandular on the upper parts; leaves strigose-puberulent on both sides, 3–5 cm. long, 2–3 mm. wide; involucres 9–10 mm. high and about as wide; bracts 8–12, linear-oblong, abruptly acute; disk-corollas 14–15 mm. long; pappus-squamellae 6–8, lanceolate, caudate-acuminate 5–6 mm. long. Plains: Colo. Au.

99. *RIGIOPÁPPUS* A. Gray.

Slender puberulent annuals. Leaves alternate, linear, entire. Heads radiate. Involucre turbinate; bracts subequal, in 2 series, linear-subulate, concave, partly enclosing the ray-flowers; receptacle flat, naked. Ray-flowers 5–8, pistillate, fertile; ligules short, scarcely exceeding the disk. Disk-flowers fertile. Style-branches short, glabrous, with subulate hirtellous tips. Achenes slender, linear, hispid. Pappus of 4 or 5 rigid subulate awn-like squamellae.

1. *R. leptocladus* A. Gray. Stem slender, 1–3 dm. high, minutely hirsutulous; branches naked below and becoming longer than the main stem; leaves

Involucre cleft below the middle; throat of the disk-flowers cylindraceous, longer than the lobes. 5. *T. subnudum*.

Heads discoid; perennials, with a rootstock or woody caudex.

Plant less than 2 dm. high; involucre with very broad scarious margins.

6. *T. marginatum*.
Plants 3-6 dm. high; involucre with very narrow scarious margins. 7. *T. gracile*.

1. ***T. trifidum*** (Poir.) Britton. A slender annual or biennial; stem branched. 3-9 dm. high, leafy; leaves bipinnately divided; inner bracts united not higher than the middle, with broad scarious margins; ligules 12-15 mm. long; awns of the pappus rather short, not longer than the width of the achenes. In dry soil: Neb.—Tex.—N.M.—e Colo. *Plain—Submont.* Je—Au.

2. ***T. tenue*** Rydb. Stem 1-3, slender, less than 2 mm. in diameter, mostly simple, 1.5-4 dm. high; leaves twice pinnately dissected; inner bracts united to the middle, broadly scarious-margined; ligules 8-12 mm. long; awns of the pappus very short, about half as long as the width of the achenes. Plains and mountain valleys: Colo. *Submont.—Mont.*

3. ***T. intermedium*** Rydb. A glabrous bushy biennial or perhaps perennial; stems several, 2-6 dm. high; leaves once or twice pinnately divided; involucre about 1 cm. broad; outer bracts very narrowly linear-lanceolate, about half as long as the inner, these united to about the middle, scarious-margined; ligules 10-12 mm. long; teeth of the pappus longer than the width of the achenes. On plains in dry or sandy soil: Neb.—Wyo.—Colo. *Plain—Submont.* Je—Au.

4. ***T. ambiguum*** A. Gray. Stem 2-4 dm. high; leaves once or twice pinnately divided; upper stem-leaves much reduced, often simple; outer bracts very short, ovate or elliptic, 1-2 mm. long, obtuse, the inner very broadly scarious-margined. In dry soil: N.M.—Colo. *Son.* Je—Jl.

5. ***T. subnudum*** A. Gray. Stem subscapose, 1-3 dm. high; leaves pinnately or bipinnately divided into linear or linear-lanceolate divisions; outer bracts short, oblong, about one-fourth as long as the inner, these broadly scarious-margined; pappus a minute 4-5-toothed crown or obsolete. In dry soil: N.M.—Colo.—Utah—Ariz. *Son—Submont.* My—Je.

6. ***T. marginatum*** Rydb. Stem 1-2 dm. high, leafy mostly at and near the base; leaves pinnately or bipinnately divided into linear divisions, 1-2 mm. wide; peduncles mostly solitary, 7-10 cm. long; heads about 1 cm. broad; outer bracts oblong, about one-third as long as the inner, these united to the middle; teeth of the pappus minute. On dry plains: Sask.—Mont. *Plain.* My—S.

7. ***T. gracile*** (Torr.) A. Gray. Stem 3-9 dm. high, branched and leafy; leaves as in the preceding, the upper reduced and often simple; heads 12-15 mm. broad; outer bracts oblong, obtuse, one-fourth as long as the inner, the latter united to the middle or beyond; awns of the pappus longer than the width of the achenes. On plains and prairies: Neb.—Tex.—Ariz.—Wyo. *Plain—Mont.* My—Au.

81. PTILONÉLLA Nutt.

Loosely branched annuals. Leaves alternate, narrowly linear, entire. Heads radiate. Bracts of the involucre narrow, subequal, in two series. Receptacle convex; paleae thin or scarious, narrow. Ray-flowers 3-6, pistillate and fertile; ligules white, 3-cleft. Disk-flowers 7-12, hemaphrodite, fertile, or the central one sterile; corollas white, 5-cleft. Style of the fertile disk-flowers with two short branches, that of the infertile central one entire. Pappus of many narrow, linear or aristiform, fimbriate-lacerate squamellae, sometimes wanting. [*Blepharipappus* Hook., in part.]

1. ***P. scabra*** (Hook.) Nutt. Annual; stem 1-3 dm. high, branched, puberulent, sometimes also sparingly hispid, more or less glandular above; leaves alternate, narrowly linear, entire, scabrous; heads short-peduncled; involucre 6-7 mm. high, 7-10 mm. broad; bracts oblong, glandular-puberulent; ligules white, 6-7 mm. long; disk white. *Blepharipappus scaber* Hook. Dry plains and mountains: Wash.—Ida.—Nev.—Calif. *Son.—Submont.* Ap—Jl.

82. **MADIA** Molina.

Glandular-viscid, heavy-scented annuals. Leaves alternate, entire, narrow. Heads radiate. Involucre campanulate; bracts in a single series, strongly inflexed on the margins enclosing the ray-achenes; paleae in a single series enclosing the disk-flowers as an inner involucre inside the rays. Ray-flowers pistillate, fertile; ligules inconspicuous, cuneate, 3-lobed. Disk-flowers hermaphrodite and fertile. Achenes angled, those of the ray-flowers laterally flattened, very oblique. Pappus wanting.

Ray-flowers 5-12; heads not glomerate.

Heads on short branches, racemously disposed.

Heads on long branches, more corymbose.

Ray-flowers 2-5, or none; heads glomerate.

1. *M. racemosa*.

2. *M. dissitiflora*.

3. *M. glomerata*.

1. ***M. racemosa*** T. & G. Stem 3-6 dm. high, pilose, glandular above; leaves linear, 8-15 cm. long, pilose on both sides; branches of the inflorescence short; involucre 8-10 cm. high and broad; ligules 5-8; disk-achenes flat, indistinctly nerved. *M. sativa racemosa* A. Gray. Rocky or sandy places: B.C.—Ida.—Utah—Calif. Son. My-Jl.

2. ***M. dissitiflora*** (Nutt.) T. & G. Stem slender, pilose, 3-6 dm. high; leaves linear or lance-linear, finely pilose, entire; heads scattered, solitary at the ends of rather slender branches; involucre about 6 mm. high and broad, glandular; ligules 5-8; achenes all flat, not at all angled. Hillsides and valleys: B.C.—Mont.—Utah—Calif. Submont. Je—Au.

3. ***M. glomerata*** Hook. Stem 3-5 dm. high, leafy, hirsute, glandular in the inflorescence; leaves linear, pilose and hirsute-ciliate; heads more or less glomerate; involucre about 6 mm. high and 4 mm. wide; rays 2-5, sometimes none; achenes of the rays somewhat curved, 1-nerved on each face, those of the disk 4- or 5-angled. Open places in the mountains: Sask.—Colo.—Calif.—B.C. Son.—Mont. Jl—S.

83. **HARPAECÁRPUS** Nutt.

Slender annuals, with narrowly linear leaves. Heads ligulate. Involucre campanulate; bracts 4-8, in a single series, boat-shaped, each enclosing a ray-achene; paleae of the receptacle united into a 3-5-toothed cup, surrounding the single disk-flower. Ray-flowers 4-8, fertile; ligules inconspicuous, cuneate. Disk-flower single, hermaphrodite and fertile. Ray-achenes compressed laterally, lunate, but broader above; disk-achene obliquely obovate. Pappus wanting.

1. ***H. exiguus*** (Smith) A. Gray. Stem slender, 1-3 dm. high, hirsute as well as glandular-puberulent, paniculately branched; heads on filiform peduncles; involucre about 3 mm. high and broad; bracts 4-8, hirsute-glandular. *Madia filipes* A. Gray. Open ground: B.C.—Ida.—L. Calif. Son. My-Jl.

84. **HEMIZONELLA** A. Gray.

Hirsute pubescent and glandular annuals, with linear, mostly opposite leaves. Heads radiate, small. Bracts of the involucre 4 or 5, broad, infolded, enclosing each a ray-achene; paleae united into a 3-5-toothed cup, surrounding the disk-flowers. Ray-flowers 4 or 5, pistillate and usually fertile; ligules minute. Disk-flowers solitary or rarely 2-4, hermaphrodite and fertile. Achenes somewhat dorso-ventrally compressed, those of the disk-flowers straight, those of the ray-flowers incurved.

1. ***H. minima*** A. Gray. Annual; stem 3-10 cm. high, pilose; leaves 1 cm. long or less, linear, pilose; peduncles shorter than the heads; involucre about 3 mm. high and broad; ray-achenes obovate, slightly curved, strongly obcompressed. Dry sterile soil: B.C.—Ida.—Nev.—Calif. Son. Je-Jl.

85. **LAGOPHYLLA** Nutt.

Slender herbs, with alternate entire leaves and small heads in leafy-bracted clusters. Heads radiate. Bracts of the involucre about 5, thin, herbaceous, with the margins at the base, infolded and each enclosing an achene, with which

they fall; paleae in a single series surrounding the disk-flowers. Ray-flowers pistillate and sterile; ligules cuneate, 3-cleft. Disk-flowers about 5, hermaphrodite and fertile. Ray-achenes obovate-oblong or clavate, obcompressed.

1. *L. ramosissima* Nutt. Stem 2-8 dm. high, at least diffusely branched, glabrate or slightly pilose when young; lower leaves spatulate, the upper linear or nearly so, softly silky-canescens; head about 6 mm. high; bracts silky-ciliate; ligules short, purplish, clavate, carinate along the upper side, about 3 mm. long. Dry ground: Wash.—Ida.—Nev.—Calif. *Son.* Je-S.

86. BLEPHARIPAPPUS Hook.

Annuals, with mostly alternate leaves. Heads radiate. Bracts of the involucre broad, flattened on the back below, with thin, infolded margins, enclosing the ray-achenes; paleae in a series between the disk- and ray-flowers and occasionally some among the latter. Ray-flowers 8-20, pistillate and fertile; ligules conspicuous, various-colored. Disk-flowers hermaphrodite and mostly sterile; corollas yellow; lobes pubescent. Achenes of the ray-flowers obcompressed, without pappus. Pappus of the disk-flowers of 5-20 bristles or awns.

1. *B. glandulosus* Hook. Annual; stem 1-4 dm. high, diffusely branched, more or less hirsute, glandular at the summit; leaves lanceolate or linear, hirsute, the lower lacinate-pinnatifid or lobed, the upper entire; involucre 7-8 mm. high, 12-15 mm. broad; bracts lance-linear, acute, hispidulous and with some black glands below; ligules 8-13, white, about 1 cm. long, 3-lobed; pappus white. *Layia glandulosa* Hook. & Arn. Sandy places: B.C.—Ida.—w N.M.—s Calif. *Son.* Mr-Je.

87. PSILOSTROPHE DC. PAPER FLOWER.

Tomentose or woolly perennial (all ours) or rarely biennial herbs, or low shrubs. Leaves alternate, entire or lobed. Involucre cylindric or campanulate; bracts in a single series, equal, connivent, sometimes with 1-4 scarious ones within; receptacle naked. Ray-flowers few, pistillate and fertile; ligules broad, 3-lobed, yellow, becoming papery, persistent. Disk-flowers hermaphrodite and fertile; corollas yellow. Style-branches truncate at the apex. Achenes linear, striate. Pappus of lacerate or ciliate squamellae. [*Riddellia* Nutt.]

Stem merely sparingly villous or floccose, not densely white-pannose.

Squamellae of the pappus one-third as long as the disk-corollas, ovate, mostly obtuse; leaves broadly spatulate; ligules 8-12 mm. long, indistinctly nerved.

1. *P. Bakeri*.

Squamellae of the pappus one-half as long as the disk-corollas, lanceolate, acute or acuminate; ligules 5-8 mm. long, distinctly veined.

Leaves oblanceolate, loosely villous; heads short-peduncled.

Upper leaves linear or linear-oblanceolate, glabrate; heads slender-peduncled.

3. *P. sparsiflora*.

4. *P. Cooperi*.

Stem densely white-pannose.

1. *P. Bakeri* Greene. Stem much branched, 1-2 dm. high, loosely floccose; basal leaves 5-10 cm. long, petioled; blades spatulate, more or less distinctly 3-5-ribbed; involucre 7-10 cm. high and nearly as broad; ligules 5, 10-15 mm. long; achenes glabrous, striate. *P. pumila* (M. E. Jones) A. Nels. Dry plains and hills: Colo.—Utah. *Submont.* My-Je.

2. *P. Tagetinae* (Nutt.) Greene. Stem 1-3 dm. high, diffusely branched, loosely villous; lower leaves spatulate, 2-5 cm. long, entire or lobed; upper leaves narrowly oblanceolate; heads numerous, paniculate; involucre 6-8 mm. high and a little less broad; ligules 3-5, 5-8 mm. long. *Riddellia tagetina* T. & G. Dry plains: Tex.—Colo.—Ariz.; n Mex. *Son.* Je-S.

3. *P. sparsiflora* (A. Gray) A. Nels. Stem 1-3 dm. high, green, but sparingly hirsute; leaves linear, 5-8 cm. long, usually entire, hirsute; heads corymbose-paniculate; involucre about 6 mm. long, 4-5 mm. wide; ligules usually 3, 7-8 mm. long and still broader. *R. tagetina sparsiflora* A. Gray. Arid places: Ariz.—Utah. *Son.*

4. *P. Cooperi* (A. Gray) Greene. Undershrub, 2-5 dm. high; branches densely and finely white-pannose; leaves linear, 2-7 cm. long, tomentose; heads

paniculate; involucre 7-9 mm. high, 5-6 mm. broad; ligules mostly 5, 8-15 mm. long; pappus-squamellae oblong or lanceolate, erose at the summit, less than half as long as the disk-corollas. Gravelly plains: Ariz.—s Utah—s Calif.; L. Calif. *L. Son.* Ap—My.

88. *BAILÈYA* Harv. & Gray. WILD MARIGOLD.

Annual or perennial floccose herbs. Leaves alternate, pinnatifid or the upper entire. Heads radiate. Involucre hemispheric; bracts equal, woolly, in two series; receptacle flat, naked, alveolate. Ray-flowers pistillate and fertile; ligules oval or oblong, yellow, 7-nerved, becoming papery, persistent. Disk-flowers hermaphrodite and fertile; corollas yellow. Anthers minutely sagittate at the base. Style-branches short, truncate. Achenes linear, truncate, many-ribbed. Pappus none.

Plant leafy throughout; annual.

Plant naked above, almost scapose; biennial.

1. *B. pleniradiata*.

2. *B. multiradiata*.

1. *B. pleniradiata* Harv. & Gray. Stem 2-4 dm. high, floccose, leafy and branched; lower leaves incise-pinnatifid, with oblong or linear divisions, loosely floccose, the upper merely toothed or entire; heads solitary at the ends of the branches; peduncles 5-10 cm. long; involucre about 6 mm. high and 12 mm. broad; ligules 25-40, about 1 cm. long, 5 mm. wide. *B. multiradiata* A. Gray, not Harv. & Gray. Plains: Ariz.—Utah—s Calif; n Mex. *Son.* Ap—N.

2. *B. multiradiata* Harv. & Gray. Stem decumbent at the base, and leafy only below, very floccose; leaves pinnately or ternately pinnatifid; divisions again cleft with obovate or elliptic divisions; peduncles 1-2 dm. long; involucre about 8 mm. high, 15-20 mm. broad; ligules about 50, 12-15 mm. long, golden-yellow. *B. multiradiata nudicaulis* A. Gray. Dry plains: w Tex.—s Utah—Nev.—Ariz.; n Mex. *Son.* Ap—O.

89. *MONÓTHRIX* Torr.

Low scabrous undershrubs. Leaves mostly alternate, small, punctate, mostly ovate. Heads radiate or discoid. Involucre hemispheric; bracts in two equal series, boat-shaped, double-ribbed, partly enclosing the marginal achenes; receptacle flat, alveolate. Ray-flowers, if present, pistillate and fertile. Disk-flowers many, hermaphrodite and fertile. Achenes flat, with a thick margin. Pappus of 1 barbellate awn or wanting.

1. *M. Stansburii* (A. Gray) Rydb. Stems 1-2 dm. high, diffusely branched; lower leaves opposite, the upper alternate, petioled; blades ovate or rhombic-ovate, dentate, 1 cm. long or less, scabrous, triple-veined; involucre 5-6 mm. high and fully as broad; bracts linear, acute; ligules 6-10, oblong, 3-4 mm. long; pappus-bristle present, shorter than the disk-corollas. *Laphamia Stansburii* A. Gray. Among rocks: Utah. *Son.* Je—Jl.

90. *PERICÔME* A. Gray.

Tall, strong-scented perennial herbs. Leaves opposite, petioled; blades hastate or triangular. Heads discoid in large cymes. Involucre turbinate-campanulate; bracts in a single series, more or less united below, hyaline-margined, with thick midrib. Flowers hermaphrodite and fertile; corollas pale yellow, 4-toothed. Anthers subsagittate at the base. Style-branches filiform, obtuse. Achenes linear-oblong, compressed, hispid-ciliate on the margins. Pappus a crown of fimbriate-lacerate squamellae, sometimes with two marginal awns.

1. *P. caudata* A. Gray. Widely branching perennial, 1 m. high or more; leaf-blades thin, green, minutely resinous-granuliferous, triangular-hastate, 5-15 cm. long, sparingly sinuate-dentate, caudately long-acuminate; involucre about 5 mm. high and 6 mm. wide. Rocky cañons: N.M.—Colo.—Calif.; n Mex. *Submont.* Jl—O.

91. *PICRADENIÓPSIS* Rydb.

Low perennial canescent herbs, more or less woody at the base. Leaves opposite, pedately 3-5-divided, with linear divisions, or the upper entire. Heads radiate, corymbose. Involucre campanulate; bracts subequal, in two series,

3-nerved, the outer more or less keeled. Ray-flowers few, pistillate and fertile; ligules yellow, short. Disk-flowers many, hermaphrodite and fertile; corollas yellow. Achenes elongate-obpyramidal, glandular or hispidulous. Pappus of a crown of 8 ovate or lanceolate squamellae.

1. **P. oppositifolia** (Nutt.) Rydb. Stem 1-2 dm. high, branched below, strigose-puberulent; leaves 1-5 cm. long, impressed-punctate and strigose-puberulent; involucre 5-7 mm. high and 7-10 mm. broad; ligules 3-4 mm. long; achenes glandular. *Bahia oppositifolia* A. Gray. Alkaline soil and dry plains: N.D.—Tex.—Ariz.—Mont. *Plain*—*Submont.* Je-S.

92. AMAURIÓPSIS Rydb.

Glandular-pubescent annuals. Leaves alternate, twice or thrice ternately divided. Heads radiate, in leafy corymbs. Involucre hemispheric; bracts 16-20, herbaceous, in 3 series; receptacle flat, alveolate. Ray-flowers 16-20, pistillate, fertile; ligules cuneate, 3-cleft. Disk-flowers hermaphrodite and fertile; corollas yellow. Achenes elongate, narrowly obpyramidal, 4-angled, striate. Pappus wanting.

1. **A. dissecta** (A. Gray) Rydb. Stem 3-10 dm. high, puberulent or glabrate below, glandular above; leaves with oblong or linear obtuse divisions, more or less puberulent; involucre 6-7 mm. high, about 1 cm. broad, glandular-puberulent; bracts oblong-oblanceolate to obovate-oblong, abruptly acuminate. *Bahia chrysanthemoides* A. Gray. *Villanova dissecta* Rydb. Along streams: N.M.—Wyo.—Ariz.; n Mex. *Son.*—*Mont.* Jl-S.

93. PLATYSCHKÛRIA (A. Gray) Rydb.

Perennial grayish puberulent herbs, woody at the base. Leaves alternate, petioled, entire. Heads radiate, corymbose. Involucre hemispheric; bracts herbaceous in 2 series, oblong; receptacle flat, glabrous. Ray-flowers pistillate and fertile; ligules yellow, oblong, slightly 3-toothed. Disk-flowers fertile; corollas glandular, yellow. Achenes elongate, 4-angled, tapering downward, sparingly hairy on the angles. Pappus of 10-16 lanceolate squamellae, with the distinct midrib extending beyond the apex.

Stem scapiform or nearly so; leaves firm, oval to lanceolate.
Stem leafy; leaves thin, oblong.

1. *P. integrifolia*.
2. *P. oblongifolia*.

1. **P. integrifolia** (A. Gray) Rydb. Stem 1.5-4 dm. high, almost scapiform; basal leaf-blades cinereous-puberulent, oval to lanceolate, 2-7 cm. long, 3-ribbed, thick; upper stem-leaves much reduced, linear-lanceolate; involucre 8-10 mm. high, 12-20 mm. broad; ligules 8-10 mm. long; pappus-squamellae lanceolate, erose, 2 mm. long. *Bahia integrifolia* A. Gray. *B. nudicaulis* A. Gray. *B. desertorum* M. E. Jones. Dry plains: Wyo.—Colo.—Utah. *Son.*—*Submont.* My-Je.

2. **P. oblongifolia** (A. Gray) Rydb. Stem leafy, 2-3 dm. high, strigose-puberulent; leaf-blades oblong or lanceolate, obtuse, 2-5 cm. long, 3-ribbed; involucre about 8 mm. high and 12 mm. wide; pappus-squamellae linear-lanceolate, entire, fully 4 mm. long. *Bahia oblongifolia* A. Gray. Arid regions: N.M.—sw Colo.—se Utah—Ariz. *Son.* Jl-S.

94. HÛLSEA T. & G.

More or less fleshy villous or viscid perennials, biennials, or annuals. Leaves alternate, sessile or with winged petioles. Heads radiate, large. Involucre hemispheric; bracts in 2 or 3 series, narrow; receptacle flat, alveolate-dentate with minute horny teeth. Ray-flowers pistillate and fertile; ligules elongate, yellow or purplish. Disk-flowers fertile; corollas yellow, glandular-viscid. Style-branches obtuse. Achenes linear-cuneate, compressed, villous especially on the margins. Pappus of 4 hyaline nerveless squamellae.

1. **H. carnosa** Rydb. Perennial, with a thick root and creeping subterranean stems, caespitose; overground stems 1.5-3 dm. high, very leafy throughout, pubescent, more or less viscid; leaves very fleshy, linear, sinuately lobed, viscid-pubes-

cent, 5-8 cm. long; head solitary, 1.5-2 cm. high; bracts linear-lanceolate, viscid-pubescent and more or less villous; rays light yellow, less than 1 cm. long. Among rocks: Mont.—Wyo.—Ida. *Subalp.*—*Alp.* *Jl*—*Au*.

95. CEPHALOBĒMBIX Rydb.

Slender glandular-hirsute annuals. Leaves impressed-punctate, pinnately dissected into linear-filiform divisions, the lower opposite, the upper alternate. Heads discoid, corymbose. Involucres turbinate or obconic; bracts 5-8, obovate, scarious and more or less colored around the margins. Flowers hermaphrodite and fertile; corollas light yellow, glandular on the tube. Style-branches with short acute appendages. Achenes elongate-obpyramidal, 4-angled, hispidulous on the angles below. Pappus of 8 scarious squamellae.

1. *C. neomexicana* (A. Gray) Rydb. Stem branched, 1-2 dm. high, sparingly strigose or glabrate; leaves pinnately divided into 3-5 linear divisions, which are entire or the lowest 2-3-cleft; involucres about 6 mm. high and 8 mm. broad; bracts about 10, striate. *Bahia neomexicana* A. Gray. Sandy soil: N.M.—Colo.—Ariz.; Mex. *Son.*—*Submont.* *Au*—*O*.

96. HYMENOPÁPPUS L'Her.

More or less tomentose-floccose perennials or biennials, with mostly 1-2-pinnately divided leaves. Heads corymbose or rarely solitary, discoid. Involucre hemispheric, or nearly so; bracts 6-12, in 1-2 series, subequal, appressed, more or less colored and scarious-margined. Receptacle naked. Disk-flowers all perfect and fertile; corollas yellow. Styles with short conic appendages. Achenes mostly obpyramidal, 4-5-angled, the faces 1-3-nerved. Pappus of 10-20 hyaline obtuse scales without costa, or none.

Throat of the corolla campanulate, 1-2 mm. long, not over twice as long as the lobes.

Pappus over 1 mm. long, equaling the corolla-tube or nearly so.

Stem 3-6 dm. high, leafy throughout; heads numerous.

Plant sparingly and loosely floccose; leaves glabrate in age.

1. *H. tenuifolius*.

Plant densely tomentose; leaves permanently tomentose.

2. *H. tomentosus*.

Stem less than 3 dm. high.

Stem-leaves much reduced; stem white-tomentose or nearly so; heads few.

3. *H. scaposus*.

Stem-leaves not much reduced; stem sparingly grayish-tomentose.

5. *H. cinereus*.

Pappus 1 mm. or less long, much shorter than the corolla-tube; stem-leaves and heads few.

Pappus not hidden by the hairs of the achenes.

Stem permanently densely white-tomentose; achenes silky.

4. *H. arenosus*.

Stem sparingly grayish-tomentose, glabrate in age; achenes loosely villous.

5. *H. cinereus*.

Pappus hidden by the hairs of the achenes, or sometimes none.

Leaflets glabrate in age, at least above; ultimate segment 5-30 mm. long.

6. *H. filifolius*.

Leaves permanently densely white-tomentose; ultimate segments short, 1-5 mm. long.

7. *H. luteus*.

Throat of the corolla cylindro-campanulate, 1.5-4 mm. long, 3-4 times as long as the lobes.

Pappus equaling the corolla-tube; plant dwarf.

Heads less than 1 cm. high and broad; corolla-tube 1.5-2 mm. long; stem not woolly at the base.

8. *H. parvulus*.

Heads over 1 cm. high and 1.5 cm. broad; corolla-tube 3-4 mm. long; stem woolly at the base.

Bracts more or less rose- or purple-tinged.

9. *H. lugens*.

Bracts yellow-tinged.

3. *H. scaposus*.

Pappus shorter than the corolla-tube; throat 3-4 mm. long; plant 2-4 dm. high.

Stem leafy at least half its height, decidedly woolly at the base.

10. *H. eriopodus*.

Stem leafy only at the base, not conspicuously woolly.

11. *H. macroglottis*.

1. *H. tenuifolius* Pursh. Biennial or short-lived perennial, slightly tomentose, in age often glabrate, 3-6 dm. high, branched and leafy; leaves except the uppermost 1-3 pinnately divided into linear divisions, 5-30 mm. long; heads numerous, 8-12 mm. broad; corollas dirty white or cream-colored; achenes densely pubescent. Plains and dry prairies: N.D.—Wyo.—N.M.—Tex.—Ark. *Plain.* *Je*—*S*.

2. *H. tomentosus* Rydb. Biennial; stem 3-4 dm. high, leafy and branched above; leaves 5-7 cm. long, bipinnately divided into linear segments, 4-10 mm. long; involucre densely woolly, somewhat turbinate, 8 mm. high and broad; flowers yellow; corolla throat a little over 1 mm. long, broadly campanulate, of about the same length as the lobes. Dry plains: s Utah. *Son.*

3. *H. scaposus* Rydb. Perennial; stem almost naked, with 1-2 reduced leaves, more or less densely tomentose; leaves mostly basal, 5-7 cm. long, bipinnately divided into linear segments, 3-10 mm. long, densely tomentose, especially at the base; heads about 1 cm. high and broad; bracts obovate, with yellowish or purplish scarious margins; corollas yellow; throat nearly 2 mm. long, campanulate and longer than the lobes; squamellae of the pappus fully 2 mm. long, longer than the tube of the corolla. Dry hills: N.M.—Utah—Nev.—Ariz. *Son.* My-Jl.

4. *H. arenosus* Heller. A white-tomentose perennial, with branched woody caudex; stems several, 2-4 dm. high, densely tomentose, especially at the base, 2-4-leaved; leaves mostly basal, twice pinnately divided into linear-filiform divisions 3-15 mm. long, 1 mm. wide; heads about 8 mm. high, 8-10 mm. broad; bracts oblong, with narrow scarious margins, tomentose; corollas yellow; throat nearly 2 mm. long; achenes long-silky; pappus rather short, about 1 mm. long, but not hidden by the hairs. On dry hills: N.M.—Colo.—Ariz. *Son.*—*Submont.* My-Jl.

5. *H. cinereus* Rydb. Perennial, with a caespitose caudex; stems about 2 dm. high, branched; leaves bipinnately divided into linear segments 1-2 cm. long and about 1 mm. wide, sparingly grayish tomentulose; heads 8-10 mm. high, 10-12 mm. broad; bracts oblong-obovate, with narrow scarious margins; corollas yellow; throat about 1.5 mm. long, broadly campanulate, longer than the lobes; achenes loosely villous. *H. ochroleucus* Greene. Dry hills and plains: Colo.—Utah. *Submont.*—*Subalp.* My-Jl.

6. *H. filifolius* Hook. Perennial; stem 2-3.5 dm. high, sparingly branched; leaves similar to those of *H. tenuifolius*; heads few, 10-15 mm. broad; bracts obovate-oblong, with broad scarious margins, tomentose; corollas bright yellow; throat about 1.5 mm. long; achenes densely villous, the long hairs hiding the small pappus; squamellae less than 1 mm. long. On plains and prairies: Alta.—Sask.—Kans.—N.M.—Nev.—Wash. *Plain*—*Submont.* Je-S.

7. *H. luteus* Nutt. Perennial; stem 1-2 dm. high, with a few reduced leaves and few heads; basal leaves 2-7 cm. long, twice pinnately divided into short lobes 1-5 mm. long; heads about 1 cm. high, 10-15 mm. broad; bracts oblong, broadly scarious-margined; corolla yellow; throat about 1 mm. long; achenes densely villous-hirsute; scales of the pappus short, about 0.5 mm. long. Bad-lands and clay-hills: Wyo. *Submont.*—*Mont.* My-Jl.

8. *H. parvulus* Greene. Perennial; stem 1-2 dm. high, scapiform, slightly tomentose; basal leaves 5-8 cm. long, bipinnatifid, with narrowly linear-filiform divisions, 5-12 mm. long, grayish-tomentose; stem-leaves few and small; involucre turbinate, 6-7 mm. high and broad; bracts oblong-obovate, greenish yellow, sparingly tomentulose; corollas brownish yellow; throat cylindro-campanulate, 1.5-2 mm. long, about 3 times as long as the teeth; achenes short villous. Dry hills: Colo. *Submont.* Jl-Au.

9. *H. lugens* Greene. Perennial; stem scapiform, 2-3 dm. high, white-tomentulose; leaves bipinnatifid with filiform divisions, permanently white-tomentose, 5-10 cm. long; stem-leaves small and few; involucre nearly 1 cm. high, 12-15 mm. broad; bracts elliptic, the outer usually with purple-tinged margins; corolla-throat cylindraceous, 3-4 mm. long, 3-4 times as long as the lobes; pappus-scales oblong-obovate, as long as the corolla-tube. Dry ridges: s Calif.—Utah—Ariz. *Son.*—*Submont.* My-Au.

10. *H. eriopodus* A. Nels. Perennial; stem 3-10 cm. high, leafy; leaves numerous, bipinnately divided into filiform divisions, sparingly tomentulose or glabrate; involucre about 1 cm. high and 12-15 mm. broad; bracts elliptic, scarious-margined, sometimes purplish; corolla-throat about 3 mm. long, cylindro-

campanulate, about 3 times as long as the lobes; pappus-scales linear-oblong, about half as long as the corolla-tube. Rocky places: Utah—Nev. *Son.* My.

11. *H. macroglottis* Rydb. Perennial; stems several, 3–4 dm. high; leaves mostly basal, about 1 dm. long, bipinnately divided into linear lobes 8–25 mm. long; stem-leaves simply pinnate or simple; heads few, 12 mm. high and 12–15 mm. broad; bracts oblong, with very narrow yellowish scarious margins; corolla yellow; throat deeply campanulate, 3–4 mm. long, 3–4 times as long as the lobes; squamellae of the pappus about 1 mm. long. Dry hills: Tex.—Colo.—Utah—Ariz. *Son.* Au-S.

97. *LEUCÁMPYX* A. Gray. WILD COSMOΣ.

More or less floccose perennials. Leaves alternate, bi- or tripinnatifid into linear divisions. Heads corymbose, radiate. Involucres hemispheric; bracts subequal, in 2–3 series, with scarious colored tips and margins; receptacle convex, with broad membranous paleae, half enclosing the achenes. Ray-flowers pistillate and fertile; ligules broad, 3-toothed, white or cream-colored. Disk-flowers fertile; corollas yellow. Style branches penicillate, with short appendages. Achenes of the ray-flowers cuneate, 3-angled, those of the disk-flowers 5-angled, all more or less curved, striate and muriculate. Pappus a minute crown.

1. *L. Newberryi* A. Gray. Stem stout, 3–6 dm. high; involucres about 8 mm. high, 10–15 mm. wide; bracts obovate, obtuse; ligules 10–15 mm. long. Cañons: Colo.—N.M. *Submont.*—*Mont.* Je—Au.

98. *OTHÁKE* Raf.

Erect glandular annual herbs. Leaves alternate, mostly entire. Heads corymbose or paniculate, radiate or discoid. Inflorescence campanulate to obconic; bracts narrow, in 1–2 series, herbaceous, usually colored, at least at the tips. Receptacle small, flat, naked. Ray-flowers, when present, pistillate, fertile; ligules pink or rose-colored, broad, 3-cleft. Disk-flowers fertile; corollas pink or rose, 5-divided almost to the tube. Style-branches filiform, pubescent throughout. Achenes linear to narrowly obpyramidal, 4-angled. Pappus of 6–12 lanceolate, strongly ribbed squamellae.

Heads radiate; leaves lanceolate to linear-lanceolate.
Heads discoid; leaves narrowly linear.

1. *O. sphacelata*.
2. *O. macrolepis*.

1. *O. sphacelata* (Nutt.) Rydb. Stem stout, branched, hispid, glandular-pubescent and viscid above, 2–6 dm. high; leaves petioled, lanceolate or linear-lanceolate, scabrous on both sides, indistinctly 3-veined; involucre 10–15 mm. high; ligules 8–10, rose-purple, 1–2 cm. long; pappus-scales of the disk-flowers 6–8, lanceolate, more than half as long as the achenes. *Polypteris Hookeriana* A. Gray, in part, not *Palafoxia Hookeriana* T. & G. Sandy plains: Tex.—Neb.—Colo.—N.M.; n Mex. *Son.*—*Submont.*

2. *O. macrolepis* Rydb. Stem 3–4 dm. high, strigose-puberulent, and glandular on the upper parts; leaves strigose-puberulent on both sides, 3–5 cm. long, 2–3 mm. wide; involucres 9–10 mm. high and about as wide; bracts 8–12, linear-oblancheolate, abruptly acute; disk-corollas 14–15 mm. long; pappus-squamellae 6–8, lanceolate, caudate-acuminate 5–6 mm. long. Plains: Colo. Au.

99. *RIGIOPÁPPUS* A. Gray.

Slender puberulent annuals. Leaves alternate, linear, entire. Heads radiate. Involucre turbinate; bracts subequal, in 2 series, linear-subulate, concave, partly enclosing the ray-flowers; receptacle flat, naked. Ray-flowers 5–8, pistillate, fertile; ligules short, scarcely exceeding the disk. Disk-flowers fertile. Style-branches short, glabrous, with subulate hirtellous tips. Achenes slender, linear, hispid. Pappus of 4 or 5 rigid subulate awn-like squamellae.

1. *R. leptocladus* A. Gray. Stem slender, 1–3 dm. high, minutely hirsutulous; branches naked below and becoming longer than the main stem; leaves

sessile, hirsutulous; heads solitary at the ends of the stem and branches; involucre 6 mm. high; flowers yellow, turning purplish or whitish. Dry ground: Calif.—Ida.—Wahs. *Son.* Mr.

100. **CHAMAECHAENACTIS** Rydb.

Cespitose scapiferous perennial, branching below the surface of the ground and with a woody root. Leaves all basal and simple, coriaceous, white-strigose below, sparingly hirsute and punctate above. Involucral bracts about twelve, in two series, the inner series longer and with scarious-margined, reddish tips. Corolla flesh-colored, with equal lobes. Stamens included. Style-tips broad. Achenes clavate, densely villous. Pappus of eight nearly equal squamellae, with prominent midrib and erose tips.

1. **C. scaposa** (Eastw.) Rydb. Leaves petioled; blades oblong or elliptic, to orbicular, 8–12 mm. long, coriaceous, entire or crenate, with revolute margins, strigose-canescens; scape 3–8 cm. long; involucre about 15 mm. high and broad; bracts oblong, obtuse, densely hirsute-villous. *Chaenactis scaposa* Eastw. *Actinella carnosus* A. Nels. Dry mesas and clayey soil: w Colo.—e Utah. My-Je.

101. **CHAENACTIS** DC. MORNING BRIDES.

Annual, biennial, or perennial herbs. Leaves alternate, usually pinnately dissected. Heads discoid, but the marginal flowers often with enlarged corollas. Involucre campanulate or turbinate; bracts herbaceous in 2 series; receptacle alveolate, naked or in some species bristly. Flowers hermaphrodite and fertile; corollas yellow, white, or flesh-colored, the throat cylindric or in some species funnellform in the marginal flowers. Achenes linear, terete or oval in cross-section, or obscurely 4-angled, pubescent. Pappus of 4–16 hyaline squamellae.

Annuals.

Corollas yellow; pappus of minute callous squamellae. 1. *C. Nevii*.

Corollas white or flesh-colored; pappus of well developed squamellae.

Stamens partly exserted; bracts all appressed.

Involucral bracts acuminate; receptacle usually somewhat bristly.

Involucral bracts obtuse or merely acute; receptacle naked. 2. *C. carphoclinia*.

Leaves bipinnatifid. 3. *C. steviodoides*.

Leaves simple, spatulate-linear. 4. *C. Cusickii*.

Stamens included; some of the outer bracts with spreading tips.

5. *C. macrantha*.

Perennials.

Leafy-stemmed plants.

Plant densely white-floccose.

Leaves mostly basal, broadly obovate in outline, with approximate divergent divisions; branches of the inflorescence usually divergent at the base and curved upwards.

Leaves scattered, ovate or lanceolate in outline; branches of the inflorescence ascending or erect, strict. 6. *C. brachiata*.

Plant 1–3 dm. high, not fruticulose; leaves regularly pinnatifid.

7. *C. achilleaeifolia*.

Plant 3–4 dm. high.

Leaves narrow, mostly regularly pinnatifid; plant often fruticulose at the base.

Leaves broader, interruptedly pinnatifid, with smaller segments interposed between the larger ones; plant not fruticulose. 8. *C. imbricata*.

9. *C. cheilanthesoides*.

Plant sparingly floccose, in age greener and glabrate.

Squamellae about half as long as the corolla; low perennials, 1–2 dm. high, branched at the caudex. 10. *C. humilis*

Squamellae at least two-thirds as long as the corollas.

Bracts shorter than the disk; stem 2–4 dm. high; biennials with a taproot. 11. *C. Douglasii*.

Bracts equalling the disk; stems 1–2 dm. high, from a cespitose rootstock. 12. *C. peduncularia*.

Subscapose perennials, with rosulate leaves and nearly naked peduncles.

Leaves oblanceolate, elliptic, or linear in outline; plants with a cespitose caudex. Inner bracts acuminate; leaf-blades narrowly lanceolate in outline. 13. *C. minuscula*.

Inner bracts merely acute; leaf-blades oblanceolate or oblong in outline. 14. *C. alpina*.

Leaf-blades obovate-cuneate or flabellate in outline; plant with a cespitose rootstock. 15. *C. Evermannii*.

1. **C. Nevii** A. Gray. Stem 1-2 dm. high, puberulent, branched; leaves pinnate or bipinnate, with linear or oblong lobes, slightly puberulent; involucre about 8 mm. high and 1 cm. broad; corollas yellow, the marginal ones not conspicuously enlarged; pappus of minute teeth or obsolete. Clayey soil: Ore.—Ida. Son. My.—Je.

2. **C. carphoclinia** A. Gray. Stem diffusely branched, puberulent, not at all tomentose, 1-3 dm. high; leaves once or twice pinnatifid, with short filiform divisions, puberulent; heads numerous, 30-40-flowered; involucre about 8 mm. high and 10 mm. broad; bracts linear-subulate, puberulent; marginal corollas scarcely enlarged; pappus squamellae 4, ovate-lanceolate, acute or acuminate, those of the marginal flowers much shorter than those of the central ones. Arid regions: N.M.—s Utah—s Calif. Son.

3. **C. stevioides** H. & A. Stem 1-3 dm. high, sparingly floccose when young, glabrate in age, and glandular-puberulent in the inflorescence; leaves once or twice pinnately divided into linear divisions, floccose when young; involucre 7-8 mm. high, 10-12 mm. broad; bracts narrowly linear, obtuse; the marginal corollas with enlarged throat and limb, oblique; pappus-squamellae oblong-lanceolate to oblong-ovate, in the marginal flowers broader than in the central ones and unequal. Arid places: Ida.—Wyo.—N.M.—Calif.—Nev. Son.—Submont. Ap.—Je.

4. **C. Cusickii** A. Gray. Stem decumbent, 1 dm. high or less, sparingly floccose, soon glabrate; leaves fleshy, 2-3 cm. long; involucre subtended by a linear leaf, 7-8 mm. high; bracts broadly linear; corolla white, the marginal not enlarged; pappus-squamellae 10, linear-oblong, nearly equal and equalling the corolla-tube. Sandy hills: Ore.—Ida. Submont.

5. **C. macrantha** D. C. Eat. Stem 1-2 dm. high, tomentose when young, glabrate in age, branched from the base; leaves pinnately or bipinnately divided into oblong or linear divisions, floccose when young, glabrate in age; involucre 12-15 mm. high and about as wide; bracts linear, more or less tomentose; corollas externally puberulent, all alike, white or flesh-colored; pappus of 4 linear-oblong squamellae, 4 mm. long, and sometimes some smaller ones. Hills in desert regions: Ariz.—Utah—Nev.—Calif. Son. My.

6. **C. brachiata** Greene. Stem 2-4 dm. high; leaves white-tomentose; involucre about 12 mm. high, 12-15 mm. broad; bracts linear, acute or obtuse; corollas dull white, 6-7 mm. long; pappus-squamellae 8, unequal, obtuse, 3-4 mm. long. Dry places: Utah. Son.

7. **C. achilleaefolia** H. & A. Stem 1-2 dm. high, densely white-tomentose; leaves twice pinnately cleft with very short crowded obtuse divisions, permanently white-tomentose; involucre 8-10 mm. high and 10-12 mm. wide, tomentose; bracts linear, obtuse; corollas flesh-colored, all alike; pappus-squamellae linear, acute, 5-6 mm. long. *C. angustifolia* Greene. Dry soil and hot-spring formations: Wyo.—Utah—Nev.—Ore. Je.—Au.

8. **C. imbricata** Greene. Stem branched at the base, about 3 dm. high, floccose; leaves 5-10 cm. long, with narrow divisions, yellowish; involucre 10-12 mm. high, 12-15 mm. broad, viscid-pubescent; bracts linear, obtuse; corollas flesh-colored or white, 6-7 mm. long; squamellae 8, oblong, obtuse, 4-5 mm. long. Dry places: Wash.—Ida.—Ore. Son.

9. **C. cheilanthoides** Greene. Stem about 3 dm. high; leaves 4-8 cm. long, white-tomentose; involucre 8 mm. high, 10 mm. broad, floccose and glandular; bracts linear or linear-spatulate, obtuse; corollas whitish, 6 mm. long; squamellae 8, linear, 5-6 mm. long, or those of the marginal flowers 2-4 mm. long. Dry places: Ore.—Ida.—Wash. Son.

10. **C. humilis** Rydb. Stems several from the crown; leaves 2-5 cm. long, floccose, in age glabrate, oblanceolate in outline, with oblong round-lobed divisions; involucre 7-8 mm. high, 5-10 mm. broad; bracts narrowly linear, obtuse, glandular-puberulent; corollas whitish; squamellae 8, oblong, obtuse, about 3 mm. long. Dry places: Wyo.—Ida. Plain.

11. *C. Douglasii* (Hook.) H. & A. Stem 2-5 dm. high, sparingly floccose, in age glabrate, glandular-puberulent in the inflorescence; leaves bipinnatifid with numerous short, crowded, obtuse lobes, more or less floccose; heads paniculate; involucre 10-13 mm. high, 15-20 mm. broad; bracts linear, obtuse, glandular-puberulent; pappus-squamellae oblong or linear, obtuse, about 5 mm. long. Sandy and rocky places: Alta.—N.M.—Calif.—B.C. *Plain—Mont.* Je-Jl.

12. *C. pedicularia* Greene. Stem leafy, 1-2 dm. high, decumbent; leaves twice pinnatifid, with short obtuse lobes, sparingly tomentulose when young; peduncles 1-2 cm. long; involucre about 15 mm. high and broad; bracts tomentulose, scarcely at all glandular, acutish; pappus-squamellae linear-oblong to linear, obtuse. High mountains: Colo. *Alp.* Jl.

13. *C. minuscula* Greene. Scape 1-3 cm. high; leaves crowded, 2-3 cm. long, lanceolate in outline, with short entire or toothed divisions, nearly glabrous; involucre 1 cm. high and broad; bracts linear, acute or the inner acuminate, finely glandular-puberulent; corollas white, 6 mm. long; squamellae oblong, obtuse, 3 mm. long. Mountain tops: Ida. *Alp.*

14. *C. alpina* (A. Gray) M. E. Jones. Stem 1 dm. high or less, subscapose; leaves mostly basal, twice pinnately dissected, with short obtuse lobes, somewhat tomentose when young; peduncles 2-7 cm. long, glandular-puberulent; involucre 8-12 mm. high, 10-15 mm. broad; bracts linear, obtuse, usually purple; corollas flesh-colored, all alike; pappus-squamellae linear-oblancoate or linear-spatulate, obtuse, 4-5 mm. long. *C. rubella* Greene. High mountains—Colo.—Calif.—Ore. *Mont.—Alp.* Jl-Au.

15. *C. Evermannii* Greene. Scape 1-3 cm. long, floccose; leaves 1-2 cm. long, 3-5-toothed or 3-5-lobed above the middle, loosely floccose; involucre 6-8 mm. high and broad, puberulent; bracts linear-spatulate, rounded at the apex; corollas flesh-colored or white, 5 mm. long; squamellae 8, unequal, oblong, obtuse, the longer 4-5 mm. long. Mountain tops: Ida. *Alp.*

102. *ERIOPHÝLLUM* Lag. WOOLLY YELLOW DAISY.

Annual or perennial (in ours with a caespitose caudex), floccose or tomentose herbs or low shrubs. Leaves alternate, entire or pinnately lobed or dissected. Heads radiate, rarely discoid. Involucre hemispheric; bracts in a single series or in 2 equal series, somewhat overlapping, concave or somewhat boat-shaped, partly enveloping the marginal achenes; receptacle usually more or less convex, naked. Ray-flowers pistillate and fertile; ligules yellow, oblong. Disk-flowers usually numerous, hermaphrodite and fertile. Achenes 4-5-angled, narrowly elongate-obpyramidal, glabrous, hirsute, or glandular. Pappus of 4-12 hyaline, often erose squamellae, or rarely wanting.

Leaves entire or merely the earlier ones toothed at the apex.

Achenes glabrous or nearly so.

Achenes decidedly pubescent or glandular.

Leaves narrowly linear-oblancoate or linear.

Leaves oblancoate or obovate.

Leaves more or less lobed or dissected.

Achenes glabrous.

Bracts acuminate, surpassing the disk.

Bracts abruptly acute, not surpassing the disk.

Achenes hairy.

1. *E. pedunculatum*.

2. *E. gracile*.

3. *E. integrifolium*.

4. *E. multiflorum*.

5. *E. lanatum*.

6. *E. Watsoni*.

1. *E. pedunculatum* Heller. Stems several, simple, 3-5 dm. high, reddish below, sparingly tomentose; leaves oblong-lanceolate, subsessile, 3-5 cm. long, 1 cm. wide, entire, acute, floccose on both sides; peduncles 5-15 cm. long; involucre about 1 cm. high and broad, lanate; bracts 8, lanceolate, short-acuminate; ligules oblong, orange, about 1 cm. long. Dry open places: Ida. *Plain.* Jl.

2. *E. gracile* (H. & A.) A. Gray. Stems several, 2-3 dm. high; leaves narrowly linear or narrowly linear-oblancoate, 3-5 cm. long, loosely floccose; involucre 7-8 mm. high and about as broad; bracts about 10, oblong, acutish; rays 7-8 mm. long; achenes densely glandular-granuliferous. Gravelly places: Wash.—Ida. *Plain—Submont.* Je-Jl.

3. **E. integrifolium** (Hook.) Greene. Stems numerous, decumbent at the base, 1-3 dm. high, finely tomentose; leaves linear-ob lanceolate, closely tomentose, 2-5 cm. long, entire or somewhat 3-lobed; involucre 6-8 mm. high and broad; bracts 8-10, elliptic, mostly obtuse; ligules orange, 7-10 mm. long; achenes hispidulous or slightly glandular above and on the margins. *E. caespitosum integrifolium* A. Gray. Hills and mountain sides: Mont.—Wyo.—Ore.—Wash. *Plain*—*Submont.* Je—Jl.

4. **E. multiflorum** (Nutt.) Rydb. Stem rather stout, 3-4 dm. high, loosely floccose; leaves pinnatifid, with lanceolate acute divisions, floccose; involucre fully 1 cm. high and 1.5 cm. broad; bracts oblanceolate, acuminate; ligules about 1 cm. long, glabrous. Dry places: Ore.—Mont.

5. **E. lanatum** (Pursh) Forbes. Stem 3-5 dm. high, loosely floccose; leaves more or less deeply pinnatifid, with oblong or linear, mostly obtuse divisions, loosely floccose; involucre fully 1 cm. high, usually over 15 mm. broad; bracts 10-14, oblong-lanceolate, acute or obtuse; ligules 10-15 mm. long, orange. Hill-sides and gravelly soil: B.C.—Ida.—Calif. *Submont.* My—Jl.

6. **E. Watsoni** A. Gray. Stem 1-1.5 dm. high, white-tomentose, simple or slightly branched; lower leaves cuneate-ob lanceolate, about 1 cm. long, 3-5-toothed at the apex, white-tomentose beneath, floccose above; stem-leaves mostly pinnatifid, with linear divisions, 1-2 cm. long, revolute-margined; involucre hemispheric, 6 mm. high, 1 cm. broad or less; bracts 9-10, acute; ligules bright yellow, 5-8 mm. long. Mountains: Ore.—Ida.—Nev. *Submont.*—Mont.

103. ANTHERÓPEAS Rydb. DAISY DWARF.

Low floccose annual herbs, branched at the base. Leaves alternate, spatulate to linear-spatulate, entire or 3-toothed. Heads radiate. Involucre campanulate; bracts 5-9, elliptic, distinct or nearly so, concave and slightly enfolding the ray-achenes; receptacle strongly convex or low-conic, obtuse, naked. Ray-flowers 5-9, pistillate and fertile; ligules yellow, white, or tinged with rose or purple. Disk-flowers hermaphrodite and fertile. Anthers with subulate tips. Style-branches obtuse or with conic tips. Achenes elongate, narrow, 5-angled, gradually tapering downward. Pappus of 6-12 opaque squamellae, either all elliptic and obtuse or those of the angles linear-lanceolate and produced into an awn-tip, or rarely wanting.

Pappus squamellae all oval or obovate, obtuse; leaves broadly spatulate or obovate; ligules yellow or reddish.

Pappus squamellae of the angles narrow, linear-lanceolate or linear; leaves linear or nearly so; ligules white.

1. *A. Wallacei*.

2. *A. lanosum*.

1. **A. Wallacei** (A. Gray) Rydb. Stem 2-10 cm. high, diffusely branched, densely floccose; leaves occasionally 2-3-toothed at the apex, 1 cm. long or less; involucre about 4 mm. high, hemispheric; bracts oblong, obtuse; ligules broadly obovate, 4 mm. long. *Eriophyllum Wallacei* A. Gray. Dry plains: Ariz.—s Utah—s Calif. *L. Son.* Ap—Je.

2. **A. lanosum** (A. Gray) Rydb. Stem 2-8 cm. high, floccose, or in age glabrate, branched; leaves floccose, 1 cm. long or less; heads campanulate, about 5 mm. high; bracts linear-elliptic, acute; ligules broadly obovate, truncate, 4 mm. long. *E. lanosum* A. Gray. Dry plains: Ariz.—s Utah—Calif. *L. Son.* Mr—My.

104. SYNTRICHOPÁPPUS A. Gray.

Low branched floccose annuals. Leaves alternate, from linear to spatulate, entire or 3-lobed at the apex. Heads radiate, solitary at the ends of the branches. Involucre campanulate; bracts 5-8, oblong, concave and partly enfolding the ray-achenes; receptacle flat. Ray-flowers 5-8, pistillate and fertile; ligules yellow, or purplish, rose, and white, oval, mostly 3-lobed at the summit. Disk-flowers about 20, fertile. Anther-tips linear-lanceolate. Style-tips elongate-lanceolate, flattened. Achenes linear, obpyramidal, 5-ribbed, hairy. Pappus-squamellae dissected into numerous barbellate bristles united at the base into a wing, falling off together, or wanting.

1. *S. Fremontii* A. Gray. Stem 1 dm. high or less, branched from the base, slightly floccose; leaves spatulate or linear-cuneate, often 3-lobed at the summit, 8-15 mm. long, floccose; involucre about 6 mm. high; bracts 5, broadly oblong; ligules 5, golden yellow, 4 mm. long and fully half as wide. Desert plains: Ariz.—Utah—Nev.—Calif. *L. Son.* Ap-My.

105. TETRANEÜRIS Greene.

Perennial (all ours) or annual, caulescent or scapose, more or less villous or silky herbs. Leaves usually entire, rarely some of them lobed, alternate, either clustered at the base, or scattered along the stem, or both. Heads radiate, rarely discoid, on slender peduncles. Involucre hemispheric, or nearly so; bracts several in two subequal series; receptacle convex, naked. Ray-flowers 10-20, pistillate and fertile; ligules yellow, oblong, broad, 3- (rarely 4-) toothed; nerves 4. Disk-flowers many, hermaphrodite and fertile; corollas with 5 short pubescent teeth. Anther-tips broad, triangular or ovate. Style-branches dilated, truncate, somewhat penicillate at the tips. Achenes obpyramidal, 5-angled, about 3 times as long as broad, densely hirsute. Pappus of about 5 hyaline squamellae, with a strong midrib, which sometimes is produced into an awn.

Heads sessile among the leaves.

1. *T. depressa*.

Heads distinctly peduncled.

Stems scapiform, leafy only at the base.

Leaves appressed-silky.

Leaves not strongly 3-nerved on the broadened bases.

Leaves spatulate or oblanceolate, 2-4 cm. long; scape stout, 5-10 cm. high.

2. *T. septentrionalis*.

Leaves linear or linear-oblanceolate; scape 10-20 cm. high.

Leaves silvery-silky; ligules 6-8 mm. long.

3. *T. acaulis*.

Leaves greenish, sparingly silky; ligules 8-10 mm. long.

4. *T. simplr.*

Leaves strongly 3-nerved on the broadened bases, narrowly linear-oblanceolate.

5. *T. trinervata*.

Leaves loosely villous or glabrate.

Leaves, scape, and involucre decidedly villous.

Involucre more than 1 cm. broad; scape 3-8 cm. long; plant densely cespitose-pulvinate; leaves not conspicuously broad-based.

6. *T. lanigera*.

Involucre less than 1 cm. broad; scape 1-3 cm. (rarely 3-5 cm.) long; plant loosely cespitose; leaves conspicuously broad-based.

7. *T. brevifolia*.

Leaves glabrous or sparingly villous; scape finely pubescent or villous (long-villous only in *T. Torreyana*).

Branches of the caudex decidedly villous at the ends, with long, at first white, but later brownish hairs.

Pappus-scales lanceolate, acuminate, not awned; scape villous.

8. *T. Torreyana*.

Pappus-scales oval, awned; scape silky.

Bracts oval.

9. *T. arizonica*.

Bracts linear-oblong.

10. *T. Crandallii*.

Branches of the caudex not conspicuously villous.

Bases of the leaves not wider than the oblanceolate or almost linear blades; branches of the caudex short and stout.

Leaves glabrous, scarcely punctate; bracts slightly shorter than the disk; ligules not strongly nerved.

11. *T. epunctata*.

Leaves long-hairy, distinctly punctate; bracts three-fourths as long as the disk; ligules strongly nerved.

12. *T. angustifolia*.

Bases of the leaves 2-4 times as wide as the linear leaf-blades; branches of the caudex or rootstock elongate.

13. *T. fastigiata*.

Stems 2-3 dm. high, with 2-6 stem-leaves.

Basal leaves oblanceolate to linear-oblanceolate, more than 5 mm. wide; involucre hemispheric.

14. *T. leptoclada*.

Basal leaves narrowly linear-oblanceolate, less than 5 mm. wide; involucre narrower.

15. *T. Ivesiana*.

1. *T. depressa* (T. & G.) Greene. Pulvinate-cespitose perennial; leaves narrowly linear or nearly so, 1-2 cm. long, 1-2 mm. wide, glabrate, hairy-tufted at the base; heads sessile; involucre about 6 mm. high and 8 mm. broad; bracts oblong, obtuse; achenes silky-strigose; pappus-squamellae ovate, tapering into an awn. *Actinella depressa* T. & G. Dry hills and mountains: Utah.

2. *T. septentrionalis* Rydb. Leaves mostly rounded at the apex, 5-8 mm. wide, canescent-tomentose, subvelutinous; scape 5-10 dm. high, rather thick,

appressed-tomentose; involucre 6-7 mm. high, 12-15 mm. broad, densely villous; bracts elliptic, rounded at the apex; ligules 8-10 mm. long, very strongly veined; pappus-squamellae ovate, abruptly short-aristate. Dry hills: Sask.—Wyo.—Ida. *Plain*. Je-Jl.

3. **T. acaulis** (Pursh) Greene. Leaves crowded, narrowly linear-ob lanceolate, 2-8 cm. long, 2-6 mm. wide, mostly acutish; involucre 7-8 mm. high, 10-15 mm. broad, hemispheric, silky-villous; bracts linear to oblong, or spatulate, obtuse; ligules 6-8 mm. long, yellow with orange veins; pappus-squamellae ovate, abruptly aristate. *Galardia acaulis* Pursh. *Actinella acaulis* Nutt. *T. incana* A. Nels. *T. eradiata* A. Nels., a rayless form. Dry hills and plains: N.D.—Tex.—N.M.—Ida.—Mont. *Plain*—*Submont.*

4. **T. simplex** A. Nels. Leaves green, sparingly appressed-pubescent, glabrate in age, ascending or erect, 2-5 mm. wide, acute; involucre 12-18 mm. broad, 8-10 mm. high, silky-villous; ligules 8-10 mm. long, 4-7 mm. wide, golden yellow, with orange veins; pappus-squamellae lance-ovate, abruptly aristate. *A. simplex* A. Nels. Dry hills: S.D.—Colo.—Wyo. *Plain*. Je-Jl.

5. **T. trinervata** Greene. Leaves 3-5 mm. long, 1-5 mm. broad, more or less appressed-silky, with tufts of brown hairs at the bases; scape 5-15 cm. long, appressed-silky; involucre hemispheric, 5-6 mm. high, about 1 cm. broad, appressed-silky; bracts linear-oblong, obtuse; ligules about 8 mm. long; pappus-squamellae ovate, aristate. Dry hills: N.M.—Colo. *Son.*—*Submont.* Jl-O.

6. **T. lanigera** Daniels. Leaves numerous, linear-ob lanceolate, 2-5 cm. long, 2-5 mm. broad, somewhat silky when young, in age with loose brownish pubescence, with tufts at their bases; scape 3-6 cm. long, loosely silky-villous; involucre 10-15 cm. broad, 7-8 mm. high, villous; bracts oblong, obtuse; ligules 8-10 mm. long; pappus-squamellae lance-ovate, rather gradually aristate. *A. lanata* Nutt., not Pursh. Mountains: Colo.—Wyo. *Submont.*—*Mont.* Je-Jl.

7. **T. brevifolia** Greene. Branches of caudex densely covered with the scarious bases of old leaves; leaves narrowly oblanceolate, 1-2 cm. (rarely 2.5 cm.) long, 2-3 mm. wide, silky-villous, rather densely so; involucre about 7 mm. high and 1 cm. broad or less, densely silky-villous; ligules pale yellow, with orange veins, 5-7 mm. long; pappus-squamellae ovate, abruptly aristate, nearly as long as the corollas. *T. acaulis caespitosa* A. Nels. *Actinea integrifolia* Torr., not Kunth. Foothills and mountains: Colo.—Wyo. *Submont.*—*Mont.* My-Je.

8. **T. Torreyana** (Nutt.) Greene. Leaves narrowly oblanceolate or spatulate, 3-5 cm. long, 3-6 mm. broad, glabrous or with a few scattered hairs; scape more or less villous, 3-8 cm. high; involucre 9-10 mm. high and about 15 mm. broad; bracts linear, slightly villous and scarious-margined; ligules 10-12 mm. long, 3-6 mm. broad; pappus-squamellae lanceolate or lance-ovate, acuminate. *A. Torreyana* Nutt. *A. glabra* A. Nels., not Nutt. Rocky hills: Wyo.—Colo.—Utah. *Plain*—*Submont.* My-Je.

9. **T. arizonica** Greene. Leaves linear-ob lanceolate, 3-5 cm. long, 3-6 mm. wide, sparingly pilose; scapes 5-20 cm. long, appressed-pubescent or glabrate; involucre about 8 mm. high and 15 mm. broad; bracts oblong or oval, obtuse, villous, often with brownish margins; ligules 7-10 mm. long; pappus-squamellae broadly ovate, abruptly aristate. *T. pilosa* Greene, a more glabrous plant. Dry regions: Ariz.—Nev.—s Colo.—N.M. *Son.*—*Submont.* My-Jl.

10. **T. Crandallii** Rydb. Leaves narrowly linear-ob lanceolate, 4-6 cm. long, 2-3 mm. wide, sparingly long-hairy, soon glabrate; scape 1-3 dm. long, sparingly strigose; involucre hemispheric; bracts about 8 mm. long, linear-oblong, silky; ligules about 15 mm. long; pappus-squamellae ovate, aristate. Dry hills: Colo. *Plain*—*Submont.* My-Je.

11. **T. epunctata** A. Nels. Leaves glabrate or with few scattered hairs, indistinctly punctate, narrowly oblanceolate, 2-4 cm. long; scape about 1 dm. high, sparsely silky-strigose; involucre about 8 mm. high and 15 mm. broad, silky-villous; bracts elliptic or oblong; ligules bright yellow, 10-12 mm. long; pappus-squamellae obovate, abruptly aristate. *T. glabra* Greene, in part. *T.*

glabriuscula Rydb. *A. epunctata* A. Nels. Dry hills: Colo.—N.M.—Utah. *Submont.—Mont.* Je—Jl.

12. *T. angustifolia* Rydb. Leaves narrowly linear-ob lanceolate, 4–10 cm. long, 4–5 mm. wide, loosely and sparingly long-villous, or glabrate in age; scape 2–3 dm. high, strigose; involucre hemispherical, 10–12 mm. wide; bracts oblong, obtuse, densely villous; ligules about 1 cm. long; pappus-squamellae ovate, acuminate. Dry rocky hills: Colo.—Tex.—N.M. *Plain—Submont.* Mr—O.

13. *T. fastigiata* Greene. Leaves basal, very narrowly linear-ob lanceolate, 2–4 cm. long, 1–2 mm. wide, strongly punctate, glabrous or with a few long hairs near the base; scape 5–10 cm. long, striate, punctate and sparingly strigose; involucre about 5 mm. high and 10 mm. wide, hemispheric; bracts elliptic, obtuse; ligules light yellow, about 10 mm. long and 5 mm. wide; pappus-squamellae ovate, acuminate. *T. stenophylla* Rydb. *A. fastigiata* A. Nels. Dry plains: Kans.—Colo.—Tex. *Plain.* My—Jl.

14. *T. leptoclada* (A. Gray) Greene. Stem 1–3 dm. high, sparingly appressed-pubescent; basal leaves glabrate or slightly hairy, hairy-tufted at the base, 3–6 cm. long, 4–6 mm. wide; stem-leaves linear, few; involucre 7–8 mm. high, 12–15 mm. broad, more or less villous; outer bracts oblong, lanceolate or linear, the inner elliptic, oval, or somewhat obovate, rounded; ligules 8–10 mm. long; pappus-squamellae ovate, gradually aristate. *A. leptoclada* A. Gray. *T. mancosana* A. Nels. *T. intermedia* Greene, a form with somewhat narrow bracts. Dry hills: Colo.—N.M.—Utah. *Submont.—Mont.* Ap—Jl.

15. *T. Ivesiana* Greene. Stem 1–3 dm. high, sparingly pubescent; leaves all narrowly linear or lance-linear, 5–10 cm. long, 1–4 mm. wide, erect; involucre somewhat turbinate, 5–6 mm. high, 7–8 mm. broad, silky-villous; bracts elliptic, obtuse; ligules about 10 mm. long, strongly veined; squamellae lanceolate, acuminate into an awn. Cañons and hillsides: Utah—Ariz.—N.M. *Son.*

106. **RYDBERGIA** Greene.

Stout caulescent perennials with taproots. Leaves alternate, once or twice ternately or quaternately divided into linear divisions, or some of them entire. Heads radiate, solitary. Involucre depressed-hemispheric; bracts in about 3 series, linear, distinct, subequal or the inner shorter, densely woolly. Receptacle convex or hemispheric, naked. Ray-flowers 15–30, pistillate, fertile; ligules yellow, elongate, 3-toothed. Disk-flowers numerous, hermaphrodite and fertile. Style-tips truncate, penicillate. Achenes obpyramidal, silky-hirsute, 5-angled. Pappus of 5 lance-subulate or linear-lanceolate attenuate squamellae with faint midrib.

Basal leaves all dissected; plant villous.

Basal leaves, at least some of them, simple; plant more glabrate.

1. *R. grandiflora*.

2. *R. Brandegei*.

1. *R. grandiflora* (T. & G.) Greene. Stem 1–3 dm. high, stout, floccose, leafy; leaves once or twice pinnatifid with linear lobes, more or less floccose; involucre 2–4 cm. broad, densely white-woolly; ligules 1.5–2 cm. long, 4–5 mm. broad. *Actinella grandiflora* T. & G. High mountain sides: Mont.—N.M.—Utah. *Mont.—Alp.* Jl—Au.

2. *R. Brandegei* (A. Gray) Rydb. Stem short-villous above, glabrate below, almost scapiform, 1–2 dm. high; leaves pinnatifid, with a few linear lobes or entire and linear, glabrate; involucre 2–3 cm. wide, dark, short villous; ligules 8–10 cm. long and 4 mm. wide. *A. Brandegei* A. Gray. *R. glabrata* (Porter) Greene. High mountains: Colo.—N.M. *Mont.—Alp.* Jl—Au.

107. **HYMENÓXYSS** Cass. COLORADO RUBBER PLANT.

Caulescent annuals, biennials, or perennials. Leaves alternate, commonly pinnatifid into narrowly linear divisions. Heads (in ours) radiate. Involucre of two series of bracts, 5–16 in each series, the outer usually narrower and more or less united at the base, rather firm, entire, acute, the inner broader, either similar, or else more or less erose on the margin and abruptly acuminate or

mucronate. Ray-flowers 5-16, pistillate and perfect; ligules usually conspicuous, 3-lobed. Disk-flowers many, hermaphrodite, perfect. Style-branches obtuse or truncate, penicillate. Achenes obpyramidal, 5-angled, densely hirsute with ascending hairs. Pappus of 5 hyaline squamellae, with faint or indistinct midrib, usually acute or acuminate. [*Picradenia* Hook.]

Perennials or biennials; inner bracts fimbriate or erose, abruptly acute, acuminate, or mucronate, unlike the outer ones; disk-corollas not expanded at the mouth.

Plant low, perennial, usually with a multicapital caudex; outer bracts united at least one-third their length; plant long-hairy on the basal leaf-bases.

Outer bracts not strongly thickened on the back.

Outer bracts united to the middle; free portions ovate or ovate-lanceolate.

Outer bracts united about a third their length; free portions narrowly lanceolate.

Involucre 10-15 mm. broad; ligules 10-18 mm. long; plant 1-3 dm. high.

Involucre 8-10 mm. broad; ligules 5-8 mm. long; plant less than 1 dm. high.

Outer bracts strongly thickened on the back, subcarinate.

Heads few, often solitary; ligules nearly rectangular-oblong.

Heads several; ligules decidedly cuneate.

Ligules light yellow, at least twice as long as wide; pappus-squamellae aristate-pointed.

Ligules orange, half longer than wide; pappus-squamellae acute or acuminate.

Plant tall, biennial or short-lived perennials; outer bracts united only at the base.

Leaves all dissected into narrowly linear divisions.

Leaves of the stem very numerous, more or less lepidote-pubescent; segments narrow, rarely more than 1 mm. wide.

Plant low, densely canescent; heads 1-3; squamellae not more than half as long as the corolla, not subulate-tipped.

Plant tall, greener; heads several or many; squamellae about half as long as the corolla, subulate-tipped.

Leaves of the stem not conspicuously numerous, glabrate and green; segments 1-3 mm. wide.

Leaves, at least the lower ones, entire or with broad lobes 3-8 mm. wide.

Annuals, with numerous heads; inner bracts not very different from the outer, neither abruptly acute nor mucronate, nor evidently erose; throat of the disk-corollas somewhat funnelform.

1. **H. Richardsonii** (Hook.) Cockerell. Stem 1-3 dm. high, glabrous or nearly so; leaves 5-10 cm. long, pinnatifid, with narrowly linear divisions 2-4 cm. long and 1-2 mm. wide; involucre about 8 mm. high and 10-15 mm. broad; ligules bright yellow, 7-10 mm. long. *Picradenia Richardsonii* Hook. *Actinella Richardsonii* Nutt. *Hymenopappus ligulaeflorus* A. Nels. *P. ligulaeflora* A. Nels. Dry plains: Sask.—Mont.—Alta. *Plain*. Je.

2. **H. macrantha** (A. Nels.) Rydb. Stem 1-2 dm. high, sparingly pubescent or glabrate, hairy-tufted at the base; leaves glabrate, pinnatifid, with narrowly linear divisions; involucre 10-15 mm. broad and 8 mm. high; inner bracts obovate, abruptly short-acuminate, tips often greenish; ligules 8-18 mm. long, bright yellow. *Picradenia macrantha* A. Nels. Dry soil: Wyo.—Colo.—Utah. *Plain*—*Mont*. Je—Au.

3. **H. pumila** (Greene) Rydb. Stem 1 dm. high or less, glabrate or slightly hairy; leaves pinnatifid, with 3-5 linear-filiform divisions, or the lower entire and filiform; involucre 8-10 mm. broad, 5-6 mm. high; inner bracts ovate, with short but sharp acumination; ligules pale yellow, 5-6 mm. long. *P. pumila* Greene. Dry hills: Wyo.—Colo.—Utah. *Submont*. Jl—Au.

4. **H. Macounii** (Cockerell) Rydb. Stem about 1 dm. high, sparingly pubescent or glabrous; leaves pinnately divided unto 3-5 filiform divisions; involucre about 6 mm. high and 8-10 mm. broad, usually acute at the base; ligules bright yellow, 5-7 mm. long. Dry plains: Sask.—Mont. *Plain*. Je—Au.

5. **H. floribunda** (A. Gray) Cockerell. Stem 1-3 dm. high, corymbosely branched; leaves pinnatifid, with 3-5 narrowly linear divisions; involucre 4-6 mm. high, 6-8 mm. broad; outer bracts scarcely united to the middle, lanceolate; ligules 6-8 mm. long, bright yellow, cuneate. *A. Richardsonii floribunda* A. Gray.

P. floribunda Greene. Dry and gravelly soil: Wyo.—Tex.—Ariz.—Utah. *Plain*—*Mont.* Je—Au.

6. **H. Earlei** Cockerell. Stem 2–3 dm. high, corymbosely branched above; leaves pinnatifid into 3–5 narrowly linear divisions, somewhat broader than in the preceding; involucre 5–6 mm. high, 7–8 mm. broad; outer bracts united about one-third their length, lanceolate; inner bracts barely mucronate. *P. Earlei* Cockerell. Foot-hills and cañons: s Colo. *Submont.* Jl.

7. **H. canescens** (D. C. Eat.) Cockerell. Stem 1–2 dm. high, canescent with flat scale-like hairs; leaves numerous, 2–4 cm. long, divided into 3–5 linear-filiform divisions, canescent like the stem, rather fleshy; involucre 5–6 mm. high, 10–15 mm. broad; outer bracts 12–15, lanceolate; ligules about 8 mm. long, 3 mm. wide. *A. Richardsonii canescens* D. C. Eat. Dry places: Nev.—Utah. *Son.*

8. **H. biennis** (A. Gray) H. Hall. Biennial; stem 3–5 dm. high, more or less grayish-puberulent; leaves numerous, pinnatifid, with narrowly linear divisions 1–1.5 mm. broad, puberulent; involucre 6 mm. high, 10–15 mm. broad; inner bracts obovate or oblanceolate, usually with one small tooth on each side; ligules fully 1 cm. long, orange, cuneate. *A. biennis* A. Gray. Arid regions: s Utah—*Ariz.* *L. Son.*

9. **H. Greenei** (Cockerell) Rydb. Stem about 3 dm. high, with erect branches, leafy, glabrous; leaves pinnatifid; divisions linear, 2–4 mm. broad; involucre about 6 mm. high and 10–13 mm. broad; inner bracts broadly obovate, more or less erose-dentate; pappus-scales lanceolate, gradually aristate. *H. Lemmonii Greenei* Cockerell. Arid regions: s Utah—Nev.—*Ariz.* *Son.*

10. **H. helenioides** Rydb. Biennial; stem leafy, about 5 dm. high, with several to many erect branches; leaves rather firm, distinctly ribbed, finely pubescent; basal leaves entire, very narrowly linear-oblanceolate; middle stem-leaves erect, fully 1 dm. long, parted into 3–5 linear divisions; upper stem-leaves linear, entire; involucre 8–10 mm. high and often 15 mm. broad; outer bracts lanceolate, longer than the inner, 14–18 in number; ligules orange, about 1 cm. long, 2–3 mm. wide. River valley: s Colo. *Mont.* Jl.

11. **H. odorata** DC. Stem branched near the base, 1–3 dm. high, sparingly pilose or glabrous; leaves pinnatifid, with linear-filiform divisions; involucre about 4 mm. high, 6–8 mm. broad; ligules cuneate, 3–5 mm. long; pappus-scales ovate, aristate. *Philozera multiflora* Buckley. *Picradenia multiflora* Greene. *A. odorata* A. Gray. Dry plains: Tex.—Kans.—Colo.—*Ariz.* *Son.* Je—Au.

108. FLAVERIA Juss.

Glabrous or puberulent herbs. Leaves opposite, narrow, entire or dentate, sessile, often more or less connate. Heads numerous, narrow, in dense cymes or glomerules. Involucre of 1–8 subequal bracts, and sometimes 1 or 2 smaller outer ones. Receptacle small, naked or setose. Ray-flowers solitary, pistillate and fertile, or wanting; ligules entire, emarginate, or 3-dentate, yellow, inconspicuous. Disk-flowers 1–15, hermaphrodite and fertile. Style of the hermaphrodite flowers 2-parted, reflexed, obtuse. Achenes oblong, somewhat compressed, 10-ribbed; pappus in ours wanting.

1. **F. campestris** J. R. Johnston. Annual; stem 2–6 dm. high, glabrous; leaves lanceolate to linear, serrulate to entire, more or less distinctly 3-ribbed; heads in close, subsessile clusters at the ends of the branches, 2–5-flowered; involucre cylindric, about 5 mm. long; bracts mostly 3, linear-oblong, glabrous; ligule elliptic, 1.5–2 mm. long, exceeding the disk. *F. angustifolia* A. Gray, not Pers. Alkali grounds: Tex.—Colo.—N.M.; Mex. *Son.* Jl—Au.

109. DUGÁLDIA Cass.

Perennial caulescent herbs, with rootstocks, more or less floccose or villous. Leaves linear, entire, not decurrent, with several nearly parallel nerves. Heads radiate, large. Involucre almost rotate; bracts lance-subulate, herbaceous, in 2 or 3 subequal series, spreading and tardily reflexed. Receptacle convex or nearly

flat, naked or with some bracts between the ray and disk. Ray-flowers fertile, pistillate; ligules yellow, rather narrow. Disk-flowers numerous. Style-branches with truncate subcapitate tips. Achenes obpyramidal, densely pubescent. Pappus of 5-7 lanceolate or subulate, acuminate, aristate, scarious, and nerveless squamellae.

1. **D. Hoopesii** (A. Gray) Rydb. Stem 3-10 dm. high, tomentulose when young, leafy; basal leaves petioled, 1-3 dm. long, 2-7 cm. broad, oblanceolate, several-ribbed; upper leaves lanceolate, sessile; involucre 2-3 cm. broad; ligules golden, 1.5-3 cm. long. *Helénium Hoopesii* A. Gray. Mountain valleys: Ore.—Wyo.—N.M.—Calif. *Submont.*—*Subalp.* Je—Au.

110. **HELENÍUM** L. SNEEZEWEED.

Annual or perennial leafy herbs. Leaves alternate, narrow, impressed-punctate, more or less decurrent, producing wings on the stem. Heads usually radiate. Involucre rotate; bracts narrow, linear or subulate in 2 or 3 series, subequal or the inner shorter, at first spreading, usually soon reflexed. Receptacle from convex to ovoid or conic, naked or sometimes with a few bracts between the ray- and disk-flowers. Ray-flowers usually present, in most species pistillate and fertile, in the rest neutral and sterile; ligules large, conspicuous, 3-4-toothed or -lobed, cuneate in outline. Disk-flowers numerous, hermaphrodite and fertile; corollas yellow, brown, or purplish. Achenes truncately obpyramidal, 4- or 5-angled, with as many intermediate ribs, pubescent on the angles and ribs. Pappus of 4-8 thin scarious squamellae, with or without midrib.

Plant scabrous-puberulent throughout; bracts about equalling the disk; ligules about 1 cm. long or less.

Plant glabrous or minutely puberulent; bracts much longer than the disk; ligules generally over 1 cm. long.

1. *H. montanum*.

2. *H. macranthum*.

1. **H. montanum** Nutt. Perennial; stem 3-10 dm. high, more or less puberulent; leaves lanceolate, decurrent, 5-10 cm. long, denticulate or subentire; heads numerous, paniculate-cymose; involucre about 8 mm. high, 10-15 mm. broad; ray-flowers fertile; ligules 8-10 mm. long, cuneate, puberulent beneath, golden yellow; pappus-scales lanceolate, acuminate. Meadows: Mont.—Kan.—N.M.—Wash.—B.C. *Plain*—*Submont.* Jl—S.

2. **H. macranthum** Rydb. Perennial; stem 3-12 dm. high; leaves broadly lanceolate or ovate-lanceolate, dentate or entire, thinner than in the preceding; heads with longer naked peduncles; involucre over 1 cm. high, 15-20 mm. broad; ligules 12-20 mm. long, orange. *H. grandiflorum* Nutt., not Gilib. *H. autumnale grandiflorum* A. Gray. Wet places: Mack.—Sask.—Wyo.—Ore.—B.C. *Plain*—*Submont.* Jl—S.

111. **GAILLÀRDIA** Foug. BLANKET-FLOWER.

Annual, biennial, or perennial herbs, either scapose or caulescent. Leaves alternate or basal, entire, toothed, or pinnatifid, often in the same species. Heads radiate or discoid, peduncled. Involucre saucer-shaped or rotate; bracts in 2-3 series, ovate, oblong or lanceolate, at least the upper half strongly reflexed. Receptacle convex to subglobose, alveolate, usually more or less fimbriate, the fimbriae from soft and short-conic, to elongate-subulate, stiff and awn-like. Ray-flowers usually neutral, rarely pistillate and fertile, often wanting; ligules, if present, broad, cuneate or flabelliform, deeply 3-cleft, yellow, or purple, or both. Disk-flowers hermaphrodite and fertile. Anthers auricled at the base. Style-branches appendaged; appendages from glabrous and short to hispidulous and filiform. Achenes broadly obpyramidal, about twice as long as broad, wholly or partly covered by long, stiff, ascending hairs.

Lobes of the disk-corollas acuminate, covered with moniliform hairs.

Plant perennial; ligules usually wholly yellow.

Plant annual; ligules partly or wholly purple.

1. *G. aristata*.

2. *G. pulchella*.

Lobes of the disk-corollas short and broad, acute or obtuse.

Plant hirsute or villous; leaves neither coriaceous nor conspicuously punctate.

Pappus-squamellae lanceolate, awn-pointed.

Disk purple; leaf-segments more or less ascending.

Leaves, except the earliest ones, pinnatifid with narrow divisions.

3. *G. pinnatifida*.

Leaves entire or with broad divisions.

Perennials with a thick root.

4. *G. gracilis*.

Annuals or biennials; root not thick.

5. *G. Mearnsii*.

Disk pale yellow; leaf-segments divaricate.

6. *G. flava*.

Pappus-squamellae elliptic, mucous, or with a very short awn-tip; disk yellow.

Squamellae with a distinct midrib, usually minutely awn-tipped.

7. *G. Pringlei*.

Squamellae without midrib and awn-tip.

8. *G. arizonica*.

Plant minutely and sparingly puberulent; caudex thick and woody; leaves coriaceous, conspicuously punctate.

Plant distinctly caulescent; leaf-blades spatulate to linear.

9. *G. spathulata*.

Plant acaulescent, scapose; basal leaf-blades broadly obovate.

10. *G. Parryi*.

1. *G. aristata* Pursh. Stem 2-6 dm. high, simple, leafy, more or less hirsute and puberulent; leaves oblanceolate in outline, the lower petioled, the upper sessile, grayish-puberulent, entire, dentate, lobed, or pinnatifid; involucre 2-3 cm. broad; bracts lance-subulate, long-attenuate, surpassing the disk, hirsute-villous; disk-corollas purple; ligules wholly yellow, or purplish at the base, 1.5-3 cm. long; pappus-squamellae lanceolate, long-aristate. *G. bracteosa* Standl. Hills and plains: Sask.—S.D.—Colo.—Ore.—B.C. *Submont.* Je-S.

2. *G. pulchella* Foug. Stem branched, leafy, 2-4 dm. high, puberulent; lower leaves oblanceolate or spatulate in outline, petioled, puberulent, entire, dentate or sinuately pinnatifid, the upper leaves sessile, lanceolate, acute or acuminate; involucre 15-20 mm. broad; bracts lanceolate, acuminate, hirsute; disk-flowers purple; ligules 10-18 mm. long, purple below with yellow tips, or sometimes wholly purple; squamellae lanceolate, long-aristate. Plains: La.—Mo.—Neb.—Colo.—Ariz.; n Mex. *Son.*—*Plain.* Ap-Au.

3. *G. pinnatifida* Torr. Perennial, often branched at the base; stem 1-3 dm. high, leafy towards the base; leaves short-pubescent, pinnatifid, with linear or lanceolate divisions, or some of the earlier merely lobed; peduncles 1-2 dm. long; involucre 15-20 mm. broad; bracts lance-subulate, attenuate, hirsute, often purplish; ligules yellow, 10-15 mm. long; squamellae lanceolate, long-aristate. Dry plains: Tex.—Colo.—Utah—Ariz.; n Mex. *Son.*—*Submont.* My-Au.

4. *G. gracilis* A. Nels. Stems usually several, 3-5 dm. high, straw-colored, finely puberulent; leaves short-pubescent, oblanceolate in outline, 4-8 cm. long, entire, lobed, rarely sinuate-pinnatifid with obtuse lobes; involucre 1.5-2 cm. wide; bracts narrowly lanceolate, attenuate, pubescent; ligules yellow, about 15 mm. long; squamellae lanceolate, abruptly acuminate. Dry valleys and canyons: Utah. *Son.* My.

5. *G. Mearnsii* Rydb. Stem 1-3 dm. high, leafy only towards the base, finely pubescent; leaves oblanceolate or spatulate, petioled, 5-10 cm. long, puberulent, entire or round-lobed; peduncles 1-2 dm. high; involucre about 2 cm. broad; bracts lanceolate, acute, grayish-pubescent; ligules yellow, 10-15 mm. long; squamellae lanceolate, each gradually attenuate into a slender awn equaling the corolla. Arid places: Ariz.—Utah. *Son.*

6. *G. flava* Rydb. Perennial, somewhat woody at the base; stem leafy, sparingly hirsutulous, about 3 dm. high; leaves obovate in outline, 3-5 cm. long, pinnately parted with divergent oblong or lanceolate, often few-toothed divisions, hirsutulous and conspicuously punctate; involucre bracts lanceolate, long-acuminate, hirsutulous; ligules pale yellow, about 8 mm. long; squamellae 5-6 mm. long, lanceolate, the midrib produced into an awn between the lobes of the 2-cleft apex. Cañons: Utah. *Son.* Jl.

7. *G. Pringlei* Rydb. A subscapose annual; leaves clustered at the base, 4-6 cm. long, usually pinnately lobed or sometimes merely toothed, with ovate lobes or teeth, villous; scape 1-2 dm. high, short-pubescent; involucre bracts 8 mm. long, villous; ligules yellow, 10-15 mm. long; disk yellow, 15-18 mm. broad; squamellae 8-10, obovate, rounded or slightly retuse at the apex. Mesas: Ariz.—Utah. *Son.*

8. *G. arizonica* A. Gray. Annual; stem 1-3 dm. high, branched and leafy at the base, puberulent; leaves pinnatifid or lobed, with obtuse divisions, puberulent or pilose; peduncles 1-2 dm. long; involucre about 15 mm. broad; bracts lanceolate or linear, acute; disk yellow; ligules yellow, 10-15 mm. long. Dry regions: s Utah—Ariz.—Nev. *L. Son.* Mr—My.

9. *G. spatulata* A. Gray. Stem leafy, 1-3 dm. high, finely puberulent or glabrate; leaves spatulate, petioled, thick; peduncles short; involucre 15-20 mm. broad; bracts ovate-lanceolate, acuminate; disk yellow; squamellae lanceolate, long-aristate, surpassing the disk. Dry valleys: Utah. *Son.* Je—Jl.

10. *G. Parryi* Greene. Leaves petioled, ovate or obovate, all basal, thick, glabrous or minutely puberulent; peduncles 1-3 dm. high; involucre about 2 cm. wide; bracts ovate, abruptly acuminate; disk yellow; ligules yellow, 15-20 mm. long; squamellae narrowly lanceolate, short-aristate. *G. acaulis* A. Gray, not Pursh. Arid regions: s Utah—Ariz. *L. Son.* Je—Jl.

112. BOÈBERA Willd. FETID MARIGOLD.

Annual or perennial herbs. Leaves opposite or the upper alternate, pinnately or bipinnately dissected. Heads usually radiate. Involucre hemispheric, turbinate or broadly campanulate, with a distinct calyculum; principal bracts 8-10, broad, thin and somewhat scarious on the margins, with 3-7 conspicuous glands; receptacle puberulent. Ray-flowers pistillate and fertile; ligules oblong to rounded-oval, yellow or orange. Disk-flowers many. Style-branches with a short conic or obtuse appendage. Achenes hirsute, more or less angled, somewhat compressed, cuneate-oblong. Pappus of 8-15 squamellae, each dissected into 5-10 bristles. [*Dyssodia* Cav., not Lour.]

1. *B. papposa* (Vent.) Rydb. Ill-scented annual; stem leafy, branched, 1-3 dm. high; leaves pinnately or bipinnately divided into linear lobes; involucre 6-8 mm. high and as broad; outer bracts linear, green, the inner 8-10, oblong, scarious, tipped, brownish green or purplish-tinged, with conspicuous glands; ligules few, inconspicuous. *Dyssodia chrysanthemoides* Lag. *D. papposa* (Vent.) Hitchc. Prairies, river valleys, roadsides, and waste places: Ohio—La.—Ariz.—Mont.; Mex. *Son.*—*Submont.* Jl—S.

113. THYMOPHYLLA Lag. TINY TIM.

Annual or perennial herbs. Leaves opposite or alternate, or both, pinnately dissected into narrow lobes. Heads usually radiate, peduncled. Involucre turbinate, campanulate, or hemispheric, with or without a few small accessory bracts below; principal bracts in one or two more or less distinct series, equal in length and more or less united, each with 1-5 glands towards the tip. Receptacle naked. Ray-flowers pistillate and fertile, rarely wanting. Disk-flowers hermaphrodite, fertile. Style-tips obtuse or truncate. Achenes clavate, 4-5-angled. Pappus of normally 10 (rarely 11-20) squamellae most often in two series. [*Hymenatherum* Cass. *Lowellia* A. Gray.]

Annuals; pappus-squamellae muticous.

Perennials; pappus-squamellae awn-tipped.

1. *T. aurea*.

2. *T. Thurberi*.

1. *T. aurea* (A. Gray) Greene. Glabrous annual; stem branched from below, leafy, 1-1.5 dm. high; leaves alternate, pinnately parted into 7-9 linear-filiform divisions; involucre 4-5 mm. high, 5-6 mm. broad; bracts oblanceolate, with conspicuous glands; ligules about 12, oblong, 5-6 mm. long; pappus of 6-8 quadrate or oblong, erose-truncate scales. *Lowellia aurea* A. Gray. *Hymenatherum aureum* A. Gray. *Dyssodia aurea* A. Nels. Dry plains: Colo.—Tex.—N.M. Je—O.

2. *T. Thurberi* (A. Gray) Woot. & Standl. Suffrutescent perennial; stems much branched, 1-2 dm. high, puberulent or glabrate; leaves pinnatifid, with filiform divisions, more or less finely short-pilose; involucre 4-6 mm. high and broad; outer bracts 1-3, subulate, very small; inner bracts linear, with triangular tips and 3-5 glands; ligules oblong, about 3 mm. long; outer pappus-squamellae

10, the inner 5, usually 3-awned, the outer 1-awned. *H. Thurberi* A. Gray. *D. cupulata* A. Nels. *D. Thurberi* B. L. Robins. Dry hills: Tex.—s Utah—Ariz.; Mex. Mr—N.

114. **PÉCTIS** L. LEMON-SCENT.

Rather low, branching, mostly aromatic or strong-scented, annual or perennial herbs. Leaves opposite, glandular-dotted, mostly entire, usually with several pairs of marginal bristles near the base. Heads usually small, solitary or cymose, radiate. Involucre from cylindric or oblong to campanulate or turbinate; bracts 3–12, free, in a single series, without calyculum, glandular-dotted, rounded-carinate at least below; receptacle naked. Ray-flowers few, pistillate and fertile; ligules yellow or tinged with red or purple. Disk-flowers rather few, hermaphrodite and fertile; corollas yellow. Style hispidulous, the short branches obtuse and without appendages. Achenes linear, terete or somewhat angled, pubescent or glabrate. Pappus various, of few or many squamellae, awns, or bristles, or rarely reduced to a mere crown.

Flowers subsessile; pappus of a crown of 4 or 5 connate squamellae, sometimes with 1 or 2 additional awns.

Flowers distinctly peduncled; pappus at least of the disk-flowers of 12–18 barbellate bristles.

1. *P. angustifolia* Torr. Glabrous annual, lemon-scented; stem branched, 5–20 cm. high; leaves narrowly linear; involucre 4–5 mm. high, 2–3 mm. broad; bracts linear, about 8; ligules oblong, about 3 mm. long. *P. papposa sessilis* M. E. Jones. "Sand-draws" and sandy hillsides: Tex.—Neb.—Colo.—Ariz.; Mex. Son.—Mont. Ap—O.

2. *P. papposa* A. Gray. Annual, glabrous; stem branched from the base, 5–30 cm. high; leaves narrowly linear, 3–5 cm. long; involucre about 4 mm. high and 3 mm. broad; bracts 7–9, linear; ligules 4–5 mm. long. Sandy places: Calif.—s Utah—N.M. Son. Au—O.

115. **ACHILLEA** (Vaillant) L. YARROW, MILFOIL.

Perennial caulescent, usually villous, herbs. Leaves alternate, from serrate to tripinnatifid. Heads several, usually radiate. Involucre campanulate to hemispheric; bracts imbricate in 3–4 series, the outer usually much shorter. Receptacle conic or convex, chaffy; paleae membranous. Ray-flowers few, 5–12, pistillate and fertile; ligules short and broad, in most species white or sometimes pink or purple. Disk-flowers 15–75, hermaphrodite and fertile; corollas yellowish white or straw-colored. Anthers with ovate obtuse tips. Style-branches in the pistillate flowers oblong, obtuse, in the hermaphrodite ones with truncate, fimbriate tips. Achenes oblong or obovate, obcompressed, callous-margined, glabrous. Pappus wanting.

Leaves pinnatifid to tripinnatifid.

Bracts with dark brown, almost black margins.

Involucre 5–6 mm. high, 4–5 mm. broad.

Ultimate segments of the leaves long and linear, not thickened at the apex; bracts all acute.

Ultimate segments of the leaves ovate, lanceolate, or oblanceolate, short, often thickened at the apex; bracts except the outermost obtuse.

Upper leaves 1–2 cm. broad, with spreading not densely crowded divisions.

Upper leaves 5–10 mm. broad, with short densely crowded divisions.

Involucre 3.5–4 mm. high, about 3 mm. broad.

Bracts with light brown, yellowish, or straw-colored margins.

Involucre 5–8 mm. high, 4 mm. broad or more.

Ultimate divisions of the leaves linear, not thickened, spreading, not crowded; bracts with light brown margins.

Ultimate divisions lanceolate or ovate, usually thickened towards the apex, ascending and crowded; bracts and their margins of the same color, light yellowish or straw-colored.

Involucre 4–4.5, rarely 5 mm. high, 2.5–4 mm. broad.

Ultimate leaf-segments linear; rachis merely margined.

Ligules 2.5–4 mm. long; leaf-segments ascending, crowded.

7. *A. lanulosa*.

Ligules 1.5–2.5 mm. long; leaf-segments more or less spreading, not crowded.

8. *A. occidentalis*.

Ultimate leaf-segments ovate or lanceolate; rachis distinctly winged.

9. *A. millefolium*.

Leaves serrate or incised, not pinnatifid.

10. *A. multiflora*.

1. ***A. borealis*** Bong. Stem stout, 2–4 dm. high, villous with long silky hairs; leaves linear or lance-linear in outline, 5–30 cm. long, 1–5 cm. broad, bipinnatifid; segments linear-filiform and spreading; bracts ovate or elliptic, acute, with blackish or brown margins; ligules suborbicular, 3–4 mm. broad. Benchlands and meadows: Mack.—(? Wyo.)—Alta.—B.C.—Alaska; e Siberia. *Subarctic*—*Subalp.* Je—Au.

2. ***A. Palmeri*** Rydb. Stem 3–6 dm. high, sparingly villous; leaves usually less than 1 dm. long, 1–2 cm. wide; primary divisions ovate, spreading, the ultimate ones lanceolate, rather conspicuously punctate; heads in corymbiform panicles; bracts about 20, the outer ovate and acutish, the inner elliptic and obtuse; margins narrow, dark brown; ray-flowers usually 5; ligules suborbicular, about 4 mm. long. Mountains: Colo.—Calif.; Mex. *Submont.*

3. ***A. fusca*** Rydb. Stem 3–6 dm. high, long-villous; leaves 1–2 dm. long, 5–10 mm. wide, bipinnatifid, linear or the lower linear-oblancoate in outline, long-villous; primary divisions short ascending, the ultimate ones lanceolate or ovate; heads in a corymbiform panicle; bracts about 20, the outer oval, the inner elliptic, all rounded or obtuse at the apex; margins dark brown, almost black; ray-flowers about 5; ligules white or pinkish, suborbicular, round-lobed, 3–4 mm. long. Hillsides: Alta.—Wash.—Yukon. *Submont.*—*Mont.*

4. ***A. subalpina*** Greene. Stem slender, 1–3 dm. high, villous with long hairs; leaves 3–10 cm. long, linear in outline, more or less long-villous; segments short and narrow, linear, much crowded; heads in a dense crowded corymb; bracts elliptic, with dark brown or blackish margins, the innermost usually acute, the rest obtuse; ligules 2–3 mm. long and broad. *A. lanulosa alpicola* Rydb. *A. alpicola* Rydb. High mountains: Alta.—N.M.—Nev.—B.C. *Subalp.*—*Alp.* Jl—Au.

5. ***A. californica*** Pollard. Stem 5–10 dm. high, usually branched above, villous, with long hairs; leaves numerous, bi- or tripinnatifid, sparingly villous, the lower 10–15 cm. long, the upper sessile and clasping, lanceolate in outline; rachis merely margined; primary divisions ovate in outline, spreading, the ultimate ones linear or lance-linear, spinulose-tipped; heads in compound corymbiform panicles; bracts about 20, all obtuse or rounded at the apex; margins brown; ray-flowers 5 or 6; ligules orbicular or rounded-oval, 3–4 mm. long. Sea coast, rarely inland: Calif.—Wash.—Ida. *Son.*

6. ***A. pacifica*** Rydb. Stem 3–7 dm. high, sulcate, usually decidedly long-villous; leaves 1–2 dm. long, 5–20 mm. wide, linear in outline, villous, bipinnatifid; primary divisions ovate in outline, short, crowded, the ultimate ones lanceolate or ovate, strongly punctate, callous-thickened towards the spinulose-mucronate tips; heads in round-topped corymbiform panicles; bracts about 20, yellowish or straw-colored, with margins of the same color, all obtuse or rounded at the apex; ray-flowers about 5; ligules 3–4 mm. long. Plains: Wash.—Ida.—Calif. *Son.*

7. ***A. lanulosa*** Nutt. Stem 3–6 dm. high, copiously villous with long silky hairs; leaves 5–10 dm. long, linear in outline, densely long-villous, bipinnatifid; segments (primary and secondary) short and directed forward, the secondary linear-lanceolate; bracts elliptic, obtuse, with green midrib and straw-colored (rarely brownish) margins. Plains and mountain valleys: Sask.—Kans.—N.M.—Calif.—B.C.; adv. eastward to Ont.; n Mex. *Plain*—*Subalp.* My—S.

8. ***A. occidentalis*** Raf. Stem 3–6 dm. high, usually rather copiously villous with long silky hairs; leaves lanceolate in outline, 5–10 cm. long, twice or thrice pinnatifid; ultimate segments narrow, linear; involucres about 4 mm. high and 3 mm. broad; bracts elliptic, obtuse, with a green midrib and straw-colored margins. Roadsides and prairies: Pa.—S.C.—Ark.—Neb.; adv. in Colo. My—Au.

9. ***A. millefolium*** L. Stem 2–6 dm. high, somewhat villous, with short hairs; leaves oblong in outline, 5–10 cm. long, 8–20 mm. broad, finely villous

or glabrate, twice pinnatifid; primary segments more or less spreading, more or less decurrent into the wing-margins; secondary segments short, lanceolate, flat, spinulose-tipped; involucre 4-5 mm. high, 3-4 mm. broad; bracts lance-elliptic or elliptic, obtuse, with brown (rarely nearly black) margins; ligules 2-3 mm. long and broad. Shores, hillsides, and roadsides: Newf.—Va.—Colo.—B.C.; nat. or adv. from Eu. Je-S.

10. A. multiflora Hook. Stem 3-10 dm. high, villous; leaves linear, 5-10 cm. long, 5-8 mm. broad, somewhat pubescent or glabrate, pectinately cleft into lanceolate, serrulate lobes; involucre 4-5 mm. high, 4-6 mm. broad; bracts more or less villous, elliptic with brown margins; ligules 10-12, suborbicular, 1-1.5 mm. long. Valleys: Mack.—Sask.—Alaska. *Boreal*. Jl-Au.

116. ANTHÉMIS L. CORN CHAMOMILE.

Annual or perennial herbs. Leaves alternate, mostly pinnatifid or bipinnatifid. Heads solitary at the ends of the branches, usually radiate. Involucre saucer-shaped; bracts in about 3 series of nearly the same length, usually thin; receptacle conic to hemispheric, chaffy; paleae membranous with a distinct midrib. Ray-flowers pistillate and fertile; ligules white. Disk-flowers hermaphrodite and fertile; corollas yellow. Anthers with ovate obtuse tips. Style-branches truncate and fimbriate at the apex. Achenes subcylindric or somewhat obovoid, not angled, with filiform ribs. Pappus wanting, or a minute crown.

1. A. arvensis L. A leafy annual; stem 2-5 dm. high, branched, hirsute-villous; leaves 3-5 cm. long, bipinnatifid, with linear-lanceolate cuspidate lobes, hirsute-villous; involucre 4-5 mm. high, 7-12 mm. broad; bracts villous-hirsute; receptacle conic; paleae linear-lanceolate, abruptly cuspidate; ligules white, 7-12 mm. long, 3-4 mm. wide; achenes subcylindric, 10-ribbed; pappus a minute border. Field and waste places: Me.—Ga.—Ore.—B.C.; adv. or nat. from Eu.

117. MARÛTA Cass. MAY WEED, DOG FENNEL, DOG CHAMOMILE.

Leafy annuals. Leaves alternate, bipinnatifid, with narrow divisions. Heads radiate, solitary at the ends of the branches. Involucre saucer-shaped; bracts in 2 series, subequal. Receptacle conic, chaffy towards the apex; paleae subulate, stiff, rather persistent. Ray-flowers 10-15, neutral; ligules white. Disk-flowers hermaphrodite and fertile; corolla-tube cylindric, longer than the funnelform throat; lobes 5, ovate, spreading. Anthers with ovate obtuse tips. Style included, with short branches truncate and fimbriate at the apex. Achenes nearly cylindric, 10-ribbed, glandular-tubercled. Pappus wanting.

1. M. Cotula (L.) DC. Annual, with fetid odor; stem glabrous or slightly pubescent above, 3-6 dm. high; leaves 3-5 cm. long, twice or thrice pinnatifid, with narrow linear-filiform divisions; glabrate or somewhat hairy; involucre 8-12 mm. broad; bracts oblong, obtuse, somewhat pubescent; ligules 10-18, white, about 1 cm. long, at length reflexed. *Anthemis Co'ula* L. Fields and waste places: Newf.—Fla.—Calif.—B.C.—Yukon; nat. from Eu. *Plain—Submont.* Jl-S.

118. CHAMOMILLA (Hall.) Gilib. CHAMOMILE, PINEAPPLE-WEED, GREEN DOG-FENNEL.

Mostly annual glabrous herbs. Leaves alternate, once to thrice pinnatifid into narrow divisions. Heads solitary or corymbose, radiate or discoid. Involucre saucer-shaped to hemispheric; bracts in 2-4 series, somewhat imbricate, obtuse, scarious-margined; receptacle conic, hemispheric, or subglobose, naked. Ray-flowers, if present, pistillate and fertile; ligules white. Disk-flowers numerous, hermaphrodite and fertile; corollas yellow; anthers with ovate obtuse tips; style-branches short, with truncate tips. Achenes usually asymmetric, with 3-5 ribs on the inner half, the back being nerveless. Pappus of a more or less developed crown or margin. [*Matricaria* L., in part.]

1. C. suaveolens (Pursh) Rydb. Annual; stem glabrous, very leafy, much branched, 1-4 dm. high; leaves glabrous, 2 or 3 times pinnatifid, with linear acute

lobes; involucre 7-10 mm. broad; bracts glabrous, oval to oblong, with broad scarious margins; ligules none; disk-corollas yellow, 4-lobed; receptacle conic; achenes oblong, slightly angular; pappus an obscure crown. *M. discoidea* DC. *M. matricarioides* (Less.) Porter. Moist and sandy places, roadsides, and waste places: Alaska—Calif.—Ariz.—N.D.; adv. or nat. eastward to Newf.—N.J.—N.Y., and in Eu. *Plain—Submont.* Mr-S.

119. **LEUCANTHEMUM** (Tourn.) Mill. OX-EYE DAISY.

Perennial herbs with rootstocks. Leaves alternate, dentate or entire or in some exotic species pinnatifid. Heads radiate, rarely discoid, solitary, rather long-peduncled at the ends of the stems. Involucre saucer-shaped; bracts many, rather narrow, in 2-4 series, somewhat imbricate. Receptacle flat or convex, naked. Ray-flowers in a single series, pistillate and fertile; ligules usually well-developed, white. Disk-corollas yellow. Anthers with ovate tips. Style of the ray-flowers slightly exerted, with short oblong branches, that of the disk-flowers included and with short branches, truncate and fimbriate at the apex. Achenes all cylindric, 10-ribbed or 10-angled. Pappus wanting.

1. **L. Leucanthemum** (L.) Rydb. Stem 3-10 dm. high, glabrous; basal leaves petioled, obovate or spatulate, coarsely dentate or incised; stem-leaves sessile, narrowly oblanceolate to nearly linear, dentate; involucre 12-15 mm. broad; bracts lanceolate, margined by a narrow brown band and a scarious margin; ligules white, 12-15 mm. long. *Chrysanthemum Leucanthemum* L. *L. vulgare* Lam. Meadows, roadsides, and pastures: Lab.—Fla.—Utah—B.C.; nat. from Eu. *Plain—Submont.* My-N.

120. **TANACETUM** (Tourn.) L. TANSY.

Strongly aromatic, leafy, mostly perennial herbs, with rootstocks. Leaves alternate, once to thrice pinnatifid, conspicuously punctate. Heads corymbose, usually several or many, radiate, but the rays often inconspicuous and not exceeding the disk. Involucre hemispheric or broader; bracts in 2-3 series, usually narrow, not very unequal in length; receptacle convex, naked. Ray-flowers pistillate and fertile; ligules yellow, varying from erect, 3-lobed, concave and scarcely exceeding the disk to spreading, flat, and well developed. Disk-flowers many, hermaphrodite and fertile; corollas yellow. Style in the ray-flowers slightly exerted, in the disk-flowers included. Anthers with obtuse tips. Achenes subcylindric, those of the ray-flowers mostly 3-angled, those of the disk-flowers 5-angled. Pappus-squamellae united into a short crown.

1. **T. vulgare** L. Stout perennial; stem 5-10 dm. high, glabrous or nearly so; leaves bipinnatifid, with oblong-acute serrate divisions, glabrous or nearly so; heads numerous in a corymbiform panicle; involucre 6-10 mm. broad; flowers yellow; marginal flowers with short oblique 3-toothed limbs. Roadsides and waste places: N.S.—N.C.—Miss.; Calif.—Wash., escaped from cultivation; native of Eurasia. Jl-S.

121. **SPHAEROMERIA** Nutt.

Low caespitose perennials, with a woody base, or small shrubs. Leaves alternate, often crowded at the base, pinnately or pedately divided or simple, usually silvery-canescens. Heads heterogamous but apparently discoid, few, corymbose, or in subcapitate clusters or solitary. Involucre hemispheric to broadly campanulate; bracts few, in 2 subequal series, usually broad; receptacle conic or convex, naked. Marginal flowers (functionally ray-flowers) few, pistillate and fertile, but without ligules; corollas cylindric to lance-ovoid, 3- or 4-lobed, slightly if at all oblique. Disk-flowers many, hermaphrodite and fertile; corollas with the short tube passing into the campanulate or cylindro-campanulate throat. Style of the ray-flowers short-exserted, that of the disk included; branches of the former oblong, obtuse, of the latter short, truncate and penicillate at the apex. Achenes subcylindric, tapering at the base, 5-10-ribbed. Pappus wanting.

- Plant shrubby, 2-4 dm. high, glabrous; heads several, corymbose. 1. *S. diversifolia*.
 Plant with caespitose caudices, 1.5 dm. or less high, silvery-canescens; heads solitary or
 in a small cluster.
 Heads few, clustered.
 Heads more or less peduncled; basal leaves obovate-cuneate, with 3-5 round lobes
 at the apex. 2. *S. argentea*.
 Heads sessile in a capitate cluster; basal leaves once or twice ternately divided
 into linear or oblong divisions. 3. *S. capitata*.
 Heads solitary; basal leaves simple, linear, or ternately cleft at the apex into linear
 divisions. 4. *S. simplex*.

1. ***S. diversifolia*** (D. C. Eat.) Rydb. Undershrub 2-4 dm. high; stem glabrous, leafy; lower leaves pinnatifid, with linear divisions, glabrous, the upper narrowly linear and entire; involucre hemispheric, 5-6 mm. broad, glabrous; bracts broadly ovate, with erose, white-scarious margins; marginal pistillate flowers 8-10. *Tanacetum diversifolium* D. C. Eat. Cañons: Utah. *Submont.* Jl-Au.

2. ***S. argentea*** Nutt. Stem 5-15 cm. high, silvery-canescens; leaves cuneate or flabelliform, 5-12 mm. long, 3-6-toothed or -lobed at the apex, silvery-canescens, or the uppermost oblong or linear, entire; heads few, corymbose; involucre hemispheric or campanulate, 3-5 mm. broad; bracts obovate, slightly tomentose when young, yellowish, with broad erose scarious margins; marginal pistillate flowers about 5. *T. Nuttallii* T. & G. Barren hills: Mont.—Wyo. *Submont.* My-Je.

3. ***S. capitata*** Nutt. Stem 5-15 cm. high, silvery-canescens; leaves mostly basal, ternately or bi-ternately divided into linear divisions, silvery-canescens; heads 8-15; involucre 4-5 mm. broad; bracts tomentose, yellowish, obovate, erose; marginal pistillate flowers about 5. *T. capitatum* T. & G. Dry hills: Mont.—Wyo. *Submont.* My-Jl.

4. ***S. simplex*** (A. Nels.) Heller. Leaves mostly basal, silvery-canescens, simple and linear or 2-3-cleft, with linear divisions, only 2-3 cm. long; stem 5-12 cm. high; heads solitary, 8-10 mm. broad, hemispheric; bracts obovate, slightly canescens, yellowish; pistillate marginal flowers few. *T. simplex* A. Nels. Dry hills: Wyo. *Submont.* My-Je.

122. PICROTHÁMNUS Nutt.

Low spiny shrubs. Leaves alternate, pedately divided and again lobed, with narrow divisions. Heads solitary or in small racemes, apparently discoid, the marginal flowers without ligules. Involucre saucer-shaped; bracts obovate-cuneate, scarious, in two more or less distinct subequal series; receptacle naked. Marginal flowers (functionally ray-flowers) few, pistillate, fertile; corolla short, deeply 2-cleft, villous; style long-exserted, with long linear obtuse branches. Disk-flowers hermaphrodite but sterile; corollas with a narrow obconic tube, a turbinate throat, and a 5-lobed limb, densely arachnoid-hairy; anthers oblong, with subulate tips and obtuse bases; style slender, with a peltate, erose stigma. Achenes ellipsoid, densely arachnoid-hairy.

1. ***P. desertorum*** Nutt. Spiny undershrub; stem villous-tomentose, 1-5 dm. high; leaves pedately 5-parted and again 3-lobed, with spatulate divisions, villous. *Artemisia spinescens* D. C. Eat. Desert regions: Wyo.—N.M.—e Calif.—Ore. *Plain—Submont.*

123. ARTEMÍSIA L. WORMWOOD, MUGWORT, CUDWEED, SAGE BRUSH.

Perennial or annual herbs, or shrubs, usually bitter-aromatic. Leaves alternate. Heads small, most commonly panicled and nodding when young, apparently discoid; the marginal flowers without ligules or wanting. Involucre campanulate to hemispheric; bracts in 2-4 series, at least the inner ones more or less scarious. Receptacle naked or hairy, convex or conic. Marginal flowers (functionally ray-flowers) pistillate and fertile or wanting; corollas cylindric or subcylindric and somewhat tapering upwards, 2-3-, rarely 4-toothed, often somewhat oblique; style more or less exserted, 2-cleft; style-branches linear-filiform and subterete to oblong and somewhat flattened. Disk-flowers hermaphrodite,

fertile or sterile; corollas campanulate, funnellform, or trumpet-shaped, 5-toothed, regular; anthers with lanceolate or subulate tips; style either 2-cleft and the branches more or less recurved, truncate at the apex, with an erose or fimbriate apex, or else entire and surmounted by an erose or fimbriate cup; achenes ellipsoid, terete, usually glabrous, without pappus.

Disk-flowers sterile, their styles undivided or with short erect branches; receptacle naked. Annual or perennial herbs; style of the disk-flowers undivided, ending in a cup-shaped penicillate appendix.

I. DRACUNCULOIDES.
Low shrubs or undershrubs; style of the disk-flowers usually more or less 2-cleft, each branch erect with truncate penicillate or erose apex.

II. FILIFOLIAE.
Disk-flowers fertile, their styles 2-cleft; branches more or less recurved.

Marginal pistillate flowers present.

Receptacle hairy.

Heads numerous, usually paniculate; plant more or less shrubby at the base.

III. FRIGIDAE.

Heads few, 1-12, racemose; plant low, herbaceous, from a rootstock, 1-3 dm. high.

IV. LANATAE.

Receptacle naked.

Annual or biennial herbs with bipinnatifid leaves.

V. ANNUAE.

Perennials.

Leaves silvery or silky or glabrate, but not tomentose beneath.

Plants low, herbaceous perennial, with rootstocks; heads many-flowered, nodding in a simple racemose inflorescence; leaves divided into linear or oblong divisions.

VI. NORVEGICAE.

Plants more or less shrubby at the base; heads paniculate.

Leaves pinnately dissected into narrow divisions (glabrate forms of *A. Abrotanum*, *A. graveolens* and *A. tenuis*).

Leaves cuneate, 3-toothed at the apex or the upper entire.

XIII. BIGELOVIANAE.

Leaves more or less tomentose beneath.

Leaves not dissected into narrowly linear more or less divergent divisions; these, if narrow, very few, directed forward and entire.

Leaves greener and glabrate above, at least in age.

Heads 60-100-flowered; leaves twice pinnatifid with obtuse divisions, the lower long-petioled.

VII. FRANSERIOIDES.

Heads 5-50-flowered; leaves simple or once pinnatifid, or if bipinnatifid, with acute lobes and sessile or short-petioled.

Leaves entire or with a few lobes, if dissected to near the midrib, the lobes rather broad [except in *A. mexicana*].

VIII. VULGARES.

Leaves deeply dissected to near the midrib; divisions linear or oblong, usually more or less cleft.

X. DISCOLORES.

Leaves white-tomentose on both sides.

IX. GNAPHALOIDES.

Leaves once or twice dissected into linear or filiform, more or less spreading divisions.

Leaf-segments broadly linear or linear-lanceolate, usually again lobed or toothed.

X. DISCOLORES.

Leaf-segments narrowly linear or filiform, mostly revolute.

Leaves once pinnatifid; plant herbaceous; style of the ray-flowers long-exserted.

XI. WRIGHTIANAE.

Leaves twice pinnatifid; plant suffrutescent; style of the ray-flowers short-exserted.

XII. PONTICAE.

Marginal pistillate flowers wanting; receptacle naked.

Shrubs 1-50 dm. high; leaves canescent, not with raised midribs.

Heads in terminal panicles; leaves entire, 3-5-toothed to 3-5-divided at the apex.

XIV. TRIDENTATAE.

Heads axillary; leaves pinnatifid into linear divisions.

XV. RIGIDAE.

Dwarf undershrubs, scarcely more than 1 dm. high; leaves pinnatifid into linear-spatulate divisions, green, with the ribs raised beneath.

XVI. PYGMAEAE.

I. DRACUNCULOIDES.

Leaves all entire or the lower 3-fid.

Leaves densely pubescent when young.

1. *A. glauca*.

Leaves glabrous.

Involucres 3-4 mm. broad; lower stem-leaves 3-12 mm. wide; heads 30-100-flowered; outermost involucre bracts almost as long as the inner.

Involucres 2-3 mm. broad; leaves 1-3 mm. wide; heads 20-40-flowered; outer bracts much shorter than the inner.

2. *A. aromatica*.

Leaves, at least the lower, pinnatifid or bipinnatifid.

3. *A. dracunculoides*.

Heads very small, 2-3 mm. broad, numerous in large leafy panicles; plants mostly tall, 3-10 dm. high.

Biennials; heads mostly erect; outer bracts acute.

Plant glabrous or nearly so.

4. *A. caudata*.

Plant decidedly pubescent. 5. *A. Forwoodii*.
Perennials, with a rootstock or caudex; heads nodding at least at first.

Plant 3-10 dm. high; stem leafy.

Stem tall, very leafy, 4-10 dm. high; bracts acute or acutish.

Stem lower, 3-5 dm. high; stem-leaves rather small and scattered; bracts

obtuse or rounded at the apex.

Plant less than 1 dm. high; stem scapiform; stem-leaves minute.

Heads larger, 4-5 mm. broad, not very numerous (except in *A. Bourgeauana*), in narrow spike-like panicles; plants low, rarely 3 dm. high.

Involucral bracts glabrous or nearly so; disk-corollas glabrous.

Involucral bracts more or less villous; disk-corollas usually with a few hairs on the lobes.

Plant 3-4 dm. high; heads very numerous, in a dense panicle.

Plant 1-3 dm. high; heads fewer, usually a spike-like panicle or racemose.

8. *A. MacCallae*.
9. *A. Bourgeauana*.
10. *A. spithamea*.

II. FILIFOLIAE.

Taller shrubs, 3-10 dm. high, with numerous heads in leafy panicles; heads 3-7-flowered.

Low undershrubs, less than 1.5 dm. high, with racemose inflorescence; heads 10-15-flowered.

Leaves ternate or biternate.

Leaves pinnatifid with 5-7 divisions.

11. *A. filifolia*.
12. *A. pedatifida*.
13. *A. minuta*.

III. FRIGIDAE.

Plant tall, 6-10 dm. high, erect; leaves twice or thrice pinnatifid.

Plant lower, 2-4 dm. high, often decumbent at base; leaves twice ternate.

14. *A. Absinthium*.
15. *A. frigida*.

IV. LANATAE.

Basal leaves twice pinnatifid into linear divisions; stem-leaves pinnate; heads 5-12.

Basal leaves pinnatifid into 3-5 linear-oblongate approximate divisions; stem-leaves ternately cleft or entire; heads 1-4.

16. *A. scopulorum*.
17. *A. Pattersoni*.

V. ANNUAE.

One species.

18. *A. biennis*.

VI. NORVEGICAE.

Heads 6-10 mm. broad, usually more than 40-flowered; corollas hairy or rarely glabrous; bracts with fuscous margins.

Plant more or less pubescent, at least on the leaves and peduncles.

Plant silvery-silky; basal leaves 6 cm. long or less, pinnatifid or bipinnatifid with few divisions.

Plant less than 1 dm. high; leaves 1-1.5 cm. long; involucral bracts with inconspicuous light brown margins, slightly tomentose, soon glabrous.

Plant 1-3 dm. high; leaves 2-6 cm. long; involucral bracts with conspicuous dark brown or blackish scarious margins.

Plant green; leaves twice pinnatifid, the basal ones more than 1 cm. long.

Leaves and stem decidedly hairy; inner bracts ovate, acute, with narrowly lanceolate green center.

Leaves sparingly pubescent or glabrate; stem glabrous or nearly so; inner bracts obovate, obtuse or rarely acutish, with broadly lanceolate green center.

Plant glabrous.

Heads 5-6 mm. broad, 30-40-flowered; corolla glandular-granuliferous; plant glabrous; bracts with light brown margins.

19. *A. minuta*.
20. *A. Tyrellii*.
21. *A. sarricola*.
22. *A. arctica*.
23. *A. laevigata*.
24. *A. Parryi*.

VII. FRANSERIOIDES.

One species.

25. *A. franserioides*.

VIII. VULGARES.

Leaf-segments again divided or lobed.

Inflorescence much branched, pyramidal; heads very numerous; involucre campanulate, 4 mm. high, 10-30-flowered; leaf-segments obovate in outline.

Inflorescence narrow, cylindric; heads fewer; involucre hemispheric, 3 mm. high, 25-35-flowered; leaf-segments lanceolate, short, acute.

Leaves or their segments entire or nearly so.

Heads not very numerous, comparatively large, 25-50-flowered; involucre hemispheric.

Inflorescence spike-like; suffruticose with a woody base; leaves coarse-toothed.

Inflorescence open-paniculate.

Leaves lanceolate, thin, deeply lobed; involucre glabrous or nearly so.

26. *A. vulgaris*.
27. *A. incompta*.
28. *A. Leibergii*.
29. *A. elatior*.

- Leaves linear-lanceolate, entire or short-lobed, thicker, sparingly floccose above; involucre arachnoid. 29. *A. arachnoidea*.
- Heads very numerous in dense compound panicles (except in *A. Lindleyana*), 5–25-flowered; involucre campanulate or ellipsoid.
- Upper leaves lanceolate or oblanceolate, usually more than 4 mm. wide.
- Involucre 4 mm. high; leaves large, 5–15 cm. long, lanceolate or ovate-lanceolate in outline, with very few divisions, directed forward.
- Lower leaves deeply divided into more or less falcate divisions. 30. *A. Hookeriana*.
- Lower leaves with shorter lobes or teeth directed forward.
- Heads nodding in anthesis, 15–25-flowered; involucre rounded-campanulate. 31. *A. Douglasiana*.
- Heads erect in anthesis, 5–15-flowered; involucre oblong or subcylindric. 32. *A. Herriotii*.
- Involucre 3 mm. high; leaves shorter; lobes of the lower leaves often spreading.
- Leaves of a lanceolate type; involucre campanulate, usually less than 3 mm. broad. 33. *A. ludoviciana*.
- Leaves of a cuneate type; involucre hemispheric, 3–4 mm. broad.
- Leaves with 3–5 ovate teeth at the apex, dark green. 34. *A. cuneata*.
- Leaves with 3–7 lanceolate lobes, yellowish green. 49. *A. rhizomata*.
- Upper leaves linear or narrowly linear-oblanceolate, less than 4 mm. wide.
- Heads numerous, paniculate; leaves usually more than 5 cm. long; plant not suffrutescent at the base.
- Inflorescence loose; branches long and heads scattered.
- Leaves entire, or the lower coarsely toothed or with short lanceolate lobes. 35. *A. silvicola*.
- Leaves, at least some of them, with long narrow, alternate, salient, falcate lobes. 36. *A. faicala*.
- Inflorescence dense and narrow; branches short; heads crowded; stem-leaves mostly pinnatifid.
- Bracts and upper surface of the leaves nearly glabrous; lower surface minutely tomentulose. 37. *A. potens*.
- Bracts and upper surface of the leaves floccose; lower surface white-tomentose. 38. *A. Underwoodii*.
- Heads less numerous, in narrow spikes or spike-like panicles; leaves narrow, usually less than 5 cm. long, the lower toothed or rarely lobed towards the apex, the upper entire, linear or nearly so; plant suffrutescent at the base. 39. *A. Lindleyana*.

IX. GNAPHALOIDES.

- Leaves all entire or the basal ones merely toothed.
- Involucre 3–4 mm. high, 2–3.5 mm. broad; heads less than 25-flowered.
- Corollas dark brown or purplish; leaves usually less tomentose above, the lower serrate towards the apex. 40. *A. gnaphaloides*.
- Corollas light brown or yellow; leaves equally white-tomentose on both sides.
- Involucre 2–2.5 mm. broad; leaves very narrow, linear or lance-linear, acute. 41. *A. pabularis*.
- Involucre 2.5–3.5 mm. broad; leaves broader, if lance-linear, more or less acuminate.
- Upper leaves ovate to lanceolate, acute; heads densely crowded and usually erect. 42. *A. Purshiana*.
- Upper leaves lanceolate to lance-linear, acuminate; heads less crowded, mostly spreading. (Entire-leaved forms of) 46. *A. diversifolia*.
- Involucre 4–5 mm. high, 4–7 mm. broad; heads 25–40-flowered (in *A. longifolia* sometimes 20–25-flowered).
- Heads nodding or spreading; leaves equally floccose on both sides, not revolute, acute.
- Heads nodding, rather long-peduncled on elongate racemiform branches; leaves linear. 43. *A. pudica*.
- Heads spreading, subsessile or short-peduncled on shorter branches; stem-leaves lanceolate. 44. *A. argophylla*.
- Heads erect, peduncled; stem-leaves linear-lanceolate, caudate-attenuate, often revolute-margined and greener above. 45. *A. longifolia*.
- Leaves, at least the lower ones, more or less lobed or divided.
- Lower leaves with simple divisions.
- Lower leaves with long and narrow lobes. 46. *A. diversifolia*.
- Involucre 3–4 mm. high, 3–4 mm. broad. 44. *A. argophylla*.
- Involucre 4–5 mm. high, 5–7 mm. broad.
- Lower leaves with short and broad often salient lobes.
- Leaves 5–8 cm. long; involucre 4–5 mm. high and about as broad.
- Leaves 1–5 cm. long; involucre 3–4 mm. high, 2–3 mm. broad.
- Stem simple up to the inflorescence.
- Inflorescence dense and much branched; heads clustered. 48. *A. Brittonii*.
- Inflorescence lax, narrow, spike-like, with short racemiform branches. 49. *A. rhizomata*.
- Stem conspicuously branched, the branches ending in small simple or branched racemes. 50. *A. albula*.

Lower leaves and often the upper with narrow, again cleft or toothed, spreading divisions.

Heads 25-50-flowered; involucre 4-5 mm. high, 5-8 mm. broad.

Heads erect, borne singly on peduncles 1-12 mm. long; leaves equally tomentose on both sides. 51. *A. floccosa*.

Heads borne in small glomerules, sessile, only the terminal one erect; leaves less tomentose above. 52. *A. candicans*.

Heads 20-30-flowered; involucre 3 mm. high, 2.5-3.5 mm. broad. 53. *A. Flodmanii*.

X. DISCOLORES.

Leaves densely white-tomentose beneath, loosely floccose above, at least when young.

Heads very numerous in a branched leafy panicle; leaves not revolute-margined. 54. *A. discolor*.

Heads fewer, usually in a narrow spike-like or racemiform inflorescence; leaves revolute-margined. 55. *A. Michauxiana*.

Leaves minutely tomentulose beneath, glabrous above.

Heads hemispheric, nodding at least in anthesis. 56. *A. graveolens*.

Heads campanulate, erect in anthesis. 57. *A. tenuis*.

XI. WRIGHTIANAE.

Leaves sparingly pubescent or glabrous, green above.

Heads erect; involucre about 2 mm. broad. 58. *A. Wrightii*.

Heads nodding; involucre about 3 mm. broad. 59. *A. Bakeri*.

Leaves white-tomentose on both sides. 60. *A. Carruthii*.

XII. PONTICAE.

One species. 61. *A. Abrotanum*.

XIII. BIGELOVIANAE.

One species. 62. *A. Bigelovii*.

XIV. TRIDENTATAE.

Involucre 4-5 mm. high, 3-5 mm. broad; heads 7-15-flowered (rarely 5- or 6-flowered).

Leaves mostly entire; heads numerous in a dense but not spike-like panicle. 63. *A. cana*.

Leaves, at least some of them, 3-5-toothed at the apex; heads fewer in a narrow spike-like panicle.

Plant 1-3 dm. high; branches decumbent or spreading at the base.

Plant about 5 dm. high, with erect strict branches. 64. *A. arbuscula*.

Involucre 2-4 mm. high, 2-2.5 mm. broad; heads 1-8-flowered. 65. *A. spiciformis*.

Leaves, at least some of them, 3-toothed at the apex.

Shrubs 5-50 dm. high; heads numerous in ample panicles.

Leaves cuneate.

Shrub 1-4 dm. high; heads fewer. 66. *A. tridentata*.

Heads glomerate in dense panicles; involucre turbinate. 67. *A. angusta*.

Heads in simple, raceme-like panicles; involucre campanulate. 62. *A. Bigelovii*.

Heads 7-9-flowered; involucre densely canescent. 64. *A. arbuscula*.

Heads 1-6-flowered; involucre nearly glabrous. 68. *A. nova*.

Leaves 3-cleft into linear-filiform divisions. 69. *A. tripartita*.

XV. RIGIDAE.

One species. 70. *A. rigida*.

XVI. PYGMAEAE.

One species. 71. *A. pygmaea*.

1. *A. glauca* Pallas. Perennial; stem 3-6 dm. high, silky-pubescent; leaves entire, linear, 2-5 dm. long, 2-5 mm. wide, or with a few linear divisions, silky-canescens; heads small, numerous in a large panicle; involucre about 13 mm. broad; bracts elliptic, pubescent, scarious-margined; flowers yellow. Prairies and banks: Man.—Neb.—Colo.—Alta.; Siberia. *Plain*. J1-O.

2. *A. aromatica* A. Nels. Perennial; stems mostly simple, 4-8 dm. high, glabrous; leaves mostly entire, some of the lower 3-cleft, linear, 2-7 cm. long, 2-6 mm. wide; heads numerous, in a large leafy panicle, nodding; involucre 3-4 mm. broad, glabrous; bracts elliptic, dark green with scarious margins; flowers brown, the fertile ones 10-20, the sterile more numerous. Mountain valleys: Alta.—Colo.—n Calif.—Wash.; n Mex. *Submont.*

3. *A. dracunculoides* Pursh. Perennial; stem 5-15 dm. high, glabrous; leaves narrowly linear, or some 3-cleft with similar divisions, glabrous, 3-7 dm. long, 1-3 mm. wide; heads very numerous, in a compound panicle, nodding; involucre broad, glabrous, yellowish green; bracts elliptic, obtuse; ray-flowers 10-20. Prairies and plains: Man.—Mo.—Tex.—Calif.—B.C. *Plain—Submont.*

4. **A. caudata** Michx. Biennial; stem glabrous, 5–20 dm. high; leaves 1–3-pinnately divided into linear-filiform divisions, glabrous or nearly so, the lower petioled, 7–15 cm. long; heads very numerous in a narrow panicle, nodding; involucre 2–3 mm. broad; bracts glabrous, elliptic, obtuse, yellowish green; flowers yellow. Sandy soil: N.B.—Fla.—Tex.—Colo.—Sask. JI–S.

5. **A. Forwoodii** S. Wats. Biennial; stem 4–7 dm. high, somewhat pubescent when young; basal leaves 5–10 cm. long, petioled, bi- or tripinnatifid into narrowly linear divisions, loosely silky-canescens at least when young; heads numerous in a dense panicle, mostly erect, heterogamous; involucre subglobose, 2–2.5 mm. high, 2.5–3 mm. broad; bracts in 3–4 series, the outermost lanceolate or ovate, acute, half as long as the innermost ones; ray-flowers 15–20. *A. caudata calvens* Lunell. Plains: Ont.—Mich.—Neb.—Sask. Plain.

6. **A. pacifica** Nutt. Perennial; stem 4–10 dm. high, glabrate or sparingly pubescent when young, often purplish; leaves 1–2 cm. long, twice pinnatifid, with narrowly linear divisions; heads very numerous, in a leafy panicle, at first nodding, soon erect; involucre subglobose, about 2.5 mm. high, 2.5–3 mm. broad; bracts glabrous or sparingly short-hairy, scarious-margined; outermost bracts ovate, acute, about half as long as the inner ones; ray-flowers 8–12; corollas glabrous. *A. desertorum* Scouleriana Besser. *A. Scouleriana* Rydb. Plains: Alta.—B.C.—Ore.; (? Colo.).

7. **A. camporum** Rydb. Perennial; stem 3–5 dm. high, striate, often purplish; basal leaves clustered, 4–10 cm. long, petioled, twice or thrice pinnatifid into linear or oblong divisions, more or less silky-canescens; upper stem-leaves sessile, pinnatifid, with narrowly linear divisions; heads numerous in a narrow leafy panicle, nodding; involucre hemispheric, 2.5–3 mm. high and fully as broad; bracts in 3–4 series, scarious-margined, the outermost ovate, obtuse, a little more than half as long as the innermost ones; ray-flowers 15–20. *A. canadensis* Nutt., not Michx. *A. Forwoodii* Rydb. (Fl. Colo.), not S. Wats. Plains and hills: Ont.—Sask.—Neb.—Ariz.—Yukon. Plain—Submont.

8. **A. MacCallae** Rydb. Perennial; stem 2–3 dm. high, rather strict, more or less canescens, sometimes purplish; basal leaves 5–10 cm. long, petioled; blades ovate in outline, twice pinnatifid, with rather few, linear or narrowly oblanceolate divisions, silky-canescens; upper stem-leaves less divided; heads rather numerous, in narrow panicles; involucre 3 mm. high, 4–5 mm. broad; bracts green with yellowish scarious margins, acutish, sparingly long-hairy or glabrous; outer bracts ovate, about half as long as the inner broadly oval ones; ray-flowers 10–15. Gravelly slopes: Alta.—Yukon—Wash.—Colo. Plain—Submont.

9. **A. Bourgeauana** Rydb. Perennial; stem 3–4 dm. high, rather densely silky-villous, more or less tinged with red; basal leaves clustered, 4–6 dm. long, petioled, sericeous-canescens on both sides, twice pinnatifid, with oblanceolate divisions; stem-leaves mostly sessile, rather small, with linear divisions, or 3-fid or entire; heads very numerous, in dense leafy panicles; involucre hemispheric, about 4 mm. high and 5 mm. broad; bracts yellowish, silky-villous, scarious-margined, the outermost about half as long as the innermost, ovate, acute; ray-flowers about 20. Plains: Sask.—N.D. Plain.

10. **A. spithamea** Pursh. Perennial; stem 1–3 dm. high, sericeous; basal leaves pinnately or bipinnately divided into oblanceolate lobes, silky-canescens on both sides; upper leaves reduced, linear or with linear lobes; heads comparatively few, in a spiciform inflorescence; involucre 4–5 mm. broad; bracts oval, silky or glabrate, with brownish green centres, and scarious margins; flowers brown or purplish. *A. borealis* Am. auth. *A. groenlandica* Wormsk. Subarctic, arctic, and alpine regions: Greenl.—Que.—Mont.—Colo.—Wash. Subalp.—Alp. JI–Au.

11. **A. filifolia** Torr. Undershrub, 3–10 dm. high; branches erect, minutely tomentulose, leafy; leaves all slender, entire and filiform, or some 3-parted with filiform divisions, minutely tomentulose, more or less fascicled; heads very small and very numerous, in narrow leafy panicles; involucre 1–1.5 mm. broad, to-

mentulose, 3-5-flowered; sterile central flowers 1-3. *A. plattensis* Nutt. Plains: Neb.—Tex.—Ariz.—Nev.; Mex. *Son.*—*Plain.* Ap—O.

12. *A. pedatifida* Nutt. Perennial, with a thick woody caespitose caudex; stems 5-15 cm. high, finely canescent; leaves mostly basal, once or twice ternately divided into linear or narrowly spatulate divisions, finely white-tomentulose; heads few in a spicate or racemose inflorescence, 12-15-flowered; involucre 3-4 mm. broad, tomentose; bracts elliptic; flowers brownish. Arid ground: Wyo.—Mont.—Ida. *Submont.* Je—Au.

13. *A. Absinthium* L. Shrubby; stem 5-15 dm. high, finely canescent; leaves 5-12 cm. long, once to thrice pinnately divided into oblong or lanceolate, obtuse divisions, finely canescent, especially beneath; heads numerous in a large panicle, with racemiform branches, nodding; involucre 4-5 mm. broad, canescent; outer bracts linear, the inner oval, scarious-margined. Waste places and around dwellings: Newf.—N.C.—Mont.; escaped, native of Eu. Au—S.

14. *A. frigida* Willd. Perennial, with a caespitose, suffrutescent caudex; stem 2-5 dm. high, finely canescent; leaves twice pinnatifid, with linear-filiform divisions, silvery-white, in age often turning brownish; heads numerous, racemously disposed, nodding; involucre 4-6 mm. broad, canescent or tomentose; bracts oblong or lanceolate; corollas yellow, glabrous. Dry plains and hills: Hudson Bay—Tex.—Ariz.—Ida.—Alaska; Asia. *Plain*—Mont. Jl—O.

15. *A. scopulorum* A. Gray. Perennial, with a caespitose caudex; stem simple, canescent, 1-2 dm. high; lower leaves petioled, 3-7 cm. long, bipinnatifid, with linear or oblong divisions, silky-canescant; upper stem-leaves small and less divided; heads 3-12, spicately or racemously disposed, 18-30-flowered; involucre 6-8 mm. broad; bracts oval, tomentose, black- or brown-margined; corollas yellow, hirsute at the summit. High mountains: Mont.—N.M.—Utah. *Subalp.*—Alp. Jl—S.

16. *A. Pattersoni* A. Gray. Perennial, with a caespitose caudex; stem white-tomentose; lower leaves pinnatifid, with 3-5 linear divisions, sericeous; upper stem-leaves linear, entire or 2-3-cleft at the apex; heads 1-5, usually conglomerate, 8-12 mm. broad; bracts oblong or elliptic, white-tomentose with brown or black margins; flowers yellow, 40-50, the central ones fertile; receptacle villous. Alpine peaks: Colo. *Subalp.*—Alp. Jl—Au.

17. *A. biennis* Willd. Biennial; stem 3-10 dm. high, glabrous; leaves pinnately or bipinnately parted into lanceolate, laciniate-dentate divisions, glabrous; heads small, numerous, in a dense leafy panicle; involucre 2-3 mm. wide, glabrous; bracts elliptic, dark-green, scarious-margined; corollas yellow, glabrous. Wet places: N.S.—N.J.—Calif.—B.C.—Mack. *Plain*—Mont. Au—D.

18. *A. minuta* Rydb. A low undershrub, woody at the base; stems 1 dm. high or less, at first slightly tomentose, in age glabrate and reddish; leaves mostly basal, silvery-silky, about 1 cm. long, pinnatifid, with 5-7 narrowly oblanceolate approximate divisions; stem-leaves smaller, with linear-filiform divisions; inflorescence simple, spike-like, 2-4 cm. long; involucre hemispheric, 2.5 mm. high; bracts about 10, light brown, slightly tomentose, in age glabrate, ovate, acutish, scarious-margined. Plains: Alta. *Plain.*

19. *A. Tyrrellii* Rydb. Tufted perennial; stems 2-3 dm. high, densely silky-canescant; leaves 1.5-3 cm. long, white-silvery on both sides, the basal ones twice pinnatifid, with 3-5 crowded primary divisions, which are 3-5-cleft into oblanceolate or spatulate divisions; upper leaves ternate to entire and linear; heads racemose, nodding; involucre hemispheric, about 5 mm. high and 7 mm. broad; bracts 12-15, elliptic, densely canescent on the back, with conspicuous dark brown scarious margins; ray-flowers about 10; disk-flowers about 30. Mountains: B.C. *Subalp.* S.

20. *A. saxicola* Rydb. Perennial, with a caespitose caudex; stem decumbent at the base, 1-3 dm. high, loosely villous; basal leaves petioled, 2-8 cm. long, twice pinnately parted into lanceolate divisions, loosely villous; heads several, racemously disposed, some of them, at least the lower, on long erect peduncles, nodding; involucre 8-10 mm. broad, villous; bracts elliptic with black or dark

brown margins; corollas yellow, loosely pubescent. *A. norvegica* A. Gray, not Fries. Higher mountains: Colo.—Alta. *Mont.—Alp.* Jl-S.

21. *A. arctica* Less. Perennial, with a caespitose caudex; stem 2-4 dm. high, glabrous or sparingly pubescent above; lower leaves petioled, 5-15 cm. long, twice pinnately parted, with lanceolate, acute or acuminate divisions, slightly pubescent or glabrate, the upper leaves less divided, smaller and sessile; heads several, in racemose inflorescence, nodding, the lower usually on elongated peduncles; involucre 8-10 mm. broad; bracts elliptic, sparingly hairy, with black or dark brown margins; corollas yellow, usually pilose. *A. norvegica pacifica* A. Gray. *A. longepedunculata* Rudolphi. Arctic, subarctic, and alpine situations: Yukon—B.C. (Selkirk Mts.)—Wash.—Alaska; Asia. Au-S.

22. *A. laevigata* Standl. A low perennial, with a rootstock; stems 2.5-3 dm. high, glabrous, reddish, striate; basal leaves slender-petioled, twice pinnatifid into oblong-linear, acute divisions, glabrous, 2-6 cm. long; stem-leaves mostly once pinnatifid into narrow acute divisions; heads 5-8, nodding, in a racemose inflorescence; involucre 8-10 mm. broad; bracts glabrous, ovate, obtuse, green on the back, with broad dark brown erose margins; ray-flowers 5-10. Mountains: Alta. *Subalp.*

23. *A. Parryi* A. Gray. Perennial, with a caespitose caudex; stem glabrous, 2-4 dm. high; leaves twice to thrice pinnatifid, with linear divisions, glabrous; heads rather many, racemosely or paniculately disposed, nodding; involucre 5-7 mm. broad, glabrous; bracts elliptic or oval with light brown margins; corollas yellow, glabrous. Alpine peaks: Colo.—e Utah. *Subalp.* Au.

24. *A. franserioides* Greene. Perennial, with a rootstock; stem 3-10 dm. high, minutely puberulent or glabrous; leaves twice or thrice pinnatifid, with oblong, obtusish divisions, green and glabrous above, pale and usually minutely tomentulose beneath; heads numerous, in a narrow panicle, nodding; involucre about 6 mm. broad, sparingly tomentose; outer bracts linear, green, the inner oblong, scarious-margined; corollas 40-90, glabrous; marginal flowers few. Mountains: Colo.—N.M.; Mex. *Submont.* Jl-S.

25. *A. vulgaris* L. A stout perennial, with a rootstock; stem 5-15 dm. high, sparingly tomentose when young; lower and middle leaves ovate in outline, pinnately or bipinnately divided to near the midrib, green and glabrate above, white-tomentose beneath, 5-10 cm. long; primary divisions 5-7, obovate, oblong, or oblanceolate, acute, the ultimate lanceolate, often few-toothed; upper leaves pinnatifid, with lanceolate or linear divisions, or simple; heads very numerous in a leafy panicle; involucre about 4 mm. high, 3-4 mm. broad, more or less tomentose; bracts ovate to oblong, obtuse; ray-flowers 6-12. Waste places: Newf.—Man.—Wis.—Ala.—Ga.; B.C.; escaped from cultivation; native of the Old World.

26. *A. incompta* Nutt. Perennial, with a creeping rootstock; stem 3-6 dm. high, glabrate or at first slightly floccose; leaves soon glabrate above, tomentose beneath, the lower obovate or oblanceolate in outline, 3-10 cm. long, often bipinnatifid with lanceolate, acute divisions, the upper narrower and merely pinnately cleft; heads numerous, in a narrow panicle; involucre glabrous or nearly so, about 4 mm. broad; bracts oval, scarious-margined; corollas brownish. *A. discolor incompta* A. Gray. Hillsides: Mont.—Colo.—Calif.—B.C. Jl-Au.

27. *A. elatior* (T. & G.) Rydb. Perennial, with a creeping rootstock; stem 5-10 dm. high, glabrous or slightly floccose; leaves glabrous or nearly so above, tomentose beneath, acuminate, 5-10 cm. long, the lower pinnatifid, with lanceolate, long-acuminate lobes, the upper trifid or entire; heads numerous, in a panicle, nodding; involucre about 5 mm. broad, shining, nearly glabrous; bracts with yellowish or brownish scarious margins, oval; corollas yellow or brownish. *A. Tilesii elatior* T. & G. Valleys: Mack.—Hudson Bay—Mont.—Wash.—Alaska. *Submont.—Subalp.* Jl-S.

28. *A. Leibergii* Rydb. A suffrutescent perennial, 3-6 dm. high, with a woody caudex and short perennial stems; branches erect, simple, sparingly tomentulose or glabrate, striate; leaves 3-6 cm. long, oblanceolate, coarsely

toothed or lobed towards the apex, or the upper entire, glabrous and yellowish green above, finely floccose beneath; heads many in a dense spike-like panicle; involucre hemispheric, about 4 mm. high, 4-5 mm. broad; bracts yellowish, only sparingly floccose, ovate, oval, acutish, broadly scarious-margined; ray-flowers 5-7. Plains: Wash.—n Ida. *Son.*—*Submont.*

29. A. arachnoidea Sheld. A perennial, with a branched rootstock or caudex; stem 5-10 dm. high, striate, arachnoid-floccose; leaves linear-lanceolate, acuminate or acute, sessile, sparingly floccose but soon glabrate above, permanently floccose beneath, 3-8 cm. long, the lower with a few lanceolate short lobes; heads many, in a lax panicle, often sub-second and nodding; involucre hemispheric, about 4 mm. high and 6 mm. broad; bracts about 10, sparingly floccose, yellowish green, ovate to elliptic, acute or obtuse, scarious-margined; ray-flowers 8-10. Banks: Ore.—Ida. *Son.*

30. A. Hookeriana Besser. Tall perennial, with a rootstock; stem 3-6 dm. high; leaves lanceolate or ovate in outline, glabrate above, densely white-tomentose beneath, the upper entire, the lower deeply cleft into 3-7 lanceolate often falcate divisions; heads numerous, in very dense elongate panicles, mostly erect; involucre about 4 mm. high and 3 mm. broad, more or less tomentose; bracts ovate to elliptic, obtuse, scarious-margined; ray-flowers 5 or 6. Valleys: Sask.—B.C.—Ore. *Plain.*

31. A. Douglasiana Besser. Stout perennial, with a rootstock; stem 6-10 dm. high; leaves numerous, 5-15 cm. long, lanceolate, acuminate, the lower more or less lobed or toothed, with few lanceolate lobes or teeth, the upper ones entire, all somewhat grayish-floccose above when young, permanently white-tomentose beneath; heads numerous, at first nodding, in a large dense narrow leafy panicle; involucre 4 mm. high, 3-4 mm. broad; bracts tomentose, at least when young; the outer lanceolate, acutish, the inner elliptic, obtuse, broadly scarious-margined above; ray-flowers 6-8. *A. vulgaris californica* Besser. *A. Kennedyi* A. Nels. Banks: Wash.—Ida.—s Calif. *Son.*—*Submont.*

32. A. Herriotii Rydb. Tall perennial, with a rootstock; stem simple, 6-10 dm. high, finely tomentose; leaves entire or sparingly and sharply toothed, 5-20 cm. long, glabrate and green above, densely white-tomentose beneath; heads very numerous, erect, in a narrow dense panicle; involucre 4-5 mm. high, 2.5-3 mm. broad; bracts tomentose, the outer ovate-lanceolate, acute; inner bracts elliptic, mostly obtuse; ray-flowers 6-8. Banks: Alta.—Sask.—S.D. *Plain.*

33. A. ludoviciana Nutt. Perennial, with a caespitose rootstock; stem usually branched, more or less tomentose, 3-6 dm. high; lower leaves oblanceolate, 3-7-lobed above the middle, 3-8 cm. long, soon glabrate and dark green above, densely white-tomentose beneath; lobes lanceolate and falcate; upper leaves lanceolate and entire; heads very numerous and small, in a compound open panicle; involucre 3-4 mm. high, 2-3 mm. broad, usually densely tomentose; bracts elliptic; corollas light brown. Prairies, cañons, and mountain sides: Mo.—Tex.—Ariz.—Utah. *Plain*—*Submont.* Au-S.

34. A. cuneata Rydb. Perennial, with a creeping rootstock; stem 5-10 dm. high, tomentose, branched; leaves sessile, 2-4 cm. long, grayish floccose above, white-tomentose beneath, those of the stem cuneate-obovate, pinnatifid, or coarsely toothed towards the apex, the lobes or teeth ovate, often mucronate; leaves of the inflorescence lanceolate and entire; heads numerous, hemispheric, about 3 mm. broad; bracts oval, obtuse, tomentose, the inner scarious-margined; ray-flowers 6 or 7. Banks: Colo.—Tex. *Son.*—*Submont.* Au-S.

35. A. silvicola Osterhout. Perennial, with a creeping rootstock; stem 4-6 dm. high, slender, sparingly tomentose; leaves linear or linear-lanceolate, 4-6 cm. long, 3-8 dm. wide, entire or with a few sharp teeth, acuminate, glabrate above, densely silvery-tomentose beneath; inflorescence loosely paniculate, 2-3 dm. long; heads numerous, nodding; involucre about 5 mm. broad, tomentose, but not very densely so; bracts oblong; ray-flowers 10-15. Mountains and prairies: Tex.—Colo.—Utah—Calif.; n Mex.—Ariz.—Ida. *Son.*—*Submont.* Au-S.

36. *A. falcata* Rydb. Tall perennial, with a rootstock; stem 6–10 dm. high, loosely floccose; leaves linear or narrowly linear-lanceolate, 10–15 cm. long, green and glabrate above, white-tomentose beneath, the upper simple, falcate, the lower usually with several alternate, spreading and strongly falcate, narrow lobes; panicle very large; involucre about 4 mm. high and fully as broad, densely floccose; outer bracts ovate, acute, the inner oval and obtuse; ray-flowers 5–7. Banks: S.D.—Sask. *Plain*. Au–S.

37. *A. potens* A. Nels. Perennial, with a creeping rootstock; stem simple, pale green, 4–8 dm. high; leaves 3–6 cm. long, sessile, pale and glabrate above, thinly tomentose beneath, with somewhat revolute margins, linear, simple or pinnatifid, with 2–4 divaricate lobes; heads numerous in a dense narrow panicle, crowded; involucre 3 mm. high and as broad; bracts 8–10, nearly glabrous, the outer ovate, acute; inner bracts oval, obtuse; ray-flowers 10–12. Banks: Calif.—Mont.—B.C.

38. *A. Underwoodii* Rydb. Perennial, with a horizontal much-branched rootstock; stem slender, 2–6 dm. high, somewhat floccose; leaves 3–5 cm. long, pinnately parted, with 3–7 (usually 5) linear or linear-lanceolate acute lobes, densely white-floccose beneath, green and slightly tomentose above, in age glabrate; panicle narrow; heads crowded; involucre 3 mm. high and 2.5 mm. broad; bracts ovate, tomentose, slightly scarious on the margin. Hills and mountain sides: Nev.—Colo.—Ariz.—Calif.—B.C. *Plain*—*Submont.* Jl–S.

39. *A. Lindleyana* Besser. Perennial, with a caespitose rootstock; stem 1–4 dm. high, slender; leaves lanceolate to linear, 1–3 cm. long, entire or the lower with sharp teeth, floccose when young, soon glabrate above, more or less permanently tomentose beneath; inflorescence narrow, racemiform, or with short erect branches; involucre 3–4 mm. high, 2–3 mm. broad, tomentose. Rocky banks: Wash.—w Mont.—Ariz.—n Calif. *Son.*—*Submont.* Jl–S.

40. *A. gnaphaloides* Nutt. Perennial, with a slender, horizontal, caespitose rootstock; stem 3–6 dm. high, white-tomentose; lower leaves oblanceolate, entire or serrate, 2–10 cm. long, tomentose on both sides; upper leaves lanceolate or linear, entire; heads very numerous, in rather dense panicles; involucre about 4 mm. high, 2–3 mm. wide, about 20-flowered. Prairies and river banks: Ont.—Mo.—Tex.—Colo.—Alta.; adv. eastward to N.H. and N.Y. *Plain*—*Submont.*

41. *A. pabularis* (A. Nels.) Rydb. Perennial, with a creeping rootstock; stem 2–4 dm. high, slender, white-tomentose; leaves linear or narrowly linear-lanceolate, the lower often toothed, densely tomentose, inclined to become yellowish, 3–5 cm. long; heads small, in a narrow spike-like inflorescence; involucre tomentose, about 3 mm. high and 2 mm. broad, about 15-flowered. *A. rhizomata pabularis* A. Nels. Saline soil: S.D.—Neb.—Colo.—Ida. *Plain*. Jl–Au.

42. *A. Purshiana* Besser. Perennial, with a horizontal rootstock; stem 3–6 dm. high, tomentose; leaves ovate to lanceolate, entire or the lower somewhat toothed, white-tomentose on both sides; heads small, in a dense, contracted panicle; involucre about 3 mm. high, 2 mm. broad, tomentose; flowers about 15. Plains: Sask.—Neb.—Calif.—B.C. *Plain*—*Submont.* Au–O.

43. *A. pudica* Rydb. Perennial, with a horizontal rootstock; stem 4–6 dm. high, simple up to the inflorescence, white-floccose; leaves linear or narrowly linear-lanceolate, 6–10 cm. long, 6–8 mm. wide, entire, white-floccose on both sides; inflorescence a narrow panicle; involucre campanulate, about 5 mm. high and 4 mm. broad; bracts ovate, densely tomentose, with a darker midrib and slightly scarious margin; flowers about 20, yellow. Mountains: Colo. *Submont.* Jl–Au.

44. *A. argophylla* Rydb. Perennial, with a strong rootstock; stem 5–10 dm. high, white-tomentose, angled; leaves many, lanceolate, entire, or the lower oblanceolate, sometimes coarsely toothed or with lanceolate lobes, 5–10 cm. long, white-tomentose on both sides, acute; heads numerous in a leafy panicle; involucre hemispheric, 4–5 mm. high, 5–7 mm. broad, densely tomentose; bracts 12–14, the outer lanceolate, acute; inner bracts elliptic or oval, obtusish; flowers 25–40; corollas yellow. Valleys: Colo.—Wyo.—Wash.—n Calif.

45. *A. longifolia* Nutt. Perennial, with a suffruticose base or woody caudex; stem 3-12 dm. high, silvery-tomentose; leaves linear or lance-linear, tomentose on both sides, in age greener above, with revolute margins; heads erect, in a narrow raceme-like panicle; involucre 5-6 mm. broad, tomentose; bracts ovate or oval; flowers about 20, yellow. *A. natronensis* A. Nels., a broad-leaved form. Plains in alkaline soil: Man.—Colo.—Ida.—Wash. *Plain*. Jl—Au.

46. *A. diversifolia* Rydb. White-tomentose perennial, with horizontal rootstock; stem simple, leafy, 5-10 dm. high; leaves densely tomentose on both sides, subsessile, 5-10 cm. long, the lower usually pinnately cleft into 3-5 narrowly lanceolate-acuminate lobes, which are directed forward, the upper or all entire, linear-lanceolate, passing into the bracts of the inflorescence; inflorescence a narrow panicle, 1.5-3 dm. long; heads numerous; involucre 3-4 mm. high and 3 mm. broad; bracts oblong or ovate-oblong, scarious-margined, densely villous-tomentose; flowers light yellow. Valleys: Hudson Bay—Neb.—Colo.—Calif.—B.C. *Plain—Submont.* Jl—S.

47. *A. platyphylla* Rydb. Perennial, with a creeping rootstock; stem 4-6 dm. high, finely tomentose, simple; lower leaves cuneate-obovate, 5-8 cm. long, with rounded-ovate mucronate lobes above the middle, equally tomentose on both sides; middle leaves similar, but the lobes deeper, triangular or lanceolate; upper leaves ovate or lanceolate, with 3 lanceolate lobes or entire; heads many, in a narrow panicle; involucre hemispheric, 4-5 mm. high and nearly as broad; bracts densely floccose, the outer ovate, acute, the inner oval, obtuse; flowers 15-25; corollas yellow. *A. ludoviciana latiloba* Nutt. Banks: Wash.—Ore.—Mont.

48. *A. Brittonii* Rydb. Perennial, with a horizontal rootstock; stem rather stout, 3-6 dm. high, white-floccose; lower leaves thick, cuneate or oblong-ob-lanceolate, 3-5-lobed, mostly above the middle, densely white-tomentose on both sides, the lobes lanceolate; upper leaves ovate-lanceolate, entire; panicles narrow; involucre 3-4 mm. high, about 2 mm. broad; bracts ovate and densely floccose; flowers about 15, light brown or yellow. Hills and plains: Wyo.—Ore.—Ariz.—N.M.; n Mex. *Submont.* Au—O.

49. *A. rhizomata* A. Nels. Perennial, with a caespitose rootstock; stem 4-6 dm. high, white-tomentose; leaves white-tomentose on both sides, 2-4 cm. long, the lower elliptic, oblanceolate, or oblong-cuneate, usually with 3-5 short ovate or lanceolate lobes, the upper lanceolate and entire; heads comparatively few, in a narrow, spike-like panicle; branches of the latter short, with 2-6 erect heads; involucre campanulate, about 3.5 mm. high and 3 mm. broad, densely tomentose; bracts ovate to elliptic, obtuse; ray- and disk-flowers each 7 or 8; corollas light brown. Hills: Wyo.—N.M. *Submont.*

50. *A. albula* Woot. Perennial, with a rootstock; stem tomentose, 4-10 dm. high; lower leaves ovate in outline, 4-5 cm. long, 3-5-lobed, white-tomentose on both sides; upper leaves linear to narrowly oblong-lanceolate, 1-3 cm. long, 2-5 mm. broad, usually entire; heads in an open leafy panicle, very numerous; involucre 3 mm. high, 2 mm. broad, tomentose; flowers 15-20, yellow. *A. microcephala* Woot., not Hildebr. Dry plains: Tex.—Colo.—s Calif.; n Mex. *Son.* Au—O.

51. *A. floccosa* Rydb. Perennial, with a creeping rootstock; stem stout, 5-8 dm. high, tomentose; leaves 3-5 cm. long, pinnately divided into oblong, linear, or lanceolate divisions, loosely white-tomentose on both sides, the upper often entire; heads erect, short-peduncled, in a racemiform panicle; involucre 5-6 mm. broad, hemispheric; bracts oval, tomentose, scarious-margined; flowers 30-60, brownish. *A. gracilentia* A. Nels. *A. paucicephala* A. Nels., is a form with more entire leaves. Dry banks and mountains: Mont.—Wyo.—Ore. *Plain—Mont.* Au—S.

52. *A. candicans* Rydb. Perennial, with a creeping rootstock; stem stout, 5-10 dm. high, tomentose, branched; leaves pinnately or bipinnately divided into oblong divisions, or the upper entire, densely tomentose on both sides; heads numerous, sessile, in small clusters forming interrupted spikes or panicles; invo-

lucres 5-8 mm. broad, hemispheric, densely tomentose; bracts oval, scarious-margined; flowers 30-40, yellowish brown. Mountains: Mont.—Ore. *Submont.* Jl—Au.

53. *A. Flodmanii* Rydb. Perennial, with a branched rootstock; stem slender, 3-5 dm. high, tomentose, grooved, simple up to the inflorescence; leaves many, 3-7 cm. long, white-tomentose on both sides, usually twice pinnatifid into lanceolate or linear divisions, the upper less divided or simple; heads numerous, in a rather dense leafy panicle; involucre about 3 mm. high, 2.5-3.5 mm. broad; bracts floccose, the outer lance-ovate, acute, the inner bracts elliptic, obtuse; flowers 20-30. Hillsides: Mont.—Wyo.—Ore.—(? Utah). *Submont.*

54. *A. discolor* Dougl. Perennial, with a horizontal rootstock; stem 5-7 dm. high, striate, slightly floccose when young, glabrate in age; leaves 4-7 cm. long, sessile, loosely floccose when young, but soon glabrous above, white-tomentose beneath, thin, pinnatifid, with linear or linear-lanceolate acute divisions; divisions of the larger leaves again cleft or toothed; involucre 3.5-4 mm. high and as broad; bracts arachnoid-tomentose, yellowish, lanceolate to elliptic, acutish; flowers 35-50. Rocky situations: Mont.—Ida.—Wash.—B.C. *Submont.*

55. *A. Michauxiana* Besser. Perennial, more or less suffruticose at the base, with a much branched caudex; stem 2-4 dm. high; leaves 3-6 cm. long, subsessile, pinnately or bipinnately divided or cleft into linear or lanceolate or rarely broader, often toothed divisions, white-tomentose beneath; involucre 3-4 mm. high, 5-7 mm. broad; outer bracts linear-lanceolate, acute, the inner oval, obtuse; flowers 25-40. *A. discolor* A. Gray, mainly. Hills and mountain sides: Sask.—B.C.—Wash.—Utah—Colo. *Plain—Mont.*

56. *A. graveolens* Rydb. Perennial, with a caespitose slender caudex; stems numerous, branched, glabrous; leaves twice or thrice pinnatifid into linear or lance-linear divisions; margins more or less revolute; heads numerous, in a narrow panicle, with racemiform branches, nodding; involucre about 4 mm. broad, glabrous; bracts ovate, with brownish scarious margins; corollas brown, glabrous, 15-30. *A. subglabra* A. Nels. Banks and hillsides: Alta.—Wyo.—Ore.—B.C. *Submont.* Jl—Au.

57. *A. tenuis* Rydb. Perennial, with a creeping caespitose rootstock; stem slender, glabrous or minutely puberulent, 3-4 dm. high; leaves 2-3 cm. long, deeply pinnatifid into 5-7 linear, acute, divergent segments; inflorescence with raceme-like slender branches; involucre about 4 mm. high, 2-3 mm. wide; bracts glabrous or minutely puberulent, with scarious margins; corollas 10-20, brownish. Sandy gulches: Mont.—n Wyo. *Submont.* Jl—Au.

58. *A. Wrightii* A. Gray. Perennial, suffruticose at the base; stem 3-5 dm. high; leaves pinnatifid, with linear-filiform divisions, slightly pubescent when young, soon glabrate above, white-tomentulose beneath, with revolute margins; heads in narrow, dense panicle; involucre about 3 mm. high, 1.5-2 mm. broad, slightly tomentose; bracts oval; flowers 10-15, yellowish. Dry hills and mountains: N.M.—s Colo.—Utah—Ariz. *Son.—Submont.* Au—S.

59. *A. Bakeri* Greene. Perennial, with a caespitose caudex; stem decumbent at the base, loosely branching, 3-7 dm. high; leaves green and glabrous above, white-tomentose beneath, with revolute margins, the lower pinnatifid, with narrowly linear segments, the upper entire and narrowly linear; heads in an open loose panicle; involucre 2.5-3 mm. high, about 2 mm. broad, only slightly tomentose; outer bracts linear, the inner oval, with broad scarious margins. Cañons and valleys: N.M.—Colo.—Ariz. *Submont.* Au—S.

60. *A. Carruthii* Wood. Perennial, with a short caespitose caudex; stem 3-5 dm. high, white-tomentose, very leafy; leaves pinnatifid, with narrowly linear divisions, with revolute margins, densely white-tomentose on both sides, the uppermost often entire, linear-filiform; heads very numerous in a dense panicle; involucre about 2.5 mm. high, 2 mm. broad, densely tomentose; outer bracts lanceolate, the inner oval, broadly scarious-margined. *A. kansana* Britton. *A. coloradensis* Osterhout, a form with broader segments. Dry plains and prairies: Mo.—Colo.—Utah—Tex. *Son.—Mont.* Au—S.

61. *A. Abrotanum* L. A much branched shrub, 5-10 dm. high; lower leaves petioled, 4-6 cm. long, twice pinnately dissected into linear-filiform divisions, with revolute margins, slightly tomentose beneath; heads numerous, nodding in leafy panicles with racemiform branches; involucre hemispheric, about 3 mm. high and 5 mm. broad; bracts canescent, the outer linear-lanceolate, the rest broadly oval, scarious; ray-flowers about 10; disk-flowers 15-20. Around dwellings: N.B.—Mass.—N.C.—Colo.; escaped from cultivation, native of s Eu. and the Orient.

62. *A. Bigelovii* A. Gray. Perennial, with a suffruticose base; stems many, 2-3 dm. high, silvery-canescant; leaves linear-cuneate to oblong, mostly 3-toothed at the apex, about 1 cm. long, silvery-canescant; heads numerous in a thyriform panicle; involucre canescent, about 2 mm. high and 1.5 mm. broad, 2-4-flowered; flowers yellow, one, or rarely two, of them pistillate. *A. petrophila* Woot. & Standl. Rocky banks and cañons: Tex.—Colo.—Utah—Ariz. *Son.* Au-S.

63. *A. cana* Pursh. Shrub, 3-30 dm. high; branches strict, canescent; leaves linear or lance-linear, acute at both ends, 1-4 cm. long, silvery-canescant on both sides, or the lower with 2-3 acute teeth or lobes at the apex; heads glomerate, in a leafy panicle; involucre 5-9-flowered; outer bracts linear or subulate, the inner oval, all more or less tomentose; flowers yellowish. *A. columbiana* Nutt. Plains and hills: Sask.—Colo.—Utah—Ore.—Mont. *Plain—Mont.* Au-S.

64. *A. arbuscula* Nutt. Low shrub, 1-3 dm. high; branches slender, canescent; leaves short-cuneate or flabelliform, 3-lobed or 3-parted, 5-12 mm. long, silvery-canescant, or the uppermost entire; heads rather few, in a spike- or raceme-like panicle; involucre about 4 mm. high and 3 mm. broad, 7-9-flowered; bracts elliptic, at least the outer decidedly tomentose; flowers brownish. Dry mountains and high plains: Wyo.—Calif.—Wash. *Submont.—Mont.* Je-Au.

65. *A. spiciformis* Osterhout. Shrub, 3-10 dm. high; branches somewhat canescent; leaves oblanceolate or cuneate, 1-3.5 cm. long, 3-toothed at the apex or the upper entire, silvery-canescant; heads comparatively few, in a spike- or raceme-like inflorescence; involucre about 6 mm. high and 5 mm. wide, about 12-flowered; bracts imbricate, ovate, at least the outer tomentose; flowers brownish. *A. throckii* A. Gray, in part. Dry plains: Colo.—Utah. *Son.—Mont.* Au-S.

66. *A. tridentata* Nutt. Shrub, 1-4 m. high, much branched; bark of the old stems shreddy; branches erect, silvery-canescant; leaves cuneate, 1-2 cm. long, 3-toothed (rarely 4-7-toothed) at the apex, or the upper linear-cuneate and entire, silvery-canescant; heads paniculate, numerous; involucre well imbricate, about 4 mm. long and 2 mm. wide, 5-8-flowered; bracts oval-elliptic, at least the outer densely tomentose; flowers yellow or brownish. Dry plains and hills: Neb.—Colo.—Calif.—B.C. *Plain—Mont.* Jl-O.

67. *A. angusta* Rydb. A shrub, 10-12 dm. high, with erect branches; leaves canescent, 2-4 cm. long, 1-4 mm. wide, linear and entire or linear-cuneate and merely 3-toothed at the apex; heads numerous, clustered in leafy panicles; involucre 3.5-4 mm. high, 2 mm. broad; the outer bracts thick, ovate, less than one-fourth as long as the innermost; inner bracts oblong, obtuse, scarious-margined; flowers 4-6. *A. tridentata angustifolia* A. Gray. Plains: Wash.—Ida. —Nev.—n Calif. *Son.*

68. *A. nova* A. Nels. Undershrub, 1-3 dm. high; branches slightly tomentose, strict; leaves narrowly cuneate, 0.5-2 cm. long, 3-toothed at the apex, finely silvery-canescant; heads numerous, in a narrow, racemiform panicle; involucre 3-4 mm. high, scarcely 2 mm. broad, 2-4-flowered; bracts well imbricate, glabrate or slightly puberulent, elliptic; flowers light brown. Plains and tablelands: Mont.—N.M.—Ariz.—Ida. *Submont.—Mont.* Au-O.

69. *A. tripartita* Rydb. Shrub or undershrub, 2-6 dm. high; branches canescent; leaves 3-cleft or 3-parted or the upper entire, silvery-canescant; blades or lobes narrowly linear; heads numerous, in a leafy panicle; involucre about 4 mm. high and 2 mm. broad, 3-6-flowered; bracts well imbricate, the

outer linear or oblong, densely canescent, the inner oval; flowers brownish. *A. trifida* Nutt. Plains: Mont.—Colo.—Nev.—Ore.—Wash. *Plain—Mont.* Au—S.

70. *A. rigida* (Nutt.) A. Gray. Undershrub, 2–4 dm. high; branches rigid, slightly canescent when young, soon glabrate, leafy to the top; leaves rigid, silvery-canescens, linear-filiform, 3-cleft, or the upper and those of the fascicles entire, 1–2 cm. long; heads solitary (rarely 2 or 3), sessile in the axils of the leaves; involucre 3 mm. long, 1.5–2 mm. wide, 5–12-flowered; bracts oval, well imbricate, hyaline-margined; corollas tinged with purple. Rocky ridges: Ore.—Ida.—Wash. *Son.* Au—O.

71. *A. pygmaea* A. Gray. Perennial, with a woody, caespitose caudex; branches 1 dm. high or less, slightly canescent or glabrate; leaves 5–10 mm. long, rigid, pinnatifid with 3–7, linear-subulate divisions, thick, glabrous above, slightly canescent beneath; heads few, in a short spike-like inflorescence; involucre 4–5 mm. long, 2–3 mm. broad, 3–4-flowered; bracts imbricate, the outer lanceolate, the inner elliptic. Desert regions: Nev.—Utah. *Son.* Au—S.

124. PETASITES L. SWEET COLTSFOOT, BUTTERBUR.

Perennial herbs, with thick creeping rootstocks. Leaves basal, long-petioled, with ample reniform, cordate, triangular, or sagittate blades, usually tomentose beneath, appearing later than the scaly-bracted flowering stems. Heads racemose or corymbose, subdioecious. Involucre campanulate; bracts in one series, herbaceous. Flowers of the fertile plants, all or most of them pistillate, fertile; corolla irregularly 2–5-toothed and cylindric, or else ligulate. Flowers of the substerile plant mostly hermaphrodite, but sterile, and a few pistillate ones at the margin; corolla of the sterile flowers tubular and 5-toothed; style 2-lobed, but ovary sterile. Achenes narrow, 5–10-ribbed. Pappus of soft white bristles.

Leaf-blades sagittate or cordate, pinnately veined (except in *P. vitifolia*).

Leaves not cleft.

Leaves repand-denticulate, with numerous teeth.

Leaves angulately and sinuately few-lobed.

Leaves cleft one-third to one-half to the midrib; lobes dentate.

Leaves not broader than long; only one pair of lateral veins rising from the base.

Leaves decidedly broader than long; two or more pairs of lateral veins rising from the base.

Leaves round-reniform, pedately veined and lobed.

1. *P. sagittata*.

2. *P. frigida*.

3. *P. corymbosa*.

4. *P. vitifolia*.

5. *P. palmata*.

1. *P. sagittata* (Pursh) A. Gray. Leaf-blades cordate, ovate-cordate to deltoid-cordate, 1–3 dm. long, 1–2 dm. wide, with a deep basal sinus, glabrate above, white-tomentose beneath; scape 2–3 dm. high; heads corymbose; involucre obconic, 8–9 mm. high, glandular-pubescent as well as tomentose; ligules of the substerile heads 5–7 mm. long, 1–1.5 mm. wide, those of the subfertile heads smaller, 3–5 mm. long, less than 1 mm. wide. *Tussilago sagittata* Pursh. *Petasites dentata* Blankinship. Wet grounds: Lab.—Minn.—Colo.—Alaska. *Plain—Mont.* My—Jl.

2. *P. frigida* (L.) Fries. Leaf-blades deltoid or cordate, with an open basal sinus, 2–10 cm. long and as broad, sinuately few-lobed or coarsely dentate; lobes or teeth 11–20; heads racemose-corymbose; involucre about 1 cm. high, tomentulose and glandular-pubescent; bracts oblong, obtuse, purplish; ligules of the substerile heads about 8 mm. long and 1.5–2 mm. wide, those of the subfertile heads about 2 mm. long and 0.5 mm. wide. Wet places: Mack.—B.C.—Alaska; n Eu. *Alp.* Je—Jl.

3. *P. corymbosa* (R. Br.) Rydb. Leaf-blades broadly deltoid or cordate in outline, 3–10 cm. long and broad, deeply cleft, the lobing extending one-third to one-half the distance to the midrib; divisions again lobed or dentate, with triangular lobes or teeth; peduncles 2–3 dm. high; heads corymbose; involucre 8–10 mm. high, glandular-pubescent, scarcely tomentose; ligules of the substerile heads 5–7 mm. long, 1.5 mm. broad, those of the subfertile heads 2 mm. long, 0.5 mm. wide. *Nardosmia corymbosa* R. Br. *P. palmata frigida* Macoun. Wet places: Alta.—B.C.—Alaska. *Subalp.* Je—Au.

4. **P. vitifolia** Greene. Leaf-blades broadly cordate or deltoid-reniform, 5–12 cm. long, 8–20 cm. broad, with two or more lateral veins rising from the base, usually 5-lobed, the basal lobes usually deeply 2-cleft and the terminal one 3–5-lobed; lobes coarsely dentate; scape 2–3 dm. high; involucre over 1 cm. high, glandular and floccose; ligules of the substerile heads about 7 mm. long and 1.5 mm. wide. Wet places: Man.—Alta. *Boreal*. Je—Jl.

5. **P. palmata** (Ait.) A. Gray. Leaf-blades reniform in outline, 5–15 cm. long, 10–30 cm. wide, sparingly villous-tomentulose beneath, pedately veined and lobed; lobes oblanceolate, coarsely few-toothed, with broadly triangular, mucronate teeth; scape stout, 1.5–6 dm. high; heads corymbose; involucre about 1 cm. high, somewhat glandular-pubescent, tomentulose at the base; ligules of the substerile heads about 5 mm. long, 1 mm. wide, those of the fertile heads 2.5–3 mm. long, 0.5 mm. wide. Boggy places: Newf.—N.Y.—Minn.—Alta. *Plain—Boreal*. Je—Au.

125. CROCIDIUM Hook.

Small winter annuals. Leaves alternate. Heads radiate. Involucre hemispheric; bracts 8–12, equal, oblong. Ray-flowers about 12, pistillate, fertile; ligules yellow. Disk-flowers hermaphrodite, fertile; corollas yellow, with slender tube, campanulate throat, and 5-toothed limb. Anthers with deltoid-ovate tips. Style-branches short and broad, with deltoid appendages. Achenes fusiform, obscurely 3–5-ribbed, papillate. Pappus of a single series of white barbellate bristles, or in the ray-flowers wanting.

1. **C. multicaule** Hook. Stems several from the base, 1–2 dm. high, slightly floccose when young; basal leaves tufted, obovate or spatulate, sessile or short-petioled, few-toothed, 2–5 cm. long; stem-leaves linear, entire or the lower denticulate; involucre 7–8 mm. broad, hemispheric; bracts lance-ovate, acute; flowers golden yellow; ligules 5–8 mm. long; achenes ovoid, angled, scurfy. Plains and hills: B.C.—Ida.—Calif. *Son.* Mr—My.

126. PSATHYRÔTHES A. Gray. VELVET-ROSETTES.

Low pubescent or scurfy, winter annuals. Leaves petioled, with broad blades. Heads discoid. Involucre hemispheric; bracts in 2 series, at least the outer herbaceous; receptacle flat. Flowers all hermaphrodite and fertile; corolla with a very short tube, cylindric throat and short obtuse teeth, woolly at the summit. Style-branches flat, obtuse or truncate, with obscure appendages. Achenes terete, turbinate-villous or hirsute. Pappus of numerous stiff, ferruginous bristles.

Leaves not beset with long hairs.

Outer bracts obovate, larger than the inner; spreading tomentum long-villous.

1. *P. ramosissima*.

Outer bracts oblong, not longer than the inner, erect; tomentum fine, furfuraceous.

2. *P. annua*.

Leaves with scattered long-jointed hairs.

3. *P. pilifera*.

1. **P. ramosissima** (Torr.) A. Gray. Stem branched from the base, scurfy-tomentose; branches decumbent, 8–12 cm. high; leaf-blades rounded, subcordate or cuneate at the base, 1–2 cm. broad, scurfy-tomentose, crenate; head solitary, axillary; involucre 5–6 mm. high; flowers yellow; achenes short-turbinate, densely long-villous. Gravelly hills: Ariz.—s Utah—Nev.—s Calif.; L. Calif. *L. Son.* Ap—My.

2. **P. annua** (Nutt.) A. Gray. Stem branched from the base, 5–12 cm. high, scurfy-tomentose; leaf-blades orbicular or rounded-ovate, cuneate at the base, coarsely dentate, 1 cm. broad or less; heads solitary, axillary, short-peduncled; involucre 5–7 mm. high; corollas pale yellow, sometimes changing into purplish; achenes oblong-turbinate, densely villous. Saline plains: Ariz.—s Utah—Nev.—s Calif. *Son.* My—Au.

3. **P. pilifera** A. Gray. Stem branched from the base, scurfy-tomentose, 5–15 cm. high; leaf-blades rhombic-obovate or subrotund, with cuneate base, entire, scurfy-tomentose and hirsute-ciliate on the margins and petioles; heads

short-peduncled; involucre campanulate, about 1 cm. high; outer bracts oblong-linear; achenes cylindric, short-hirsute. Arid places: s Utah. *Son.* Au-S.

127. *HAPLOËSTES* A. Gray.

Suffrutescent perennials. Leaves opposite, linear-filiform, somewhat fleshy. Heads cymose, radiate. Involucres campanulate; bracts 4 or 5, broadly oval, strongly overlapping. Receptacle flat, naked. Ray-flowers few, pistillate and fertile. Disk-flowers hermaphrodite and fertile. Achenes linear, terete, glabrous, ribbed. Pappus of a single series of rigid, scabrous, white bristles.

1. *H. Greggii* A. Gray. Stem 3-6 dm. high, branched, glabrous, leafy; heads cymose; involucre hemispheric, about 4 mm. high; bracts glabrous, obovate, shorter than the disk; flowers yellow; ligules 3-5, oblong, about 3 mm. long. Saline soil: Tex.—Kans.—Colo.—N.M.; n Mex. *Son.* Je-S.

128. *ÁRNICA* L. *ARNICA*.

Perennial caulescent herbs, ours with rootstocks. Leaves mostly opposite, entire or toothed. Heads usually radiate, rarely discoid, several or solitary. Involucre campanulate or turbinate; bracts equal, in 1 or 2 series. Receptacle flat, naked, pubescent, or fimbriate. Ray-flowers pistillate and fertile; ligules yellow. Disk-flowers many, hermaphrodite and fertile; corolla tubular, yellow. Anthers sometimes sagittate. Achenes narrow, 5-10-ribbed, pubescent or glabrous. Pappus a single series of capillary, scabrous bristles.

Stem with several pairs of leaves, the upper not conspicuously reduced (except in *A. Parryi*); heads usually several.

Heads nodding in the bud, usually discoid.

I. ERADIATAE.

Heads erect in bud, radiate.

Basal leaves cordate or ovate, long-petioled.

Pappus white, merely barbellate; involucre turbinate (except in *A. granulifera*), not conspicuously glandular-hirsute (except in *A. paniculata*).

Achenes densely hirsute; involucre densely villous at the base.

II. CORDIFOLIAE.

Achenes glabrous, glandular-puberulent, or with a few scattered hairs above.

Involucre, peduncle, and achenes densely glandular-granuliferous.

Involucre hemispheric; disk about 15 mm. high.

III. GRANULIFERAEE.

Involucre turbinate; disk 10-12 mm. high.

IV. GRACILES.

Involucre slightly villous at the base, scarcely glandular, turbinate; disk about 15 mm. high.

V. LATIFOLIAE.

Pappus tawny or brownish, distinctly plumose; involucre distinctly glandular-hirsute.

VI. DIVERSIFOLIAE.

Basal leaves lanceolate or oblanceolate, short-petioled.

Pappus distinctly plumose, brownish.

Achenes glandular-granuliferous; involucre glandular-hirsute (villous in *A. gracilentia* and glandular-granuliferous in *A. arcana*).

VII. LONGIFOLIAE.

Achenes pubescent, not glandular; involucre usually glandular-hirsute (villous in *A. gracilentia* and glandular-granuliferous in *A. arcana*).

VIII. MOLLES.

Pappus merely barbellate, white or yellowish.

Leaves numerous, more or less grayish, the larger more than 7 cm. long; pappus yellowish; heads many.

IX. FOLIOSAE.

Leaves rather few, green, the larger not more than 7 cm. long; pappus white; heads 1-3.

X. ALPINAEE.

Stem-leaves 1-3 pairs, the upper much reduced, linear or linear-lanceolate; heads 1-3.

Heads erect.

Involucre hemispheric, glandular-hirsute; pappus brown, plumose.

XI. PEDUNCULATAE.

Involucres turbinate, villous at the base (glandular only in *A. arnogllossa*); pappus white, barbellate.

XII. LESSINGIANAE.

Heads nodding in bud.

I. ERADIATAE.

One species.

1. *A. Parryi*.

II. CORDIFOLIAE.

Heads numerous; involucre more or less glandular-hirsute; bracts linear.

2. *A. paniculata*.

Heads 1-3, rarely 5; involucre villous, only with sessile glands.

Plant 2-4 dm. high; leaves thin, usually coarsely toothed; bracts oblanceolate.

Lower leaves with a close sinus, their teeth salient.

3. *A. grandifolia*.

Lower leaves with an open sinus, their teeth directed forward.

4. *A. cordifolia*.

- Plant 1-2 dm. (rarely 3 dm.) high; leaves thick, subentire, or with a few teeth; bracts linear-lanceolate. 5. *A. pumila*.
- One species. III. GRANULIFERAE. 6. *A. granulifera*.
- Upper leaves not linear. IV. GRACILES. 7. *A. gracilis*.
- Bracts linear-lanceolate; leaves thin, usually more or less dentate. 8. *A. puberula*.
- Bracts oblanceolate; leaves thick, usually entire. 9. *A. arnogglossa*.
- Upper stem-leaves linear, much reduced. V. LATIFOLIAE.
- Leaves decidedly hairy, especially above. 10. *A. Jonesii*.
- Leaves nearly glabrous. Achenes slightly glandular-granuliferous, and with a few scattered hairs above. 11. *A. ventorum*.
- Leaves not saliently toothed, merely denticulate. 12. *A. Menziesii*.
- Leaves saliently and coarsely toothed. 13. *A. latifolia*.
- Achenes glabrous; leaves more or less toothed. VI. DIVERSIFOLIAE.
- Leaves thin, nearly glabrous. 14. *A. silvatica*.
- Leaves thick, densely glandular-puberulent, at least above. 15. *A. diversifolia*.
- VII. LONGIFOLIAE.
- Involute merely puberulent or glandular-granuliferous; leaves not caudate-attenuate; stem usually over 3 dm. high. 16. *A. longifolia*.
- Involute copiously hirsute, as well as puberulent; leaves caudate-acuminate. 17. *A. caudata*.
- VIII. MOLLES.
- Involute villous, not at all glandular or viscid. 18. *A. macilentia*.
- Involute more or less glandular or viscid. 19. *A. arcana*.
- Involute densely glandular-granuliferous, only with a few white hairs. Involute decidedly villous or hirsute, as well as glandular. Middle stem-leaves broadly ovate, less than 5 cm. long; stem 2-3 dm. high. Involute less than 1 cm. high, villous at the base, only slightly glandular; bracts broadly lanceolate. 20. *A. coloradensis*.
- Involute 12-15 mm. high, densely glandular-hirsute; bracts narrowly oblanceolate. 21. *A. ovata*.
- Middle stem-leaves lanceolate, oblanceolate, or linear-lanceolate. Bracts oblanceolate, abruptly acuminate. 22. *A. mollis*.
- Bracts linear or lanceolate. Stem-leaves more or less sharply dentate, except at the base. Leaves nearly glabrous, except the margins. Stem-leaves ovate-lanceolate, broad at the base. 23. *A. amplexifolia*.
- Stem-leaves oblanceolate or narrowly lanceolate, narrowed at the base. 24. *A. Macounii*.
- Leaves decidedly pubescent, both villous and glandular-granuliferous. 25. *A. rivularis*.
- Stem-leaves entire, sparingly denticulate, densely glandular-puberulent. 26. *A. subplumosa*.
- IX. FOLIOSAE.
- Pubescence of the leaves long and soft, villous. Bracts obovate-oblanceolate, mostly obtuse. 27. *A. tomentulosa*.
- Bracts oblong-lanceolate, acute. Plant sparingly pubescent, with long flat hairs; leaves long-acute. 28. *A. Chamissonis*.
- Plant densely pubescent with fine hairs; leaves acute or obtuse. Leaves broadly oblanceolate or lanceolate. 29. *A. rhizomata*.
- Leaves linear or lance-linear. 30. *A. foliosa*.
- Pubescence of the leaves very short and fine. Stem-leaves linear-lanceolate, usually entire or callous-denticulate; involucre rarely more than 1 cm. high. Pubescence of the involucre and peduncle very short and fine. 31. *A. ocreata*.
- Pubescence of the involucre and peduncle longer and coarser. 32. *A. celsa*.
- Stem-leaves broadly lanceolate, more or less dentate; involucre usually more than 1 cm. high. 33. *A. rubricaulis*.
- X. ALPINAE.
- Stem-leaves ovate. 20. *A. coloradensis*.
- Stem-leaves linear to lanceolate. Leaves glabrate in age, at least above. Involute and peduncle more or less glandular-puberulent; achenes hispidulous. 9. *A. arnogglossa*.
- Involute more or less villous, at least at the base; achenes canescent. Leaves and lower part of the stem glabrous or nearly so; leaves mostly acute; bracts green. Leaves strongly 3-ribbed. 34. *A. Rydbergii*.
- Leaves faintly 3-ribbed. 35. *A. tenuis*.

Leaves and stem villous when young; leaves mostly acuminate; bracts purple-tinged.

Leaves densely villous-tomentose.

36. *A. alpina*.

37. *A. tomentosa*.

XI. PEDUNCULATAE.

Stem with tufts of brown wool at the base.

Stem without tufts of wool at the base.

38. *A. pedunculata*.

39. *A. fulgens*.

XII. LESSINGIANAE.

One species.

40. *A. Louiseana*.

1. ***A. Parryi*** A. Gray. Stem 2-6 dm. high, somewhat hirsute-villous below, glandular above; lower leaves petioled; blades ovate or ovate-oblong, usually denticulate; upper leaves sessile, narrowly lanceolate, smaller and entire; heads 3-9; involucre broadly turbinate, 12-15 mm. high, glandular-hirsute; bracts linear, attenuate; ligules usually none, but the marginal flowers sometimes ampliate; achenes hirsute or glabrate; pappus brownish, subplumose. *A. radiata* (A. Gray) Heller. Mountains: Alta.—N.M.—Utah—Ore.—B.C. Mont.—Alp. Jl—Au.

2. ***A. paniculata*** A. Nels. Stem 4-7 dm. high, glandular and viscid-villous; blades of the basal leaves broadly ovate, subcordate at the base, 6-10 cm. long, viscid-villous on both sides; stem-leaves 3-4 pairs, the lower petioled, the upper sessile; blades ovate, denticulate; heads paniculate-cymose; involucre nearly hemispheric, 12-15 mm. high; bracts linear-lanceolate, acute or acuminate; achenes hirsutulous. Moist woods: Mont.—Wyo.—Utah. Au.

3. ***A. grandifolia*** Greene. Stem 3-4 dm. high, sparingly villous-ciliate or glabrous; basal leaf-blades ovate-cordate, 5-7 cm. long, toothed; stem-leaves about 3 pairs, the lowest pair long-petioled; blades cordate, with a narrow sinus, 10-15 cm. long, saliently toothed with triangular teeth, puberulent above, glabrous or nearly so beneath; upper stem-leaves subsessile, oval or ovate; involucre nearly hemispheric, about 15 mm. high; bracts oblanceolate, short-acuminate. Perhaps a large-leaved form of *A. cordifolia*. Mountain sides: Mont.—B.C. Mont. Jl.

4. ***A. cordifolia*** Hook. Stem 2-6 dm. high, somewhat viscid; basal leaf-blades broadly cordate, usually coarsely toothed, 3-10 cm. long, puberulent, and viscid-villous on the veins; stem-leaves 2-4 pairs, all except the uppermost petioled and cordate or rarely ovate; involucre campanulate-turbinate, 15-18 mm. high; bracts oblanceolate, acuminate. *A. abortiva* Greene, a small-leaved form. Wooded hills: Alta.—Colo.—Calif.—B.C. Submont.—Subalp. Je—Au.

5. ***A. pumila*** Rydb. Stem 1-2, rarely 3 dm. high, viscid-villous; basal leaf-blades firm, ovate, rarely subcordate, entire or few-toothed, 2-5 cm. long, puberulent; stem-leaves 1-3 pairs, short-petioled or the upper sessile; involucre turbinate, 10-12 mm. high, puberulent and slightly villous. *A. parvifolia* Greene. *A. Evermannii* Greene. Mountains: Alta.—Colo.—Utah—B.C. Mont.—Subalp. Je—Au.

6. ***A. granulifera*** Rydb. Stem about 3 dm. high, glandular-granuliferous; basal leaves petioled, with probably cordate blades, fallen at the time of flowering; lower stem-leaves obovate, dentate, about 5 cm. long, glandular-granuliferous, thin, with strong ribs; upper stem-leaves ovate or cordate, sessile; heads 3-5; involucre about 12 mm. high and 2 cm. broad; bracts oblanceolate, abruptly acuminate, glandular-granuliferous and slightly ciliate; ligules orange, about 1 cm. broad; achenes glandular-puberulent, striate; pappus dirty white, barbellate. Mountains: Mont. Mont. Au.

7. ***A. gracilis*** Rydb. Stem slender, 1-3 dm. high, glabrous; inflorescence glandular-pruinose; basal leaf-blades broadly ovate, dentate, 3-ribbed, 2-4 cm. long, glabrous or nearly so; stem-leaves 2 or 3 pairs, the lower short-petioled, the upper sessile and smaller; heads usually 1-5; involucre turbinate, about 1 cm. high; bracts oblanceolate, acuminate; achenes sparingly glandular-pruinose. *A. lactucina* Greene. *A. columbiana* A. Nels. *A. multiflora* Greene, with more numerous heads. (?) *A. ovalifolia* Greene. Mountain meadows: Alta.—Wyo.—Wash.—B.C. Submont.—Mont. Je—Au.

8. *A. puberula* Rydb. Stem about 3 dm. high, glandular-puberulent; lower leaves short-petioled; blades ovate, 2-4 cm. long, puberulent and glandular-pruinose, entire or slightly dentate; upper stem-leaves sessile, ovate, mostly entire; heads 1-5; involucre turbinate, about 1 cm. high and broad; bracts oblanceolate, glandular-puberulent, with deltoid tips; ligules 10-12 mm. long; achenes glandular-puberulent, brown; pappus straw-colored, barbellate. Rocky places and hillsides: Alta.—Wyo.—B.C. *Mont.* Jl-Au.

9. *A. arnoglossa* Greene. Stem 3-5 dm. high, rather slender, glandular-puberulent and with scattered hairs; lower leaf-blades lanceolate, acute, wing-petioled, remotely serrate, strongly 5-ribbed, firm, sparsely scabrous, pale beneath; upper stem-leaves lanceolate, sessile; heads 1-5, usually 3; involucre turbinate, 9-10 mm. high, glandular-puberulent; achenes slightly hirsute. Hills: (Black Hills) S.D.—Wyo.—Alta. *Submont.*—*Mont.* Je-Au.

10. *A. Jonesii* Rydb. Stems 3-4 dm. high, glandular-puberulent and slightly villous, especially on the peduncles; basal leaves long-petioled; blades ovate-cordate, 1-3 cm. long, sparingly villous and glandular-puberulent; stem-leaves sessile, ovate-cordate, 2-5 cm. long, dentate; heads 1-3; involucre turbinate, 10-12 mm. high and as broad; bracts linear-lanceolate, acuminate, slightly villous, as well as glandular-puberulent; ligules about 1 cm. long; achenes glandular-puberulent and with a few stiff hairs on the upper part; pappus straw-colored, barbellate. Mountains: Utah. *Mont.* Jl-Au.

11. *A. ventorum* Greene. Stem 2-4 dm. high, glabrous or nearly so; basal leaf-blades ovate to orbicular-cordate, thin, repand-denticulate, 3-6 cm. long, delicately ciliate, otherwise glabrous; stem-leaves 2-3 pairs, the lower short-petioled, the upper sessile, oval or ovate, acute, minutely denticulate; heads 1-3; involucre turbinate, 12-15 mm. high, puberulent; bracts narrowly oblanceolate, acuminate; achenes glandular-scabrellous. Wet places in the mountains: Wyo.—Utah. *Mont.* Au.

12. *A. Menziesii* Hook. Stem 3-6 dm. high, sparingly hairy or nearly glabrous below; basal leaf-blades cordate or broadly ovate, sinuately dentate, 4-8 cm. long, minutely puberulent, thin; stem-leaves 2-4 pairs, the lower short-petioled, the rest sessile and usually more sharply toothed; heads 3-5; involucre broadly turbinate, 10-12 mm. high; bracts narrowly oblanceolate, acuminate; rays bright yellow, 12-15 mm. long; achenes sparingly glandular-puberulent, or with a few short hairs towards the apex. *A. platyphylla* A. Nels., at least in part, more glabrous than the type. Meadows: Calif.—Mont.—Alaska. *Mont.* Je-Au.

13. *A. latifolia* Bong. Basal leaf-blades 4-6 cm. long, ovate or cordate, toothed, minutely puberulent or glabrate, thin; lower stem-leaves short-petioled and more oval; upper stem-leaves sessile, oval; heads 1-5; involucre turbinate, 12-15 mm. high, sparingly villous-pilose; bracts narrowly oblanceolate, acuminate; achenes usually wholly glabrous. *A. teucrifolia* Greene. *A. platyphylla* Rydb. (Fl. Colo.). *A. ventorum* Coult. & Nels., in part, not Greene. Wet places: Alta.—Colo.—Utah—Alaska. Je-Au.

14. *A. silvatica* Greene. Stem slightly villous, with scattered hairs and somewhat glandular-puberulent above; basal leaf-blades ovate, glabrous or slightly glandular-puberulent above, hirsutulous-ciliate on the margins, coarsely dentate; stem-leaves 4-5 pairs, the lower wing-petioled, the uppermost sessile, very coarsely incisely dentate, all more or less connate-sheathing; heads 3-5; involucre hemispheric, 12-15 mm. high; bracts linear-lanceolate, acute; achenes sparsely hirsute. Woods: Colo. *Mont.* Jl-Au.

15. *A. diversifolia* Greene. Stem 3-6 dm. high, densely glandular-puberulent and with a few scattered hairs; basal leaf-blades broadly ovate or subcordate, saliently toothed, glandular-puberulent on both sides or nearly glabrate beneath; upper stem-leaves ovate and sessile, saliently toothed; heads 1-5; involucre hemispheric; bracts lanceolate, acuminate; achenes hirsute on the angles. *A. latifolia viscidula* A. Gray. Mountains: Alta.—Calif.—B.C. *Mont.* Jl-S.

16. *A. longifolia* D. C. Eat. Stem tufted, leafy, 3-6 dm. high, finely puberulent; leaves linear-lanceolate, 5-15 cm. long, entire or denticulate, finely puberu-

lent, sessile, the lower sheathing at the base; heads paniculate-cymose; involucre hemispheric, 8-10 mm. high, densely puberulent; bracts linear, attenuate. *A. polycephala* A. Nels. Meadows: Mont.—Colo.—Calif.—Wash. *Submont.*—*Mont.* JI—Au.

17. *A. caudata* Rydb. Stem 2-3 dm. high, leafy, villous, and densely glandular-puberulent; leaves linear-lanceolate, mostly sheathing at the base, densely glandular-puberulent and with scattered villous hairs, 5-10 cm. long, with entire, somewhat revolute margins; heads mostly 3, cymose; involucre turbinate, about 1 cm. high; bracts linear-lanceolate, almost subulate, attenuate; ligules nearly 1 cm. long. Wet places: Utah. *Mont.* Au.

18. *A. macilenta* Greene. Stem 4-7 dm. high, softly villous; leaves 5-6 pairs, the lower ones elliptic-ob lanceolate, tapering below into winged petioles, often connate-sheathing, sparingly and softly short-pubescent on both sides, repand-denticulate or entire; upper leaves lanceolate, sessile; heads 1-3; involucre hemispheric, about 12 mm. high; achenes sparingly hirsutulous; pappus tawny, barbellate. Mountains: Colo.—Utah—Wyo.—(? Alta.). *Mont.*—*Subalp.* JI—Au.

19. *A. arcana* A. Nels. Stem about 3 dm. high, glandular-granuliferous; basal leaves petioled; blades oblong-ob lanceolate, glandular-granuliferous, denticulate; upper leaves lanceolate, sessile, 3-5 cm. long; heads usually 3; involucre turbinate, about 8 mm. high; rays orange; achenes sparingly hispidulous; pappus whitish, barbellate. Rock crevices in the mountains: Wyo.—Utah—Ida. *Mont.* JI—Au.

20. *A. coloradensis* Rydb. Stem about 2 dm. high and with about 3 pairs of leaves, villous; lower leaves obovate, nearly sessile, sparingly pubescent, 4-5 cm. long; upper leaves sessile, ovate or ovate-lanceolate, 5-nerved; heads often solitary or few; involucre hemispheric; bracts broadly ob lanceolate, acute or acuminate, often tinged with purple, 8-9 mm. long; ligules bright yellow, over 1 cm. long; achenes finely strigose. Mountains: Colo. *Mont.*

21. *A. ovata* Greene. Stem 3-4 dm. high, glandular-puberulent and slightly villous; lower leaves obovate, with short winged petioles, finely pubescent on both sides, callous-denticulate or entire; upper stem-leaves ovate, sessile; heads 1-5; involucre hemispheric, 10-15 mm. high; bracts lanceolate, acuminate; achenes hirsute, angled. Mountains: Utah—Wyo. *Mont.*—*Subalp.* JI.

22. *A. mollis* Hook. Stem 3-6 dm. high, glandular-puberulent and more or less villous; lower leaves ob lanceolate, short-petioled, 5-15 cm. long, usually denticulate, more or less pubescent on both sides; upper leaves sessile, ovate to lanceolate; heads 1-3; involucre hemispheric, 12-15 mm. high; achenes hirsute. *A. crocea* and *A. crocina* Greene. Mountains: Alta.—Colo.—Utah—Wash.—B.C. *Submont.*—*Mont.* Je—Au.

23. *A. amplexifolia* Rydb. Stem 3-6 dm. high, sparingly ciliate; stem-leaves ovate-lanceolate, sharply and saliently dentate, 5-12 cm. long, broad, rounded and sometimes half-clasping at the base; heads 3-9; involucre hemispheric, about 12 mm. high; bracts linear-lanceolate, acute or acuminate; achenes hirsutulous. *A. amplexicaulis* Nutt. (?) *A. columbiana* Greene. *A. Greenei* A. Nels. Mountains in damp places: B.C.—w Mont.—Wash. *Submont.* Je—JI.

24. *A. Macounii* Greene. Stem 6-10 dm. high, glabrous or sparingly ciliate; lower stem-leaves ob lanceolate, tapering below, 5-15 cm. long, saliently dentate, hispidulous-ciliate on the margins, sparingly pubescent above; upper stem-leaves elongate-lanceolate, long-attenuate, somewhat clasping; heads 1-7; involucre hemispheric, 10-12 mm. high; bracts linear-lanceolate, acuminate; achenes hirsutulous. Valleys: B.C.—Alta.—Mont.—Wash. *Submont.*

25. *A. rivularis* Greene. Stem 3-6 dm. high, more or less glandular-granuliferous and sparingly hirsute; leaves 3-5 pairs, the lowest short-petioled and ob lanceolate, the rest sessile, lanceolate, denticulate; heads 3-5; involucre hemispheric, about 12 mm. high; bracts linear-lanceolate, acuminate; ligules 10-12, deep yellow, 12-15 mm. long; achenes sparingly hirtellous and granuliferous. Along mountain streams: Alta.—Ore.—B.C. Je—Au.

26. *A. subplumosa* Greene. Stem 3–8 dm. high, more or less villous and somewhat glandular above; lower leaves oblanceolate, wing-petioled, 5–10 cm. long, denticulate or entire; upper stem-leaves sessile, lanceolate or oblanceolate; heads 1–5; involucre hemispheric, 10–15 mm. high; bracts linear-lanceolate, acute; achenes hirsute, rarely almost glabrous. *A. Chamissonis longinodosa* A. Nels. *A. subplumosa silvatica* A. Nels., in part, a low form. Mountain meadows: Mont.—Colo.—Utah. *Mont.*—*Subalp.* Je—Au.

27. *A. tomentulosa* Rydb. Stem villous, about 4 dm. high; leaves oblanceolate, obtuse, sessile or the lower with short-winged petioles, denticulate, finely villous-pubescent, almost tomentulose, with two pairs of stronger veins, the larger 13 cm. long, somewhat yellowish; heads few, hemispherical; involucre about 12 mm. high and 2 cm. broad; bracts ovate or ovate-oblong, villous; rays light yellow, over 1 cm. long; achenes sparingly hispidulous. (?) *A. stricta* A. Nels. Mountains: Wyo.—Colo. *Mont.* Au.

28. *A. Chamissonis* Lessing. Stem 4–6 dm. high, softly villous, very leafy; lower leaf-blades oblanceolate, tapering into winged petioles, which are connate-clasping, usually with 5 stronger veins, 7–15 cm. long, denticulate or entire; upper leaves lanceolate, sessile; heads cymose-paniculate; involucre hemispheric, about 1 cm. high, hirsute-villous; bracts narrowly linear-lanceolate; achenes hirsutulous. Wet places: Sask.—Mont.—Ida.—B.C. *Submont.* Jl—Au.

29. *A. rhizomata* A. Nels. Stem 2–5 dm. high, densely short-tomentose; leaves 5–7 pairs, oblong-lanceolate, obtuse or acute, 6–9 cm. long, denticulate or entire, densely tomentose, the lower tapering into winged petioles, which are sheathing at the base, the upper sessile; heads 1–5; involucre 10–12 mm. high, more or less villous-tomentose; bracts oblong or oblong-lanceolate, obtuse or acute; achenes sparingly hirsutulous. *A. lanulosa* Greene. *A. exigua* A. Nels., a depauperate form. Valleys: Mont.—Colo.—Utah—Ida. *Mont.*—*Subalp.* Jl—Au.

30. *A. foliosa* Nutt. Stem 3–6 dm. high, tomentose, slightly glandular-puberulent in the inflorescence; leaves linear or linear-lanceolate, densely tomentulose, entire or rarely denticulate, 5–10 cm. long, the lower petioled, the upper sessile; heads 1–7; involucre about 8 mm. high, hemispheric, tomentose, at least at the base; bracts linear or lance-linear, acute; achenes hispidulous. Wet places: Mack.—Colo.—Utah—Alaska. *Submont.*—*Mont.* Jl—Au.

31. *A. ocreata* A. Nels. Stem 2–4 dm. high, sparingly puberulent, somewhat glandular so above; leaves linear-lanceolate, entire, or sparingly denticulate, finely puberulent, but green, the lower tapering into petioles, more or less sheathing, the upper sessile; heads 3–5; involucre somewhat turbinate, 7–9 mm. high, finely puberulent; achenes glabrous or sparingly hispidulous. Valleys: Mont.—Wyo.—Utah. *Plain*—*Submont.* Jl—Au.

32. *A. celsa* A. Nels. Stem 4–6 dm. high, sparingly villous, and glandular-puberulent in the inflorescence; leaves 6–8 pairs, puberulent and glandular-granuliferous, green, linear-oblanceolate or linear-oblong, the lower petioled, with sheathing bases; upper leaves sessile, lanceolate; heads 3–5, corymbose-cymose; involucre hemispheric, nearly 1 cm. high, villous as well as glandular-puberulent; bracts linear-lanceolate, acute; achenes sparingly hirsutulous. Perhaps not distinct from the preceding. Wet meadows: Mont.—Colo.—Ida. *Submont.*—*Mont.* Jl—Au.

33. *A. rubricaulis* Greene. Stem 3–6 dm. high, villous, often tinged with reddish purple; leaves lanceolate, 8–15 cm. long, the lower tapering into winged petioles, all thin, triple-ribbed, sinuate-dentate or -denticulate, short-pubescent on both sides; heads many, paniculate; involucre about 1 cm. high, nearly 2 cm. broad; bracts lanceolate, acutish, sparsely hirsute; ligules about 12 mm. long; achenes hirsute; pappus brownish, plumose. Meadows: B.C.—Mont.—(? Alaska). *Submont.*—*Mont.* Je—Au.

34. *A. Rydbergii* Greene. Stem 2–4 dm. high, sparingly villous; basal leaves oblanceolate, entire, petioled; stem-leaves 3–4 pairs, glabrate or sparingly

puberulent, villous-ciliate on the margins, 3-8 cm. long, remotely dentate, strongly 3-nerved, the lower short-petioled and spatulate or oblanceolate, the upper lanceolate and sessile; heads 1-3; involucre turbinate, 10-12 mm. high, villous; bracts lanceolate, acute; ligules usually orange; achenes densely silky-pilose. *A. caespitosa* A. Nels. *A. aurantiaca* Greene. Hills and mountains: Alta.—Colo.—Wash. *Mont.*—*Subalp.*

35. *A. tenuis* Rydb. Stem sparingly villous-pubescent, about 2 dm. high, monocephalous; leaves usually 3 pairs, sparingly villous when young, entire, the lower two pairs oblanceolate or spatulate, the upper lanceolate; involucre turbinate-campanulate, villous, about 10 mm. high; bracts linear, 1-1.5 mm. wide, green; ligules orange, 16-18 mm. long; achenes sparingly pilose. (?) *A. lasiosperma* Greene. Mountains: Wyo.—Colo. *Mont.*—*Subalp.* Jl—Au.

36. *A. alpina* (L.) Olin. Stem 1-3 dm. high, loosely villous; basal leaves with margined petioles, 4-10 cm. long; blades lanceolate, 3-nerved, acuminate; stem-leaves 1 or 2 pairs, sessile, lanceolate, with long acumination; heads usually solitary; involucre turbinate, about 1 cm. high, loosely white-villous, densely so at the base; bracts lanceolate. *A. angustifolia* Vahl. Arctic-alpine situations: Greenl.—Lab.—B.C.—Alaska; Wyo.; n Eu. *Alp.* Au.

37. *A. tomentosa* J. M. Macoun. Stem rarely over 1 dm. high; basal leaves oblanceolate, 3-nerved, white villous-tomentose, 2-5 cm. long, entire; stem-leaves 1 or 2 pairs, lanceolate, the upper pair diminutive, acute; heads usually solitary; involucre turbinate, 10-12 mm. high, densely white-villous; bracts lanceolate, acute or obtusish; achenes densely silky villous. High mountains: Alta.—B.C. *Alp.* Jl—Au.

38. *A. pedunculata* Rydb. Stem 2-6 dm. high, finely villous, somewhat glandular above; leaves mostly basal, broadly oblong to nearly linear, 3-5-ribbed, 5-10 cm. long, densely short-pilose, entire, tapering into winged petioles; stem-leaves usually 2 pairs, linear, sessile, the upper small; heads usually solitary; involucre hemispheric, 12-15 mm. high, densely villous; bracts 18-20, lanceolate or linear-lanceolate, acute; ligules orange, 1.5 cm. long; achenes hirsute. *A. monocephala* Rydb., a low broad-leaved form. Hills and meadows: Sask.—N.D.—Colo.—Calif.—Wash. *Submont.*—*Subalp.* Je—Au.

39. *A. fulgens* Pursh. Stem 2-4 dm. high, glandular-pubescent; basal leaves petioled, 6-8 cm. long; blades oblanceolate, glandular-puberulent, somewhat hirsutulous on the veins, 3-ribbed, entire; stem-leaves 2 or 3 pairs, linear-lanceolate or linear, small; heads usually solitary, sometimes 3; involucre hemispheric, 12-15 cm. high; bracts linear, acute; ligules orange; achenes hirsute. *A. stricta* Greene, not A. Nels. *A. sororia* Greene. Hills: S.D.—Colo.—Calif.—B.C. *Plain*—*Submont.* My—O.

40. *A. Louiseana* Farr. Stem 1-2 dm. high, glandular-puberulent and with scattered longer hairs; leaves glandular-puberulent and hispidulous-ciliate on the margins, about 3 pairs; lowest pair obovate, short-petioled, mostly entire; second pair oblong, 4-6 cm. long, sparingly denticulate, sessile, the uppermost lanceolate, reduced; heads 1-3, nodding; involucre broadly turbinate, villous-glandular at the base, about 1 cm. high; bracts lanceolate, purplish, glandular-puberulent; flowers light yellow; achenes with scattered hairs; pappus white, barbellate. Rocky slopes: Alta. *Subalp.*—*Alp.* Jl—Au.

129. *SENËCIO* L. GROUNDSEL, RAGWORT, SQUAW-WEED.

Annual or perennial caulescent herbs. Leaves alternate, entire, toothed, or pinnatifid. Heads several or many, rarely solitary, radiate or discoid. Involucre from hemispheric or campanulate to cylindric; bracts many, strictly in one series or with a few smaller, forming a calyculum at the base. Receptacle flat or slightly convex, naked, often pitted. Ray-flowers, if present, pistillate and fertile, ligulate. Disk-flowers more numerous, hermaphrodite and fertile; corollas yellow, tubular. Anthers obtuse or rarely slightly sagittate at the base. Style-branches in the disk-flowers spreading and recurved. Achenes terete, or slightly flattened, 5-10-ribbed. Pappus copious, of capillary bristles.

Perennials with a more or less developed rootstock or caudex; if the latter is less well-developed, it bears numerous fibrous-fleshy roots.

Heads more or less nodding.

Heads discoid; crown short, with fleshy-fibrous roots.

I. PUDICI.

Heads radiate; rootstock well developed.

II. AMPLECTENTES.

Heads not nodding.

Heads more than 15 mm. high and 20 mm. broad, solitary (seldom 2-3).

Plant low, less than 2 dm. high, with rootstocks; bractlets short.

II. AMPLECTENTES.

Plant tall, 3-5 dm. high, stout, with a short crown and a cluster of fleshy-fibrous roots.

Bractlets linear-filiform, almost equalling the involucre; bracts not black-tipped.

XIX. MEGACEPHALI.

Bractlets short; bracts usually tipped with black.

XVIII. INTEGERRIMI.

Heads less than 15 mm. high and broad.

Plants equally leafy throughout.

Leaves or their divisions not narrowly linear or filiform.

Leaves merely toothed or entire, not pinnatifid.

Leaf-blades oval, elliptic, or obovate, usually obtusish; heads few; plants caespitose.

III. OCCIDENTALES.

Leaf-blades triangular or ovate to linear-lanceolate, distinctly acute; heads usually many.

Leaf-blades, at least the lower ones, triangular or cordate; plants growing in clumps, with fleshy-fibrous roots.

IV. TRIANGULARES.

Leaf-blades neither triangular nor cordate.

Plant tall, 5-15 dm. high; heads numerous; plants with rootstocks.

V. SERRAE.

Plant low, 2-4 dm. high; heads few.

Heads radiate.

XVI. CRASSULI.

Heads discoid.

XVII. RAFIFOLII.

Leaves pinnatifid.

VI. EREMOPHILI.

Leaves or their divisions linear-filiform; plants usually suffruticose at the base.

VII. LONGILOBI.

Plants with the stem-leaves more or less reduced upwards.

Rootstock well developed, horizontal or ascending, woody.

Stem leafy, more than 2 dm. high.

Heads campanulate, rarely solitary.

Stem stout; rootstock not caespitose; leaves callous-denticulate or saliently dentate.

Heads discoid; leaves saliently dentate.

XVII. RAFIFOLII.

Heads radiate; leaves callous-denticulate.

Leaves glabrous.

VIII. GLAUCESCENTES.

Leaves tomentose.

IX. FOLIOSI.

Stem slender; rootstock usually more or less caespitose; leaves neither callous-denticulate, nor saliently and closely dentate; stem-leaves in the larger forms usually pinnatifid.

Basal leaves entire, more or less white-tomentose.

X. CANI.

Basal leaves, at least most of them, toothed or pinnatifid.

Leaves and stem more or less floccose, tardily becoming glabrate.

XI. TOMENTOSI.

Leaves and stem glabrous or slightly floccose when young.

XII. AUREI.

Heads turbinate, solitary.

XIII. SUBNUDI.

Stem subscape, less than 2 dm. high.

XIV. ANDICOLAE.

Rootstock very short, erect, of short duration, with numerous fleshy-fibrous roots; leaves dentate or entire.

Tall bog-plants, 5-15 dm. high; basal leaves long-petioled.

XV. HYDROPHILI.

Meadow or wood-plants, 2-5 dm. high; basal leaves comparatively short-petioled.

Leaves sharply and densely dentate.

XVI. CRASSULI.

Leaves entire-margined or denticulate, seldom sinuate-dentate.

XVIII. INTEGERRIMI.

Annuals.

Plant branched, more or less viscid; heads discoid, or with minute rays.

XX. VULGARES.

Plant simple, more or less floccose; heads radiate.

XXI. PALUSTRES.

I. PUDICI.

Heads 12-20 mm. high, broadly campanulate.

Auricles of the upper leaves small and entire; midvein of the leaves long-villous.

1. *S. acciden.*

Auricles of the upper leaves large and usually toothed; midvein of the leaves not conspicuously villous.

2. *S. chloranthus.*

Heads 8-10 mm. high, narrowly campanulate.

3. *S. pudicus.*

II. AMPLECTENTES.

Stem 2 dm. or more high, leafy; leaves acute.

Stem-leaves with clasping bases; stem high, slightly floccose when young.

Stem-leaves not clasping, usually short-petioled.

Stem less than 2 dm. high.

Rootstock hard, scaly at the top; upper stem-leaves sessile.

Rootstock fleshy, not scaly; stem-leaves usually petioled.

Basal leaves gradually tapering into the petioles.

Plant glabrous or nearly so; leaves dentate; bracts oblong.

Plant arachnoid-floccose; leaves pinnatifid; bracts narrowly lanceolate.

Basal leaves abruptly contracted into the petioles.

4. *S. amplexans*.

5. *S. pagosanus*.

6. *S. seridophyllus*.

7. *S. Holmii*.

8. *S. taraxacoides*.

9. *S. Soldanella*.

III. OCCIDENTALES.

Plant 2-3 dm. high; stem-leaves obovate or oblong, clasping.

Plant very leafy; involucre 10-15 mm. broad, short-peduncled or subsessile; achenes strigose.

Plant less leafy; involucre about 10 mm. broad, long-peduncled; achenes glabrous.

Plant about 1 dm. high; stem-leaves spatulate or obovate, scarcely clasping.

Leaves obovate-spatulate; plant glabrous; achenes puberulent.

Leaves oval, spinulose-dentate; leaf-margins scaberrulous; surfaces with a few hairs; achenes glabrous.

10. *S. carthamoides*.

11. *S. blitoides*.

12. *S. Fremontii*.

13. *S. invenustus*.

IV. TRIANGULARES.

Heads few; involucre 10 mm. high; lower leaf-blades cordate, the upper oval.

Heads usually many; involucre 6-8 mm. high; all leaves triangular, or the upper deltoid-lanceolate.

Stem 3-4 dm. high; leaves fleshy.

Stem 4-10 dm. high; leaves thin.

14. *S. variifolius*.

15. *S. saliens*.

16. *S. triangularis*.

V. SERRAE.

Heads 12-15 mm. high; disk 8-15 mm. broad; whole plant dark green.

Heads 8-10 mm. high; disk 5-6 mm. wide; plant light green.

Leaves oval-deltoid to lanceolate; panicles elongate.

Leaves narrowly lanceolate to almost linear; panicles round-topped.

Leaves, at least the lower, closely dentate; involucre cylindro-campanulate.

Leaves entire; involucre turbinate-campanulate.

17. *S. admirabilis*.

18. *S. Solidago*.

19. *S. serra*.

20. *S. lanceolatus*.

VI. EREMOPHILI.

Blades of the leaves sinuately lobed, the upper cleft halfway to the midrib.

Bracts linear-subulate, not thickened on the back.

Bracts linear, carinate on the back.

Blades of the leaves pinnatifid or lacinate, cut usually to near the midrib.

Leaf-blades ovate in outline; divisions toothed or lobed.

Involucre 6-7 mm. high, 5-6 mm. broad; bracts black-tipped.

Involucre 7-10 mm. high, 6-8 mm. broad.

Leaf-blades narrowly oblanceolate; divisions linear, entire.

21. *S. glaucifolius*.

22. *S. Kingii*.

23. *S. ambrosioides*.

24. *S. eremophilus*.

25. *S. Kuntzei*.

VII. LONGILOBI.

Plant glabrous, at least in age.

Leaves except those of the branches pinnately divided.

Leaves oblanceolate, with lanceolate or oblong lobes or teeth.

Leaves and their divisions linear-filiform.

Bractlets one-third to one-half as long as the bracts, filiform.

Bractlets very short, subulate.

Involucre campanulate; bracts 12-15.

Involucre almost cylindrical; bracts 8-10.

Leaves entire, linear-filiform, or some rarely with a pair of filiform lobes.

Plant more or less permanently tomentose.

25. *S. Kuntzei*.

26. *S. filicifolius*.

27. *S. Riddellii*.

28. *S. multicapitatus*.

29. *S. spartioides*.

30. *S. longilobus*.

VIII. GLAUDESCENTES.

Basal leaves spatulate or oblanceolate.

Bracts long-attenuate, slightly if at all black-tipped; lower leaves broadly spatulate.

Bracts short, acute, with conspicuous black tips.

Lower leaves broadly spatulate.

Lower leaves oblanceolate.

Basal leaves narrowly linear-oblanceolate.

31. *S. anacletus*.

32. *S. glaucescens*.

96. *S. lapathifolius*.

33. *S. lugens*.

IX. FOLIOSI.

Heads cylindro-campanulate; disk about 5 mm. wide.

Bracts black-tipped.

Bracts broadly linear, abruptly acute.

Bracts narrowly linear, long-acute.

Bracts not black-tipped.

Heads openly campanulate; disk 8-10 mm. wide; upper stem-leaves much reduced.

34. *S. atratus*.

35. *S. milliflorus*.

36. *S. foliosus*.

37. *S. sphaerocephalus*.

X. CANI.

Heads 7-8 mm. high.

Involucres as well as the whole plant densely white-tomentose.

Involucres glabrate or nearly so.

Plant densely tomentose; basal leaves short-petioled; petioles scarcely exceeding the blades.

Blades of the basal leaves obovate or spatulate.

Blades of the basal leaves linear or nearly so.

Plant finely tomentose, becoming more glabrate in age; basal leaves with slender petioles, much longer than the blades.

Heads 1 cm. or more high.

Blades of the basal leaves narrowly oblanceolate; stem-leaves linear, entire.

Plant 3-6 dm. high; involucres campanulate; upper leaves much reduced.

Plant 1-2 dm. high; involucres turbinate-campanulate; upper leaves not much reduced.

Blades of the basal leaves spatulate or broadly oblanceolate; stem-leaves lanceolate or oblong, usually more or less pinnatifid; heads hemispheric.

38. *S. Hallii*.

39. *S. Purshianus*.

40. *S. larimiensis*.

41. *S. Howellii*.

42. *S. spatuliformis*.

43. *S. Harbourii*.

44. *S. canus*.

XI. TOMENTOSI.

Some of the basal leaves entire or dentate.

Basal leaves obovate or spatulate.

Plant conspicuously rosulate-stoloniferous; stem-leaves sinuately round-lobed.

Plant not stoloniferous; stem-leaves pinnatifid with toothed lobes or dentate.

Lower stem-leaves acute; plant dark green.

Lower stem-leaves obtuse or rounded at the apex; plant yellowish green.

Basal leaves dentate; achenes hispidulous on the angles.

Basal leaves crenate; achenes glabrous.

Basal leaves lanceolate or oblanceolate; achenes glabrous.

Basal leaves narrowly oblanceolate, serrate.

Basal leaves lanceolate, sinuate-dentate.

All leaves pinnatifid, with toothed segments.

Heads discoid; leaves crisp.

Heads radiate; leaves scarcely crisp.

Caudex subligneous; plant tomentose; bracts shorter than the disk; achenes glabrous.

Caudex not subligneous; plant glabrate in age.

Achenes glabrous.

Achenes hispidulous.

50. *S. Fendleri*.

45. *S. plattensis*.

46. *S. neomexicanus*.

47. *S. Leonardi*.

48. *S. salicinus*.

49. *S. canovirens*.

51. *S. lanatifolius*.

50. *S. Fendleri*.

52. *S. uintahensis*.

53. *S. multilobatus*.

XII. AUREI.

Heads radiate.

Leaves thick, more or less fleshy.

Basal leaves narrowly oblanceolate.

Plant low, less than 2 dm. high, often with several stems from the base; basal leaves short-petioled; achenes hispidulous on the angles; ligules yellow.

Cyme dense; upper leaves usually pinnatifid with narrow lobes.

Cyme more open; stem-leaves entire or merely crenate.

Basal leaves subentire or 3-toothed at the apex.

Basal leaves crenate.

Plant about 4-6 dm. high, simple; achenes glabrous; ligules orange.

Leaves serrate or subentire; basal leaves 1 cm. or more, slender-petioled.

Stem-leaves with long, triangular lobes; basal leaves 5 cm. long or less.

Basal leaves cuneate, spatulate, or broadly oblanceolate, subentire at the base.

Lower stem-leaves spatulate, with broad-winged petioles; upper ones sessile and with much enlarged bases.

Stem-leaves neither broad-winged nor with much enlarged bases.

Stem-leaves, like the basal ones, broadly obovate, coarsely toothed.

Stem-leaves reduced, either very narrow or else pinnatifid.

Basal leaves angularly dentate or crenate all around, or more or less lyrate.

Achenes glabrous.

Basal leaves oval, crenate, or subentire.

55. *S. tridenticulatus*.

56. *S. oblanceolatus*.

57. *S. longipetiolatus*.

58. *S. Rydbergii*.

72. *S. dimorphophyllus*.

59. *S. oodes*.

60. *S. laetiflorus*.

- Basal leaves obovate, dentate or incised. 61. *S. rubricaulis*.
 Achenes hispidulous. 62. *S. mutabile*.
 Basal leaves toothed above the middle.
 Basal leaves dentate.
 Lower stem-leaves cuneate; plant 3-4 dm. high. 63. *S. subcuneatus*.
 Lower stem-leaves oblanceolate; plant about 2 dm. high. 64. *S. acutidens*.
 Basal leaves crenate. 65. *S. cymbalarioides*.
- Leaves thin.
 Basal leaves distinctly crenate or dentate.
 Achenes glabrous.
 Basal leaf-blades broad, from cordate to obovate or oval, not tapering at the base.
 Stem stout; heads 8-10 mm. high.
 Basal leaves usually subcordate at the base; stem-leaves lyrate-pinnatifid, with the lower lobes narrow. 66. *S. pseud aureus*.
 Basal leaf-blades obovate; stem-leaves pinnatifid, with broad divisions. 67. *S. platylobus*.
 Stem slender; heads 6-7 mm. high. 68. *S. flavulus*.
 Basal leaf-blades oblanceolate.
 Plant subglaucous. 70. *S. Willingii*.
 Plant not subglaucous. 69. *S. multinomensis*.
 Achenes hispidulous. 71. *S. Tweedyi*.
 Basal leaves sinuate or entire.
 Stem-leaves pinnatifid with dilated-auricled bases.
 Plant low, 1-2 dm., rarely 3 dm. high; ligules mostly yellow. 72. *S. dimorphophyllus*.
 Plant tall, 3-7 dm. high; ligules deep orange to brick-red. 73. *S. crocatus*.
 Stem-leaves not with dilated-auricled bases.
 Stem-leaves entire or nearly so, not auricled. 74. *S. Tracyi*.
 Stem-leaves more or less lyrate-pinnatifid.
 Basal leaf-blades suborbicular, sinuate. 75. *S. Pammelii*.
 Basal leaf-blades oval or ovate.
 Plant densely cespitose; bracts 5-6 mm. long. 76. *S. aquariensis*.
 Plant not densely cespitose; bracts 7-8 mm. long. 77. *S. Farriae*.
- Heads discoid.
 First basal leaves reniform. 78. *S. nephrophyllus*.
 None of the leaves reniform.
 Plant stout; stem-leaves with broad laciniate segments. 79. *S. idahoensis*.
 Plant slender; stem-leaves with narrow segments.
 Plant yellowish or light green; bracts not purple-tinged. 68. *S. flavulus*.
 Plant dark green.
 Basal leaves crenate; head 8-10 mm. high; bracts purple-tinged, linear. 80. *S. pauciflorus*.
 Basal leaves wavy; heads about 6 mm. high; bracts broadly lanceolate or oblong, not purple-tinged. 81. *S. fedifolius*.
- XIII. SUBNUDI. 82. *S. subnudus*.
- XIV. ANDICOLAE.
 Blades of the basal leaves orbicular, rounded, subcordate, obovate or cuneate, toothed at least at the apex, obtuse. 83. *S. Wardii*.
 Heads 7-8 mm. high, several in a dense cluster.
 Heads 9-12 mm. high, solitary or a few in an open corymb. 84. *S. petrocallis*.
 Rays golden yellow.
 Rays paler yellow.
 Basal leaf-blades sub-reniform; plant subacaulescent. 85. *S. Porteri*.
 Basal leaf-blades oval or obovate; plant with a short stem.
 Involucre hemispherical to campanulate.
 Flowering stems about 2 dm. high; heads 9-10 mm. high; basal leaves crenate-serrate, except at the very base; achenes hispidulous on the angles. 86. *S. cognatus*.
 Flowering stems less than 1.5 dm. high; heads 10-12 mm. high; achenes glabrous.
 Stem-leaves linear or linear-oblanceolate, if toothed, only at the apex. 87. *S. pentodontus*.
 Stem-leaves lanceolate, the lower more or less pinnately lobed or toothed. 88. *S. ovinus*.
 Involucre turbinate. 89. *S. turbinatus*.
 Blades of the basal leaves elliptical to linear, entire or very rarely some of them 3-toothed at the apex, acute.
 Plant in age nearly glabrous, monocephalous, 5-6 cm. high. 90. *S. alpicola*.
 Plant more or less permanently floccose, with usually several heads, over 1 dm. high. 91. *S. werneriaefolius*.

XV. HYDROPHILI.

- Leaves thick, entire or rarely minutely denticulate; inflorescence dense.
 Heads discoid; stem-leaves more or less clasping. 92. *S. pacificus*.
 Heads radiate; stem-leaves narrowed at the base. 93. *S. hydrophilus*.
 Leaves dentate; inflorescence open. 94. *S. hydrophiloides*.

XVI. CRASSULI.

- Stem-leaves linear or linear-lanceolate.
 Stem naked above; disks 8–10 mm. broad. 95. *S. pereziifolius*.
 Stem leafy; disks 12–15 mm. broad. 96. *S. lapathifolius*.
 Stem-leaves ovate or ovate-lanceolate.
 Leaves firm; bracts very thick and fleshy. 97. *S. crassulus*.
 Leaves thin; bracts not very thick. 98. *S. semiamplexicaulis*.

XVII. RAPIFOLII.

- One species. 99. *S. rapifolius*.

XVIII. INTEGERRIMI.

- Heads several.
 Bracts of the involucre narrowly linear-lanceolate, long-attenuate.
 Bracts without black tips; leaves entire-margined.
 Plant low, 1–3 dm. high, simple, more or less villous. 100. *S. Scribneri*.
 Plant tall, 4–10 dm. high, branched, glabrous. 101. *S. integerrimus*.
 Bracts usually black-tipped; leaves more or less dentate or denticulate.
 Leaves thick, the basal ones obovate, dentate. 102. *S. Hookeri*.
 Leaves thin, the basal ones oblanceolate or spatulate, merely denticulate. 103. *S. dispar*.
 Bracts of the involucre linear or oblong, rather abruptly acute, with a lanceolate or triangular black tip.
 Basal leaf-blades cordate to broadly oval, rather abruptly contracted into the petioles.
 Rays ochroleucous or white. 104. *S. Leibergii*.
 Rays deep yellow.
 Leaves more or less dentate or denticulate; stem 3–10 dm. high. 105. *S. exaltatus*.
 Basal leaves entire; stem 2–3 dm. high. 106. *S. Flintii*.
 Basal leaf-blades spatulate to linear-oblanceolate or rarely lanceolate, gradually tapering into the petioles.
 Bracts about half as long as the fully developed disk.
 Plant 6–8 dm. high; inflorescence open, broad, about 2 dm. wide. 107. *S. latus*.
 Plant 3–6 dm. high, slender; inflorescence 5–8 cm. broad, with a few heads. 33. *S. lugens*.
 Bracts more than half as long as the disk; inflorescence usually congested.
 Leaves crisp, as well as the stem, conspicuously arachnoid-hairy, especially when young; inflorescence dense; heads less than 1 cm. high. 108. *S. condensatus*.
 Leaves not crisp, only slightly villous when young; inflorescence more open; heads usually over 1 cm. high.
 Leaves more or less dentate; inflorescence even in age a flat-topped corymb. 109. *S. columbianus*.
 Leaves merely callous-denticulate; inflorescence with a short-peduncled terminal head and the lateral ones usually very long-peduncled. 110. *S. perplexus*.
 Heads solitary. 111. *S. solitarius*.

XIX. MEGACEPHALI.

- One species. 112. *S. megacephalus*

XX. VULGARES.

- One species. 113. *S. vulgaris*.

XXI. PALUSTRES.

- One species. 114. *S. palustris*.

1. *S. accidens* Greene. Stem 4–10 dm. high, simple and leafy; basal leaves and lower stem-leaves tapering into rather long winged petioles, lanceolate or oblanceolate, 10–15 cm. long, dentate or denticulate; upper stem-leaves linear-lanceolate, sessile and somewhat clasping; heads few or several on erect branches, nodding; involucre 2–2.5 cm. broad; bracts glabrous, thin, oblong-linear, acute. *S. Bigelovii* Hallii A. Gray. *S. scopulinum* Greene. Mountains: Colo.—Utah—N.M.—Wyo. *Mont.* Jl–O.

2. *S. chloranthus* Greene. Stem 3–10 dm. high, leafy; basal leaves and lower stem-leaves oblanceolate, abruptly contracted into short, winged petioles, coarsely dentate, acute; uppermost leaves sessile, lanceolate; heads several, corymbose or racemose, the lower ones on elongate, erect peduncles, nodding; involucre openly campanulate, 12–15 mm. high and 20–25 mm. broad; bracts glabrous, thin, linear, oblong, or lanceolate, acute. *S. Bigelovii* A. Gray, in part.

S. contristatus Greene, a glabrous form with purplish involucre. Mountains: Colo.—N.M. *Mont.*—*Alp.* Jl—Au.

3. *S. pudicus* Greene. Stem leafy, often much branched, 3-8 dm. high; basal leaves rather short-petioled, firm; blades about 1 dm. long, oblong or narrowly lanceolate, acute, denticulate or rarely dentate; upper leaves linear, sessile, entire, not clasping; inflorescence paniculate, with numerous heads; branches erect; bracts linear, acute, 7-8 mm. long, about one-fourth shorter than the disk, with membranous margins. *S. cernuus* A. Gray. Mountain meadows and creek-banks: Colo.—se Utah—N.M. *Submont.*—*Subalp.* Jl—Au.

4. *S. amplexans* A. Gray. Stem 3-6 dm. high, leafy; lower leaves with winged petioles, 7-15 cm. long, slightly floccose when young; blade oblanceolate, very thin, sinuate-dentate or denticulate, acute or mucronate, tapering at the base into winged petioles, clasping at the base; upper leaves oblong, more entire, sessile, half-clasping; heads 1-4, nodding, about 2 cm. broad; bracts linear, acuminate, about equalling the disk, purplish, the calyculate ones few; ligules almost 2 cm. long. Wet subalpine places in open woods: Colo.—N.M. *Mont.*—*Alp.* Jl—Au.

5. *S. pagosanus* Heller. Stem 2-4 dm. high, glabrous; lower leaves petioled, 10-15 cm. long; blades oblanceolate, or elliptic, obtusish, deeply and sharply dentate, glabrous and somewhat glaucous; upper stem-leaves sessile, lanceolate, tapering at the base; heads 1-4, nodding, on erect long peduncles; involucre broadly campanulate, glabrous, 15-20 mm. broad; bracts linear, scarious-margined; ligules 15-20 mm. long. *S. lactucinus* Greene (1900, not 1893). Alpine regions: Colo. *Subalp.*—*Alp.* Jl—Au.

6. *S. seridophyllus* Greene. Stem about 2 dm. high, 2-3-leaved, the lower short-petioled, oblanceolate, the upper oblong or lanceolate, sessile, and half clasping, thin, sinuate-dentate, 5-10 cm. long, slightly glaucous; head solitary or 2 or 3, nodding, about 2 cm. in diameter; bracts very thin, light green, linear, acuminate, shorter than the disk, the calyculate ones very few, about half as long; ligules light yellow, about 15 mm. long and 3-4 mm. wide. Alpine regions: Nev.—w Wyo.—Utah. *Mont.*—*Subalp.* Au—S.

7. *S. Holmii* Greene. Stem 1-2 dm. high, often almost scapiform, with 1, seldom 2-3, large heads; lower leaves obovate or oblanceolate, 5-10 cm. long, thin, shining, sharply sinuate-dentate, tapering at the base, obtuse or acutish at the apex, the upper ones much reduced, linear-lanceolate; heads about 15-20 mm. broad, nodding; bracts linear or linear-lanceolate, acute, thin, with a membranous margin, light green or tinged with purple; ligules light yellow, about 1 cm. long. High mountains: Colo.—e Utah. *Mont.*—*Alp.* Jl—Au.

8. *S. taraxacoides* (A. Gray) Greene. Stem subscapose or with a few leaves, 5-9 cm., seldom 10-12 cm. high; leaves 3-4 cm. long, oblanceolate or spatulate, or the stem-leaves, if any, lanceolate in outline, pinnatifid, with sharp triangular salient lobes; head solitary, openly campanulate, 12-15 mm. broad; bracts narrowly linear-lanceolate, acuminate, rather thick, about equalling the disk, the calyculate ones about half as long; ligules 8-14 mm. long. *S. amplexans taraxacoides* A. Gray. Alpine peaks: Colo.—N.M. *Mont.*—*Alp.* Jl—Au.

9. *S. Soldanella* A. Gray. Stem about 1 dm. high, 3-4-leaved, perfectly glabrous; leaves more or less petioled; blades orbicular, reniform, or obovate-spatulate, rounded or somewhat cordate at the base, rounded or obtuse at the apex, callous-denticulate or subentire; head solitary, 15-18 mm. high and 2-3 cm. broad, erect or slightly nodding; bracts lanceolate, acute, often tinged with purple, almost equalling the disk, the calyculate ones often long; ligules 6-10 mm. long. Rocky places: Colo. *Mont.*—*Alp.* Jl.

10. *S. carthamoides* Greene. Stem 2-5 dm. high, very leafy; leaves thickish and somewhat fleshy, obovate or spatulate, coarsely and sharply dentate or somewhat pinnatifid-dentate, obtuse or acutish, 2-6 cm. long, sessile and clasping; inflorescence leafy-corymbose; peduncles rather short; bracts lanceolate, acuminate, about equalling the disk, thick and somewhat fleshy, the calyculate ones narrowly linear-lanceolate, about one-third as long; ligules light yellow, about 8 mm. long. Alpine regions: N.M.—Wyo. *Mont.*—*Alp.* Jl—Au.

11. *S. blitoides* Greene. Stem 2-3 dm. high, leafy; leaves thinner than in the preceding, obovate or oval, tapering at the base, sharply dentate, 2-4 cm. long; inflorescence leafy-corymbose, but the peduncles 3-10 cm. long; bracts as in the preceding species; ligules 7-8 mm. long. Mountains: Colo.—Utah—s Wyo. *Subalp.*—*Alp.* Au.

12. *S. Fremontii* T. & G. Glabrous and fleshy perennial, branching below the surface of the ground; stem about 1 dm. high; leaves 2-3 cm. long, rounded-obovate or spatulate, fleshy, coarsely toothed or lobed, the lower with a winged petiole, the upper sessile; involucre campanulate, about 8 mm. high and broad; bracts linear or linear-lanceolate, acute, glabrous, the calyculate ones very small; ligules bright yellow, about 8 mm. long. *S. ductoris* Piper. *S. occidentalis rotundatus* Rydb. Alpine regions, among loose rocks: Mont.—Wyo.—Ore.—B.C. *Subalp.*—*Alp.* Jl—Au.

13. *S. invenustus* Greene. Stem 1-1.5 dm. high, very leafy, glabrous; leaves 2-4 cm. long, spatulate or obovate, doubly lacinate-toothed, glabrate or nearly so, scaberrulous on the margins; heads 2-5, short-peduncled; involucre campanulate, about 1 cm. high and 8 mm. broad, glabrous; bracts linear, scarious-margined, the calyculate ones few and half as long; ligules orange, 6-7 mm. long; achenes glabrous, striate. Higher peaks: Colo.—e Utah. *Mont.*—*Alp.* Jl—Au.

14. *S. variifolius* Rydb. Stem 6-12 dm. high, angled or striate, branched above, leafy; basal leaves petioled; blades cordate, saliently dentate, acute, rather firm, about 1 dm. long; upper stem-leaves elliptical or lanceolate, short-petioled or sessile, 5-10 cm. long; cyme open; heads few; involucre 6-7 mm. broad; bracts linear, acute, with broad membranous margins, slightly shorter than the disk, the calyculate ones small, linear-subulate; ligules 5-10 mm. long; achenes glabrous, angled. Wet places in the mountain regions: Mont.—Ida. *Submont.* Jl—Au.

15. *S. saliens* Rydb. Stem simple, 3-4 dm. high; leaves rather thick, petioled or the upper subsessile; blades 3-5 cm. long, elongate-triangular or lanceolate, very sharply dentate; cyme corymbiform, dense; involucre 8 mm. high and broad; bracts broadly linear, acute, rather thick; ligules bright yellow, 8-10 mm. long; achenes glabrous. Wet subalpine stations, among rocks: Yukon—Mont.—Wyo.—Wash.—B.C. *Mont.*—*Subalp.* Jl—Au.

16. *S. triangularis* Hook. Stems several from the same clump, 5-15 dm. high; leaf-blades thin and shining, elongate-triangular or lanceolate, acute, 5-20 cm. long, dentate, with triangular teeth; petiole narrowly winged, in the lower 1-3 cm. long; heads numerous in an open, more or less leafy cyme; involucre campanulate, 6-8 mm. high and broad; bracts broadly linear, very thin, the calyculate ones linear-subulate, short; ligules light yellow, about 1 cm. long; achenes glabrous. Along brooks and in swamps, especially in the mountains: Sask.—N.M.—Calif.—Alaska. *Submont.*—*Subalp.* Je—Au.

17. *S. admirabilis* Greene. Stem simple or branched above, striate, 5-15 dm. high; leaves linear-lanceolate, 10-15 cm. long, sharply serrate with callous teeth, acute or acuminate at both ends, sessile or very short-petioled; cyme paniculate, with numerous heads and somewhat leafy; bracts lanceolate or ovate-lanceolate, two-thirds as long as the disk, thick on the back, with broad scarious erose margins; tips abruptly spreading; ligules light yellow, about 1 cm. long; achenes glabrous and shining, striate. Damp places in mountain valleys: Colo.—Wyo. *Submont.*—*Mont.* Jl—Au.

18. *S. Solidago* Rydb. Stem about 1 m. high, glabrous, very leafy and much branched; leaves 6-10 cm. long, rather thin, coarsely dentate, with salient teeth, short-petioled or the upper subsessile; panicle very large and branched, elongate; heads small, about 8 mm. high; involucre glabrous; bracts linear, yellowish, much shorter than the disk; ligules pale yellow; achenes glabrous. Wet places: Mont.—Ida.

19. *S. serra* Hook. Stem 6-15 dm. high; leaves lanceolate or linear-lanceolate, 5-15 cm. long, sharply serrate or the upper entire, subsessile or the lower short-petioled; heads very numerous, in a leafy panicle; involucre almost cylin-

drical, about 6-7 mm. high and 5-6 mm. wide; bracts narrowly lanceolate or linear, thick on the back; tips not spreading, very dark, glandular and puberulent; ligules light yellow, 6-8 mm. long; achenes glabrous. *A. andinus* Nutt., a form with the upper leaves entire-margined. Mountain meadows: Mont.—Colo.—Ore.—Wash. *Plain—Mont.* Jl—Au.

20. *S. lanceolatus* T. & G. Stem 6-10 dm. high, glabrous; leaves lanceolate or linear-lanceolate, entire, shining, yellowish green, 1-2 dm. long; heads paniculate; involucre turbinate-campanulate, about 6 mm. high and 5 mm. broad, glabrous; bracts linear-lanceolate, scarious-margined, acute, the calyculate ones subulate; ligules light yellow, 5 mm. long; achenes cylindric, glabrous, striate. *S. serpa integrisculus* A. Gray, in part. Along streams: Wyo.—Nev. *Submont.* Jl—Au.

21. *S. glauciifolius* Rydb. Perennial, with a rootstock, glabrous or slightly tomentose when young; stem 5-6 dm. high, leafy; lower leaves elliptic, coarsely sinuately lobed, generally with smaller lobes on the petioles, which are somewhat enlarged and clasping at the base; stem-leaves ovate or rounded-ovate in outline, sessile and half-clasping, deeply cleft into oblong divergent lobes; heads many, corymbose or paniculate, about 1 cm. high; involucre bracts very narrowly linear, almost subulate; rays narrow, light yellow; achenes striate, glabrous. Meadows: Mont.

22. *S. Kingii* Rydb. Stem glabrous, 3-6 dm. high, rather stout, leafy; leaves obovate or oblanceolate in outline, 4-7 cm. long, the lower petioled, all pinnately lobed one-third to one-half the distance to the midrib, with ovate or lanceolate, more or less toothed lobes; heads corymbose-paniculate; involucre glabrous, campanulate, 7-8 mm. high, 6-7 mm. broad; ligules 5-7 mm. long; achenes scabrous-papillose. Mountains: Utah. *Submont.—Mont.* Jl—Au.

23. *S. ambrosioides* Rydb. Stem glabrous, leafy, 4-10 dm. high; leaves lanceolate or oblanceolate in outline, pinnatifid to near the midrib or the lower incised, mostly short-petioled, the lobes lanceolate, coarsely dentate or incised; heads corymbose-paniculate; bracts carinate, linear, acute, with black tips, the calyculate ones subulate, 4-5 mm. long; ligules light yellow, 5-6 mm. long; achenes minutely scabrous-puberulent on the angles. Mountains: Wyo.—Utah.—N.M. *Mont.—Subalp.* Jl—Au.

24. *S. eremophilus* Richards. Stem stout, 5-10 dm. high; leaves deeply pinnatifid, 1-2 dm. long, the lower petioled, the upper sessile; lobes lanceolate, usually toothed or cleft; heads many, corymbose, 10-12 mm. high; bracts linear-lanceolate, costate, black-tipped; ligules 6-8 mm. long; achenes papillose-scabrous on the angles. Wet ground: Sask.—N.D.—Wyo.—Alta.—Mack. Au—S.

25. *S. Kuntzei* Rydb. Perennial, probably suffruticose below; stem 5 dm. high or more; stem-leaves oblanceolate in outline, 5-10 cm. long, with a broad blade above, pinnately cleft into linear, oblong, or lanceolate lobes below the middle, the upper merely toothed, those of the branches linear and entire; heads numerous, cymose-paniculate; involucre cylindro-turbinate, nearly 1 cm. high, 8 mm. broad; bracts linear, acute; ligules about 1 cm. long; achenes hispidulous. Mountains: Colo.—Wyo. *Submont.* Jl—S.

26. *S. flicifolius* DC. Stem 5-10 dm. high, slightly floccose when young, soon glabrate; leaves pinnatifid, with linear-filiform divisions; heads corymbose, 10-12 mm. high; involucre campanulate, slightly floccose when young; bracts carinate, linear, abruptly acuminate, the calyculate ones linear-subulate, one-half to two-thirds as long; ligules 10-15 mm. long; achenes strigose-canescens. *S. lathyroides* M. E. Jones. Sandy plains: Ariz.—Utah—Calif. Ap—N.

27. *S. Riddellii* T. & G. Stem 3-10 dm. high, glabrous, leafy, branched; leaves pinnatifid, with linear or linear-filiform divisions, glabrous; heads corymbose, 10-12 mm. high; involucre campanulate, glabrous; bracts linear, acute, somewhat carinate; ligules about 12, light yellow, 9-12 mm. long; achenes somewhat canescent. Plains: Tex.—Neb.—Wyo.—N.M. *Plain—Submont.* Je—O.

28. *S. multicapitatus* Greenm. Stem 4-10 dm. high, yellowish, glabrous, branched and broom-like, leafy; leaves irregularly pinnately dissected into

linear-filiform lobes, 1-1.5 mm. wide, or the upper simple and linear-filiform, somewhat fleshy; heads in a corymbiform inflorescence, numerous; involucre almost cylindric, 6-7 mm. high, about 4 mm. in diameter; bracts linear, gradually acute, the calyculate ones small, subulate; ligules pale yellow, 7-8 mm. long; achenes strigose-hispidulous. Mountain valleys and high plains: N.M.—Colo.—Ariz. *Submont.*—*Subalp.* Au-S.

29. *S. spartioides* T. & G. Stem 3-6 dm. high, leafy throughout, often several from one root; leaves glabrous, narrowly linear, entire; heads corymbose; involucre nearly cylindric; bracts about 12, carinate, linear, acute, the calyculate ones subulate, minute; ligules few, 8-10 mm. long; achenes silky-canescens. Banks and plains: Tex.—Neb.—Wyo.—Ariz. *Plain*—*Mont.* Jl-O.

30. *S. longilobus* Benth. Stem 3-10 dm. high, white-tomentose, at least when young, leafy; leaves white-tomentose, pinnately divided into linear-filiform divisions, or the upper entire and linear-filiform; heads corymbose, 12-15 mm. high; involucre campanulate, 10-12 mm. broad, floccose at the base; bracts linear, carinate, short-acuminate; ligules 10-12 mm. long; achenes finely strigose-canescens. *S. filifolius* Nutt., not Bergius. Plains and valleys: Tex.—Colo.—Utah—Ariz.; Mex. *Son.*—*Submont.* Ap-Au.

31. *S. anacletus* Greene. Stems 1-3, few-leaved, terete and slightly striate; basal leaves obovate or broadly spatulate, obtuse or mucronate, copiously callous-denticulate, rather thick, 5-15 cm. long, with a distinct winged petiole; stem-leaves few and small, from spatulate to narrowly lanceolate, sessile and often subentire; cyme corymbiform; involucre campanulate, 10-12 mm. high and 12-15 mm. broad; bracts linear-lanceolate, acuminate, about two-thirds as long as the disk; ligules bright yellow, about 8 mm. long; achenes glabrous. *S. toluccanus microdonthes* A. Gray. (?) *S. Wootonii* Greene. Damp places in the mountains: Ariz.—N.M.—Colo. *Submont.*—*Subalp.* My-Jl.

32. *S. glaucescens* Rydb. Stem 2-7 dm. high, striate, shining, glabrous or slightly hairy at first; lower leaves 5-10 cm. long, with winged petioles; blades spatulate or oblanceolate, or even oval, callous-dentate or subentire, somewhat glaucous; upper stem-leaves reduced, lanceolate, sessile; cyme corymbose, dense; heads campanulate, about 1 cm. high; bracts linear-lanceolate, acute, black-tipped, about two-thirds as long as the disk; ligules dark yellow, about 8 mm. long; achenes glabrous. Wet places: Mont.—n Wyo.—Ida. *Plain*—*Submont.* Au.

33. *S. lugens* Richards. Stem slender, terete, about 3 dm. high; basal leaves 5-10 cm. long, narrowly oblanceolate, sinuate-dentate; upper stem-leaves much reduced, linear or linear-lanceolate; cyme corymbiform; heads 5-7, campanulate, about 1 cm. high, 8-12 mm. broad; bracts rather thick, linear-oblong or lanceolate, acute, conspicuously black-tipped; rays about 8 mm. long; achenes glabrous. Wet places: Subarctic America—Man.—Iga.—Alaska. *Subalp.* Je-Jl.

34. *S. atratus* Greene. Plant tomentose when young, tardily becoming more glabrate in age; stem 3-6 dm. high, terete; basal leaves distinctly petioled, 1-2 dm. long; blade spatulate or oblanceolate, callous-denticulate, tapering at the base; upper stem-leaves lanceolate and sessile; cyme compound, corymbiform; heads very numerous, small; involucre 6-10 mm. high, almost cylindric; bracts broadly linear, acute; ligules light yellow, 6-8 mm. long; achenes glabrous. *S. lugens foliosus* A. Gray, in part. Mountain sides: Colo.—Utah—N.M. *Submont.*—*Subalp.* Je-Au.

35. *S. milliflorus* Greene. Stem persistently tomentose, about 1 m. high; basal leaves petioled, 2-3 dm. long, tomentose on both sides; blades oblanceolate, callous-dentate; stem-leaves lanceolate, sessile, acuminate; heads very numerous, in a compound flat-topped cyme; involucre narrow, cylindric, 6-7 mm. high, about 12-flowered; bracts about 8, narrowly linear; ligules 3 or 4, 3-4 mm. long; achenes glabrous. Mountains: Colo. *Mont.* Jl.

36. *S. foliosus* (A. Gray) Rydb. Stem floccose-tomentose when young, 2-3 dm. high, terete; lower leaves oblanceolate, 7-10 cm. long, sinuate-denticulate, acute, tapering at the base and short-petioled; upper leaves lanceolate or

linear, sessile; cyme compound, corymbiform; heads small; involucre about 8 mm. long, almost cylindric; bracts broadly linear, acute, about two-thirds as long as the disk; ligules light yellow, 6-8 mm. long; achenes glabrous. *A. lugens foliosus* A. Gray, in part. Subalpine regions: Utah. *Subalp.* Jl.

37. *S. sphaerocephalus* Greene. Stem 6-10 dm. high, striate, sparingly woolly when young, leafy below; lower leaves 2-3 dm. long, wing-petioled; blades firm, oblanceolate, sinuately callous-dentate, more or less tomentose on both sides; upper leaves linear-lanceolate; heads in a corymbiform cyme, about 1 cm. high; bracts linear, rather thick, black-tipped, much shorter than the disk; ligules 8 mm. long, orange or lemon; achenes hispidulous on the angles. *S. altus* Rydb. Wet meadows in the mountains: Mont.—Wyo.—Nev.—Ida. *Mont.*—*Subalp.* Jl—Au.

38. *S. Hallii* Britton. Plant densely white-tomentose; stems several, a little over 1 dm. high; basal leaves 2-3 cm. long, distinctly petioled; blade spatulate, obtuse, thick, entire; stem-leaves linear, sessile; heads few, crowded, about 5 mm. high and as broad; involucre turbinate-campanulate; bracts broadly linear, acute, densely tomentose; ligules light yellow, about 5 mm. long; achenes glabrous. Geyser formations: Yellowstone Park, Wyo. *Mont.* Jl—Au.

39. *S. Purshianus* Nutt. Stems 1-2 dm. high; basal leaves broadly spatulate, entire, 3-5 cm. long, obtuse; cyme small, corymbiform; heads 2-10; involucre campanulate, 7-8 mm. high; bracts linear-lanceolate, acute; ligules bright yellow, about 6 mm. long; achenes glabrous. Dry hills and mountain sides: Sask.—Tex.—Utah—B.C. *Plain*—*Alp.* Je—Au.

40. *S. larimiensis* A. Nels. Stem 1-2 dm. high, floccose; basal leaves 4-5 cm. long, short-petioled; blades linear or linear-oblanceolate, entire, white-tomentose; stem-leaves similar, but smaller and sessile; heads 10 mm. high or less; bracts linear-lanceolate, acute, almost glabrous, calyculate ones few, small and subulate; ligules about 5 mm. long; achenes glabrous. Scarcely distinct from *S. Purshianus*. Dry hills: Wyo.—S.D. (Black Hills). *Plain.* My—Jl.

41. *S. Howellii* Greene. Stem 2-4 dm. high, finely white-tomentulose, in age sometimes more glabrate; lower leaves 5-15 cm. long, with slender petioles longer than the blades, white-tomentulose; blades oblanceolate, entire, the upper sessile, more or less pinnatifid or toothed, lanceolate in outline; heads corymbose; involucre 7-8 mm. high, one-fourth shorter than the disk, glabrous or nearly so; bracts linear-lanceolate, acute; ligules 8-10, yellow, about 5 mm. long; achenes glabrous. Hillsides and banks: Mont.—n Wyo.—Ore.—Wash. *Submont.*—*Mont.* My—Jl.

42. *S. spatuliformis* Heller. Stem 3-6 dm. high; leaves mostly basal, 1-2 dm. long, with long petioles; blades linear-oblanceolate, entire or undulate, floccose, sometimes glabrate above in age; upper stem-leaves small and scattered, subulate, sessile; heads in an open corymb, about 1 cm. high; bracts linear, acute, almost glabrous, yellowish; ligules bright yellow, 1 cm. long; achenes glabrous. *S. fastigiatus* Nutt., not Schwein. *S. leucocrinus* Greene. Wet ground, mostly near the coast: Ore.—Wash.—Ida. (acc. to Gray). Je—Jl.

43. *S. Harbourii* Rydb. Stem 1-2 dm. high, striate, white-floccose, leafy; basal leaves and most stem-leaves petioled, 3-10 cm. long, densely white-floccose; blades oblanceolate or linear-spatulate, entire; uppermost stem-leaves sessile, lanceolate, more or less auricled at the base; inflorescence corymbiform; heads 2-7, mostly 10-15 mm. high; bracts narrowly linear, long-attenuate, light yellowish green and slightly floccose, the calyculate ones minute, subulate; rays bright yellow, over 1 cm. long; achenes brown, shining, glabrous, angled. Mountains: Colo. *Mont.*—*Alp.* Jl—Au.

44. *S. canus* Hook. Stem 3-5 dm. high; basal leaves petioled, entire, 4-15 cm. long, obovate or spatulate, thick, obtuse; stem-leaves oblong or lanceolate in outline, more or less lyrate-pinnatifid or lobed, sessile, auricled; cyme compound, corymbose; heads generally many, 10-12 mm. high; bracts narrowly linear-lanceolate; ligules bright yellow, 8-10 mm. long; achenes glabrous. Dry hills: Sask.—Neb.—Colo.—Calif.—B.C. *Plain*—*Submont.* My—Au.

45. *S. plattensis* Nutt. Stem 2-5 dm. high, loosely floccose, very tardily glabrate; basal leaves petioled, 3-10 cm. long; blades ovate or elliptic, floccose when young, glabrate in age; lower stem-leaves petioled, lyrate-pinnatifid, with oblong lobes, the upper sessile, reduced, linear-lanceolate in outline, pinnatifid or toothed; heads corymbose; involucre campanulate, 6-7 mm. high, tomentose at the base; bracts lance-linear, acute, the calyculate ones minute, subulate; ligules about 8 mm. long, orange; achenes hispidulous on the angles. *S. pseudo-tomentosus* Mack. & Bush. Prairies and river valleys: w Ont.—Mo.—Tex.—Colo. e Mont.—Sask. *Plain.* My-Je.

46. *S. neomexicanus* A. Gray. Stem 2-4 dm. high, densely and loosely floccose when young; basal leaves 3-8 cm. long, petioled; blades spatulate, coarsely dentate, tomentose on both sides, glabrous in age above; stem-leaves very small, linear-oblancoate or linear, more or less dentate or pinnatifid; heads rather few, corymbose; involucre campanulate, about 8 mm. high, shorter than the disk, tomentose at the base; bracts lance-linear, acute; ligules light yellow, 8 mm. long. Mountains: N.M.—Ariz.—(? Colo.). *Son.* My-Jl.

47. *S. Leonardi* Rydb. Stem 4-5 dm. high, loosely floccose; lower leaves petioled; blades obovate or oval, 2-6 cm. long, densely crenate, rather thick, loosely floccose, or in age glabrate, rounded at the apex, the middle ones more or less lyrate-pinnatifid at the base, the upper 1-3 cm. long, lanceolate in outline, pinnately lobed and somewhat auriculate-clasping; heads in a rather dense corymb; involucre somewhat turbinate and floccose at the base, 5-6 mm. high, 6-7 mm. broad; bracts linear, acute, carinate; ligules orange, about 6 mm. long, 2 mm. wide. Valleys: Utah. Jl.

48. *S. salicinus* Rydb. Stems several, about 4 dm. high, simple below, striate and floccose; basal leaves 5-10 cm. long, narrowly oblanceolate, the first ones subentire, but most of them serrate except at the tapering base, finely tomentose on both sides, in age more glabrate above; stem-leaves small, linear, sessile, dentate, slightly auricled at the base; heads subumbellate, 7-8 mm. high, slightly floccose at the base; bracts yellowish, thin, lanceolate, shorter than the disk; ligules light yellow, short and broad, 3-4 mm. long; achenes glabrous. Mountains: Colo. *Submont.* Je-Jl.

49. *S. canovirens* Rydb. Stem 4-5 dm. high, loosely floccose; lower leaves 5-12 cm. long, short-petioled; blades lanceolate or oblanceolate, sinuately toothed, dark green, firmly floccose, in age almost glabrate above; upper leaves linear, sinuately dentate, with rather acute teeth; cyme with erect or ascending branches; involucre 7-8 mm. high, turbinate-campanulate; bracts 12-14, oblong, linear, floccose at the base and more or less villose; ligules 5-6 mm. long, at first orange, in age paler; achenes glabrous. Mountains: Colo.—N. M. *Submont.*—Mont. Je-Au.

50. *S. Fendleri* A. Gray. Stem 2-3 dm. high, floccose when young, but in age sometimes almost glabrate, floccose only at the axils of the leaves; leaves all deeply pinnatifid, or the lower oblanceolate, round-lobed or entire, more or less tomentose on both sides or glabrate above, 4-8 cm. long, the lower petioled, the upper sessile; divisions of the leaves toothed or cleft; heads corymbose; involucre campanulate, 4-5 mm. high, one-half to two-thirds as high as the disk, only slightly tomentose at the base; bracts lance-linear, abruptly acuminate; ligules yellow, 5 mm. long; achenes glabrous. *S. rosulatus* Rydb., a form with subentire basal leaves. *S. Nelsonii* Rydb. Mountains: N.M.—Colo.—Utah. *Submont.*—*Alp.* Je-Au.

51. *S. lanatifolius* Osterhout. Stems several, 1-2 dm. high, usually branched, very leafy to the inflorescence; leaves linear, pectinate-pinnatifid, the divisions crenate-toothed with inrolled edges, especially those of the lower leaves; both stem and leaves pannose-canescens; heads numerous and crowded, about 8 mm. high; involucre campanulate, glabrate; bracts about 7, the calyculate ones minute; flowers 15; rays none; achenes glabrous. Hills and mountains: Colo.—Neb. *Plain*—Mont.

52. *S. uintahensis* (A. Nels.) Greenm. Stems several, 2-4 dm. high, floccose when young, soon glabrous; leaves pinnatifid or the lower lyrate, tomentose

when young, soon glabrate, 5-10 cm. long; divisions obovate, usually toothed or cleft; heads in a dense corymb; involucre campanulate, somewhat turbinate at the base, 7-8 mm. high, only slightly shorter than the disk; bracts linear, acuminate, the calyculate ones minute, subulate or wanting; ligules 5-6 mm. long, bright yellow or orange. *S. Nelsonii Uintahensis* A. Nels. Hills and mountain sides: Wyo.—Colo.—Ariz.—Ida. *Submont.*—*Mont.* My-Jl.

53. *S. multilobatus* T. & G. Stems several, 2-3 dm. high, glabrous, except at the leaf-axils where they are sometimes slightly floccose; leaves somewhat fleshy, pinnatifid or the lower merely lyrate, loosely floccose when young, soon glabrate, 4-10 cm. long; divisions obovate or those of the stem-leaves oblong, toothed or cleft; heads corymbose; involucre glabrate, campanulate, 5-6 mm. high; bracts linear, abruptly acuminate; ligules about 6 mm. long. Dry plains: Colo.—Utah—n Wyo. *Son.*—*Submont.* My-Jl.

54. *S. densus* Greene. Stem 1.5-3 dm. high, tomentose at the base and at the axils of the leaves; basal leaves petioled, 4-7 cm. long; blades oblanceolate or linear-oblanceolate, serrate, thick, slightly floccose when young; lower stem-leaves similar but lacinate or pinnately lobed; upper stem-leaves reduced, more or less pinnatifid; heads in a small dense corymb; involucre 6-7 mm. high, hemispheric, glabrous; bracts linear or oblong, abruptly acuminate, scarios-margined; ligules 6-7 mm. long. *S. aureus compactus* A. Gray. *S. compactus* Rydb., not Kirk. *S. condensatus* Rydb., not Greene. Plains: Man.—Neb.—e Colo. My-Je.

55. *S. tridenticulatus* Rydb. Stem very slender, 2-3 dm. high; basal leaves very narrowly linear-oblanceolate, thick, with a slender petiole, slightly 3-toothed (rarely 5-toothed) at the apex or wholly entire, 4-8 cm. long and 4-5 mm. wide; stem-leaves linear and subentire; heads 7-8 mm. high; bracts lanceolate, acute; ligules light yellow, about 8 mm. long, 3-nerved. *S. Metcalfei* Greene. Plains: Tex.—N.M.—Colo. *Son.*—*Submont.* My-Jl.

56. *S. oblanceolatus* Rydb. Stem short and stout, about 2 dm. high, floccose at the base of the leaves; basal leaves oblanceolate, thick and fleshy, 4-6 cm. long, obtuse, crenate, with entire long tapering bases, or the first subentire; stem-leaves similar or reduced and linear in outline; heads about 8 mm. high; bracts linear, acute, yellowish green, the calyculate ones minute and few; ligules 5-6 mm. long. Dry plains: Wyo.—Tex.—N.M.—Utah. *Plain*—*Mont.* My-Jl.

57. *S. longipetiolatus* Rydb. Stem strict, 3-6 dm. high, terete; lower leaves oblanceolate, 1-1.5 dm. long, with slender petioles, from serrate to subentire, the upper reduced, lanceolate, sessile, sharply serrate, or lacinate-dentate, often auricled at the base; heads 8-9 mm. high; bracts about 20, linear, acute; ligules dark orange, 4-7 mm. long. Valleys: Wyo.—Colo. *Submont.*—*Mont.* Jl—Au.

58. *S. Rydbergii* A. Nels. Stem about 3 dm. high; basal leaves oblanceolate, thick and somewhat fleshy, dentate or subentire; lower stem-leaves spatulate, with a winged petiole, coarsely dentate; upper stem-leaves sessile with an auricled base; heads about 8 mm. high; bracts about 15, oblong, acute, with a broad membranous margin; ligules 4-5 mm. long and 2 mm. wide, dark orange. *S. fulgens* Rydb., not Nichols. Creek banks: Wyo.—Ida. *Mont.* Au.

59. *S. oodes* Rydb. Stem 3-4 dm. high, slightly floccose below, branched; lower leaves long-petioled, loosely villous-floccose when young, in age glabrous; blades thick, oval, 3-6 cm. long, 1.5-4 cm. wide, rounded or obtuse at the apex, abruptly contracted below, coarsely dentate-crenate, with triangular-ovate, obtuse teeth; lower stem-leaves with enlarged toothed or lobed stipule-like bases, the upper short-petioled and narrower; heads many, about 1 cm. high; bracts linear, abruptly acute, 5-7 mm. long, slightly villous; ligules bright yellow, 10-12 mm. long, about 2 mm. wide; achenes glabrous. Mountains: Colo. Je—Au.

60. *S. laetiflorus* Greene. Stem 2-5 dm. high, slightly floccose, soon glabrous; lower leaves petioled, 1-6.5 cm. long; blades broadly ovate, elliptic, or obovate, entire or crenate-dentate, cuneate at the base; stem-leaves lyrate or pinnately lobed, the upper semi-amplexicaul; heads 8-10 mm. high; involucre

campanulate; bracts thickish, at first slightly tomentulose; ligules pale yellow; achenes glabrous. Meadows and open slopes: Ore.—Ida.—Nev.—Calif. *Submont.* Je—Au.

61. *S. rubricaulis* Greene. Stem about 3 dm. high, slender, terete; basal leaves rounded-obovate, sinuately dentate, sometimes more or less lyrate, their petioles often tinged with red; stem-leaves oblanceolate in outline, pinnatifid, with oblong segments, generally short-petioled; heads about 8 mm. high; bracts 12–15, lanceolate, acuminate, as long as the disk, membranous-margined; ligules about 5 mm. long. *S. Jonesii* Rydb. Mountains: Utah—w Wyo.—Nev. *Mont.*—*Subalp.* Jl—Au.

62. *S. mutabile* Greene. Stem striate, 4–5 dm. high; basal leaves spatulate or cuneate, dentate-serrate, about 5 cm. long, with short petioles, soon glabrous; lower stem-leaves long-petioled, cuneate or spatulate, lyrate lobed, the upper narrowly oblanceolate and subsessile, slightly auricled at the base; heads about 8 mm. high; bracts 12–16, glabrous, yellowish green, lanceolate, thin; ligules golden yellow, 5–6 mm. long. *S. aurellus* Rydb. Valleys: Colo.—N.M.—Utah. *Submont.*—*Mont.* Je.

63. *S. subcuneatus* Rydb. Stem 3–4 dm. high; basal leaves about 5 cm. long, spatulate or cuneate, dentate or serrate above the middle, tapering into short petioles, rather thick; lower stem-leaves narrowly cuneate, short-petioled, dentate at the apex, the upper ones linear and sessile, often sharply dentate; heads about 8 mm. high; bracts about 15, lanceolate, acute, shorter than the disk; ligules 4–5 mm. long; achenes glabrous. In meadows: Colo.—Wyo. *Submont.*—*Mont.* Je—Jl.

64. *S. acutidens* Rydb. Stems several, about 2 dm. high, angled, more or less tinged with red; lower leaves about 5 cm. long, thick, fleshy and somewhat glaucous, obovate or spatulate, sharply dentate above the middle, at the base abruptly contracted into slender petioles, the upper reduced, linear, laciniate-dentate or somewhat pinnatifid; heads 8–10 mm. high; bracts broadly linear, acute; ligules about 5 mm. long; achenes glabrous. Mountains: Wyo.—N.M. *Submont.*—*Mont.* Au.

65. *S. cymbalarioides* Nutt. Stem 2–3 dm. high; basal leaves petioled; blades obovate or obovate-cuneate, 2–5 cm. long, crenate above the middle; lower stem-leaves similar or lyrate-pinnatifid, the upper reduced, sessile, lobed or toothed; cyme corymbiform; heads 7–9 mm. high; involucre hemispheric, 6–7 mm. high; bracts broadly linear, acutish; ligules 6–8 mm. long, bright yellow; achenes glabrous. *S. aureus borealis* A. Gray. Mountain meadows: Mack.—N.M.—Utah—B.C. *Mont.*—*Alp.* Je—Au.

66. *S. pseudoreus* Rydb. Stem 3–8 dm. high; basal leaves long-petioled; blades thin, broadly ovate or subcordate, serrate, 3–7 cm. long; stem-leaves more or less lacinate or lyrate-pinnatifid, the upper clasping; heads 8–10 mm. high; involucre hemispheric; bracts lance-linear, acute; ligules bright yellow, about 8 mm. long; achenes glabrous. *S. Burkei* Greenm. Wet meadows: Mack.—S.D. (Black Hills)—N.M.—Calif.—B.C. *Submont.*—*Alp.* Je—S.

67. *S. platylobus* Rydb. Stem about 4 dm. high, rather leafy, striate and somewhat angled; basal leaves 6–10 cm. long, slender-petioled; blades obovate or broadly oval, sinuately crenate-dentate, thin; lower stem-leaves oblanceolate, petioled, deeply lobed or divided, with rounded lobes; upper stem-leaves broadly ovate in outline, sessile, pinnately divided into broadly oblong or cuneate divisions, which are more or less deeply sinuate-dentate; heads about 8 mm. high; bracts broadly lanceolate, acute, membranous-margined; ligules 6–7 mm. long; achenes glabrous. Wet banks: Wyo.—Utah—Ida.—Alta. Je—Au.

68. *S. flavulus* Greene. Stem 3–4 dm. high, striate, pale; basal leaves 3–8 cm. long, obovate or broadly oval, gradually tapering into the petioles, but sometimes truncate at the bases, obtuse, crenate or sinuate, light green; lower stem-leaves oblanceolate in outline and petioled, the upper lanceolate or linear and sessile, all deeply pinnatifid, with narrow, oblong or linear segments; heads 7–8 mm. high; bracts linear, acute, yellowish green; ligules pale yellow, about 6 mm.

long or often lacking; achenes glabrous, striate. *S. flavovirens* Rydb. Wet meadows: Mont.—N.M.—Ida. *Submont.* Je—Jl.

69. *S. multnomensis* Greenm. Stem 3–7 dm. high, slightly floccose in the axils of the leaves; lower leaves 4–15 cm. long, petioled; blades oblong-ob-lanceolate, obtuse or rounded at the apex, crenate-dentate, or somewhat lyrate-lobed; upper stem-leaves pinnatisect, or the uppermost entire; heads 10–13 mm. high; involucre campanulate; bracts linear-lanceolate, pale green; ligules yellow; achenes glabrous. Meadows and open places: Sask.—Ore.—B.C.—Mack. *Submont.*—Mont. Je—Jl.

70. *S. Willingii* Greenm. Stem erect, 2.5–3 dm. high, glabrous; leaves oblong-lanceolate, 3–12 cm. long, crenate-serrate to pinnatifid into oblong entire or subentire lobes, floccose-tomentulose along the veins when young; heads 8–10 mm. high; involucre campanulate, sparingly floccose; bracts linear-lanceolate; ligules yellow; achenes glabrous. Gravelly soil: Man.—Alta. *Plain.*

71. *S. Tweedyi* Rydb. Stem glabrous, or slightly floccose at the leaf-axils, 4–6 dm. high, striate; basal leaves 3–15 cm. long, petioled; blades elliptic or oval to oblanceolate, crenate-dentate, often lyrate-pinnatifid, with a few lobes below the large terminal one; lower stem-leaves similar, but more pinnatifid; upper stem-leaves deeply pinnatifid, with oblong toothed divisions; involucre somewhat turbinate at the base, about 8 mm. high and as broad; ligules narrow, bright yellow, 8–10 mm. long; achenes hispidulous on the margins. *S. flavovirens* Greenm., mainly, not Rydb. Wet meadows: Wyo.—Mont. Je—Au.

72. *S. dimorphophyllus* Greene. Stem 1.5–3 dm. high; basal leaves 2–3 cm. long, obovate or spatulate, crenate or subentire, with a winged petiole; lower stem-leaves with broader winged petioles somewhat auricled at the base, or else oblong without distinction between blade and petiole; upper stem-leaves ovate or triangular with very large and large-toothed auricles; heads 8–10 mm. high; bracts about 20, linear; ligules 7–8 mm. long and 1.5–2 mm. wide, bright to pale yellow; achenes striate, glabrous. *Senecio aureus croceus* A. Gray, and *S. crocatus* Rydb., in part. *S. heterodoxus* Greene. Higher mountains: Wyo.—Colo. *Mont.*—Alp. Jl—Au.

73. *S. crocatus* Rydb. Stem 3–7 dm. high, glabrous, leafy; basal leaves long-petioled; blades thin, glabrous, broadly ovate, subcordate, or even subreniform, sinuate or subentire, 4–8 cm. long; stem-leaves larger, lyrate pinnatifid or lobed, the lower 1–1.5 dm. long, with winged petioles and enlarged, lacinate bases, the uppermost sessile, with enlarged, clasping, and lobed bases; heads 8–9 mm. high; involucre hemispheric, glabrous; bracts linear, acute; ligules orange or brick-red, about 7 mm. long; achenes glabrous. *S. aureus croceus* A. Gray. *S. pyrrhochrous* Greene. Wet meadows: Colo.—Wyo. *Mont.* Jl—Au.

74. *S. Tracyi* Rydb. Stem about 4 dm. high, glabrous; basal leaves glabrous, long-petioled; blades round-oval or oval, thin, 1.5–5 cm. long, 1–3 cm. wide, entire or merely wavy, rounded at the apex, rounded, truncate or subcordate at the base; stem-leaves lanceolate, acuminate, 2–6 cm. long, the uppermost still smaller, sinuate-crenate, auriculate-clasping; involucre broadly turbinate, 6–7 mm. high; bracts linear, abruptly acute, glabrous; ligules yellow, 6–8 mm. long, about 2 mm. wide; achenes glabrous. Mountains: Colo.—e Utah. *Mont.*—Subalp. Jl—S.

75. *S. Pammelii* Greenm. Stem 2–4 dm. high, more or less purplish towards the base, slightly white-tomentose in the axils; lower leaves long-petioled, 1–2.5 cm. long; blades rounded-ovate or suborbicular, subcordate or truncate at the base, sinuate-crenate or entire; stem-leaves lyrate to entire; heads 7–10 mm. high; bracts linear-lanceolate, acute, glabrous; ligules bright yellow; achenes glabrous. Mountains: Utah—Nev. *Mont.* Jl—Au.

76. *S. aquariensis* Greenm. Stem erect, 2–3.5 dm. high; lower leaves petioled; blades ovate to oblong-lanceolate, 1–7 cm. long; stem-leaves petioled and lyrate to sessile and pinnatisect; heads 8–10 mm. high; involucre campanulate; bracts lanceolate; achenes glabrous. Table-lands: Utah. *Mont.* Au.

77. *S. Farriae* Greenm. Stem 1-3 dm. high, branched near the base; lower leaves with winged petioles; blades ovate to obovate, 1-4 cm. long, rounded at the apex, crenate to subentire; stem-leaves lyrate or irregularly pinnatifid, the upper bract-like; heads about 1 cm. high; involucre campanulate, sparingly tomentose at the base; bracts often reddish tipped; ligules yellow; achenes glabrous. Mountains: Alta.—Wash. *Mont.* Je-Jl.

78. *S. nephrophyllus* Rydb. Stem 3-5 dm. high, branched above, glabrous; basal leaves long-petioled; blades of the earliest reniform or orbicular, slightly wavy or entire, those of the succeeding ones oval, sinuate; lower stem-leaves petioled and lyrate, the upper sessile and pinnatifid, with obtuse segments and rounded sinuses; heads rayless; involucre campanulate, 7-9 mm. high; bracts linear, glabrous, 5-6 mm. long, greenish yellow or brownish; achenes glabrous. (?) *S. debilis* Nutt. Wet ground: Mont.—Colo.—Ida. Jl-Au.

79. *S. idahoensis* Rydb. Stem 4-5 dm. high, branched, striate, tinged with purplish; basal leaves obovate, serrate; lower stem-leaves oblanceolate in outline, about 1 dm. long, petioled, the upper ovate or lanceolate in outline, sessile and auricled at the base, all bluish green, pinnately divided into oblong or oblique-cuneate incised segments; heads numerous, about 1 cm. high; bracts very narrowly linear, equalling the disk; achenes glabrous. Wet places: Mont.—Ida.—B.C. *Plain—Submont.* Je-Jl.

80. *S. pauciflorus* Pursh. Stem glabrous, 3-5 dm. high, slender; basal leaves petioled; blades oval, ovate, or subcordate, crenate or rarely serrate, 1-3 cm. long; stem-leaves lyrate or pinnatifid, the upper reduced; heads about 8 mm. high; involucre campanulate; bracts narrowly linear, acute, usually purple-tinged; achenes glabrous. *S. discoideus* (Hook.) Britton. Low ground: Lab.—Que.—Mich.—Wyo.—Calif.—B.C.—Alaska. *Mont.—Subalp.* Je-Au.

81. *S. fedifolius* Rydb. Stem slender, weak, about 1.5 dm. high; basal leaves 3-5 cm. long, with slender petioles; blades 1-2 cm. long, rounded-ovate or broadly oval, wavy or subentire; stem-leaves mostly small, pinnately divided into short oblong segments; heads 2-3, about 6 mm. high; involucre somewhat turbinate; bracts broadly lanceolate, conspicuously membranous-margined; achenes glabrous. High mountains: Colo. *Subalp.*

82. *S. subnudus* DC. Stem 1-3 dm. high; basal leaves petioled; blades broadly obovate or orbicular, coarsely crenate-dentate; stem-leaves pinnately lobed, with clasping bases, the uppermost minute; involucre decidedly turbinate, 8 mm. high, with narrow linear-acuminate bracts; ligules orange, 7-8 mm. long; achenes glabrous. *Senecio aureus subnudus* A. Gray. Marshy ground: Mont.—Wyo.—n Calif.—B.C. *Mont.—Subalp.* Jl-Au.

83. *S. Wardii* Greene. Stem 5-15 cm. high, glabrous; basal leaves petioled; blades thick, obovate, 1-2 cm. long, crenate above the middle or entire; stem-leaves much reduced, sessile, crenate; heads several, in a dense head-like cluster; involucre campanulate, 7-8 mm. high; bracts glabrous, linear-lanceolate; ligules few, 4-5 mm. long; achenes glabrous. High mountains: Utah—Mont. *Mont.*

84. *S. petrocallis* Greene. Stem 2-10 cm. high; basal leaves numerous, petioled; blades rather thick, broadly obovate or orbicular, 1-2 cm. long, somewhat tomentose when young; stem-leaves 1-2, the lower similar, with dilated petioles, the upper linear-lanceolate and bract-like; head 1 or 2; involucre turbinate-campanulate, 1 cm. high, slightly floccose at the base; bracts linear, often tinged with purple; ligules golden yellow, 6-8 mm. long; achenes glabrous. *S. petraeus* Klatt. *S. petrophilus* Greene. Alpine peaks: Colo.—Utah—Ida. *Subalp.—Alp.* Je-Au.

85. *S. Porteri* Greene. Stem scapiform, purplish; basal leaves numerous, petioled; blades subreniform, crenate or crenately lobed, 8-12 mm. long, dark green above, glabrous; heads solitary, 9-12 mm. high; bracts shorter than the disk, 8 mm. long, linear-lanceolate, purple, the inner slightly scarious-margined; ligules about 8 mm. long, bright yellow; achenes glabrous. *S. renifolius* Porter, not Schultz-Bip. Alpine peaks: Colo. *Alp.*

86. *S. cognatus* Greene. Stem nearly scapiform, 2-3 dm. high, slightly floccose; basal leaves slender-petioled; blades obovate, with cuneate bases, 2-4 cm. long, crenate, except at the base, grayish tomentulose; lower stem-leaves oblanceolate, pinnately lobed, the rest very small and bract-like; heads 2-10; involucre campanulate, about 8 mm. high, shorter than the disk; bracts linear, acute, scarious-margined; ligules light yellow, 6-8 mm. long, over 2 mm. broad; achenes slightly hispidulous on the angles. Dry lowlands and mountains: Colo. Jl—Au.

87. *S. pentodontus* Greene. Stem scapiform, 5-20 cm. high, slightly floccose; basal leaves petioled; blades obovate, 1-4 cm. long, crenate or dentate above the middle, or entire, rather thick, loosely floccose when young; stem-leaves much reduced, the lower oblanceolate, the upper subulate; heads 1-5, slender-peduncled; involucre campanulate, about 1 cm. high; bracts linear-lanceolate, acute, slightly floccose below; ligules yellow, about 8 mm. long; achenes striate, glabrous. Alpine mountain sides: Wyo.—N.M. *Submont.* Jl—Au.

88. *S. ovinus* Greene. Stem less than 1 dm. high, decumbent at the base; basal leaves short-petioled; blades orbicular, oval or obovate, some entire and some dentate; stem-leaves, at least the lower ones, lyrate-pinnatifid, floccose when young; heads mostly solitary, about 1 cm. high; involucre hemispheric; bracts linear-lanceolate, acute, often purple-tinged; ligules 12-15, yellow, 7-8 mm. long; achenes glabrous. *S. Lyallii* Klatt, not Hook. *S. conterminus* Greenm. High mountains: Alta.—Mont.—B.C. *Alp.—Subalp.* Je—Au.

89. *S. turbinatus* Rydb. Stem scapiform, about 1.5 dm. high, more or less floccose; basal leaf-blades cuneate-obovate, thick, 2-3 cm. long, 8-18 mm. wide, loosely floccose when young, dentate above the middle, rounded at the apex, tapering below into the petioles; heads about 4, about 12 mm. high, turbinate, floccose at the base; bracts linear, gradually acute; ligules pale yellow, 8-9 mm. long. Mountains: Colo.

90. *S. alpicola* Rydb. Stem less than 5 cm. high, glabrous or tomentose when young; basal leaves 1-3 cm. long; blades thick, elliptic, entire or rarely sinuately 3-toothed at the apex, with slightly winged petioles; stem-leaves reduced to small bracts; heads solitary, about 1 cm. high; bracts linear-lanceolate, green or slightly purplish, equalling the disk; ligules lemon yellow, about 8 mm. long; achenes glabrous. High mountains: Mont. *Alp.* Jl.

91. *S. werneriaefolius* A. Gray. Stem adscurgent at the base, 1-2 dm. high, floccose, tardily glabrate; basal leaves numerous, petioled; blades 1-5 cm. long, from oval to linear-oblong, entire or some sinuately 3-toothed at the apex, tomentose or in age glabrate, thick; stem-leaves bract-like, linear or subulate; heads 1-8, corymbose, 9-12 mm. high; involucre densely floccose at the base; bracts linear-lanceolate, slightly scarious-margined; ligules 5-9, bright yellow, 5-7 mm. long; achenes glabrous. *S. scaposus* A. Nels., and *S. perennans* A. Nels., a broad-leaved form. High mountains: Wyo.—Colo. *Mont.—Subalp.*

92. *S. pacificus* (Greene) Rydb. Stem glabrous, 6-10 dm. high, hollow; basal leaves petioled, 2-3 dm. long; blades thick, oblanceolate, entire or sinuate-dentate; stem-leaves narrowly lanceolate, half-clasping; inflorescence corymbose-cymose; heads 8-10 mm. high; involucre campanulate, glabrous; bracts linear or oblong, scarious-margined; achenes glabrous. *S. hydrophilus pacificus* Greene. Wet places: Calif.—Nev.—Ida.—Wash. Je—O.

93. *S. hydrophilus* Nutt. Stem 5-20 dm. high, striate, hollow, strict and simple; basal leaves generally long-petioled, 1-3 dm. long, thick, oblanceolate and entire; stem-leaves subsessile, lanceolate, oblong or linear, the upper much reduced and bract-like; heads numerous; involucre cylindric-campanulate, about 1 cm. high and 5-8 mm. broad; bracts oblong, thin, membranous-margined, acute, more or less black-tipped, shorter than the disk; ligules few, light yellow, about 5 mm. long; achenes glabrous. Swampy places: S.D.—Colo.—Calif.—B.C. *Plain—Submont.* Je—Au.

94. *S. hydrophiloides* Rydb. Stem 6-8 dm. high; lower leaves with long winged petioles; blades rather thick, oblanceolate, sinuate-dentate, the upper

much reduced, lanceolate, sessile; cyme corymbiform; heads cylindro-campanulate, about 1 cm. high; bracts linear; ligules few, light yellow, about 7 mm. long; achenes glabrous. Wet places: Mont.—Ida.—Wash.—B.C. Je-Jl.

95. *S. pereziifolius* Rvdb. Stem 6-8 dm. high, glabrous, striate, somewhat branched above; basal leaves 2-2.5 dm. long, thin and glabrous, oblong or elliptic, with a short winged petiole, sinuately dentate, with small sharp salient teeth; lower stem-leaves similar, but sessile; the upper ones linear, with entire margins; cyme rather narrow; heads cylindric-campanulate, about 1 cm. high; bracts linear, tipped with black, much shorter than the disk; ligules fully 1 cm. long; achenes glabrous. Swampy ground: Mont. *Submont.* Jl.

96. *S. lapathifolius* Greene. Stem glabrous, about 3 dm. high; leaves 1-1.5 dm. long; lower leaves linear-ob lanceolate, glabrous, denticulate, tapering below into broadly winged petioles; upper leaves linear-lanceolate, half-clasping; heads 5-10; involucre campanulate, 10-15 mm. high, with the peduncle gradually thickened under the head; bracts lanceolate, thickened on the back, the calyculate ones few, linear-subulate, almost as long; ligules about 1 cm. long, narrow; achenes glabrous. Mountains: Colo.—Wyo. *Mont.—Subalp.* Jl-Au.

97. *S. crassulus* Gray. Stem 2-4 dm. high, glabrous; basal leaves 8-15 cm. long; blades obovate or lanceolate, acutish or obtuse, dentate or denticulate, tapering into a winged petiole; upper stem-leaves oblong, ovate, or lanceolate, sessile and clasping at the base; heads corymbose; involucre campanulate, 12-15 mm. high and 10-12 mm. broad; bracts oblong, acute, very thick and fleshy, the inner with membranous margins, slightly shorter than the disk, the calyculate ones linear-subulate, about one-third as long; ligules bright yellow, about 1 cm. long; achenes glabrous. Subalpine meadows: (Black Hills) S.D.—N.M.—Utah—Ida. *Submont.—Alp.* Je-Au.

98. *S. semiamplexicaulis* Rydb. Stem 4-6 dm. high, glabrous; lower leaves obovate, tapering into winged petioles, acute, the upper oblong, more or less clasping by a slightly auricled base, acute or acuminate, all very thin, sinuately dentate and often with salient teeth; heads few; disk 12-15 mm. high; involucre campanulate; bracts oblong, tipped with black, much shorter than the disk; ligules narrow, about 8 mm. long; achenes glabrous. Wet meadows: Mont.—Colo.—Utah—Ida. *Submont.—Mont.* Jl-Au.

99. *S. rapifolius* Nutt. Stem 2-5 dm. high, terete or slightly obtuse-angled; leaves rather thin, sharply dentate or incised; blades of the lower leaves obovate or broadly oblanceolate, obtuse or acutish, 3-10 cm. long, tapering into wing-margined and auricled petioles, half-clasping at the base; upper leaves subsessile, oval, oblong, or lanceolate, clasping and auricled at the base; heads numerous, paniced, 6-8 mm. high and about 5 mm. broad; bracts oblong, acute, thick on the back, membranous-margined, about two-thirds as long as the brownish yellow disk; ligules none; achenes glabrous. *S. lactucinus* Greene. Rocky wooded hillsides and mountains: Ida.—Colo.—S.D. (Black Hills). *Submont.* Jl-Au.

100. *S. Scribneri* Rydb. Stem stout, 2-3 dm. high, more or less villous; basal leaves oval or oblanceolate, with somewhat winged petioles, 3-4 cm. long, fleshy; stem-leaves linear or linear-lanceolate, the upper sessile; heads 5-16, 10-15 mm. high; involucre campanulate; bracts linear, slightly villous, long-attenuate; ligules 12-15 mm. long; achenes glabrous. Wet places: Sask.—Mont. Je-Jl.

101. *S. integerrimus* Nutt. Stem 3-10 dm. high, striate, leafy, branched above; basal leaves oblong-lanceolate, entire or sinuate-petioled, acute, somewhat fleshy; stem-leaves linear-lanceolate, sessile, sometimes auricled at the base; heads numerous, 12 mm., or in fruit even 16 mm. high and 10-15 mm. broad; involucre campanulate; bracts narrowly lanceolate, long-acuminate, thick and fleshy, somewhat shorter than the disk; ligules dull yellow, about 1 cm. long; achenes glabrous. Wet meadows: Minn.—Neb.—Colo.—Sask. *Plain—Submont.* Je-Au.

102. *S. Hookeri* T. & G. Stem stout, arachnoid-villous when young, glabrate in age, simple, 2-3 dm. high; lower leaves 5-10 cm. long, more or less dis-

tinely petioled, sinuate, obtuse, from oval-obovate to oblanceolate; upper stem-leaves reduced, narrowly lanceolate and sessile; heads in a dense corymb, 10–12 mm. high; bracts linear or linear-lanceolate, long-acuminate; ligules bright yellow, 8–10 mm. long; achenes glabrous. Wet meadows: Subarctic America—Mont.—Ida. *Submont.*—*Subalp.* My—Au.

103. *S. dispar* A. Nels. Stem erect, 3–8 dm. high, sparingly crisp-hairy when young; leaves thin, entire, or rarely denticulate, the lower long-petioled, 8–10 cm. long; blades oblong-oblanceolate or sometimes oval; upper leaves sessile, lanceolate, the uppermost reduced; heads 5–20, corymbose, the central one usually short-peduncled; bracts 7–9 mm. long, linear-subulate, long-attenuate, minutely black-tipped; ligules 12–15 mm. long, 3 mm. broad; achenes glabrous. Mountain valleys: Wyo.—Colo.—Utah. *Plain—Mont.* Je—Jl.

104. *S. Leibergii* Greene. Stem 5–10 dm. high, sparingly arachnoid-tomentose when young, soon glabrate; lower leaves slender-petioled, 1–2 cm. long; blades oval or elliptic, 5–8 cm. long, sinuate-dentate or nearly entire; middle stem-leaves lanceolate or lance-linear, sessile, denticulate, somewhat arachnoid-hairy when young; inflorescence corymbiform; involucre 7–8 mm. high, about half as high as the disk; achenes glabrous. *S. exaltatus ochroleucus* A. Gray. *S. ochraceus* Piper. Bluffs and open woods: Ore.—w Mont.—Wash.—B.C. *Submont.* My—Je.

105. *S. exaltatus* Nutt. Stem 3–10 dm. high, striate, simple; basal leaves with slender petioles; blades ovate, rarely subcordate, 5–8 cm. long, sinuately dentate or denticulate, acute, rounded or truncate at the base; stem-leaves lanceolate, sessile, with more or less auricled bases, the upper ones much reduced; heads numerous, 10–12 mm. high and as broad; involucre campanulate; bracts two-thirds as long as the disk; ligules bright yellow, 8–10 mm. long; achenes glabrous. Wet places in the woods: B.C.—Sask.—n Wyo.—Calif. *Submont.* My—Jl.

106. *S. Flintii* Rydb. Stem about 3 dm. high, striate, sparingly arachnoid-hairy; basal leaves about 8 cm. long; blades orbicular or rounded-oval, abruptly contracted into short petioles, sparingly arachnoid when young, rather thick, entire-margined; stem-leaves lanceolate, sinuately-toothed, auricled and clasping at the base; heads 3–6, about 1 cm. high; bracts linear, 7–8 mm. long; ligules light yellow, broad; achenes striate, glabrous. Mountains: Colo.

107. *S. latus* Rydb. Stem 6–8 dm. high, more or less densely crisp-hairy; lower leaves about 1 dm. long, broadly oblanceolate, sinuately toothed, tapering into short winged petioles, white-hairy above, glabrous beneath, except the veins and the margins; upper leaves lanceolate, more or less clasping at the broad base; inflorescence a large compound corymb; involucre bracts short, scarcely more than half as long as the fully developed disk, rather fleshy, oblong; achenes glabrous. Wet places: Mont.

108. *S. condensatus* Greene. Stem copiously arachnoid-floccose when young, 3–4 dm. high; basal leaves 7–15 cm. long, rather thick, with winged petioles; blades lanceolate, floccose, irregularly sinuate-dentate, usually crisp; stem-leaves lanceolate, sessile and half-clasping, with auricled bases; heads in a dense cluster; involucre campanulate, 8–9 mm. high; bracts linear; ligules light yellow, 8 mm. long; achenes glabrous. *S. arachnoideus* Rydb. Wet places: Mont.—Ida.—Wash. *Plain—Submont.* My—Je.

109. *S. columbianus* Greene. Stem 3–6 dm. high, floccose when young; leaves sinuate-dentate, the lower petioled, oblanceolate or spatulate, the uppermost linear-lanceolate, much reduced, sessile; inflorescence a short corymb; involucre campanulate, about 1 cm. high; ligules 5–8 mm. long; achenes glabrous. *S. lugens* A. Gray, in part. *S. atripiculatus* Rydb. Valleys: Sask.—Colo.—Ida.—Alaska. *Plain—Submont.* Je—Au.

110. *S. perplexus* A. Nels. Stem erect, 3–6 dm. high, slightly and loosely arachnoid-floccose when young; lower leaves oblanceolate or obovate-oblanceolate, obtuse, 5–10 cm. long, with short petioles; upper leaves lanceolate or linear, entire or rarely denticulate, slightly if at all clasping, the uppermost reduced;

heads 8-15; involucre 8-10 mm. high, campanulate; bracts shorter than the disk; achenes striate, glabrous. Perhaps not distinct from *S. columbianus*. Wet places: Wyo.—Colo.—Utah—Ida. *Submont.*—*Subalp.* Je-Au.

111. *S. solitarius* Rydb. Stem glabrous, 3-4 dm. high; lower leaves thin, glabrous, wing-petioled; blades oval, subentire, about 5 cm. long; middle leaves lanceolate, clasping at the base, the uppermost reduced, linear-lanceolate or subulate; heads solitary, about 2 cm. high; bracts narrowly linear, black-tipped; ligules light yellow, almost 1.5 cm. long; achenes glabrous. Meadows: n Wyo.

112. *S. megacephalus* Nutt. Stout, more or less floccose perennial, with a thick rootstock; stem simple; leaves oblong, oblanceolate, or linear, 1-2 dm. long, rather thick, entire-margined or merely denticulate; heads solitary or seldom 2-3, 15-20 mm. high and about 1.5 cm. broad; bracts linear, thick, acuminate, often surpassed by the subulate calyculate ones; disk light brownish yellow; ligules orange, 15-20 mm. long; achenes glabrous. Mountain regions: Ida.—Mont.—Alta.—B.C. *Mont.*—*Subalp.* Jl-Au.

113. *S. vulgaris* L. Annual; stem erect, 1-4 dm. high, more or less pilose or glabrate; leaves sinuate-pinnatifid, glabrous or slightly arachnoid, with oblong to rounded incised divisions, the upper auriculate-clasping; heads cymose; involucre campanulate-cylindric, 7-9 mm. high, glabrous; bracts linear-subulate, black-tipped, the calyculate ones minute; rays none; achenes canescent-puberulent. Waste places: Lab.—Newf.—N.C.—Calif.—Alaska; nat. from Eu. F-Au.

114. *S. palustris* (L.) Hook. Stem arachnoid-villous when young, 1.5-5 dm. high, rather fleshy, strongly striate; lower leaves with winged petioles; blades lanceolate in outline, sinuately dentate to lacinate-pinnatifid, the upper linear, more or less clasping; cyme crowded, corymbiform; involucre hemispheric, about 8 mm. high, not calyculate; bracts narrowly linear-lanceolate, acuminate; ligules broad and short, oblong, light yellow, 4-5 mm. long; achenes glabrous. Wet ground: Lab.—Ia.—Sask.—Alaska and the Arctic coast; Eu. *Subboreal*—*Subarctic.* My-Jl.

130. TETRADÏMIA DC.

Low and rigid shrubs; leaves or branches, or both covered with white permanent or deciduous tomentum. Leaves alternate, entire, with smaller secondary ones fascicled in their axils, or the primary leaves modified into spines. Heads discoid. Involucre cylindric or oblong; bracts 4-6, concave, overlapping. Receptacle small, flat, naked. Corolla with elongate cylindric tube and lanceolate, spreading lobes longer than the short campanulate throat. Anthers sagittate at the base, with triangular tips. Style-branches flat, with short obtusely conical tips. Achenes terete, 5-nerved, short. Pappus of numerous fine, white, minutely scabrous bristles.

Heads 4-flowered; bracts 4, lance-oblong; branches with scurvy-tomentose lines.

Primary leaves linear to oblanceolate, permanently tomentose, more or less spreading.

Primary leaves oblanceolate.

Primary leaves linear.

Primary leaves 2-3 cm. long, straight.

Primary leaves 1-1.5 cm. long, arcuately recurved, pungent-pointed; secondary leaves fascicled.

Primary leaves linear-subulate.

Primary leaves erect, slender; secondary leaves linear, or spatulate-linear, glabrate in age.

Primary leaves spreading, stiff, spine-like; secondary leaves oblanceolate.

Heads 5-9-flowered; bracts 5-6, at least the inner broadly oval; branches throughout; plant spiny.

Spines 5-12 mm. long, more or less curved.

Spines 15-30 mm. long, straight.

1. *T. inermis*.

2. *T. canescens*.

3. *T. linearis*.

4. *T. glabrata*.

5. *T. Nuttallii*.

6. *T. spinosa*.

7. *T. longispina*.

1. *T. inermis* Nutt. Shrub, 2-5 dm. high; branches canescent, short and crowded, very leafy; primary leaves oblanceolate or linear-oblanceolate, white-tomentose, 1-4 mm. long; heads about 1 cm. high; involucre cylindric; bracts 4, white-tomentose, linear-oblong, obtuse, somewhat carinate; achenes silky-canescant. *T. multicaulis* A. Nels., a dwarf form, merely suffruticose at the base. Alkaline flats and stony ridges: Mont.—Colo.—Utah—Nev. *Plain*—*Mont.* Jl-S.

2. **T. canescens** DC. A shrub, 3-10 dm. high; branches canescent, leafy; leaves not fascicled, narrowly linear, straight or nearly so, 2-3 cm. long, 1-2 mm. broad, white-tomentose; heads about 15 mm. high; bracts 4, linear-oblong, obtusish, canescent, slightly carinate; achenes densely silky-hirsute. Dry hillsides: Calif.—Utah—Ida.—B.C. *Son.* Je-S.

3. **T. linearis** Rydb. A low, unarmed shrub; bark of the older stems shining and flaky; leaves linear, white-tomentose, somewhat keeled; bracts of the involucre oblong, acute, white-tomentose, about 8 mm. long; achenes hirsute-villous. Dry hills: Utah—Colo. *Son.* Jl-Au.

4. **T. glabrata** A. Gray. Shrub, 3-10 dm. high; primary leaves 6-15 mm. long; secondary ones narrowly linear, spatulate, fleshy, 4-10 mm. long; heads about 12 mm. high; involucre cylindric, 6-7 mm. high, 4 mm. broad, silky-tomentose; achenes densely silky-hirsute. Dry hills: Ore.—Ida.—Utah—Calif. *Son.* Je-Au.

5. **T. Nuttallii** T. & G. Shrub, 3-10 dm. high; primary leaves transformed into spreading subulate spines, 10-18 mm. long; secondary leaves oblanceolate, 8-12 mm. long, loosely floccose; heads 10-14 mm. high, fascicled-corymbose; involucre 7-8 mm. high, tomentose; bracts 4, linear-oblong; achenes densely white-hoary. Barren hills: Wyo.—Utah. *Son.*—*Submont.* My-Au.

6. **T. spinosa** Hook. & Arn. A divaricately branched shrub, 5-12 dm. high; branches white-tomentose; primary leaves transformed into spines, 5-12 mm. long, usually more or less curved; secondary leaves 5-15 mm. long, linear-clavate, fleshy, glabrous or soon glabrate; heads from the axil of the leaves, 15-18 mm. high; involucre tomentose, about 1 cm. high; bracts oval, obtuse, or some of them acutish. Dry hills and plains: Mont.—Colo.—Nev.—Ore. *Plain*—*Submont.* My-Au.

7. **T. longispina** (M. E. Jones) Rydb. Shrub, 1-2 m. high; branches divaricate, tomentose; primary leaves transformed into slender, straight spines, 1.5-3 cm. long; secondary leaves linear-clavate, 10-12 mm. long, glabrate; heads solitary in the axils of the leaves, 12-15 mm. high; involucre about 6 mm. high, tomentose; bracts elliptic; achenes with long white hairs equalling the pappus. *T. spinosa longispina* M. E. Jones. Alkaline hills: Utah—Ariz.—Calif. *Son.* Ap-Jl.

131. **ÁRCTIUM** L. BURDOCK.

Coarse biennial herbs. Leaves alternate, petioled, with broad cordate or sagittate blades. Heads discoid. Involucre globular; bracts imbricate, in many series, subulate, with hooked tips. Receptacle flat, setose. Flowers hermaphrodite and fertile. Corolla purple or white; tube slender. Anthers sagittate at the base. Achenes oblong, somewhat compressed and 3-angled, truncate. Pappus of numerous short and rigid bristles, falling off separate.

Involucre less than 2 cm. broad; inner bracts not exceeding the flowers. 1. *A. minus*.
Involucre 2.5 cm. broad or more; inner bracts at least equalling the flowers. 2. *A. Lappa*.

1. **A. minus** Schk. Stem stout, 5-20 dm. high, puberulent, branched; leaves petioled; blades 2-4 cm. long, cordate, repand, grayish tomentulose beneath; heads in a leafy panicle, often with racemiform branches; involucre 12-20 mm. high, glabrous; the inner bracts purple-tipped; corollas rose-purple. *Lappa minor* DC. Waste places: N.S.—Ga.—Ala.—Colo.—Ida.—B.C.; nat. from Eu. Au-S.

2. **A. Lappa** L. Stem 1-2 m. high; leaf-blades thin, broadly ovate-cordate, the lower 4-5 cm. long, grayish tomentose beneath; heads corymbose; involucre glabrous or nearly so; bracts longer and more spreading or reflexed; corollas rose-purple. Waste places: N.B.—N.Y.—Neb.—Minn.; Mont.; nat. or adv. from Eu. Jl-O.

132. **SAUSSÛREA** DC.

Perennial herbs. Leaves not spiny, entire or dentate, often somewhat floccose. Heads discoid, many-flowered. Involucre usually narrow, turbinate; bracts imbricate in several series. Receptacle flat, fimbriate or chaffy. Corollas

purple or violet; tube slender; throat inflated, and limb 5-toothed. Flowers hermaphrodite and fertile. Anthers caudate at the base, with setiform ciliate or villous appendages. Pappus double, the outer of short rigid bristles, the inner of stout plumose bristles united at the base.

Leaves broadly ovate or the lower cordate; plant tall, 4-10 dm. high. 1. *S. americana*.
Leaves lanceolate to linear.

Leaves lanceolate; stem 1-2 dm. high; heads crowded. 2. *S. densa*.

Leaves very narrowly linear-lanceolate; stem 3-4 dm. high; heads long-peduncled.

3. *S. remotiflora*.

1. ***S. americana*** D. C. Eat. Stem 4-10 dm. high, glabrous or slightly arachnoid-hairy when young, leafy; lower leaves petioled, the uppermost sessile; blades cordate or ovate, thin, arachnoid when young, dentate, acute or acuminate; heads more or less paniculate; involucre cylindro-campanulate, about 12 mm. high, 7-9 mm. broad, arachnoid-pubescent; bracts in 5-6 series, deltoid or deltoid-ovate, acute, the inner dark-margined; corollas blue or purple. Mountain meadows and slopes: Ore.—Ida.—Wash. *Submont.*—*Mont.* Jl—Au.

2. ***S. densa*** (Hook.) Rydb. Stem short, 1-2 dm. high, leafy; leaves 5-10 cm. long, the lower with winged petioles, the upper sessile; blades lanceolate, arachnoid-hairy when young, sinuate-dentate; involucre campanulate, about 1 cm. high and broad, arachnoid-hairy; bracts in 4-5 series, but almost of the same length, lanceolate or ovate-lanceolate, acuminate; flowers purple. *S. alpina densa* Hook. High mountains: Canadian Rockies. *Alp.* Au.

3. ***S. remotiflora*** (Hook.) Rydb. Stem slender, 3-4 dm. high, glabrous or slightly arachnoid, sparingly leafy, often purple-tinged; lower leaves petioled, 5-10 cm. long, arachnoid when young; blades linear-lanceolate, remotely dentate; inflorescence corymbiform; involucre turbinate, about 12 mm. high and 10 mm. broad, slightly arachnoid; bracts lanceolate, acute, well-imbricate, the outer successively shorter; flowers purple. *S. alpina remotiflora* Hook. Valleys: Sask.—Yukon—Alaska. *Alp.* Jl—Au.

133. CIRSIIUM (Tourn.) Hill. THISTLE.

Stout perennial or biennial herbs. Leaves alternate, with spinosely tipped lobes or teeth, often decurrent on the stem. Heads discoid. Involucre globose, campanulate or urceolate, of many imbricate bracts in several series. Receptacle flat, bristly. Flowers hermaphrodite and fertile, or the plant rarely dioecious. Corollas all alike, tubular, deeply 5-cleft. Anthers sagittate at the base, the two lobes produced into longer or shorter tails. Styles filiform or sometimes thickened, or with a ring at the base of the stigmatic portion. Achenes obovate or oblong, somewhat flattened. Pappus of one series of slender plumose bristles, united at the base and falling off together.

Bracts of the involucre conspicuously arachnoid-pubescent.

Bracts not reflexed, only the tips sometimes spreading; stem arachnoid.

Inner bracts conspicuously dilated.

I. PARRYANA.

Inner bracts not dilated.

Leaves not conspicuously decurrent.

II. ERIOCEPHALA.

Leaves conspicuously decurrent, forming wings on the stem.

III. LANCEOLATA.

IV. NEOMEXICANA.

Bracts squarrose and the lower reflexed.

Bracts of the involucre not arachnoid-pubescent, or only slightly so on the margins.

V. CARLINOIDIA.

Bracts all, except the outermost, with dilated fimbriate tips.

Bracts all, except sometimes the very innermost, without dilated fimbriate tips.

Bracts neither with a dorsal glutinous ridge, nor a dark spot.

Bracts, at least some of them, spinulose-ciliate on the margins, not very unequal in length.

VI. LEIOCEPHALA.

Bracts not spinulose-ciliate, regularly imbricate, the inner much longer.

Innermost innocuous bracts not conspicuously elongate, their tips more or less spreading, usually crisp or twisted, sometimes erose.

VII. FOLIOSA.

Innermost innocuous bracts elongate and usually more or less reddish, straight, neither dilated, crisp or twisted.

VIII. PULCHELLA.

Bracts with either a glutinous dorsal ridge or a black spot near the tip.

Bracts with a dark spot, but not glutinous; their spines erect.

IX. GRISEA.

Bracts with a glutinous dorsal ridge.

Flowers perfect.

X. UNDULATA.

Flowers dioecious.

XI. ARVENSA.

I. PARRYANA.

Flowers light, not pinkish; leaves glabrate.

Flowers light greenish yellow; leaves arachnoid, but not tomentose beneath.

Flowers whitish; leaves somewhat tomentose beneath.

Flowers pinkish; leaves densely white-tomentose beneath.

1. *C. Parryi*.
2. *C. araneosum*.
3. *C. scariosum*.

II. ERIOCEPHALA.

Anthers glabrous.

Leaves densely tomentose on both sides.

Leaves not densely tomentose on both sides.

Flowers ochroleucous or white.

Leaves with very short or no lobes and numerous almost parallel spines along the margins, not crisp.

Leaves with deep divisions, often again lobed, crisp, and with the spines pointing in various directions.

Leaves white-tomentose beneath.

Involucre densely arachnoid; bracts all narrowly linear-lanceolate.

Heads not nodding, scattered on short branches in the axils of the leaves.

Heads in a terminal dense cluster, at first nodding.

Involucres only slightly arachnoid; outer bracts lanceolate.

Leaves glabrous on both sides; heads clustered in an elongate leafy spike.

Flowers purple or pink.

Involucre densely arachnoid; bracts rarely spinulose-ciliate.

Heads 3.5-4 cm. high, 4-6 cm. broad, not densely clustered; corolla red-purple.

Heads 2.5-3 cm. high and about as broad.

Heads sessile at the end of the stem; bracts linear-subulate; corolla purple.

Heads scattered; bracts lance-subulate; corolla pink.

Involucres only slightly arachnoid if at all; bracts except the innermost spinulose-ciliate.

Anthers pubescent.

III. LANCEOLATA.

One species.

IV. NEOMEXICANA.

Leaves densely white-tomentose; heads 3.5-6 cm. high, 4-8 cm. broad; bracts strongly squarrose, the outer reflexed.

Leaves loosely floccose; heads 3-3.5 (rarely 4) cm. high, 3.5-5 cm. broad; bracts spreading only in age.

V. CARLINOIDIA.

Flowers ochroleucous or white; bracts without glutinous ridge.

Leaves pinnately divided.

Leaves merely sinuately lobed, the upper with broad clasping bases.

Flowers red.

Bracts without glandular ridge; leaves deeply lobed, with lanceolate divisions.

Bracts with glandular ridge; leaves slightly lobed, with broadly triangular lobes.

VI. LEOCEPHALA.

Leaves green on both sides, glabrous or arachnoid beneath.

Leaves crisp and very spiny; involucre bracts very spiny, the outer ones as long as the inner; corollas rose or pink.

Leaves almost flat, with weak spines; involucre bracts well imbricate, the outer ones short and with short spines.

Leaves tomentose beneath; involucre bracts with strong flat spines.

39. *C. griseum*.

VII. FOLIOSA.

Plant acaulescent or nearly so; heads clustered.

Plant distinctly caulescent.

Inner bracts with scarcely dilated, not erose linear-lanceolate tips.

Heads 3.5-5 cm. high.

Leaves deeply pinnatifid, with strong spines.

Leaves nearly entire, spinulose-ciliate.

Heads 2-3.5 cm. high.

Leaves green, distinctly decurrent.

Lobes of the leaves lanceolate or triangular.

Lobes of the leaves semi-orbicular.

Leaves more or less tomentose beneath, scarcely decurrent.

Bracts broad and short, with flat spines.

22. *C. acaulescens*.
23. *C. coloradense*.
24. *C. Butleri*.
33. *C. calcareum*.
34. *C. lactucinum*.
35. *C. spathulatum*.

Bracts narrow, with weak or slender spines.

Bracts greenish, sometimes slightly arachnoid on the margins, but not floccose; lobes of the leaves obtuse. 25. *C. orophilum*.

Bracts slightly floccose when young; lobes of the leaves acute.

Involucral spines more or less spreading; bracts yellowish; leaves slightly lobed. 15. *C. nevadense*.

Involucral spines ascending; bracts greenish; leaves deeply lobed. 26. *C. olivescens*.

Inner bracts with conspicuous dilated, ovate or lanceolate, erose and twisted tips.

Leaves not at all tomentose; heads usually solitary; corollas rose-purple. 27. *C. Drummondii*.

Leaves more or less tomentose beneath; heads usually clustered; corollas white or pale rose.

Heads on short branches solitary in the axils of the leaves.

28. *C. magnificum*.

Heads subsessile and clustered at the end of the stem.

Plant more or less arachnoid as well as tomentose; leaves linear in outline. 29. *C. foliosum*.

Plant not arachnoid, dark green; leaves broader. 30. *C. lacerum*.

VIII. PULCHELLA.

Leaves glabrous or at least glabrate in age.

Spines of the middle bracts fully 1 cm. long and longer than the bracts.

31. *C. diffusum*.

Spines of the middle bracts 3-7 mm. long, shorter than the bracts.

Divisions of the leaves linear to triangular; involucre campanulate.

Divisions of the leaves linear or linear-lanceolate, often again pinnatifid; leaves scarcely decurrent. 32. *C. bipinnatum*.

Divisions of the leaves ovate or triangular; leaves conspicuously decurrent. 33. *C. calcareum*.

Divisions of the leaves semi-orbicular, rounded-ovate; involucre hemispheric.

34. *C. lactucinum*.

Leaves permanently tomentose, at least beneath.

Tips of the inner bracts chartaceous, yellow, spreading, and slightly erose.

35. *C. spathulatum*.

Tips of the inner bracts soft, erect and usually purplish.

Spines of the middle bracts more than 1 cm. long, stout.

36. *C. nidulum*.

Spines of the middle bracts 3-6 mm. long, slender.

Divisions of the leaves narrow; corolla rose-purple; involucre narrow.

37. *C. pulchellum*.

Divisions of the leaves broad and short, ovate; corollas crimson; involucre broad. 38. *C. arizonicum*.

IX. GRISEA.

Leaves green above, tomentose beneath; bracts not viscid.

Bracts, with short spines, the outer not spinulose-ciliate.

35. *C. spathulatum*.

Bracts, with long spines.

Spines of the bracts stout; heads 2.5-3 cm. broad.

39. *C. griseum*.

Spines of the bracts slender; heads about 1.5 cm. broad.

40. *C. modestum*.

Leaves loosely floccose on both sides; bracts decidedly viscid.

41. *C. canovirens*.

X. UNDULATA.

Leaves white-tomentose beneath.

Flowers ochroleucous.

Involucral bracts very viscid, with broad glutinous dorsal ridge; divisions of the leaves rather few; spines of the bracts short.

Tips of the inner bracts more or less dilate and crisp; involucre of the terminal head 4-5 cm. in diameter. 42. *C. plattense*.

Tips of the inner bracts linear-lanceolate, neither dilated nor crisp; heads usually less than 4 cm. in diameter.

Bracts very numerous and small, with small spreading spines.

Stem-leaves deeply pinnately lobed, with rather stout spines.

Lobes, at least of the lower leaves, oblong to rounded-ovate, obtuse. 43. *C. Nelsonii*.

Lobes of the leaves lanceolate or linear-lanceolate, acute.

Heads more than 3 cm. broad; bracts linear-lanceolate.

44. *C. palouense*.

Heads less than 3 cm. broad; middle bracts ovate-lanceolate or ovate.

45. *C. Tracyi*.

Stem-leaves sinuate-dentate or sinuately lobed, merely spinulose;

heads 2.5-3 cm. broad. 46. *C. nebraskense*.

Bracts comparatively few and broad, with erect spines; leaves sinuate-

dentate or slightly lobed. 47. *C. brevifolium*.

Involucral bracts greenish or yellowish, scarcely viscid, with inconspicuous dorsal ridge; divisions of the leaves numerous; spines of the bracts long and slender.

48. *C. acutum*.

Flowers rose or purple, rarely white; dorsal viscid ridge not so prominent.

Involucres less than 4 cm. broad.

Spines of the middle bracts 5-10 mm. long.

Spines of the middle bracts slender and spreading. 48. *C. acutum*.

- Spines of the middle bracts stout and ascending.
 Upper leaves entire or with shallow lobes; involucre less than 2 cm. broad, very dark. 49. *C. canescens*.
 Upper leaves deeply pinnatifid; involucre about 3 cm. broad, light colored, except the viscid ridge. 50. *C. pulcherrimum*.
 Spines of the middle bracts 5 mm. long or less, weak and spreading.
 Leaves, at least the upper ones, entire or slightly lobed, tomentose on both sides. 51. *C. oblanceolatum*.
 Leaves pinnately divided or deeply lobed.
 Leaves deeply pinnatifid, with narrow, linear-lanceolate lobes; plant yellowish. 52. *C. Flodmannii*.
 Leaves with triangular or ovate-lanceolate lobes.
 Bracts with very inconspicuous glandular ridge, not at all viscid. 53. *C. floccosum*.
 Bracts with a conspicuous glandular ridge, surrounded by a viscid area. 54. *C. undulatum*.
 Leaves glabrate and dark green above. 55. *C. Engelmannii*.
 Involucres 4-7 cm. in diameter.
 Spines of the involucral bracts rarely more than 5 mm. long; leaves not conspicuously decurrent. 56. *C. megacephalum*.
 Spines of the middle bracts fully 1 cm. long; leaves narrower, conspicuously decurrent. 57. *C. ochocentrum*.
 Leaves greenish and sparingly floccose on both sides; bracts linear-lanceolate, very viscid, with stout erect or ascending spines. 41. *C. canotivrens*.

XI. ARVENSLA.

58. *C. arvense*.

One species.

1. **C. Parryi** (A. Gray) Petrak. Stem 3-10 dm. high; lower leaves petioled, oblanceolate, 2-4 dm. long, stem-leaves lanceolate or linear in outline, sessile, with auriculate-clasping bases, more or less lobed with triangular teeth and weak spines; heads several, spicately-glomerate, leafy-bracted, 2-3 cm. high; outer bracts with weak spines, the inner mostly with lanceolate-erose tips, spineless. *Cnicus Parryi* A. Gray. *Carduus viridiflorus* Greene. Mountains: Colo.—Utah—N.M.—Ariz. *Submont.*—*Subalp.*

2. **C. araneus** Rydb. Stem slender, about 5 dm. high, slightly arachnoid; leaves linear in outline, 10-12 cm. long, slightly arachnoid or glabrate and bright green above, grayish tomentose beneath, pinnatifid, with oblong, moderately strongly spine-tipped lobes; heads at the ends of the branches, 2.5-3 cm. high; outer bracts tapering into a stout broad-keeled spine, the inner with narrow lanceolate erose tips. Perhaps of hybrid origin. *Carduus araneosus* Osterh., not Steud. Banks: Colo. *Submont.*—*Mont.* Je—Au.

3. **C. scariosus** Nutt. Stem slender; leaves densely white-tomentose beneath, pinnatifid with short lobes; heads about 3 cm. high; bracts lanceolate to lance-subulate, the outer spinulose-ciliate, the inner with lanceolate-erose tips. *Carduus scariosus* Hook. *C. Hookerianus* Rydb. (Fl. Mont.), in part. Mountains: Wyo.—Mont. *Submont.* Jl—Au.

4. **C. subniveum** Rydb. Stem 6-10 dm. high, white-floccose, paniculately branched above; leaves 1-1.5 cm. long, linear in outline, deeply pinnatifid, tomentose on both sides, densely so and white beneath, more loosely so above; lobes lanceolate or triangular, often toothed or lobed and armed with moderately strong yellow spines; involucre 2 cm. high and nearly as broad, densely arachnoid, almost floccose; outer bracts with ascending spines, 5 mm. long, the inner with subulate weak tips. Valleys: w Wyo. Au.

5. **C. Kelseyi** Rydb. Stem 5-20 dm. high, very leafy; leaves linear, at most sinuately short-lobed, green above, somewhat tomentose or glabrate beneath; heads 3-4 cm. high, erect, in a leafy spike-like inflorescence; bracts all linear-lanceolate, attenuate into short spines or slender tips. *Carduus Kelseyi* Rydb. Mountains: Mont. *Plain*—*Submont.* Je—Au.

C. Butleri × **Kelseyi**. With the inflorescence of *C. Kelseyi* and the bracts of *C. Butleri*, but slightly arachnoid-hairy. Mont.

6. **C. Hookerianum** Nutt. Stem 3-6 dm. high; leaves scarcely decurrent, pinnatifid, with rather distant, oblong-lanceolate lobes and short spines, densely tomentose beneath, sparingly floccose above; heads 2.5-3 cm. high; bracts linear-subulate, attenuate into short spines. *Carduus Hookerianus* (Nutt.) Heller. Mountains: Alta.—Mont.—B.C. Jl—Au.

7. **C. scopulorum** (Greene) Cockerell. Stem 3-6 dm. high, very leafy; leaves more or less decurrent, pinnatifid, with numerous triangular or ovate lobes, glabrate and green above, more or less tomentose beneath; heads 3-4 cm. high; bracts linear-subulate, attenuate into long yellowish spines. *Cnicus eriocephalus* A. Gray. *Cirsium eriocephalum* A. Gray. *Carduus Hookerianus* (Fl. Colo.) in part. *Carduus scopulorum* Greene. Mountains: Colo.—Wyo. Mont.—Subalp.

8. **C. polyphyllum** Rydb. Stem stout, 3-8 dm. high, very leafy; leaves 1-2 dm. long, deeply pinnatifid, with lanceolate divisions ending in yellow spreading spines; heads hemispheric, about 3 cm. high and broad; bracts linear-subulate, the outer with rather long yellow spines often 1 cm. long. *Carduus polyphyllus* Rydb. Mountains: Mont.—Alta. Subalp. Jl—Au.

9. **C. edule** Nutt. Stem 1-2 m. high, sparingly arachnoid, moderately leafy; leaves pinnately cleft; divisions again 2-3-lobed, with broadly triangular lobes, sparingly arachnoid and green above, grayish floccose beneath, weakly spiny; heads solitary or 2 or 3 together, leafy-bracted; bracts conspicuously arachnoid, gradually tapering into short spines. *Cnicus edulis* A. Gray. Low ground: B.C.—Mont.—Calif. Son.—Submont. Je—Au.

10. **C. Macounii** (Greene) Rydb. Stem 3-10 dm. high; leaves pinnatifid, with broadly ovate lobes, toothed and with weak spines, arachnoid-hairy and somewhat tomentose beneath; involucre 2.5-3 cm. high; bracts linear-subulate, the outer with weak dark brown or purplish spines, the inner almost innocuous. *Carduus Macounii* Greene. Valleys: Alta.—Mont.—Wash.—B.C. Submont.—Mont.

11. **C. Tweedyi** Rydb. Stem stout, 3-5 dm. high, in age glabrate; leaves not decurrent, shining, somewhat glaucous, pinnatifid, with rounded-ovate lobes, with short yellow spines; heads about 3 cm. high, somewhat leafy-bracted; bracts with short yellowish spines 5-8 mm. long. *Carduus Tweedyi* Rydb. Mountains: Mont.—n Wyo. Jl—Au.

12. **C. hesperium** (Eastw.) Rydb. Stem stout, leafy, almost glabrous, 3-4 dm. high; leaves 10-15 cm. long, pinnatifid with numerous rounded lobes, with yellow spines up to 5 mm. long, glabrate above, tomentose beneath; heads terminal, sessile in an erect cluster; involucre 2 cm. high; bracts with broad yellowish bases, tapering into long brownish spines; flowers light purple or pink. *Cnicus hesperius* Eastw. *Carduus hesperius* (Eastw.) Heller. Mountains above timberline: Colo. Alp.—Subalp. Au.

13. **C. lanceolatum** (L.) Hill. Stem 1-1.5 m. high, more or less villous when young; leaves deeply pinnatifid, with lanceolate lobes and long stout spines, grayish tomentose or glabrate beneath; heads scattered at the ends of the branches, 4-5 cm. high; bracts lanceolate, attenuate, with long yellowish spines; flowers rose-purple. *Carduus lanceolatus* L. Waste places and roadsides: N.S.—Ga.—Calif.—B.C.; nat. from Eu. Jl—S.

14. **C. neomexicanum** A. Gray. Stem 6-12 dm. high, white-tomentose; leaves lanceolate or oblong-linear, sinuately pinnatifid, with short ovate or triangular lobes ending in weak yellow spines, tomentose on both sides; heads solitary or few, hemispheric; bracts linear-subulate, ending in rather stout yellow spines; corolla pink or white. *Carduus neomexicanus* Greene. Plains: N.M.—Colo.—Ariz. Son. Ap—Jl.

15. **C. humboldtense** Rydb. Stem strict, rather slender, 5-10 dm. high, sparsely arachnoid-pubescent; leaves loosely floccose, pinnatifid, with short triangular lobes and rather short spines; heads few or solitary; bracts linear-lanceolate, without a dorsal glutinous ridge, in age more or less spreading, gradually tapering into yellow spines, 3-6 mm. long; corollas white. *Carduus nevadensis* Greene. Mountains and hills: Nev.—sw Utah—nw Ariz. Son. My—Je.

16. **C. Centaureae** (Rydb.) K. Schum. Stem rather slender, 6-10 dm. high; leaves deeply pinnatifid to near the midrib, above light green, beneath more or less permanently grayish tomentose; lobes lanceolate or triangular, with weak spines, the upper sessile and clasping, lanceolate and undivided; heads 2-2.5 cm.

high; outer bracts narrowly lanceolate, yellowish, often with a darker center and a flat weak spine. *Cnicus carlinoides americanus* A. Gray. *Cnicus americanus* A. Gray. *Carduus americanus* Greene. *Cirsium americanum* Daniels, not K. Schum. *Carduus Centaureae* Rydb. Mountains: Colo.—Wyo. Submont.—Mont. Jl—Au.

C. Centaureae × **spathulatum**. Resembling *C. americanum* in habit and leaf-form; the bracts being somewhat erose on the margins as in that species, but scarcely at all dilated, and if so only the innermost, and tipped with the short and broad spines characteristic of *C. spatulatum*. Colo.

C. Centaureae × **griseum**. With the leaves of *C. griseum*, dark green above, grayish tomentose beneath, the strong and broad spines of the involucre bracts of that species; but most of the bracts are erose on the margins and the inner ones have dilated tips as in *C. americanum*. Colo.

C. acaulescens × **Centaureae**. Resembling *C. americanum*, but the stem lower, heads crowded, involucre bracts elongate and less dilated, leaf-segments more lanceolate, spines stronger, and stem somewhat arachnoid. Colo.

C. Centaureae × **coloradense**. Resembling *C. americanum*, but head larger, hemispheric, bracts broader, with less dilated tips, leaves more spiny, with more numerous, lanceolate lobes, and slightly arachnoid. *Carduus erosus* Rydb. Colo.

17. C. laterifolium (Osterhout) Rydb. Stem 6–8 dm. high; leaves broad, oblong, 1–1.5 dm. long, sessile, auriculate at the base, short-lobed, glabrous above, white-tomentose beneath, with short and slender spines; involucre 1.5 cm. long and as broad; bracts glabrous, except the slightly tomentose edges, the outer with short spines, the inner spineless, with narrow, lanceolate tip. *Carduus laterifolius* Osterhout. Cañons: Colo. A.J.

18. C. vernale (Osterhout) Cockerell. Stem 2–5 dm. high, slightly tomentose, grooved; leaves narrowly linear in outline, white-tomentose beneath, green and glabrate or slightly floccose above, up to 1 dm. long, distantly lobed, with triangular-lanceolate lobes; heads scattered, 1.5–2 cm. wide and about as high; bracts all except the innermost with dilated fimbriate tips; flowers bright rose-colored. *Carduus vernalis* Osterhout. Hills: w Colo. Submont. My–Je.

19. C. perplexans Rydb. Stem slender, about 5 dm. high, striate, purplish, slightly tomentose; lower leaves oblanceolate, the upper lanceolate and clasping, all merely toothed, with weak yellowish spines, glabrous and somewhat glaucous above, rather thinly white-tomentose beneath; heads about 3 cm. high and broad; outer bracts tipped with a short weak spine, the inner tipped with a dilated, deltoid, erose appendage; corolla rose or red-purple. *Carduus perplexans* Rydb. *C. americanus perplexans* A. Nels. Mountains: Colo. Submont. Je.

20. C. Eatoni (A. Gray) B. L. Robinson. Stem 3–6 dm. high, glabrous or slightly arachnoid, angled; leaves linear in outline, pinnatifid, with short ovate lobes ending in yellow spines, 5–15 cm. long, green on both sides, glabrous or slightly arachnoid on the veins; heads scattered, 3–3.5 cm. high, leafy-bracted; outer bracts spinulose-ciliate and ending in rather stout spines; inner bracts sparingly if at all arachnoid, lance-subulate; corollas rose-purple. *Cnicus Eatoni* A. Gray. *Carduus leiocephalus* (D. C. Eat.) Heller. Mountains: Ida.—Utah—Colo. Mont.—Subalp. Jl–S.

C. Eatoni × **olivescens**. Resembling *C. Eatoni* in habit, but leaves with fewer and deeper lobes and grayish tomentose beneath, and involucre with shorter and weaker spines; differing from *C. olivescens* in the broader leaf-segments, and narrower bracts, the outer of which are spinulose-ciliate. Utah.

21. C. clavatum (M. E. Jones) Rydb. Stem 3–7 dm. high, glabrous throughout or nearly so; leaves 2–3 dm. long, pinnatifid, with lanceolate or ovate divisions, ending in very short spines, glabrous and shining; heads solitary or few, hemispheric, 2.5–3 cm. high; bracts glabrous, with a dark spot, all except the innermost with short spines 1–3 mm. long, the outer ones ovate and spinulose-ciliate on the margins, the innermost lance-linear and attenuate into lanceolate or linear-lanceolate, spreading tips; corollas white. *Cnicus clavatus* M. E. Jones; *Carduus clavatus* Heller. Wet hillsides: Utah. Subalp. Au.

22. C. acaulescens (A. Gray) K. Schum. Biennial or perennial; leaves oblanceolate or linear in outline, green, but more or less arachnoid-hairy above, white-tomentose beneath, pinnatifid, with lanceolate lobes tipped with yellow

spines; heads subsessile, clustered on the crown, 2.5–3 cm. high; bracts glabrous, lanceolate, the outer successively shorter and tipped with usually short spines, the inner with lanceolate, slightly erose and twisted tips; corollas pinkish or white. *Cnicus Drummondii acaulescens* A. Gray. *Carduus acaulescens* Rydb. *Carduus americanus* Rydb., not Greene, *Carduus longissimus* Heller, and *Cirsium americanum* K. Schum. represent a form with long-spined involucre bracts. Mountains: Colo.—Utah—Wyo. *Submont.*—*Mont.* Je—Au.

23. *C. coloradense* (Rydb.) Cockerell. Stem rather stout, simple, 3–5 dm. high, striate, sparingly arachnoid; leaves 1.5–2 dm. long, pinnately lobed about half-way to the midrib, sparingly arachnoid or glabrous above, more or less white-tomentose beneath; lobes ovate, tipped with yellowish spines, 2–5 mm. long; heads usually scattered, 3–4 cm. high and about as broad; bracts glabrous or nearly so, firm, the outer with weak spines, the inner unarmed; corolla white or slightly pinkish. *Carduus coloradensis* Rydb. *Cnicus Drummondii* A. Gray, in part. *C. scariosus* A. Gray, in part. Mountains: Colo.—Utah. *Submont.*—*Mont.* Jl—Au.

***C. acaulescens* × *coloradense*.** Intermediate between the two parents, usually short-stemmed with small heads, in a flat-topped terminal cluster. Colo.—Utah.

***C. coloradense* × *undulatum*.** Resembling *C. undulatum* in the red flowers, though paler, in the bracts which have a glandular ridge, though less distinct, and in the leaf-form; and approaching *C. coloradense* in the habit and the form of the bracts, the innermost of which have lanceolate twisted tips. Colo.

24. *C. Butleri* Rydb. Stem angled, purple, sparingly arachnoid-hairy, very leafy, 6–10 dm. high or more; leaves linear-oblancoate or linear, almost entire or sinuately lobed, spinulose-ciliate, and if lobed the short lobes ending in slightly stronger spines, green and sparingly arachnoid above, grayish tomentose beneath; heads few, scattered, leafy-bracted, hemispheric, about 4 cm. high, 4–5 cm. wide; outer bracts lanceolate, brownish, glabrous or nearly so, ending in short weak spines 2–3 mm. long, the innermost linear-lanceolate, attenuate; corollas pinkish. *Carduus Butleri* Rydb. Valleys: *Mont.* Jl—Au.

25. *C. oreophilum* Rydb. Stem 4–8 dm. high, stout, angled; basal leaves about 2 dm. long, thin, light green and glabrate above, more or less grayish tomentose beneath, pinnately lobed; lobes triangular, usually 2–3-lobed, with slender spines 3–10 mm. long; heads hemispheric, 2–2.5 cm. high; outer bracts tipped with flat spines, 3–6 mm. long. *Carduus oreophilus* Rydb. *Cirsium eriophilum* K. Schum. Wooded valleys: Colo.—Utah. *Submont.*—*Subalp.* Jl—Au.

***C. oreophilum* × *scopulorum*.** Resembling *C. scopulorum* in the heads crowded at the ends of the stem, the arachnoid involucre, and general habit; but the leaves are broader, the involucre bracts broader at the base, and the flower-cluster not nodding; differing from *C. oreophilum* in its less deeply dissected leaves and more arachnoid inflorescence. Colo.

***C. acaulescens* × *scopulorum*.** Resembling *C. acaulescens* in leaf-form and pubescence, in the small and clustered heads, but is usually leafy-stemmed and has arachnoid involucre. Colo.

***C. foliosum* × *scopulorum*.** This has the habit and bracts of *Cirsium foliosum*, but the involucre is densely arachnoid as in *C. scopulorum* and the leaves have more numerous and crowded lobes. Wyo.

***C. griseum* × *scopulorum*.** With the habit, leaf-form and long flat involucre bracts of *C. griseum*, but inflorescence arachnoid-hairy and leaf-segments more numerous. *Carduus Osterhoutii* Rydb. Colo.

26. *C. olivescens* Rydb. Stem slender, somewhat tinged with purple, more or less floccose, 4–8 dm. high; leaves linear in outline, 1–2 dm. long, densely white-tomentose beneath, loosely floccose above, deeply pinnatifid, with numerous lanceolate, often 2- or 3-cleft lobes, ending in short yellow spines; heads few, peduncled, about 3 cm. high, 3–3.5 cm. wide; bracts slightly floccose on the margins, light olive-colored, ending in yellow spines 2–4 mm. long, or the innermost innocuous; corollas straw-colored. *Carduus olivescens* Rydb. Table lands: Utah. *Mont.* Au.

27. *C. Drummondii* T. & G. Stem low, 1–3 dm. high, slightly arachnoid-hairy; leaves oblanceolate in outline, green, somewhat arachnoid, but not at all

tomentose, with triangular lobes and weak spines; heads 4-6 cm. high; bracts thin, brownish, the outer ovate, tipped with bristle-like spines; corollas rose-purple. *Carduus Drummondii* Coville. Hills and mountains: Sask.—(Black Hills)—S.D.—B.C. *Submont.*—*Mont.* Jl—Au.

28. *C. magnificum* (A. Nels.) Rydb. Stem tall, 1-2 m. high, purplish, slightly arachnoid, leafy; leaves glabrate above, tomentose beneath, 1-3 dm. long, deeply pinnatifid, with 2-3-cleft divisions with lanceolate lobes; heads racemously disposed, each ending a short axillary branch, 4-6 cm. high and broad, leafy-bracted; bracts glabrous except the margin, the outer ones with slender spines; flowers rose-purple. *Carduus magnificus* A. Nels. Saline flats: Ida. Je.

29. *C. foliosum* (Hook.) DC. Stem 2-6 dm. high, more or less arachnoid-hairy; leaves light green, but more or less arachnoid above, tomentose beneath, from deeply pinnatifid, with oblong lobes, to nearly entire, with rather weak yellow spines; heads clustered at the end of the branches, leafy-bracted, 3-5 cm. high; outer bracts ovate, glabrous, with short weak spines; corollas white or nearly so. *Carduus foliosus* Hook. *C. scariosus* Rydb. (Fl. Mont. & Fl. Colo.) Mountain valleys: Sask.—S.D.—Colo.—Utah—B.C. *Submont.*—*Mont.*

30. *C. lacerum* Rydb. Stem stout, 6-10 dm. high, sparingly arachnoid; lower leaves oblanceolate, 2-3 dm. long, pinnatifid, with rather broad, ovate or lanceolate divisions ending in weak spines, glabrous or slightly long-hairy and green above, grayish tomentose beneath; upper leaves lanceolate, sessile and clasping, with narrower lobes and stout spines; heads more or less clustered, about 4 cm. high and broad; outer bracts ovate-lanceolate, glabrous, ending in short stout spreading spines 3-5 mm. long; corollas rose-colored. *Carduus lacerus* Rydb. Valleys: Utah. *Submont.* Jl—S.

31. *C. diffusum* (Eastw.) Rydb. Stems several, 6-9 dm. high, glabrous or slightly floccose when young; leaves pinnatifid, with triangular lobes and rather stout yellow spines, glabrous or slightly floccose beneath when young; stem-leaves somewhat decurrent; heads scattered, 3-4 cm. high, scarcely 2 cm. broad; bracts lanceolate to linear-lanceolate, slightly tomentose on the margins, the outer and middle ones spine-tipped; spines in age spreading; inner bracts attenuate into slender, purple, straight tips; corollas rose-purple; pappus plumose except the slender tips. *Cnicus Rothrockii diffusus* and *C. diffusus* Eastw. *Carduus diffusus* Heller. Cañons: Ariz.—Utah. Jl—S.

32. *C. bipinnatum* (Eastw.) Rydb. Stem glabrous or slightly arachnoid, 5-8 dm. high, branching above; leaves pinnatifid, with numerous linear or linear-lanceolate divisions, which are deeply parted at the base on one side, or sometimes pinnatifid-incised, with weak spines and spinulose-ciliate, glabrous or slightly deciduously floccose beneath; heads scattered, 3-4.5 cm. high, 2-2.5 cm. wide; outer bracts ovate-lanceolate, with short weak prickles, 3-5 mm. long, the inner purplish, soft; corollas purplish. *Cnicus Drummondii bipinnatus* and *C. bipinnatus* Eastw. *Carduus bipinnatus* Heller. *Carduus truncatus* Greene. Cañons and sage plains: Colo. Jl—S.

33. *C. calcareum* (M. E. Jones) Woot. & Standl. Stem stout, 4-6 dm. high, slightly arachnoid, branched above; leaves 2-3 dm. long, distinctly decurrent, pinnatifid, with triangular or oblong lobes, with short and stout yellow spines, glabrous or nearly so on both sides, shining; head scattered, sessile, about 2.5 cm. high; bracts glabrous, the outer ovate, with short spines, the inner subulate-acuminate; corollas rose-colored. *Cnicus calcareus* M. E. Jones. Mountains: Utah. *Submont.*—*Mont.* Jl.

34. *C. lactucinum* Rydb. Stem 5-10 dm. high, glabrous, striate; leaves very thin, glabrous, dark green, pinnately lobed, the lower petioled, 3-4 cm. long, the upper clasping, with rounded auricles; lobes broadly ovate or semi-orbicular, angular, armed with yellow spines 3-10 mm. long; heads scattered, about 3 cm. high and as broad; involucre glabrous, about 2 cm. high; bracts ovate to lance-linear, well imbricate, brownish green, darker towards the end, the innermost not much elongate, with soft tips, the rest ending in weak spines, 2-6 mm. long; corolla rose-colored. Under overhanging cliffs: se Utah. *Son.*

35. *C. spathulifolium* Rydb. Stem 6-8 dm. high, slightly tomentose; lower leaves oblanceolate, 1-2 dm. long, remotely serrate; stem-leaves pinnately cleft, with oblong or ovate lobes and slender spines, glabrate above, densely tomentose beneath; heads several, about 3 cm. high; bracts glabrous or slightly floccose on the edges, lanceolate, the outer with short slender spines, the inner acuminate; corollas rose-colored or whitish. *Carduus spathulatus* Osterhout, not Gaudin. Mountains: Colo. *Mont.* Au.

36. *C. nidulum* (M. E. Jones) Rydb. Stem 5-7 dm. high, floccose-tomentose; leaves tomentose on both sides, lanceolate in outline, pinnatifid, with triangular lobes, with stout yellow spines 1-2 cm. long; heads scattered, campanulate, 2.5-3 cm. high; outer and middle bracts ovate to lanceolate, with stout spines, those of the middle ones fully 1 cm. long; inner bracts linear-subulate, attenuate, red-tipped; corolla purplish (?). *Cnicus nidulus* M. E. Jones. *Carduus nidulus* Heller. Red sand: Utah—Ariz. *Son.—Submont.* My-Je.

37. *C. pulchellum* (Greene) Woot. & Standl. Stem 3-10 dm. high, loosely floccose when young; leaves white-tomentose beneath and deciduously floccose above, pinnatifid, with linear-oblong or lanceolate divisions, armed with short weak spines; heads scattered, about 4 cm. high and 3 cm. broad; outer and middle bracts ovate to lanceolate, slightly floccose on the margins, with short and weak spines less than 5 mm. long; inner bracts linear-lanceolate, attenuate, purplish; corollas rose or purplish. *Carduus pulchellus* Greene. Mountains and valleys: Colo.—Utah. *Submont.* Jl.

***C. pulchellum* × *undulatum*.** Resembling *C. pulchellum* in habit, but the involucre more hemispheric, the bracts broader and with a narrow glutinous ridge, and the inner ones not so elongate as in that species; differing from *C. undulatum* in the narrower segments of the leaves, the glabrate upper surface, the somewhat purple-tipped inner bracts, and the inconspicuous dorsal ridge. Utah—Colo.

38. *C. arizonicum* (A. Gray) Petrak. Stem 5-10 dm. high, floccose; leaves white-tomentose beneath, loosely floccose above, pinnatifid, with lanceolate or triangular lobes and rather weak yellow spines; heads solitary or scattered, 4-4.5 cm. high, 3-4 cm. broad; outer and middle bracts ovate to lanceolate, with short yellow spines, slightly floccose on the margins, the innermost linear-lanceolate, attenuate, purple-tipped; corollas crimson. *Cnicus arizonicus* A. Gray. *Carduus arizonicus* Greene. Mountains: Ariz.—Utah—(? Wyo.) *Son.—Submont.* My—Au.

39. *C. griseum* (Rydb.) K. Schum. Stem stout, sparingly floccose when young; basal leaves oblanceolate in outline, thin, glabrate above, grayish tomentose beneath, deeply pinnately divided; segments 3-4 cm. long, deeply 2-3-lobed and toothed, with rather slender spines 3-5 mm. long, the upper less deeply divided, sessile and half-clasping by the dilated rounded shortly decurrent base; heads about 3 cm. high and broad; outer bracts narrowly lanceolate, with a long-attenuate tip gradually changing into a flat spine, and somewhat lacinate or spinulose-dentate on the margin, the inner ones less rigid, their tips not spinose, long-attenuate, scarious and somewhat crisp; flowers ochroleucous. *Carduus griseus* Rydb. Mountains: Colo. *Submont.—Subalp.* Jl—Au.

40. *C. modestum* (Osterhout) Rydb. Stem 6-8 dm. high, slightly arachnoid-pubescent; lower leaves oblanceolate in outline, 1-2 dm. long, pinnately parted into triangular divisions, white-tomentose beneath; spines small; upper leaves lanceolate and less divided; heads scattered, small, 1.5 cm. high; bracts somewhat floccose, the middle ones with somewhat broadened spines, the inner unarmed; flowers whitish. *Carduus modestus* Osterh. Cañons: n Colo. Au.

***C. Centaureae* × *modestum*.** Resembling *C. Centaureae* in habit, but the bracts scarcely dilated and with flat short spines. Colo.

41. *C. canovirens* Rydb. Stem 6-10 dm. high, more or less floccose, striate; leaves about 2 dm. long, grayish green, slightly floccose on both sides or glabrate in age above, the lower petioled, the upper more or less decurrent, deeply pinnately divided, with lanceolate or triangular lobes, tipped with moderately strong spines; heads scattered, usually many, 2-3 cm. high; bracts more or less floccose on the margins, with broad glutinous ridges, the innermost attenuate into a

slender tip, the rest lanceolate with yellow spines 3-5 mm. long; corolla straw-colored. *Carduus canovirens* Rydb. Meadows and slopes: Mont.—n Wyo.—Ida. *Submont.* Jl—Au.

42. *C. plattense* (Rydb.) Cockerell. Stem 3-7 dm. high, white-tomentose; leaves deeply pinnatifid into oblong divisions, 3-5 cm. long, tipped with slender short yellow spines, densely white-tomentose beneath, more sparingly floccose above; heads 4-5 cm. high; bracts very numerous, yellow, with dark thick glutinous backs, all except the innermost broad, ovate, lanceolate, with short yellow spreading spines. *Carduus plattensis* Rydb. Sandy places: Neb.—Colo. *Plain.* Je—Jl.

***C. plattense* × *undulatum*.** Resembling *C. plattense* in the heads and leaf-form, but the former smaller and with narrower and less viscid bracts. Colo.

43. *C. Nelsonii* (Pammel) Rydb. Stem 6-10 dm. high, tomentose; leaves deeply pinnatifid, densely white-tomentose beneath, loosely floccose above; lobes with yellow spines; heads scattered, hemispheric, 3-3.5 cm. high, 3-4 cm. wide; bracts very numerous, all except the innermost lanceolate and tipped with short, flattened, yellow, spreading spines. *Cnicus Nelsonii* Pammel. Plains: Wyo. *Plain.*

44. *C. palousense* Piper. Stem 3-10 dm. high, tomentose; leaves lanceolate, pinnatifid, with entire or 2-cleft lobes, gradually tapering into short spines, white-tomentose beneath, loosely floccose or glabrate above; heads scattered, 3-4 cm. high, hemispheric; bracts very numerous, all but the innermost with short slender, terete spines. *Carduus palousensis* Piper. Meadows: Ore.—Ida.—Wash. *Son.* Je—Au.

45. *C. Tracyi* Rydb. Stem 3-7 dm. high, loosely floccose; leaves oblanceolate in outline, divided to near the base, green but slightly floccose above, more or less tomentose beneath; lobes lanceolate to linear-lanceolate, tipped with yellow spines 5-8 mm. long; heads 3-3.5 cm. high and about 3 cm. or less wide; bracts slightly floccose when young, yellowish, the outermost and inner narrowly lanceolate, the middle ovate-lanceolate, all except the innermost with short spreading spines; innermost bracts attenuate into a linear-lanceolate yellow tip. *Carduus Tracyi* Rydb. Dry fields: Colo.—Utah. *Submont.* Je—Jl.

46. *C. nebraskense* (Britton) Lunell. Stem 3-5 dm. high, tomentose; leaves linear-oblong or lanceolate, white-tomentose beneath, loosely floccose above, entire or irregularly toothed; heads solitary, 3-3.5 cm. high, 3-4 cm. broad; bracts numerous, lanceolate, with short, slender, spreading spines; inner bracts linear-lanceolate, tapering into linear-lanceolate spreading tips. *Carduus nebraskensis* Britton. Magnesia cliffs: w Neb.—Wyo. *Plain.* Jl.

47. *C. brevifolium* Nutt. Stem tomentose, 3-5 dm. high; leaves oblanceolate or lanceolate, more or less lobed, with triangular lobes and weak yellow spines, white-tomentose beneath, more loosely floccose above; head solitary, about 3 cm. high and 2.5 cm. broad; bracts fewer than in the related species, ovate, with small erect yellow spines, the innermost lance-linear tapering into a slender yellow tip. Hills and ravines: Sask.—Mont.—Ida.

48. *C. acutatum* (Osterhout) Rydb. Stem 8-10 dm. high, striate, floccose; leaves numerous, linear in outline, divided halfway to the midrib, the divisions being again divided into 2 or 3 lanceolate, attenuate, strongly spiny lobes; lower surface densely tomentose, the upper loosely arachnoid, floccose; heads 15-20 mm. wide; bracts somewhat floccose on the margins, with a narrow glandular dorsal ridge, all except the innermost armed with slender spreading spines, 5-6 mm. long. *Carduus acutus* Osterhout. River banks: Colo. *Submont.* Jl.

49. *C. canescens* Nutt. Stem 3-5 dm. high, more or less tomentose; leaves oblong or lanceolate, entire or pinnatifid, with short rounded-oblong lobes, densely white-tomentose beneath, loosely floccose and at last green above; heads scattered or sometimes conglomerate, 2-2.5 cm. high, usually less than 2 cm. broad; bracts lanceolate, with very broad, dark glutinous ridges, all except the innermost with stout ascending or erect spines 5-10 mm. long; corollas rose or rose-purple. Hills and plains: Colo.—Wyo. *Plain—Submont.* Je—S.

50. *C. pulcherrimum* (Rydb.) K. Schum. Stem about 4 dm. high, very leafy, grayish tomentose; lower leaves 1-1.5 dm. long, pinnately divided, bright green and glabrate above, densely white-tomentose beneath; segments lanceolate or triangular, lobed and toothed with slender spines 3-5 mm. long, the upper sessile and half-clasping; heads 2.5-3 cm. high, 2.5-4 cm. broad; outer bracts lanceolate, slightly floccose, tipped with yellow spines about 5-7 mm. long; flowers rose-colored. *Carduus pulcherrimus* Rydb. Plains: Wyo.—Colo. *Submont.* Jl—Au.

51. *C. oblanceolatum* (Rydb.) K. Schum. Stem rather slender, 3-6 dm. high, densely white-tomentose; lower leaves about 1 dm. long, thick, merely spinulose-dentate or rarely with a few triangular lobes, loosely floccose above, densely white-tomentose beneath; spines slender, 2-5 mm. long; upper leaves lanceolate, sessile and half-clasping; heads 1-3, campanulate, 3-3.5 cm. high, 1.5-2.5 cm. broad; bracts slightly floccose at first, with slender divergent spines 3-5 mm. long, the innermost unarmed; flowers rose-colored. *Carduus oblanceolatus* Rydb. Mountains: Colo.—Wyo.—Utah—Mont. Jl—S.

52. *C. Flodmanii* (Rydb.) Arthur. Stem comparatively slender, 5-10 dm. high, white-floccose; leaves deeply pinnatifid (or those of the seedlings entire), with narrowly lanceolate lobes, tipped with short prickles, densely tomentose beneath, floccose above; heads 3-4 cm. high and nearly as broad; bracts more or less floccose when young, the outer ovate and with short ascending or spreading spines; the innermost linear-lanceolate, attenuate into a weak tip; corollas rose or rose-purple. *Carduus canescens* Pammel, mainly, not *Cirsium canescens* Nutt. *Carduus Flodmanii* Rydb. *Carduus filipendulus* A. Nels., not Rydb. Meadows and river valleys: Sask.—Minn.—Ia.—Colo.—Mont. *Plain—Submont.*

53. *C. floccosum* Rydb. Stem angled, loosely floccose; leaves about 2 dm. long, loosely floccose on both sides, divided two-thirds to the midrib; lobes 2-cleft, each division lanceolate, 1.5-2 cm. long, tipped with spines about 5 mm. long; heads about 3 cm. high, 1.5-2.5 cm. wide; bracts slightly floccose on the margins, the outer lanceolate, with short and weak spines, the innermost attenuate into a purplish tip; corolla red-purple. Mountains: Colo. *Submont.* Jl.

54. *C. undulatum* (Nutt.) Spreng. Stem 3-6 dm. high, white-tomentose; leaves pinnately lobed or parted, with ovate or triangular lobes and moderately strong prickles, white-tomentose beneath, floccose or rarely in age glabrous above; heads solitary or few, scattered, 3-4 cm. high and about as broad; bracts numerous, except the innermost ovate to ovate-lanceolate, with short divergent spines, the innermost lance-linear, attenuate into a weak point; corollas rose or rose-purple, rarely white. *Carduus undulatus* Nutt. Dry plains: Mich.—Tex.—Ariz.—B.C. *Plain—Submont.* Jl—S.

55. *C. Engelmannii* Rydb. Perennial; stem 5-10 dm. high, loosely floccose; leaves lanceolate, more or less pinnatifid or the upper entire, with triangular lobes, white-tomentose beneath, loosely floccose above, in age glabrate and dark green, with short spines; heads long-peduncled, 3.5-4 cm. high, 4-5 cm. wide; bracts numerous, slightly tomentose on the margins, ovate, with conspicuous glutinous ridges and short slender, spreading spines, the innermost attenuate; corollas rose-purple. *Cirsium virginianum filipendulum* Engelm., not *Cirsium filipendulum* Lange. *Carduus filipendulus* Rydb. Plains and waste places: Colo.—Tex.; apparently also Ida. and Mont. Jl—Au.

***C. Engelmannii* × *ochrocentrum*.** With the large heads and long spines of *C. ochrocentrum*, but the broad non-decurrent leaves, dark and glabrate above, of *C. Engelmannii*. Colo.

***C. Engelmannii* × *megacephalum*.** Resembling *C. Engelmannii*, but the heads larger and with broader bracts, and the leaves broader and conspicuously auriculate-clasping. Colo.

56. *C. megacephalum* (A. Gray) Cockerell. Stem 3-7 dm. high, tomentose; leaves broadly oblanceolate or lanceolate, pinnatifid, with short triangular lobes, moderately stout-spined, densely tomentose beneath, floccose but in age becoming green above; heads peduncled, solitary or few, 5-7 cm. high and as broad; bracts numerous, all except the innermost with short and slender diver-

gent spines and conspicuous dorsal glutinous ridges, the inner tapering into slender tips; corollas rose or purple, rarely white. *Cnicus undulatus megacephalus* A. Gray. Prairies and plains: N.D.—Mo.—Tex.—Colo.—Ida. Plain—Submont. Je—S.

C. Flodmanii × **megacephalum**. Intermediate between the two parents, leaves much broader and with broader lobes, heads larger and bracts more glutinous than in *C. Flodmanii*. Colo.

C. megacephalum × **ochrocentrum**. Leaves broad, resembling those of *C. ochrocentrum*, but not decurrent and involucre bracts with short spines as in *C. megacephalum*. Neb.—Kans.

57. C. ochrocentrum A. Gray. Stem stout, 3–15 dm. high, tomentose; leaves pinnatifid, with crowded, triangular segments and long, yellow spines, the upper leaves usually conspicuously decurrent, white-tomentose beneath, floccose above, greener but scarcely glabrate in age; heads 4–6 cm. high; bracts numerous, lanceolate, with conspicuous broad glutinous ridges; spines yellow, stout; inner bracts attenuate; corollas purple, rose, or rarely white. *Carduus ochrocentrus* Greene. Plains: Neb.—Tex.—Ariz. Son.—Plain. Je—Au.

58. C. arvensis (L.) Scop. Perennial, with a horizontal rootstock, dioecous; stems striate, 3–10 dm. high, branched above, hirsutulous or glabrous; leaves sessile, slightly clasping, or the lower petioled, green on both sides, glabrous or slightly pubescent, pinnatifid, with oblong, lanceolate or triangular lobes; heads numerous, corymbose, about 2 cm. high; involucre of the staminate heads hemispheric, those of the pistillate ones campanulate; corollas purple or rarely white. *Cnicus arvensis* L. *Carduus arvensis* Robson. CANADA THISTLE. Fields, roadsides, and waste places: Newf.—Va.—Utah—B.C.; nat. from Eu. Je—S.

134. ONOPORDON (Vaill.) L. COTTON THISTLE, SCOTCH THISTLE.

Coarse biennial or perennial herbs. Leaves alternate, lobed, spinescent, conspicuously decurrent on the stem. Heads discoid. Involucre globose; bracts imbricate in many series, tipped with long spines. Receptacle flat, honey-combed, not bristly. Flowers all hermaphrodite and fertile. Corolla mostly purplish; tube slender; throat dilated, and limb 5-cleft. Filaments pilose; anthers sagittate at the base. Achenes 4-angled, oblong. Pappus of many plumose or barbellate bristles, in several series, united at the base.

1. O. Acantium L. Biennial; stem 1–3 m. high, white-tomentose, wing-angled by the decurrent leaves; leaf-blades oblong, densely white-tomentose, with triangular lobes, very spiny, the lower often 3 dm. long; heads 3–5 cm. broad; bracts floccose and arachnoid-hairy, ending in short spines; flowers pale purple. Waste places: N.S.—N.J.—Mich.; Utah—Colo.; native of Eurasia, cultivated and escaped. Jl—S.

135. CENTAURĒA L. BLUE BOTTLE, CORNFLOWER, BACHELOR'S BUTTONS, STAR THISTLE.

Perennial or annual herbs. Leaves alternate, entire or lobed. Heads discoid. Involucres ovoid or globose, or urn-shaped; bracts imbricate in several series, with appressed bases and spreading, lacerate, erose or spine-tipped appendages. Receptacle flat, densely bristly. Flowers all hermaphrodite and fertile, or the marginal ones usually neutral, and with funnell-form-dilated corollas. Corolla of the fertile flowers purple, pink, yellow, or blue, with slender tube and 5-cleft limb. Anthers sagittate at the base. Style-branches short and obtuse. Achenes compressed or obtusely 4-angled, obliquely attached, and crowned by a disk or margin. Pappus of several series of bristles or palea, rarely wanting.

Involucre bracts with lacerate broad appendages; flowers blue.

Involucre bracts with 3–5 spines; flowers yellow.

1. *C. Cyanus*.

2. *C. solstitialis*.

1. C. Cyanus L. Annual; stem 3–7 dm. high, with slender, ascending branches, more or less floccose; leaves linear or linear-lanceolate, floccose, entire or the lowest dentate or somewhat pinnatifid; heads long-peduncled; involucres round-urceolate, about 15 mm. high; bracts greenish yellow, with dark brown fimbriate margins and tips; flowers blue, varying to rose or white. Waste places

and around dwellings: Que.—Va.—Calif.—B.C.; native of Eu.; escaped from cultivation. Je-S.

2. C. solstitialis L. Annual; stem much branched, 3-6 dm. high, canescent; leaves decurrent on the margins of the stem, canescent, the lower pinnatifid with oblong or ovate divisions, the upper entire and linear; involucre round-urceolate, about 1 cm. high; bracts yellowish, ending in 3-5 spines; the central one of the middle bracts very stout, 1-2 cm. long; corollas yellow. Waste places: Mass.—N.Y.—Ia.—Ont.; Calif.—Utah; adv. from the Mediterranean region. Jl-S.

FAMILY 137. **CICHORIACEAE.** CHICORY FAMILY.

Herbs with a bitter or milky sap. Leaves mostly alternate, sometimes all basal. Flowers all alike, hermaphrodite and fertile, in involucre heads. Involucres of 1-several series of bracts, sometimes subtended by a series of smaller bracts (calyculum). Receptacle flat or nearly so. Corollas all gamopetalous, split on one side part way down, the upper portion modified into a strap-shaped ligule. Stamens 5; anthers united into a tube around the pistil; sacs auricled or sagittate at the base, appendaged at the apex. Style 2-cleft; branches filiform, naked, stigmatic only towards the base.

- A. Pappus none; achenes with corky pericarp. 1. ATRICHOSERIS.
- B. Pappus present.
- I. Pappus of plumose bristles, often more or less paleaceous at the base.
 - Achenes truncate at the apex, not beaked.
 - Flowers yellow; simple plants with fusiform roots. 2. PTILOCALAIS.
 - Flowers pink, rose, or white; branched plants with rush-like stems. 3. PTILORIA.
 - Achenes with long beaks.
 - Receptacle not chaffy.
 - Involucres of 7-15 linear-acuminate equal bracts and smaller calyculate ones at the base; achenes obscurely ribbed; branched annuals with pinnatifid leaves. 4. NEMOSERIS.
 - Involucres of several lanceolate-attenuate herbaceous bracts; no calyculate ones at the base; achenes 5-10-ribbed; leaves grass-like and heads solitary. 5. TRAGOPOGON.
 - Receptacle chaffy. 6. HYPOCHERIS.
- II. Pappus not plumose.
 - a. Pappus consisting, at least partly, of squamellae or these reduced and united into a crown.
 - 1. Involucres simple and naked, *i. e.*, without smaller calyculate ones below; pappus of both squamellae and bristles; flowers yellow. 7. ADOPOGON.
 - 2. Involucres double, either imbricate or with smaller calyculate ones below. Flowers blue; pappus crown-like of small numerous blunt squamellae in 2 or more series; tall perennials. 8. CICHORIUM.
 - Flowers yellow; pappus of large squamellae; low annuals, acaulescent or nearly so.
 - Squamellae of the pappus 5, cleft at the apex with an awn in the notch; involucres calyculate. 9. UROPAPPUS.
 - Squamellae of the pappus 20-30, very narrow, linear-lanceolate, tapering into a bristle-like apex; bracts nearly equal, in two series. 10. NOTHOCALAIS.
 - b. Pappus of capillary bristles, not plumose, slightly if at all broadened below.
 - 1. Achenes not flattened.
 - a. Pappus-bristles promptly deciduous, mainly together, only a few of the stouter ones in some species remaining.
 - Achenes more or less narrowed into a beak.
 - Achenes without a cup-shaped shoulder, not cancellate.
 - Achenes 5-ribbed; main bracts scarious-margined; receptacle bristly. 11. CALYCOSERIS.
 - Achenes 10-striate; bracts not scarious; receptacle not bristly. 12. YOUNGIA.
 - Achenes 5-ribbed, conspicuously cancellate-sculptured, with a cupulate shoulder, from which the slender, 5-ribbed hollow beak arises. 13. GLYPTOPLURA.
 - Achenes not beaked, columnar, 5-15-ribbed, truncate at the apex.
 - Involucres of broad silvery-scarious bracts, regularly imbricate; bristles of the receptacle persistent. 14. MALACOLEPIS.
 - Involucres of narrow acuminate or acute bracts, only slightly scarious-margined; bristles of the receptacle, if any, few and deciduous. 15. MALACOTHRIX.

- b* Pappus persistent, tardily falling off, separately, or together only by the breaking off of the beak.
 Beak of the achenes none or a mere attenuation.
 Flowers rose or purplish.
 Plants spiny and rush-like; leaves scale-like; achenes truncate at the summit. 16. *PLEIACANTHUS*.
 Plants not spiny.
 Stems rush-like and striate; leaves narrowly linear-lanceolate or reduced; achenes tapering at the summit. 17. *LYGODESMIA*.
 Stems not rush-like; leaves ample; achenes tapering to the base. Annuals; heads 4-5-flowered; achenes with 4-5 strong ribs. 18. *PRENANTHELLA*.
 Perennials; heads 8-30-flowered (rarely less); achenes terete or 4-5-angled. 19. *NABALUS*.
 Flowers yellow or white.
 Heads several, rarely solitary; stem leafy.
 Achenes tapering upwards; pappus white.
 Achenes not dilated into a pappiferous disk.
 Bracts in fruit more or less thickened at the base or on the midrib. 20. *CREPIS*.
 Bracts not thickened on the backs. 21. *HETEROPLEURA*.
 Achenes contracted into a more or less distinct beak, enlarged at the apex into a pappiferous disk. 12. *YOUNGIA*.
 Achenes not tapering upwards; pappus in ours sordid or reddish; bracts not thickened.
 Leaves simple and entire-margined or denticulate; inflorescence in ours more or less corymbiform; bracts narrow, green. 22. *HIERACIUM*.
 Leaves divided or lobed; inflorescence thyrsoid-paniculate; bracts broad and colored. 19. *NABALUS*.
 Heads solitary on a leafless scape. 10. *NOTHOCALAIS*.
 Beaks of the achenes distinct and slender; plants scapiferous.
 Achenes 10-ribbed or 10-nerved, not spinose-muricate; involucre more or less imbricate. 23. *AGOSERIS*.
 Achenes 4-5-ribbed, muricate-spinulose at least near the apex; involucre of a single series of principal bracts and several or numerous calyculate ones below. 24. *LEONTODON*.
 2. Achenes flattened; leafy-stemmed plants with paniculate heads.
 Achenes narrowed at the top or beaked; pappus-bristles falling separately; involucre cylindraceous. 25. *LACTUCA*.
 Achene truncate at the top; pappus-bristles falling off more or less in connection; involucre hemispherical or campanulate. 26. *SONCHUS*.

1. *ATRICHÓSERIS* A. Gray.

Glabrous winter annuals of desert regions, acaulescent, with cymosely branched scapes. Involucre of about 15 linear, acute bracts in a single series, and several small calyculate ones at the base. Receptacle scrobiculate. Flowers white or purplish; ligules 5-toothed at the truncate apex. Achenes oblong, with corky-thickened pericarp, 8-10-ribbed, the alternate ribs thicker. Pappus none.

1. *A. platyphylla* A. Gray. Leaves rosulate-tufted at the base, sessile, rounded-obovate, denticulate, with callous or spinulose teeth, 4-10 cm. long; scape 3-6 dm. high, paniculately branched, with small bracts; involucre turbinate, 6-8 mm. high; corollas white, with a purple base; ligules 10-12 mm. long. Gravelly deserts: s Calif.—s Utah—w Ariz. Ap-Je.

2. *PTILOCALAIS* Greene.

Perennial herbs, with fusiform roots. Heads solitary at the end of the branches. Involucre cylindric, of 8-12 bracts, in 1 or 2 series, and a few small calyculate ones at the base. Receptacle with narrow scarious paleae. Corollas yellow. Achenes 8-10-ribbed, columnar, linear, truncate at the apex. Pappus of 15-20 white soft plumose bristles with paleaceous bases.

Pappus-squamellae oblanceolate or oblong, truncate or abruptly contracted into the awn. Leaves entire or with short lobes.

Leaf-blades proper lanceolate or elliptic; heads about 2.5 cm. high.

Leaf-blades proper linear or linear-lanceolate; heads less than 2 cm. high.

Leaves with long filiform lobes.

1. *P. major*.
2. *P. nutans*.
3. *P. graciloba*.

Pappus-squamellae linear-lanceolate, gradually tapering into the awn.

Leaves linear-lanceolate or lanceolate; squamellae 4-5 mm. long. 4. *P. macrolepis*.
Leaves narrowly linear; squamellae 2 mm. long or less. 5. *P. tenuifolia*.

1. **P. major** (A. Gray) Greene. Stem 3-6 dm. high, glabrous; lower leaves petioled, the upper sessile and half-clasping, glabrous; blades lanceolate or elliptic, entire, lacinate-toothed or pinnatifid with lanceolate divisions; involucre 15-20 mm. high, often finely puberulent; bracts proper 10-15, linear-lanceolate, attenuate; squamellae about 2 mm. long, oblong, truncate or 3-toothed at the apex, the middle tooth ending in a plumose bristle about 5 mm. long. *Microseris major* A. Gray. Hillsides and valleys: Mont.—Utah—Calif.—B.C. Son. Ap-Jl.

2. **P. nutans** (Geyer) Greene. Stem 2-5 dm. high, slender; lower leaves petioled, the upper sessile; blades linear or narrowly linear-lanceolate, entire or pinnatifid with rather short divergent lobes; involucre turbinate, 10-15 mm. high; bracts 8-10, lanceolate, acuminate; squamellae 2 mm. long, oblanceolate, truncate and slightly toothed at the apex; awns 4-5 mm. long. *M. nutans* A. Gray. Hillsides and valleys: Mont.—Colo.—Calif.—B.C. Son.—Submont. My-Jl.

3. **P. graciloba** (Kellogg) Greene. Stem slender, 2-6 dm. high, glabrous or minutely puberulent; leaves pinnatifid, with elongate narrowly linear divisions, or the uppermost linear and entire; involucre turbinate, 10-15 mm. high; bracts 9-12, linear-lanceolate, attenuate; pappus-squamellae oblong, truncate, 2 mm. long; bristles about 5 mm. long. *Calais graciloba* Kellogg. *M. major laciniata* A. Gray. Hills and grasslands: Mont.—Utah—Calif.—B.C. Son. My-Jl.

4. **P. macrolepis** Rydb. Stem 2-5 dm. high; lower leaves petioled, the upper sessile; blades linear-lanceolate, entire or rarely pinnatifid with linear-lanceolate divergent divisions; involucre turbinate, 2 cm. high; bracts proper 12-15, linear-lanceolate, attenuate; pappus-squamellae lanceolate, 4-5 mm. long; bristles 6-7 mm. long. Benchlands: Utah. Son.—Submont. Ap-Je.

5. **P. tenuifolia** Osterhout. Stem very slender, 1-3 dm. high, often scapiform; leaves narrowly linear, entire or with a few distant linear lobes directed downwards; involucre turbinate, 12-15 mm. high; bracts 8-15, linear-lanceolate, attenuate; squamellae lanceolate; awns 5-6 mm. long. Hillsides and valleys: Colo.—Utah. Mont. Je-Au.

3. PTILÒRIA Raf. DESERT PINK, FLOWERING STRAW.

Rush-like slender plants, with the upper leaves reduced and mostly bract-like. Heads small, 3-20-flowered. Involucre cylindric, rarely campanulate. Bracts few, in a single series, with a few small calyculate ones at the base. Flowers pink or flesh-colored. Achenes prismatic, truncate at both ends, strongly angled, glabrous, often rugose, the base broad and hollowed. Pappus of 10-20 bristles, somewhat paleaceous at the base, plumose at least above the middle. [*Stephanomeria* Nutt.]

Perennials.

Heads 10-20-flowered; involucre over 1 cm. high; leaves broad, runcinate, with short lobes. 1. *P. Parryi*.

Heads 3-9- (mostly 5-) flowered.

Pappus plumose to the base; involucre 7-10 mm. high.

Leaves very narrow, almost filiform and usually entire. 2. *P. tenuifolia*.

Leaves, at least the lower ones, broad, oblanceolate in outline, and runcinate. 3. *P. ramosa*.

Pappus merely scabrous or hirsutulous at the base.

Leaves runcinate, but narrow; involucre 9-10 mm. high. 4. *P. pauciflora*.

Leaves linear-filiform; involucre 5-6 mm. high. 5. *P. myrioclada*.

Annuals or biennials.

Pappus-bristles not dilated at the base; heads usually subsessile on spike-like branches. 6. *P. virgata*.

Pappus-bristles somewhat dilated at the base, often more or less united; heads paniculate. 7. *P. paniculata*.

Pappus plumose only above the middle; plant usually low and stout. 8. *P. exigua*.

1. **P. Parryi** (A. Gray) Coville. Stem rather stout, white, 1-3 dm. high, branched; leaves thickish, runcinate-pinnatifid; lobes reflexed, spinulose-tipped;

heads 10–20-flowered, terminating leafy branches; involucre fully 1 cm. high; bracts 8–10; achenes smooth; pappus-bristles naked at the base, sordid. *Stephanomeria Parryi* A. Gray. Desert regions: s Utah—Ariz.—Calif. *Son.* My-Je.

2. *P. tenuifolia* (Torr.) Raf. Stem slender, much branched, with ascending branches; leaves narrowly linear, usually entire; involucre about 7 mm. high, about 5-flowered; bracts usually 5, linear, obtuse; achenes smooth or slightly rugose; pappus white; bristles plumose to the base. *S. minor* Nutt. Plains: Mont.—Colo.—Ariz.—Wash. *Son.*—Plain. Je-S.

3. *P. ramosa* Rydb. Stem branched at the base, with more or less spreading branches, striate, puberulent below, 2–3 dm. high; lower leaves lanceolate, runcinate-divided; upper leaves linear and entire; involucre 8–10 mm. high, usually 5-flowered; bracts proper usually 5, lance-linear, usually acutish; achenes strongly rugose; pappus white, plumose to the base. (?) *S. runcinata* Nutt. Dry hills: Neb.—Colo.—Mont. Plain—Submont. Je-S.

4. *P. pauciflora* (Torr.) Raf. Stem 2–4 dm. high, with stiff ascending branches; leaves linear or nearly so, the lower runcinate-pinnatifid with narrow divisions, the upper entire; involucre 9–10 mm. high; bracts about 5, linear, obtuse; achenes rugose; pappus tawny; bristles naked at the base. (?) *S. runcinata* Nutt. Dry plains: Kans.—Tex.—Ariz.—Nev. *Son.* Je-S.

5. *P. myrioclada* (D. C. Eat.) Greene. Stem 3–5 dm. high, slender, more or less flexuose, with numerous branches; leaves linear-filiform, 1–4 cm. long; heads on short lateral branches; bracts 3–5, narrow, 5–6 mm. long; achenes striate; pappus white, merely hirsutulous at the base. *S. myrioclada* D. C. Eat. Dry hills and slopes: Nev.—Ida. *Son.* Je-S.

6. *P. virgata* (Benth.) Greene. Stem 3–10 dm. high, ridged; lower leaves oblong or spatulate, sinuate or pinnatifid, 2–4 cm. long; upper leaves linear, very small, entire; heads 6–8 mm. high, subsessile; bracts 5–7, linear; flowers 4–10; achenes rugose-tuberculate; pappus-bristles moderately plumose. *S. virgata* Benth. Arid regions: Ore.—Colo.—Calif. *Son.* Je-O.

7. *P. paniculata* (Nutt.) Greene. Stem erect, 3–6 dm. high; lower leaves oblanceolate or spatulate, toothed, the upper linear, entire, much reduced; panicles with racemiform or spicate branches; bracts mostly 5, linear, 5–7 mm. long; achenes more or less rugose. *S. paniculata* Nutt. Plains: Wash.—Ida.—Calif. *Son.* Jl-O.

8. *P. exigua* (Nutt.) Greene. Annual; stem 3–6 dm. high, diffusely branched; lower leaves pinnatifid, with lanceolate or linear divisions, those of the branches diminutive and scale-like; heads paniculate, ending short scaly branches; calyculate bracts ovate, 1–1.5 mm. long; bracts proper mostly 5, linear, obtuse, 6–7 mm. long; flowers 3–8, mostly 5; achenes thick-ribbed, rugose-tuberculate. *S. exigua* Nutt. Dry places: Wyo.—N.M.—Calif.—Nev. *Son.*

4. NEMÓSERIS Greene. DESERT CHICORY.

Stout branching winter annuals, with somewhat fistulose stems and toothed or pinnatifid leaves. Heads 15–30-flowered. Involucre turbinate-cylindric; bracts 7–15, linear, acuminate, equal, in a single series, with a few small calyculate ones at the base. Flowers white or tinged with rose-color. Achenes terete, with obscure ribs, produced into a beak at the summit, callous at the base, with a hollowed insertion. Pappus of 10–15 capillary plumose bristles. [*Rafinesquia* Nutt.]

Ligules 10–15 mm. long; beak of the achenes much shorter than the body.

Ligules about 5 mm. long; beak of the achenes as long as the body. 1. *N. neomexicana*.

2. *N. californica*.

1. *N. neomexicana* (A. Gray) Greene. Stem 2–5 dm. high; leaves lanceolate, runcinate-pinnatifid, with narrow divisions; heads few, paniculate; bracts 10–12, linear-lanceolate, 15–18 mm. long; ligules white, tinged with flesh-color; achenes gradually tapering into the short beak. *R. neomexicana* A. Gray. Sand-hills: N.M.—s Utah—se Calif. *L. Son.* Mr-My.

2. *N. californica* (Nutt.) Greene. Stem glabrous, 5-10 dm. high, paniculately branched; leaves oblong, 5-15 cm. long, lanceolate, runcinate-pinnatifid, the cauline ones somewhat clasping; bracts 12-15, linear-lanceolate, acuminate, 12-15 mm. long; ligules white; beak of the achenes slender. *R. californica* Nutt. Moist ground: Calif.—s Utah—Ariz. *L. Son.* Ap-Je.

5. **TRAGOPŌGON** (Tourn.) L. SALSIFY, OYSTER PLANT.

Tall perennial herbs, with fleshy taproots and long alternate grass-like leaves clasping at the base. Involucres nearly cylindric; bracts in a single series, united at the base. Flowers many, yellow or purplish; ligules truncate and 5-toothed at the apex. Achenes muricate, 5-10-ribbed, produced at the apex into a distinct beak. Pappus of plumose bristles connate at the base.

Flowers yellow.

Bracts 8-9; flowers chrome yellow; involucre bracts equalling or shorter than the flowers.

Bracts 10-13, rarely less; flowers lemon yellow; involucres longer than the flowers.

Flowers purple; involucre bracts much longer than the flowers.

1. *T. pratensis*.

2. *T. dubius*.

3. *T. porrifolius*.

1. *T. pratensis* L. Stem 3-6 dm. high, glabrous; leaves linear-lanceolate, long-attenuate; peduncles scarcely fistulose, little if at all thickened below the heads; bracts linear-lanceolate, attenuate, 2.5-3 cm. long; outer achenes muricate. Fields and waste places: N.B.—N.J.—Utah—Mont.—Man.; adv. or nat. from Eu. Je-Au.

2. *T. dubius* Scop. Stem 5-10 dm. high, glabrous; leaves clasping, lanceolate, attenuate; peduncles fistulose, gradually thickening upwards; bracts green, linear-lanceolate; achenes strongly tuberculate. Waste places: Colo.; escaped from cultivation.

3. *T. porrifolius* L. Stem 6-10 dm. high, glabrous; leaves clasping, with lanceolate bases, long-attenuate; peduncles distinctly fistulose, gradually thickened below the head; bracts 8-10, linear-lanceolate, long-attenuate, 3-5 cm. long; outermost achenes strongly muricate. Fields and waste places: Ont.—N.C.—N.M.—Utah; Calif.—B.C.; escaped from cultivation. Je-Au.

***T. dubius* × *porrifolius*.** Corolla very pale purplish; involucre bracts 9-13. With the parents. Colo.

***T. porrifolius* × *pratensis*.** Corolla pale lilac; involucre bracts 8-10, mostly 8. With the parents. Ont.—N.J.—Colo.—Mont.

6. **HYPOCHAËRIS** L. CAT'S-EAR, GOSMORE.

Subscapose annuals or perennials. Leaves mostly in basal clusters or rosettes, often lyrate. Involucres campanulate; bracts rather few, but imbricate and the outer successively shorter. Receptacle chaffy; paleae thin and narrow. Flowers yellow. Achenes fusiform or oblong, 10-ribbed, tapering at the top into a more or less distinct beak. Pappus of capillary plumose bristles, or some of the outer bristles shorter and not plumose.

1. *H. radiata* L. Perennial; stem 5-20 dm. high, corymbosely branched, almost leafless; basal leaves lyrate-pinnatifid, with the lateral lobes oblong, obtuse, hirsute; involucre about 25 mm. high; ligules 7-10 mm. long. Waste places and fields: N.Y.—N.J.—Colo.; Calif.—B.C.; adv. or nat. from Eurasia. My-O.

7. **ADOPŌGON** Neck.

Perennial herbs with pale green foliage. Leaves mainly basal. Involucre campanulate; bracts in 1 or 2 subequal series, without calyculum. Receptacle naked. Flowers yellow. Achenes oblong or somewhat turbinate, 15-20-ribbed, beakless. Pappus of 10-15 outer short squamellae and 15-20 capillary inner bristles.

1. *A. virginicus* (L.) Kuntze. Stem glabrous, 3-6 dm. high, 1- or 2-leaved, branched above; basal leaves spatulate, wing-petioled, runcinately lobed, toothed, or entire, 5-10 cm. long; cauline leaves partly clasping, with a broad base; bracts 10-15, linear-lanceolate, acutish, glabrous, 8-10 mm. long; flowers orange

Krigia amplexicaulis Nutt. Moist woods: Ont.—Ga.—Colo.—Man. Plain—Submont.

8. CICHORIUM (Tourn.) L. CHICORY.

Herbs with stiff branching stems and mostly basal leaves, the stem-leaves reduced and bract-like. Involucres cylindraceous; bracts in 2 series, the outer somewhat spreading, the inner erect and partly enfolding the achenes at the base. Flowers blue, rose, or pink. Achenes 5-angled, truncate and beakless at the apex. Pappus of 1-3 series of short blunt squamellae.

1. **C. Intybus** L. Perennial, with a taproot; stems slightly hispid, 3-10 dm. high; basal leaves spreading, runcinate-pinnatifid, spatulate in outline, 7-15 cm. long; stem-leaves smaller, lanceolate or oblong, lobed or entire, clasping and auricled at the base; heads numerous, 1-4 together in sessile clusters; bracts proper about 8, glandular-ciliate. Roadsides, fields, and waste places: N.S.—N.C.—Calif.—B.C.; nat. from Eu. Plain—Submont. JI-S.

9. UROPAPPUS Nutt.

Acaulescent annuals. Leaves basal, narrow. Involucres narrowly turbinate; bracts nearly equal, subtended by a calyculum of small ones. Flowers yellow; ligules short. Achenes fusiform, produced into a beak. Pappus of 5 scarious squamellae, 2-cleft at the apex, with an awn between the lobes.

Awns 1-2 times as long as the short pappus-squamellae.
Awns scarcely half as long as the long pappus-squamellae.

1. *U. macrochaetus*.
2. *U. linearifolius*.

1. **U. macrochaetus** (A. Gray) Greene. Leaves mostly near the base, linear, entire, sinuately and saliently toothed or lobed; peduncles 2-4 dm. long; involucres narrowly turbinate, 15-20 mm. high; squamellae lanceolate, about 2 mm. long, cleft to the middle; awns 6-7 mm. long. *Microseris macrochaeta* A. Gray. Meadows: Ore.—Ida.—s Calif. Son. Ap-My.

2. **U. linearifolius** (DC.) Nutt. Leaves near the base, somewhat pubescent when young, narrowly linear, entire or with divaricate linear lobes; peduncles 1-3 dm. long, usually thickened above; involucres turbinate, 18-25 mm. high; bracts linear-lanceolate, acuminate, the outer about half as long as the inner; squamellae 7-9 mm. long, linear-lanceolate, notched at the apex; awns 3-4 mm. long. *M. linearifolia* A. Gray. Low ground: Ida.—N.M.—Calif.—Wash. Son. Mr-Je.

10. NOTHOCALAIS (A. Gray) Greene.

Acaulescent perennial, of the habit of *Agoseris*, with narrow, entire or pinnatifid leaves. Involucres oblong-campanulate; bracts in 2-3 series, nearly equal, without calyculum. Receptacle naked. Flowers yellow. Achenes attenuate-fusiform, beaked. Pappus of 20-30 narrow linear-lanceolate, in one species nearly bristle-like, squamellae tapering into an awn.

Bracts linear-lanceolate, scarcely spotted.

Pappus distinctly paleaceous, of narrow squamellae gradually attenuate.

Pappus of bristles only slightly broader and flattened at the base.
Bracts ovate or ovate-lanceolate, acuminate, conspicuously spotted.

1. *N. troximoides*.
2. *N. cuspidata*.
3. *N. nigrescens*.

1. **N. troximoides** (A. Gray) Greene. Leaves narrowly linear-lanceolate, undulate, attenuate; scape puberulent when young, 1-3 dm. high; involucres about 2 cm. high; bracts narrowly linear-lanceolate, somewhat purple-tinged on the midrib, gradually attenuate; pappus of 20-25, narrowly linear-lanceolate attenuate scales. *Microseris troximoides* A. Gray. Wooded hills and plains: Mont.—Utah—Calif.—Wash. Plain—Submont. Ap-Je.

2. **N. cuspidata** (Pursh) Greene. Leaves somewhat glaucescent, linear-lanceolate, caudately attenuate, more or less wavy, villous-tomentulose on the margins when young; scape 6-30 cm. long; involucres turbinate, about 2 cm. high; bracts lanceolate or linear-lanceolate, gradually acuminate, somewhat tinged with purple; pappus of 40-50 bristles. *Troximon cuspidatum* Pursh. Prairies and plains: Wis.—Mo.—Colo.—S.D. Plain—Submont. Ap-Je.

3. *N. nigrescens* (Henders.) Heller. Perennial, with a taproot and short caudex; leaves linear-ob lanceolate, 3-24 cm. long, 3-10 mm. wide, pale green, acute or acuminate, mucronate; scape 1-2 dm. high, slightly villous below the head; involucre campanulate; bracts in 3 series, abruptly acuminate, the outer ovate, the inner lanceolate, conspicuously scarious-margined and black-dotted; flowers purple on the outside; achenes blackish; pappus of very narrow scales gradually attenuate upwards into long bristles. *Micoseris nigrescens* Henders. Wet meadows: Mont.—n Wyo.—Ida. Plain—Submont. Je.

11. *CALYCÓSERIS* A. Gray.

Much branched winter annuals, glabrous below, glandular in the inflorescence. Involucre campanulate; bracts many, scarious-margined, equal, with 1-2 outer series of small calyculate ones. Receptacle with capillary bristles. Flowers yellow or rose-colored. Achenes 5-ribbed, narrowed above into a short beak, ending in a denticulate crown. Pappus of numerous capillary white bristles united at the base and falling away in a ring.

Flowers rose-colored; achenes with the short beak about 5 mm. long.
Flowers yellow; achenes with the long beak about 10 mm. long.

1. *C. Wrightii*.
2. *C. Parryi*.

1. *C. Wrightii* A. Gray. Stem 2-4 dm. high, branched from the base; leaves mostly close to the base, pinnately or bipinnately dissected into narrow linear divisions; heads corymbose; involucre 12-15 mm. high; bracts more or less glandular-ciliate; bracts proper linear or lance-linear; flowers tinged with rose; ligules 10-15 mm. long; achenes rugose on the thick ribs. Arid regions: N.M.—s Utah—Ariz. *L. Son.* Mr—My.

2. *C. Parryi* A. Gray. Stem more leafy, 3-5 dm. high; leaves pinnatifid, with linear or lanceolate divisions; heads paniculate; involucre 12-15 mm. high, bracts glandular-ciliate, in about 3 series, lanceolate, the outer squarrose; bracts proper lance-linear; flowers yellow, about 15 mm. long; achenes more slender, not rugose; beak with a more distinct apical cup. Arid regions: Ariz.—s Utah—s Calif. *L. Son.* My.

12. *YOÚNGIA* Cass.

Low or depressed perennials, with many basal leaves. Heads several, 8-15-flowered. Involucres cylindric; bracts linear, obtuse, in single series, not thickened on the back, with 3 or 4 short calyculate ones at the base. Flowers yellow. Achenes narrow, 10-striate, tapering above and there enlarged into a disk, bearing the pappus. Pappus of numerous white capillary deciduous bristles.

Achenes conspicuously beaked; stem 1-2 dm. high.

1. *Y. elegans*.

Achenes scarcely beaked, merely constricted below the disk; stem 5 cm. or less high.

2. *Y. nana*.

1. *Y. elegans* (Hook.) Rydb. Perennial, with a taproot; stem branched, 1-2 dm. high; leaves petioled, 5-10 cm. long; blades oblanceolate, entire to sinuately lyrate-pinnatifid, with triangular salient lobes; heads paniculate; involucre about 8 mm. high; bracts proper narrowly linear; achenes 4 mm. long. *Crepis elegans* Hook. *Barkhausia elegans* Nutt. High mountains: Mack.—Sask.—Wyo.—B.C.—Yukon. Mont. Jl—Au.

2. *Y. nana* (Richards.) Rydb. Depressed perennial, with creeping root-stock; stem 1-5 cm. high; leaves mostly basal, petioled, 2-5 cm. long; blades obovate or spatulate, entire, repand-dentate, or lyrate; involucre 8-10 mm. high; bracts proper linear, obtuse, with the backs thickened at the base; achenes cylindric, about 5 mm. long, 0.5 mm. thick. *Crepis nana* Richards. *Y. pygmaea* Ledeb. High mountains: Lab.—Alta.—Utah—Ida.—B.C.; Asia. Mont.—Subalp. Jl—Au.

13. *GLYPTOPLEÛRA* D. C. Eat.

Tufted annuals, with thick runcinate leaves. Involucres campanulate; bracts 7-12, linear-lanceolate, in one series, and a few loose and foliaceous ones at the base. Flowers white, pink, or yellow. Achenes obtusely 5-angled, oblong, each interval with two rows of tubercles, abruptly contracted above into a stout

beak, the base of which is surrounded by a cup-shaped border. Pappus of capillary white bristles, in several series, the outer falling off separate.

Corollas white, turning pink; leaves with broad white scarious margins and short broad teeth. 1. *G. marginata*.

Corollas yellow, turning pink; leaves with very narrow white scarious margins and subulate, setiform teeth. 2. *G. setulosa*.

1. ***G. marginata*** D. C. Eat. Stems many, 1-5 cm. long; leaves numerous, with winged petioles, runcinate-pinnatifid; lobes rounded, scarious-margined, with triangular obtusish teeth; leaves subtending the heads pectinate-setiferous; involucre 10-12 mm. high; bracts lance-linear; ligules 2-3 mm. long; achenes 4 mm. long; beak 1 mm. Desert regions: Nev.—s Utah—Ariz.—Calif.—Ore. *L. Son.* My-Je.

2. ***G. setulosa*** A. Gray. Stems 1-5 cm. long; leaves petioled, oblanceolate or obovate in outline, runcinate-pinnatifid; lobes rounded, with lance-linear or subulate, setiform teeth; ligules 1-2 cm. long; achenes similar to those of the preceding. Desert regions: s Utah—Ariz.—s Calif. *L. Son.* My.

14. **MALACOLÈPIS** (A. Gray) Heller. SNAKE'S HEAD.

Leafy-stemmed annuals, with broad leaves. Involucre broadly campanulate; bracts imbricate in several series, silvery-scarious, with green midribs, the outer short and orbicular. Receptacle bearing slender persistent bristles. Corollas white, becoming purple-tinged in fading. Achenes 4- or 5-angled, 12-15-ribbed, columnar, truncate and denticulate at the apex. Pappus of numerous white capillary bristles, united at the base and falling off together, and one or two stouter outer ones, more persistent.

1. ***M. Coulteri*** (A. Gray) Heller. Stem glabrous, 2-4 dm. high; lower leaves short-petioled, the upper sessile and clasping, all sinuate-dentate to pinnatifid, with broad triangular lobes or teeth; heads paniculate; involucre 12-15 mm. high. *Malacothrix Coulteri* A. Gray. Hillsides: s Calif.—s Utah—Ariz. *L. Son.* Mr-My.

15. **MALACÓTHRIX** DC. DESERT DANDELION.

Annual or perennial herbs, commonly with a basal cluster of leaves. Involucre campanulate or turbinate; bracts narrow, acute or acuminate, imbricate. Receptacle naked or with a few deciduous bristles. Flowers yellow, white, or pinkish. Achenes short, truncate at the apex, with a denticulate border, 10-15-ribbed. Pappus of numerous, capillary, white-scarious bristles, more or less united at the base and falling off together or with 1-8 stronger outer ones more persistent.

Divisions of the leaves filiform; plant scapose or nearly so.

1. *M. glabrata*.

Divisions or lobes of the leaves not filiform; stem more or less leafy.

Leaves sinuately runcinate; lobes entire or nearly so; achenes not winged.

2. *M. runcinata*.

Leaves deeply pinnatifid; divisions toothed or lobed.

Achenes wing-margined on 5 of the ribs; outer persistent bristles of the pappus present.

3. *M. Torreyi*.

Achenes not winged; outer persistent bristles of the pappus none.

4. *M. sonchioides*.

1. ***M. glabrata*** (D. C. Eat.) A. Gray. Annual, branched at the base, subacaulescent; leaves mostly basal, pinnatifid, with narrowly linear divisions, glabrous; branches scapiform, bearing 1-3 heads; involucre about 1 cm. high; bracts lance-linear, slightly tomentulose when young; flowers yellow; outer pappus of 2 persistent bristles; achenes narrow, slightly costate-striate. Dry regions: s Utah—Ariz.—e Calif.—Ida. *Son.* Ap-My.

2. ***M. runcinata*** A. Nels. Annual; stem branched at the base, 5-15 cm. long, with decumbent branches, glabrous or nearly so; leaves 2-4 cm. long, oblanceolate to linear in outline, dentate to runcinate-pinnatifid, with mostly entire lobes; involucre 10-12 mm. high, broadly campanulate; bracts linear-lanceolate, in about 3 series, scarious-margined; achenes linear-columnar, about 3 mm. long,

with 15 subequal ribs; outer persistent pappus-bristles often wanting, sometimes 1 or 2. Dry sandy slopes: Wyo.—Colo. *Son.*—*Submont.* Je.

3. *M. Torreyi* A. Gray. Annual; stem branched at the base, 1-2 dm. high, with decumbent branches, glabrous or sparingly glandular in the inflorescence; leaves obovate in outline, runcinate-pinnatifid, with oblong or lanceolate, divergent toothed, lobes; heads paniculate; involucre about 1 cm. high; achenes linear-cylindric, with 5 of the angles wing-margined; outer pappus of 2-5 persistent bristles. Low ground: Ore.—Utah—Calif. *Son.* Je.

4. *M. sonchioides* (Nutt.) T. & G. Annual; stem branched at the base, with ascending branches; leaves oblanceolate or obovate in outline, lyrate-pinnatifid, with oblong, dentate lobes; heads paniculate; involucre 8-10 mm. high; bracts in 3 series, the outer ovate-lanceolate, the inner linear-lanceolate; achenes cylindric, 15-ribbed, with 5 ribs, but slightly stronger, not winged; outer persistent bristles usually none. Plains: Neb.—Kans.—s Calif.—Nev.—Ida. *Son.* My—Je.

16. *PLEIACÁNTHUS* (Nutt.) Rydb.

Diffuse and spinescent perennials, suffruticose at the base, with flexuose branches. Lower leaves linear, entire, the upper reduced to scales. Involucre cylindric; bracts 3-5, linear, with 1-3 minute calyculate ones at the base. Flowers 3-5, rose-colored. Achenes prismatic, 4- or 5-ribbed, truncate at the apex. Pappus of rather few rigid, unequal bristles, falling off separate.

1. *P. spinosus* (Nutt.) Rydb. Lower leaves linear, the upper leaves scale-like, lanceolate, 2-5 mm. long; heads lateral, short-peduncled; calyculate bracts ovate, more or less imbricate; bracts proper, ovate-lanceolate. *Lygodesmia spinosa* Nutt. Gravelly hills and plains: Mont.—Ariz.—Calif.—B.C. *Plain*—*Submont.* Au—S.

17. *LYGODESMIA* D. Don. WILD ASPARAGUS, SKELETON WEED, PRAIRIE PINK.

Rush-like herbs, with narrow alternate leaves. Involucre cylindric; bracts 5-12, linear, equal, with a few calyculate ones at the base. Flowers 5-12, pink or rose-colored. Achenes slender, 4-8-ribbed, slightly tapering towards the summit. Pappus of numerous soft bristles, falling off separate.

Perennials, with deep-seated rootstocks.

Involucres 15-25 mm. high, 6-10-flowered.

Involucres 10 mm. high, usually 5-flowered; upper leaves reduced.

Annuals; involucres 10-15 mm. high.

1. *L. grandiflora*.

2. *L. juncea*.

3. *L. rostrata*.

1. *L. grandiflora* (Nutt.) T. & G. Stem simple below, 1-4 dm. high, leafy; leaves narrowly linear, ascending, 5-10 cm. long; calyculate bracts ovate, 2-3 mm. long; bracts proper narrowly linear; achenes about 1 cm. long; pappus sordid. Gravelly hills: Wyo.—Colo.—Ariz.—Ida. *Son.*—*Submont.* My—Jl.

2. *L. juncea* (Pursh) D. Don. Stem 2-4 dm. high, much branched from near the base; lower leaves linear, 2-10 cm. long, those of the branches reduced and subulate; involucre 10-12 mm. high; calyculate bracts lanceolate, 1-2 mm. long; bracts proper 5, narrowly linear; achenes 5-6 mm. long; pappus sordid. Plains and prairies: Minn.—Mo.—N.M.—Nev.—Alta. *Plain*—*Submont.* Je—Au.

3. *L. rostrata* A. Gray. Stem erect, 3-10 dm. high, with strongly ascending branches; leaves narrowly linear, obscurely 3-nerved, 5-20 cm. long; heads numerous, ending short scaly branches; calyculate bracts lanceolate, 2-3 mm. long; bracts proper 8-9, narrowly linear; flowers as many; achenes fusiform, 5-8-striate; pappus dull white. Cañons and sandy plains: Sask.—Kans.—Colo. *Plain.* Jl—S.

18. *PRENANTHÉLLA* Rydb.

Low diffusely branched annuals, with numerous small heads terminating the branches. Lower leaves ample, more or less runcinate, the upper reduced and bract-like. Involucres oblong, 4-5-flowered, with as many oblong bracts and

1 or 2 small calyculate ones. Achenes gradually tapering downward from the truncate summit, 4-5-ridged. Pappus of white soft capillary bristles.

1. **P. exigua** (A. Gray) Rydb. Stem 1-2 dm. high, divaricately branched; basal leaves spatulate or oblong in outline, 2-3 cm. long; involucre 3-4 mm. high; calyculate bracts small, ovate; bracts proper 4-5, oblong. *Lygodesmia exigua* A. Gray. Stony hills: Tex.—Colo.—Utah—se Calif. Ap-Je.

19. **NĀBALUS** Cass. RATTLESNAKE-ROOT.

Perennial caulescent herbs. Heads small, clustered, and usually nodding. Involucre narrow, cylindric to campanulate; bracts narrow, in 1 or 2 subequal series, subtended by a few small calyculate ones. Receptacle flat, naked. Flowers pale, cream-colored or purplish. Achenes oblong or columnar, terete or 5-angled, often 10-ribbed, sometimes slightly tapering towards the base. Pappus of numerous capillary, rather rigid, pale or brown bristles. [*Prenanthes* Vaill.]

Basal leaves oblanceolate or spatulate; inflorescence hirsute. 1. *N. racemosus*.
Basal leaves cordate, sagittate, or hastate; inflorescence glabrous or puberulent.

Leaves variously lobed or cleft; heads nodding; calyculate bracts ovate, very short. 2. *N. albus*.

Leaves dentate; flowering heads not nodding; calyculate bracts linear, half as long as the bracts proper. 3. *N. sagittatus*.

1. **N. racemosus** (Michx.) DC. Stem 5-10 dm. high, glabrous or pubescent above; basal leaves glabrous, entire or dentate, with winged petioles; stem-leaves sessile, oblong or elliptic, partly clasping; heads in a long spike-like thyrsus; involucre campanulate, 12-14-flowered, 10-12 mm. high; bracts narrowly linear, obtuse, hirsute; flowers rose or purplish; pappus fulvous. Moist ground: N.B.—N.J.—Colo.—Mont.—Alta. *Plain*—*Mont.* Au-S.

2. **N. albus** (L.) Hook. Stem 5-15 dm. high, glabrous, often tinged with purple; leaves petioled; blades deltoid-hastate, denticulate, dentate, lobed, or divided, or the upper lanceolate and entire, thin, glabrous, paler beneath; heads numerous, paniculate, pendulous, about 12 mm. high and 6 mm. broad; principal bracts about 8, purplish, linear; corollas greenish or white; pappus reddish brown. Open woods: Me.—Ga.—Ky.—Minn.—Sask. *Boreal.* Au-S.

3. **N. sagittatus** (A. Gray) Rydb. Stem glabrous, 3-7 dm. high; lower leaves petioled; blades sagittate, hastate or ovate, dentate or lobed, with lanceolate salient lobes, glabrous, thin; upper leaves sessile, lanceolate, acuminate; heads in a narrow panicle, at first erect, in fruit spreading or rarely somewhat deflexed; involucre about 12 mm. high; bracts linear, green; flowers tinged with purple; pappus sordid. Along rivers: Mont.—Ida. *Submont.* Jl-S.

20. **CRĒPIS** L.

Annual, biennial, or perennial (all ours), mostly caulescent herbs. Involucre cylindric or campanulate; bracts in a single series, equal, with a more or less thickened midrib; a small outer calyculum present or absent. Flowers yellow. Achenes 10-30-ribbed, narrowed towards the summit. Pappus of numerous, white and soft bristles.

Plant neither canescent nor furfurulent; heads hemispherical to turbinate.

Involucres glabrous or tomentulose when young; neither hirsute nor glandular.

Involucres and peduncles tomentulose, at least when young. 1. *C. tomentulosa*.

Involucres glabrous or slightly puberulent when young. 2. *C. glauca*.

Involucres and peduncles hirsute or glandular or both.

Plant 3-10 dm. high; heads few or many.

Leaf-blades oblanceolate or oblong to linear-oblanceolate.

Leaves long-petioled; petioles half as long to fully as long as the blades, not winged.

Blades of the basal leaves broadly oblanceolate; stem usually with 1-2 leaves; involucres over 1 cm. high. 3. *C. petiolata*.

Blades of the basal leaves narrowly linear-lanceolate or linear-oblanceolate; stem scapiform; involucres less than 1 cm. high.

4. *C. glauca*.

Leaves subsessile or with short winged petioles.

Leaves glabrous or nearly so; involucres with a few short hairs.

5. *C. perplexans*.

Leaves hairy.

Involucres more sparingly and usually short-hirsute; peduncles and stem usually glabrous; involucres less than 1 cm. high.

Involucres, peduncles, and usually also the stem, copiously glandular-hirsute; involucre over 1 cm. high.

Leaf-blades obovate to elliptic; involucres and peduncles densely glandular-hispid with long hairs.

Involucres over 1 cm. high; leaves hairy, 1.5–2 dm. long.

Involucres 1 cm. or less high; leaves glabrous or nearly so.

Plant 1–2 dm. high; heads solitary, rarely 2 or 3.

Plant more or less canescent or furfurascens, especially the leaves; heads mostly narrow, often almost cylindric.

Involucres glabrous, 5–7-flowered.

Leaves lanceolate in outline, pinnately lobed, with lanceolate to linear lobes.

Leaves more or less twice dissected, with linear-filiform divisions.

Involucres canescent.

Involucres cylindric; principal bracts of the involucres 5–8 (rarely 9–14); flowers of the same number; bracts not black-hairy, except sometimes in *C. gracilis*.

Leaves not divided to near the midrib; blade proper wider than the lobes.

Blade proper broadly lanceolate; lobes usually directed downward.

Blade proper narrowly lanceolate to almost linear; lobes curved upwards or spreading.

Leaves dissected to near the midrib into linear-filiform divisions, the blade proper or rachis scarcely broader than the divisions.

Involucres campanulate; principal bracts of the involucres 9–18; flowers 10–20; plant low.

Involucres and peduncles without black hairs; achenes nearly columnar.

Involucres and peduncles with some black hairs intermixed with the tomentum; achenes more or less fusiform.

Hairs glandular.

Hairs not glandular.

Achenes ribbed, at maturity brown or almost black.

Stem low, 1–2 dm. high, as well as the petioles usually hispid with yellow hairs; leaves not long-acuminate.

Stem tall, 4–5 dm. high, not hispid; leaves long-acuminate.

Achenes not ribbed at maturity, greenish or reddish.

Achenes not ribbed at maturity, greenish or reddish.

1. *C. tomentulosa* Rydb. Stem scape-like, 4–5 dm. high; basal leaves glabrous and glaucous, 1–1.5 dm. long, oblanceolate in outline, acute, sessile, dentate, with sharp salient or reflexed teeth; stem-leaves, if any, linear-lanceolate, bract-like, entire; involucre turbinate, about 12 mm. high; bracts linear-lanceolate, acuminate, with dark backs, and with a few calyculate ones at their base. Mountains: Colo. *Submont.*—*Mont.* JI.

2. *C. glauca* (Nutt.) T. & G. Stem scape-like, 3–6 dm. high, glabrous; leaves oblanceolate in outline, tapering below into short petioles, more or less runcinate-pinnatifid, with triangular or lanceolate lobes or sometimes entire, glabrous and somewhat glaucous; involucres turbinate, about 1 cm. high; bracts narrowly linear-lanceolate, acute, glabrous. *C. lancifolia* Greene. Valleys: Sask.—Colo.—Nev.—Alta. *Plain*—*Mont.* Je—Au.

3. *C. petiolata* Rydb. Stem with 1–3 leaves, glabrous and often purplish below, more or less glandular-hirsute above; basal leaf-blades usually obtuse, sinuate-dentate or entire, about 1 dm. long, glabrous and glaucous; stem-leaves oblanceolate and usually sessile; involucre about 12 mm. high, turbinate-campanulate, with glandular black hairs; bracts linear-lanceolate, acuminate. Mountains: S.D.—Colo.—Utah—Wyo. *Submont.*—*Mont.* JI—Au.

4. *C. glaucella* Rydb. Stem slender, about 3 dm. high, glabrous and shining; basal leaves glabrous and shining, somewhat glaucous, thin, 5–10 cm. long; blades oblanceolate, acute at the apex, remotely sinuate-dentate, with divaricate or retrorse short teeth, or entire; stem-leaves 1–2, much reduced, 1–2 cm. long, linear or nearly so; involucre turbinate, sparingly hirsute; bracts linear-lanceolate, acuminate. Wet meadows: Sask.—Mont.—Colo. *Submont.*—*Mont.* JI—S.

5. *C. perplexans* Rydb. Stem scape-like; leaves about 1 dm. long, glaucous and glabrous or rarely with a few hairs on the midrib below and on the margin,

of the narrower base, oblanceolate, runcinate-toothed; involucre turbinate-campanulate, about 1 cm. high, more or less glandular-hairy, with yellowish hairs; bracts linear-lanceolate, acuminate; calyculum about one-third as long. Valleys: Man.—Neb.—Colo.—Alta. *Submont.*—*Mont.* Je—Au.

6. *C. runcinata* (James) T. & G. Stem scapiform, 3–5 dm. high, slightly pubescent or glabrous; leaves mostly basal, oblanceolate or spatulate, tapering below, dentate or entire or runcinate, rather densely glandular-hirsute; involucre turbinate, glandular-hirsute, with yellowish hairs; bracts narrowly lance-linear. Valleys: Sask.—N.D.—Colo.—Alta. Je—Au.

7. *C. platyphylla* Greene. Stem scape-like, 3–6 dm. high, glandular-hirsute in the inflorescence, otherwise glabrous; leaves basal, hirsute, oblanceolate, dentate or somewhat runcinate, 10–15 cm. long; involucre broadly turbinate, 12–15 mm. high, densely glandular-hirsute; bracts lance-linear. *C. runcinata hispidulosa* Howell. (?) *C. subcarnosa* Greene. Meadows and bogs: Mont.—Wyo.—Utah—Neb.—Ore. *Plain*—*Submont.* Je—Au.

8. *C. riparia* A. Nels. Stems 2–4 dm. high, subscapose, minutely and sparsely pubescent below, glandular-hirsute in the inflorescence; leaves mostly basal, usually rounded at the apex, coarsely and irregularly dentate or entire, somewhat runcinate towards the base, 10–18 cm. long, sparingly hirsute on the veins; involucre broadly turbinate, 12–15 mm. high, densely glandular, with dark hairs; principal bracts linear. (?) *C. aculeolata* Greene. River-banks: Neb.—Colo.—Utah—Wyo. *Plain*—*Submont.* Ji—Au.

9. *C. denticulata* Rydb. Stem scape-like; leaves basal, obovate or more rarely obovate-oblanceolate, glabrous or nearly so, obtuse, less than 1 dm. long, denticulate or with a few lobes towards the base. Mountains: Wyo.—Colo.—Utah. *Submont.*—*Mont.* Ji—Au.

10. *C. alpicola* (Rydb.) A. Nels. Stem scape-like, 1–2 dm. high, glandular-hirsute above; leaves obovate or oblanceolate, sessile or nearly so, entire or dentate, glabrous, 3–6 cm. long; involucre 12–14 mm. high, glandular-hirsute; principal bracts lance-linear. High mountains: Mont.—Colo. *Mont.*—*Alp.* Au.

11. *C. acuminata* Nutt. Stem 4–8 dm. high, 1–3-leaved; basal leaves slender-petioled; blades 1–2 dm. long, broadly lanceolate in outline, long-acuminate at the apex, grayish canescent; lobes salient or reflexed; stem-leaves subsessile, the upper ones linear and entire; heads corymbose; involucre cylindric, glabrous, about 1 cm. high, 4–5 mm. broad; principal bracts 5–7. Hillsides: Alta.—Colo.—Calif.—B.C. *Submont.* Je—Au.

12. *C. sesilifolia* Rydb. Stem 4–6 dm. high, slender, canescent-tomentose or glabrous above; basal leaves long-petioled; blades 1–2 dm. long, deeply twice-pinnatifid, with linear-filiform divisions, canescent, caudate-acuminate; stem-leaves subsessile, less divided, the uppermost entire and linear-filiform; involucre about 1 cm. high; bracts proper 5–7, linear, yellowish green. Rocky hillsides: Ida. *Submont.* Je.

13. *C. intermedia* A. Gray. Stem 3–5 dm. high, canescent-tomentulose; basal leaves broadly lanceolate, acuminate, canescent-tomentulose, usually divided only halfway to the midrib into lanceolate acuminate lobes, which are usually directed downward; stem-leaves subsessile, the uppermost linear and entire; involucre subcylindric, tomentose, 12–14 mm. high; bracts proper about 7, linear-lanceolate, more or less scarious-margined. Hillsides: Sask.—Colo.—Calif.—B.C. *Submont.* My—Au.

14. *C. angustata* Rydb. Stems 3–7 dm. high; basal leaves and lower stem-leaves petioled, canescent-puberulent, runcinate; main body narrowly linear-lanceolate, acuminate; upper stem-leaves entire and sessile; involucre cylindric, about 1 cm. high and 5 mm. broad; bracts 5–7, linear-lanceolate, acute, canescent. Mountains: Mont.—Colo.—Ore.—B.C. *Submont.* Je—Au.

15. *C. gracilis* (D. C. Eat.) Rydb. Stem slender, 2–5 dm. high, canescent-tomentulose; basal leaves petioled, the cauline ones sessile, all except the uppermost pinnatifid, with narrowly linear divisions; involucre tomentulose, cylindric, about 1 cm. high; bracts proper, 7–14, narrowly linear-lanceolate, often with a

few black hairs along the midvein. *C. occidentalis gracilis* D. C. Eat. *C. exilis* Osterhout. Hillsides and mountain slopes: Mont.—Colo.—Nev.—Ida. *Son.*—*Submont.* Je—Au.

16. *C. pumila* Rydb. Stem rather low and stout, 1.5–2 dm., rarely 3 dm. high, canescent-tomentose, leafy; basal leaves petioled; blades 8–10 cm. long, broadly lanceolate, acute, lacinate-pinnatifid about halfway to the midrib, with lanceolate-triangular lobes; the stem-leaves sessile; involucre canescent, campanulate, about 12 mm. high; principal bracts about 10, linear or linear-lanceolate. *C. occidentalis costata* A. Gray. Dry hillsides: Mont.—Wyo.—Utah—Nev. *Submont.* My—Au.

17. *C. occidentalis* Nutt. Stem stout, 1–3 dm. high, canescent-tomentose, usually also glandular-hispid in the inflorescence; basal leaves petioled; blades 1–2 dm. long, broadly lanceolate or oblanceolate, runcinate-lobed or cleft, usually about halfway to the midrib, canescent-tomentose, acute; lobes triangular or lanceolate, often toothed; involucre campanulate, 12–15 mm. high; bracts proper 9–14, tomentose. Plains and hillsides: Sask.—Colo.—Ariz.—Calif.—B.C. *Plain*—*Submont.* My—Au.

18. *C. subacaulis* (Kellogg) Coville. Stem 1–2 dm. high, striate, canescent-tomentose as well as hirsute but not glandular; basal leaves petioled; cauline leaves sessile, all pinnatifid or bipinnatifid, tomentose and somewhat hirsute on the rachis and ribs; involucre campanulate, 12–15 mm. high; bracts proper 11–17, lance-linear, tomentose and usually with scattered bristles. *C. occidentalis subacaulis* Kellogg. Dry hillsides: Calif.—Wyo. *Son.*—*Submont.* Je.

19. *C. atribarba* Heller. Stem 4–5 dm. high, tomentose or in age glabrate; basal leaves petioled; blades lanceolate, 1–1.5 dm. long, deeply pinnately lobed or runcinate, with lanceolate or lance-linear divisions, canescent-tomentulose, long-caudate; uppermost cauline leaves much reduced and entire; involucre campanulate, 12–14 mm. high, tomentose; bracts linear, somewhat scarious-margined, with scattered black bristles on the back. Hills: Mont.—Ida. *Son.*—*Submont.* Je.

20. *C. scopulorum* Coville. Stem 1–4 dm. high, scantily tomentose, usually glabrate in age, bearing scattered glandless bristles; basal leaves petioled, pinnatifid or bipinnatifid, with linear or linear-lanceolate divisions, tomentose and also hirsute on the veins; heads corymbose, long-peduncled; involucre campanulate, 10–12 mm. high, sparingly tomentose, and sparingly greenish hispid; calyculate bracts lanceolate, 2 mm. long; bracts proper 13–17, lance-linear. Mountains: Mont.—Colo.—Nev.—Ore. *Submont.* My—Jl.

21. *HETEROPLEÛRA* Schultz-Bip.

Perennial leafy-stemmed herbs, of the habit of *Hieracium*. Involucre campanulate; bracts in 1 or 2 series, subequal, narrow, with a few calyculate ones at the base, not thickened on the back. Flowers light yellow. Achenes tapering from the base to the summit, 10-ribbed, the alternating ribs much stronger. Pappus of numerous dirty white soft bristles.

1. *H. Fendleri* (Schultz-Bip.) Rydb. Stem scape-like, 2–3 dm. high, sparingly setose-hirsute; basal leaves spatulate or obovate, with short wing-margined petioles, setose-hirsute, the hairs long, with pustulate bases; stem-leaves few, the upper or all reduced, narrowly linear, and bract-like; heads rather few, racemiform-paniculate, long-peduncled, nodding in anthesis; involucre campanulate, 12–14 mm. high; bracts proper lance-linear, puberulent or glabrate, with or without a few long hairs; achenes reddish or blackish. *Heteropleura ambigua* (A. Gray) Schultz-Bip. *Hieracium Fendleri* Schultz-Bip. *H. nigrocollinus* S. Wats. Woods: (Black Hills) S.D.—N.M.—Ariz. *Submont.*—*Mont.* Je—Au.

22. *HIERÀCIUM* (Tourn.) L. HAWKWEED.

Perennial, mostly caulescent herbs, with entire or dentate leaves and paniculate heads. Involucre cylindric or campanulate; bracts in 1–3 series, subequal or somewhat imbricate, not thickened on the back, with a few small calyculate

ones at the base. Flowers yellow, seldom white or orange. Achenes cylindric, not tapering towards the apex, truncate, 10-15-ribbed. Pappus of 1 or 2 series of sordid or brownish, fragile capillary bristles.

Involucres of the rather large heads irregularly more or less imbricate.

Stem yellowish or whitish hirsute below.

Stem glabrous or puberulent.

Involucres of the rather small heads of an almost single series of principal bracts and small calyculate ones below.

Flowers yellow.

Plant 4-10 dm. high, leafy.

Involucres and peduncles densely hairy with long yellow hairs.

Involucres blackish and glandular, without or with a few scattered yellow hairs.

Involucres 8-10 mm. high, with scattered yellow hairs.

Involucres 6-8 mm. high, without yellow hairs on the involucre or peduncles.

Plant low, 1-3 dm. high, with 1-3 stem-leaves and few heads.

Flowers white or ochroleucous.

6. *H. gracile*.

7. *H. albiflorum*.

1. *H. columbianum* Rydb. Stem about 6 dm. high, terete, more or less tinged with purple; lower leaves oblanceolate, 8-10 cm. long, light green and somewhat glaucous beneath, usually more or less silky-hirsute, sinuately dentate, acute; middle leaves lanceolate or ovate-lanceolate, with rounded or obtuse bases, sessile, the uppermost much reduced and bract-like; inflorescence corymbose-cymose; heads 2-6; involucres 10-12 mm. high; bracts lanceolate, dark, puberulent when young, glabrous in age. Marshy ground: Mont.—Ida.—Wash.—B.C. *Submont.* Jl—Au.

2. *H. scabriusculus* Schwein. Stem erect, rather simple and strict, leafy; lower leaves oblanceolate, the rest lanceolate, sessile, 3-8 cm. long, distantly and acutely dentate, rather firm, paler beneath, scabrous-puberulent; heads corymbose; involucres rounded-campanulate, 10-12 mm. high; bracts glabrous or nearly so, usually blackish. *H. macranthum* Nutt. Open woods, hills, and valleys: Man.—Minn.—Wis.—Ore.—B.C. *Plain—Submont.*

3. *H. albertinum* Farr. Stem 3-5 dm. high, villous with long white or yellowish hairs from black papillae, or black-hairy above; leaves 5-12 cm. long, the lower oblanceolate with winged petioles, the upper lance-linear to oblong-lanceolate, densely long-hairy; heads paniculate; involucres 10-12 mm. high; bracts long, narrowly lance-linear; pappus tawny. *H. Scouleri* A. Gray, not Hook. Hills and woods: Alta.—Utah—Ore.—Wash. *Submont.—Mont.* Jl—Au.

4. *H. griseum* Rydb. Stem 6-10 dm. high, covered with long white or yellowish hairs from evident papillae; lower leaves linear-oblanceolate, the upper oblong-linear or lance-linear, sessile, densely long-hairy; heads in a narrow panicle; involucres about 1 cm. high; inner bracts linear-lanceolate, glandular, dark, and at least when young beset with a few long hairs; pappus yellowish or tawny. Hills, benchlands, and open woods: Alta.—Wyo.—Utah—B.C. *Submont.—Mont.* Jl—Au.

5. *H. cynoglossoides* Arvet-Touvet. Stem 3-5 dm. high, several-leaved, hirsute throughout or glabrous above; lower leaves oblanceolate, rather sparingly hirsute; upper leaves lanceolate, sessile, often glabrate; heads corymbose-paniculate; involucres campanulate, 8-10 mm. high, black; bracts proper narrowly linear, densely glandular, but without long hairs; pappus tawny-white. Hills: Mont.—Wyo.—Wash.—B.C. *Submont.* Je—Au.

6. *H. gracile* Hook. Stem 1-3 dm. high, often scape-like, puberulent or glabrate, sometimes with a few hispid hairs, especially in the inflorescence; basal leaves obovate to oblong-spatulate, 2-7 cm. long, petioled, entire or repand-denticulate, glabrous or nearly so; upper stem-leaves all small and bract-like; heads usually few; involucres campanulate, 7-9 mm. high, usually densely black-hirsute; pappus sordid or tawny. Mountains: Alta.—N.M.—Calif.—Alaska. *Submont.—Subalp.* Je—Au.

7. *H. albiflorum* Hook. Stem 3-6 dm. high, more or less leafy or in depauperate specimens scapiform, long-hirsute below, glabrate above; basal leaves

petioled; blades oblanceolate or oblong, thin, long-hirsute, especially on the veins and petioles; stem-leaves sessile, lanceolate, less hairy; heads numerous, corymbose-paniculate; involucre campanulate, 8-10 mm. high; bracts proper narrowly lance-linear, glabrous or minutely puberulent; pappus sordid. Woods: Sask.—Colo.—Calif.—Yukon. *Submont.*—*Mont.* Je-Au.

23. AGÓSERIS Raf. GOAT CHICORY.

Perennial herbs, with strong taproots, or annuals, mostly acaulescent. Involucre campanulate to nearly cylindric; bracts imbricate in a few series, the outer broader and shorter. Flowers yellow, orange, or purplish. Achenes fusiform or oblong, 10-ribbed, narrowed above into a beak. Pappus of numerous capillary white bristles.

Perennials.

Beak short, scarcely more than half as long as the body of the achene, striate throughout. I. GLAUCAE.

Beak long, about as long as or longer than the body of the achene, scarcely striate at the middle.

Body of the achenes tapering at the apex. II. AURANTIACAE.

Body of the achenes truncate at the apex. III. RETROSAE.

Annuals.

IV. HETEROPHYLLAE.

I. GLAUCAE.

Leaves decidedly pubescent, even in age.

Outer bracts linear-lanceolate to oblong, obtuse or acute.

Outer bracts linear-lanceolate.

Plant tall and stout, 3-5 dm. high; involucre broadly campanulate, about 2.5 cm. high and 2.5-3 cm. wide. 1. *A. taraxacifolia*.

Plant low, 1-2 dm. high; involucre less than 2 cm. high and 1-2 cm. wide.

Leaves linear-oblanceolate, 6-10 cm. long; peduncle slender, about 2 dm. high. 2. *A. pubescens*.

Leaves oblanceolate, 4-6 cm. long, often lobed or toothed; peduncles 1 dm. high or less. 3. *A. aspera*.

Outer bracts oblong or oblong-ovate.

Scape low and stout, about 2 dm. high; leaves oblanceolate, about 1 dm. long. 4. *A. villosa*.

Scape tall, about 6 dm. high; leaves 2-3 dm. long; flowers turning purple. 5. *A. altissima*.

6. *A. maculata*.

Outer bracts ovate or ovate-lanceolate, acuminate.

Leaves in age glabrate and glaucous.

Bracts villous-ciliate, at least on the margins.

Involucre turbinate; leaves narrowly linear; flowers light yellow, turning pink. 7. *A. turbinata*.

Involucre campanulate to hemispherical; leaves oblanceolate or lanceolate.

Inner bracts long-acuminate; plant less than 2 dm. high. 8. *A. attenuata*.

Inner bracts merely acute.

Leaves obtuse or acute, entire or rarely toothed.

Outer bracts much broader than the inner, often obtusish; plant generally low and leaves short, obtuse. 9. *A. pumila*.

Outer bracts usually not much broader than the inner; plant 3-5 dm. high; leaves long and acute. 10. *A. scorzoneraefolia*.

Leaves acuminate, more or less pinnatifid. 11. *A. agrestis*.

Bracts glabrous; involucre if at all hairy, tomentose only at the very base.

Outer bracts oval or ovate, obtusish; leaves 2-3 dm. long, oblanceolate; flowers rose-colored. 12. *A. roseata*.

Bracts all linear-lanceolate, acute or acuminate; flowers yellow.

Leaves entire or toothed; flowers yellow, turning pink.

Leaves linear-oblanceolate. 13. *A. glauca*.

Leaves narrowly linear. 14. *A. parviflora*.

Leaves pinnatifid, with narrow lobes; flowers yellow, turning purple.

Bracts, with loose spreading tips; heads broadly campanulate.

Bracts appressed; heads more or less turbinate. 15. *A. rosea*.

16. *A. laciniata*.

II. AURANTIACAE.

Bracts all broad, ovate to elliptical, abruptly acuminate.

17. *A. montana*.

Bracts, at least the inner ones, linear or linear-lanceolate, acute.

Involucre more or less regularly imbricate; beak about equalling the body of the achenes.

Leaves densely pubescent.

Plant low; flowers purple. 18. *A. arachnoidea*.

Plant tall; flowers yellow. 19. *A. elata*.

Leaves glabrous or nearly so, somewhat hairy in No. 27.

Flowers reddish brown or deep orange, changing into purplish.

Bracts with purplish blotches; leaves glaucous.

20. *A. purpurea*.

Bracts not with purplish blotches, if at all purplish only along the midrib.
Leaves narrowly linear, glaucous, usually pinnatifid with linear lobes.

21. *A. graminifolia*.

Leaves oblanceolate, usually entire, rarely with short broad lobes or teeth.

All bracts linear-lanceolate and acute.

Plant tall, slender, 3-5 dm. high; leaves erect; heads 2-3 cm. high.

22. *A. gracilens*.

Plant low, 1-3 dm. high; leaves spreading; heads 1.5-2 cm. high.

23. *A. nana*.

Outer bracts oblong or lanceolate, often obtuse.

Plant low, 1 dm. high or less; inner bracts only slightly longer.

24. *A. carnea*.

Plant taller, 3-5 dm. high; inner bracts much longer.

25. *A. aurantiaca*.

Flowers light yellow, but often turning pinkish; inner bracts elongate in age.

Involucres 2-2.5 cm. in diameter; plant tall and stout, scarcely glaucous.

19. *A. elata*.

Involucres less than 1 cm. in diameter; plant slender, glaucous.

Scapes tall, 2.5-4 dm. high, much exceeding the leaves.

26. *A. arizonica*.

Scapes low, about 1 dm. high, slightly if at all exceeding the leaves.

27. *A. leptocarpa*.

Involucres of two distinct sets of bracts, the inner narrowly linear, 2-3 times as long as the ovate or oval outer ones; beak 2-3 times as long as the body of the achenes.

Leaves glabrous and glaucous, linear or oblanceolate, acuminate, with linear lobes, or entire.

Outer bracts oblong-obtuse; lobes of the leaves linear to lanceolate, acute.

28. *A. rostrata*.

Outer bracts acute or acuminate; lobes of the leaves narrowly linear.

29. *A. tenuifolia*.

Leaves more or less pubescent, oblanceolate in outline.

Leaves obtuse and with oblong-obtuse lobes.

30. *A. obtusifolia*.

Leaves attenuate and with lanceolate, acute lobes.

31. *A. grandiflora*.

III. RETRORSAE.

One species.

32. *A. retrorsa*.

IV. HETEROPHYLLAE.

One species.

33. *A. heterophylla*.

1. *A. taraxacifolia* (Nutt.) Dietr. Leaves oblanceolate or linear-oblanceolate in outline, usually more or less toothed or lobed, with lanceolate, salient teeth or lobes, permanently villous, 1-2 dm. long; scape more or less villous; involucre broadly campanulate, about 2.5 cm. high, 2.5-3 cm. broad, villous-tomentose at the base; bracts all linear-lanceolate, villous-ciliate on the margins, with a purplish midvein and sometimes with purple blotches, the inner attenuate; flowers yellow, turning pinkish; body of the achenes fusiform, about 1 cm. long, gradually tapering into a striate beak 3 mm. long. *Troximon taraxacifolium* Nutt. Meadows: Wash.—Ida.—Utah. *Submont.* Je-Jl.

2. *A. pubescens* Rydb. Leaves narrowly oblanceolate, about 1 dm. long, 0.5-1 cm. wide, acuminate, slightly glaucous, but even in age villous-pubescent; scape 1.5-2 dm. high, sparingly villous; involucre about 2 cm. high and 1.5 cm. wide, villous and somewhat viscid; bracts with a dark median line and sometimes tinged with purple, the outer ones lanceolate to linear-lanceolate; flowers lemon-yellow, the outer striate or tinged with purple. *T. pubescens* A. Nels. Moist meadows and hillsides: Man.—Colo.—B.C. *Plain—Submont.* Je—Au.

3. *A. aspera* Rydb. Leaves oblanceolate, 4-6 cm. long, often lobed or toothed, permanently short-villous, with rather coarse hairs; scapes 3-10 cm. high; involucre turbinate, 10-14 mm. high; bracts linear-lanceolate or the outer lanceolate, acute, with a purplish midvein, villous throughout, with longer hairs on the margins; flowers light yellow, turning pink, purple-veined. *A. Leonardon* v. *aspera* and v. *pygmaea* Rydb. Mountains: Mont.—Ida.—B.C. *Mont. —Subalp.* Jl.

4. *A. villosa* Rydb. Leaves very villous, about 1 dm. long, broadly lanceolate or oblanceolate, entire or laciniately toothed, rather thick; scape stout, 1-3 dm. high, densely villous when young; involucre broadly campanulate or hemispheric, 2 cm. high and 2-2.5 cm. broad; bracts densely villous, the outer oblong or oblong-ovate, obtuse or acutish, the inner lanceolate, acute, with dark mid-

rib; flowers light yellow, turning pinkish. *T. villosum* A. Nels. Mountains and hills: Alta.—Mont.—Utah—B.C. *Submont.*—Mont. Je—Au.

5. *A. altissima* Rydb. Leaves linear-ob lanceolate, entire, sparingly villous, especially on the margins; scapes sparingly villous; involucre broadly campanulate, 2 cm. high and broad; bracts densely pilose, more or less brownish in color, the outer ovate-oblong, obtuse, or acute, the inner lanceolate, acute; flowers yellow, turning pinkish. Meadows: Alta.—Mont. *Submont.*

6. *A. maculata* Rydb. Leaves oblanceolate, more or less pubescent, especially on the margins and veins; scape 1-2 dm. high, often sparingly hairy and villous under the head; involucre campanulate, about 2 cm. high; outer bracts dotted with blackish dots; inner bracts lanceolate, all abruptly acuminate; ligules yellow or the outer tinged with reddish. *A. apiculata* Greene. Mountains: Colo. *Mont.*—Alp. Jl—Au.

7. *A. turbinata* Rydb. Leaves narrowly linear, 7-15 cm. long, 1-5 mm. broad, glabrous, bluish green, the midvein and base often purplish, entire, attenuate; scape about 3 dm. high, slender, sparingly villous, more densely so under the head; involucre 17-20 mm. high; bracts all narrowly lance-linear, villous on the back and the margins, with dark purple middle and yellowish green margins; ligules 15-18 mm. long, yellow, with purple veins, turning pinkish in age. Mountains: Alta. *Mont.*

8. *A. attenuata* Rydb. Leaves narrowly oblanceolate, 1-1.5 dm. long, glabrous and glaucous, usually denticulate, tapering into a short petiole; scape about 1.5 dm. high, villous near the head; involucre campanulate, about 2 cm. high; outer bracts ovate-lanceolate, somewhat villous on the margins, purplish on the back. Mountains: Colo. *Mont.* Au.

9. *A. pumila* (Nutt.) Rydb. Leaves 5-15 cm. long, usually broadly oblanceolate, entire or merely dentate, glabrous and somewhat glaucous; scape 1-2 dm. (rarely 3 dm.) high, stout, more or less villous under the heads; involucre campanulate, about 2 cm. high, 2-2.5 cm. broad; bracts villous-ciliate on the margins and usually also on the back; outer bracts ovate to oblong, often obtuse or rounded at the apex; flowers light yellow, with purplish veins, turning pinkish in age. *T. pumilum* Nutt. Hills: Mont.—Colo. *Submont.*—Alp. Jl—Au.

10. *A. scorzoneraefolia* (Schrud.) Greene. Leaves oblanceolate or linear-ob lanceolate, scarcely glaucous, glabrous, 1-3 dm. long, usually acute, entire, or rarely dentate; scape villous under the head; involucre 2-3 cm. high, 2-3.5 cm. wide; bracts lanceolate or the inner linear-lanceolate, acute, villous-ciliate at least on the margins; flowers light yellow, with purplish veins, turning pinkish in age. *T. glaucum dasycephalum* T. & G. Hillsides: Alta.—S.D.—Colo.—Nev.—Ore.—B.C. *Plain*—*Submont.* Jl—Au.

11. *A. agrestis* Osterhout. Leaves linear or oblong in outline, more or less pinnatifid or saliently toothed, with up-turned divisions, acuminate; scape 2-3 dm. high, glabrous; involucre about 2 cm. high and as broad; bracts acuminate, the outer ovate or ovate-lanceolate, the inner linear-lanceolate; flowers yellow, drying purplish. *A. Leontodon* Rydb. (Fl. Colo.), in part. Hills and mountains: Colo.—Mont. *Submont.*—*Subalp.* Jl—Au.

12. *A. roseata* Rydb. Leaves about 2 dm. long, long-petioled; blades oblanceolate, acute, denticulate or entire or pinnatifid, glabrous and glaucous; scape 5-6 dm. high, slightly villous above; involucre campanulate, 1.5-2 cm. high; bracts oblong-ovate, acute, nearly glabrous, often with a rose-colored spot in the middle; corolla rose-colored. Hills: Colo. *Submont.* Jl—Au.

13. *A. glauca* (Nutt.) Greene. Leaves 1-2 dm. long, glaucous, not two-ranked, rarely pinnatifid; scape 2-4 dm. high, glabrous; involucre turbinate or turbinate-campanulate; bracts lanceolate or linear-lanceolate, acute; corollas light yellow, turning pinkish. (?) *A. vicinalis* Greene. *T. glaucum* Nutt. Prairies and meadows: Man.—S.D.—Colo.—Utah—Wash.—B.C. *Plain*—Mont. Je—Au.

14. *A. parviflora* (Nutt.) Greene. Leaves 1-1.5 dm. long, 2-5 mm. wide; more or less distinctly 2-ranked; scapes decumbent at the base, 1-2 dm. high,

glabrous; involucre turbinate, about 15 mm. high; bracts linear-lanceolate; corollas yellow, turning pink in drying. *T. parviflorum* Nutt. Meadows: Man.—N.D.—Colo.—Utah—Wash. *Plain—Submont.* Je—Au.

15. *A. rosea* (Nutt.) Greene. Leaves 7–15 cm. long, pinnatifid, with linear divisions, caudate-acuminate, glabrous; scape 1–1.5 dm. high, decumbent or ascending, glabrous; involucre about 15 mm. high, slightly villous at the base; bracts lanceolate to linear-lanceolate; corollas yellow, turning rose-colored. *T. roseum* Nutt. Plains and table-lands: Colo.—Wyo. *Submont.* My—Jl.

16. *A. laciniata* (Nutt.) Greene. Leaves linear or lance-linear in outline, pinnatifid with narrow, lanceolate or linear divisions, glabrous or slightly villous, when young; scape 1–2 dm. high; involucre turbinate, slightly villous below, about 15 mm. high; bracts linear-lanceolate or lanceolate; corollas light yellow, turning rose-colored. *Stylopappus lacinatus* Nutt. *Troximon arachnoideum* A. Nels., not *A. arachnoidea* Rydb. Meadows and valleys: Wyo.—Colo.—Calif.—B.C. *Submont.—Mont.* Je—Au.

17. *A. montana* Osterhout. Leaves oblanceolate, 1–2 dm. long, glabrous or slightly villous when young, entire or dentate, dark green; scapes 1–3 dm. high, woolly beneath the head and at the base; involucre campanulate, about 3 cm. high, more or less villous; flowers yellow. Mountains: Colo.—Wyo. *Mont.—Subalp.* Jl—S.

18. *A. arachnoidea* Rydb. Leaves 1.5–2 dm. long, more or less runcinate-lobed, oblanceolate in outline, long-attenuate at the apex, densely floccose when young; scape 1.5–4 dm. high, densely woolly above; head 2–2.5 cm. high, 1.5–2 cm. broad; bracts in about 3 series, linear-lanceolate, long-attenuate; flowers at least in age rose-purple. Hills: Colo. *Submont.—Mont.* Je—Jl.

19. *A. elata* (Nutt.) Greene. Leaves thickish, oblanceolate in outline, dentate or pinnatifid, with lanceolate divisions, somewhat villous, especially when young, or glabrate; scapes usually several, robust, 3–5 dm. high, villous, especially under the heads; involucre campanulate, villous especially below; bracts linear-lanceolate or the outer lanceolate, all gradually acute; corollas yellow. *T. Nuttallii* Greene. *T. elatum* A. Nels., not Greene. Low ground: Mont.—Colo.—Calif.—B.C. *Submont.—Mont.* Je—Au.

20. *A. purpurea* (A. Gray) Greene. Leaves linear or linear-oblanceolate, glaucous and glabrous, at least in age, dentate or pinnatifid; scape 1–2 dm. (rarely 3 dm.) high, villous, especially under the heads; involucre turbinate, 1.5 cm. high, or in fruit fully 2 cm. high; outer bracts oblong and obtuse, the inner linear-lanceolate, acute; flowers orange, turning purple. *T. aurantiacum purpureum* A. Gray. Mountains: Colo.—N.M.—Ariz.—Utah. *Submont.—Mont.* Jl—Au.

21. *A. graminifolia* Greene. Leaves glabrous, somewhat glaucous, narrowly linear, from entire to pinnatifid with linear lobes, long-attenuate; scape about 3 dm. high, villous under the head; involucre turbinate, about 2 cm. high, villous at the base; bracts lanceolate or linear-lanceolate, acute to long-attenuate; flowers orange, drying purple. *T. gracilens Greenei* A. Gray. *A. Greenei* Rydb., not *A. Greeneana* O. Kuntze. Meadows: Alta.—Ariz.—Utah—B.C. *Submont.—Subalp.*

22. *A. gracilens* (A. Gray) Kuntze. Leaves oblanceolate, rarely linear in outline, usually entire or some with a few short lobes, 1–2 dm. long; scape slender, 1–4 dm. high, villous below the head; involucre turbinate-campanulate, 18–20 mm. high; bracts linear-lanceolate, acute or acuminate; flowers orange, turning purple. *T. gracilens* A. Gray. *A. gracilentia* Greene. Meadows and hillsides: Alta.—Colo.—Utah—B.C. *Plain—Subalp.*

23. *A. nana* Rydb. Leaves spreading or ascending, oblanceolate or linear-oblanceolate, 6–10 cm. long, entire or denticulate, glabrous or slightly hairy on the short petioles; scape 1–1.5 (seldom 2) cm. high, slightly villous below the head; involucre 1.5–2 cm. high; bracts linear-lanceolate, slightly villous-ciliate; corolla rose-purple or at first orange. *A. humilis* Rydb., not Kuntze. Mountains: Colo.—Wyo. *Mont.*

24. *A. carnea* Rydb. Leaves oblanceolate, entire, or denticulate, 8-15 cm. long, glabrous, dark green; scape 1-2 dm. high, villous under the head; involucre turbinate, about 15 mm. high, villous; outer bracts oblong, obtuse, about equaling the inner linear-lanceolate, acute ones, somewhat purple-spotted; flowers orange, turning pink and purple. Wet places: Alta.—Mont.—B.C. *Submont.*—Mont. JI-Au.

25. *A. aurantiaca* (Hook.) Greene. Leaves oblanceolate, entire or dentate or lobed with reflexed or salient lobes; scape 4-6 dm. high, villous under the head; involucre turbinate-campanulate, 15-20 mm. high; inner bracts linear-lanceolate and acute; flowers orange, turning purplish. *T. aurantiacum* Hook. Meadows and banks: Alta.—Colo.—Utah—B.C. *Submont.*—Alp. JI-Au.

26. *A. arizonica* Greene. Leaves linear or linear-ob lanceolate, entire, runcinate-toothed, or somewhat lobed, 1-1.5 dm. long, somewhat glaucous; scape 2.5-4 dm. high, villous under the head; involucre turbinate, 2-2.5 cm. high, about 1.5 cm. broad; bracts rather few, in three series, lanceolate to narrowly linear-lanceolate, nearly glabrous and with a purple midvein; flowers light yellow, turning rose-colored. Mountains: N.M.—Colo.—Utah—Ariz. *Submont.*—Mont. Je-Au.

27. *A. leptocarpa* Osterhout. Leaves linear or linear-ob lanceolate, entire to runcinate-pinnatifid, 5-8 cm. long, glabrous or somewhat villous, somewhat glaucous; scape 1-1.5 cm. high, villous under the heads; involucre turbinate, 15-20 mm. high; bracts in 3 series, with purple midribs, the outermost lanceolate, acute, the inner linear-lanceolate; flowers light yellow, turning pinkish. *A. caudata* Greene. Hills and plains: Wyo.—Colo.—Utah. *Submont.*—Mont. Je.

28. *A. rostrata* Rydb. Leaves narrowly linear-lanceolate, about 2 dm. long, usually more or less lacinate, with linear lobes, glabrous and glaucous; scape 2-6 dm. high, more or less villous under the head; involucre fully 3 cm. high; inner bracts elongate-linear or linear-lanceolate; corolla orange or purple. Mountains: Colo. *Submont.*—Mont. Je-Au.

29. *A. tenuifolia* (A. Gray) Rydb. Leaves linear-ob lanceolate or linear, lacinate-dentate or pinnatifid, with narrow divisions, slightly villous or glabrous, caudate-acuminate; scape slender, 3-5 dm. long, glabrous, slightly villous under the heads; involucre campanulate or nearly hemispheric, 15-25 mm. high; bracts in about 4 series, those of the two outer ovate-acuminate; inner bracts linear or linear-lanceolate. *T. grandiflorum tenuifolium* A. Gray. *T. laciniatum* A. Gray, not *Stylopappus laciniatus* Nutt. Dry places: Ore.—Ida.—B.C. *Son.* My-JI.

30. *A. obtusifolia* (Suksd.) Rydb. Leaves pinnatifid, or rarely entire, more or less villous on the midrib and veins beneath; scape stout, 3-6 dm. high, villous under the heads; involucre campanulate, 3-4 cm. high; bracts in 4 series, the outer two series short, ovate or oval, decidedly villous, acute or short-acuminate; inner bracts glabrous, narrowly linear-lanceolate. *T. grandiflorum obtusifolium* Suksd. Valleys: Wash.—Ida.—Calif. *Son.* My-JI.

31. *A. grandiflora* (Nutt.) Greene. Leaves 1-2 dm. long, oblanceolate, attenuate at each end, sinuate-dentate to lacinate-pinnatifid, with acute divisions more or less pubescent, at least on the midrib; scape 2-5 dm. high; involucre 2.5-3 cm. high and as wide; bracts very unequal, the outer ovate or lanceolate, lanate or tomentose, the inner linear and glabrate. *Stylopappus grandiflorus* Nutt. *T. grandiflorum* A. Gray. Plains and hillsides: B.C.—Ida.—Calif. *Son.* Ap-Au.

32. *A. retrorsa* (Benth.) Greene. Leaves pinnatifid, decidedly villous, with linear, salient or retrorse lobes, caudate-elongate; scape 3-8 dm. high, more or less villous; involucre campanulate, 3-4 cm. high; bracts in about 4 series, more or less villous, the outer ovate, elliptic, or oval, acute; inner bracts narrowly linear-lanceolate; flowers yellow. *T. retrorsum* A. Gray. Pine woods and grassy slopes: Calif.—sw Ida.—Ore. *Son.*—*Submont.* Ap-JI.

33. *A. heterophylla* (Nutt.) Greene. Leaves linear-ob lanceolate or linear, entire or dentate, or somewhat pinnatifid, with lanceolate divisions, more or less hirsute; scapes several, 1-2.5 dm. high, slender; involucre more or less hirsute,

campanulate, 12–18 mm. high; bracts in 3 series, the outermost bracts ovate-lanceolate, the innermost linear-lanceolate, all acute; flowers light yellow; marginal achenes with broad wavy wings or wingless, the central ones merely costate; body about 5 mm. long; beak filiform, about 1 cm. long. *Macrorhynchus heterophyllus* Nutt. Hills and prairies: Calif.—Utah—Ida.—B.C. Son. My—Je.

24. LEÓNTODON L. DANDELION.

Acaulescent perennial herbs, with pinnatifid fleshy taproots, toothed or rarely entire leaves, and the heads solitary on naked hollow scapes. Involucre campanulate; bracts equal, subtended by a well-developed calyculum of shorter bracts, the calyculate bracts in several series. Receptacle naked. Flowers yellow. Achenes mostly fusiform, 4- or 5-angled, 8–10-ribbed, retrorsely spinulose above, contracted into a slender beak. Pappus of numerous persistent bristles spreading in fruit. [*Taraxacum* (Haller) Ludv.]

Outer bracts (calyculum) more or less squarrose.

Outer bracts reflexed from the base; leaves deeply runcinate, with triangular to lanceolate lobes.

Achenes bright red.

1. *L. erythrospermum*.

Achenes greenish or brownish.

Bracts numerous; leaves broad and the terminal lobe large.

2. *L. Taraxacum*.

Bracts few; leaves narrow and the terminal lobe small.

3. *L. mexicanum*.

Outer bracts or most of them appressed at the base and with spreading or reflexed tips; leaves with short lobes or sinuate.

Bracts conspicuously corniculate, the outer about two-thirds as long as the inner; scape usually much exceeding the erect leaves; achenes spinulose-toothed above and tuberculate on some of the ribs to near the base.

4. *L. dumetorum*.

Bracts, at least the outer ones, not corniculate, the outer about half as long as the inner; achenes merely tuberculate above, smooth below.

5. *L. leiospermum*.

Outer bracts wholly appressed, short, the mere tip rarely spreading.

Plant not dwarf; scape 5–20 cm. high; involucre 15 mm. or more high.

Plant with a tuft of brown hairs at the base.

6. *L. eriophorum*.

Plant not with brown hairs at the base.

Achenes brownish or greenish.

Calyculate bracts in 2–3 series; achenes muricate to near the base.

7. *L. monticola*.

Calyculate bracts in 1–2 series; achenes smooth below the middle.

8. *L. angustifolium*.

Achenes bright red.

9. *L. ammophilum*.

Plant dwarf; scape 2–10 cm. high; involucre 6–12 mm. high, dark green.

Involucres campanulate, 10–12 mm. high; lobes of the leaves oblong or lanceolate, acutish.

10. *L. rupestre*.

Involucres cylindro-campanulate, 6–8 mm. high, 5 mm. broad; lobes of the leaves broadly triangular, obtuse.

11. *L. scopulorum*.

1. ***L. erythrospermum*** (Andrz.) Eichw. Leaves 1–2 dm. long, oblanceolate in outline, deeply runcinate-pinnatifid to near the midrib; lobes with a triangular base, more or less caudate-lanceolate; scape 1–3 dm. high; involucre about 15 mm. high; inner bracts 12–20, linear, with a lanceolate, slightly scarious-margined base; achenes 3 mm. long, bright red; ridges spinulose above and muricate below to the very base. *Taraxacum erythrospermum* Andrz. Roadsides and around dwellings: Me.^e—W.Va.—Kans.—Wyo.—Alta.; nat. from Eu. My—Au.

2. ***L. Taraxacum*** L. Leaves 1–3 dm. long, oblanceolate in outline, usually deeply runcinate, with triangular, more or less cut-toothed lobes, the terminal division large, deltoid or deltoid-ovate; scape 1–3 dm. high; involucre about 15 mm. high; inner bracts linear-lanceolate, 15–25, with narrow scarious margins, rarely corniculate; achenes greenish or brownish yellow, the ridges spinulose above, then muricate and nearly smooth at the base. *T. officinale* Weber. *T. Taraxacum* Karst. Around dwellings, fields, and roadsides: Lab.—S.C.—Calif. Alaska; nat. from Eu. Plain—Mont. Mr—N.

3. ***L. mexicanum*** (DC.) Rydb. Leaves 1–1.5 dm. long, narrowly oblanceolate, deeply runcinate, with retrorsely obliquely triangular, often toothed lobes; terminal division small, deltoid; scape 5–15 cm. long; involucre about 15 mm. high, green or slightly livid; inner bracts narrowly linear, lanceolate, scarious-margined towards the base, 12–20 in number; achenes about 3 mm. long; ridges strongly spinulose above and muricate usually to the very base. *T. mexicanum*

DC. Meadows and hills: N.M.—Colo.—Utah—Ariz.; Mex. *Submont.*—*Mont.* My—Au.

4. **L. dumetorum** (Greene) Rydb. Leaves 1-2 dm. long, oblanceolate, mostly erect, sinuately toothed or lobed, glabrous or slightly hairy on the veins; teeth or lobes usually triangular; scape 1-4 dm. high; involucre 2-3 cm. high; inner bracts narrowly linear-lanceolate, dilated and bifid at the apex; achenes olive-green; ribs spinulose at the summit, muricate below. *T. dumetorum* Greene. Mountain valleys: Man.—N.M.—Utah—B.C. *Submont.*—*Mont.* My—Au.

5. **L. leiospermum** Rydb. Leaves spreading, broadly oblanceolate, less than 1 dm. long, dark green, obtuse or acutish, retrorse-dentate, rarely lobed; scape about 1 dm. high, slightly villous when young; outer bracts 7-10 mm. long, lanceolate, with spreading tips, the inner linear, about twice as long, neither corniculate; achenes greenish. *T. leiospermum* Rydb. Mountains: Colo. *Submont.*—*Mont.* Jl—Au.

6. **L. eriophorum** Rydb. Leaves 2-3 cm. long, oblanceolate to spatulate, slightly sinuately dentate or entire; scape 2-3 dm. high; involucre about 1.5 cm. high, somewhat livid; calyculate bracts in a single series, ovate, erect, slightly corniculate. *T. eriophorum* Rydb. Hills: *Mont.* *Submont.*

7. **L. monticola** Rydb. Leaves oblanceolate in outline, 6-12 cm. long, from dentate to sinuately lobed with triangular entire lobes, glabrous or nearly so; scape 1-2 dm. high; involucre campanulate, 15-18 mm. high; bracts proper linear-lanceolate, in 2 series, the inner ones with broad scarious margins; achenes greenish or brown; ribs strongly spinulose above. *T. montanum* Nutt., not DC. Mountains: Alta.—Colo. *Submont.*—*Mont.* Je—Au.

8. **L. angustifolium** (Greene) Rydb. Leaves oblong-linear, 4-10 cm. long, obtuse or mucronate, denticulate or dentate; scape decumbent, at last twice as long as the leaves; involucre narrowly campanulate; achenes brown, spinulose at the apex, smooth below the middle. *T. angustifolium* Greene. (?) *T. fasciculatum* A. Nels. Meadows: Wyo.—Colo. *Mont.*—*Alp.* Jl—Au.

9. **L. ammophilum** (A. Nels.) Rydb. Leaves decumbent, 1 dm. long or less, glabrous, oblong or oblanceolate, sinuate-dentate; scape decumbent, about as long as the leaves; involucre about 15 mm. high; bracts proper narrowly linear-lanceolate, slightly scarious-margined; achenes dark red; ribs spinulose above, tuberculate below. *T. ammophilum* A. Nels. Grassy valleys: Wyo.—Colo. *Mont.*—*Subalp.* Je—Au.

10. **L. rupestre** (Greene) Rydb. Leaves narrowly oblanceolate in outline, acute, runcinate-pinnatifid or runcinate-toothed, 3-8 cm. long; involucre narrowly campanulate, dark livid green, 10-12 mm. high; proper bracts 10-15, in 2 series, lance-linear, the inner series with broad scarious margins; ribs of the achenes spinulose at the summit, muricate below. *T. rupestre* Greene. (?) *T. ovinum* Greene. High mountains: Alta.—*Mont.*—B.C. *Subalp.*—*Alp.* Jl—Au.

11. **L. scopulorum** (A. Gray) Rydb. Leaves 2-6 cm. long, sinuate-pinnatifid; scape 1-6 cm. high; involucre 6-8 mm. high, 5 mm. wide, dark livid green; bracts proper 8-12, in 2 series, oblong-linear, scarious-margined, often obtuse. *T. officinale scopulorum* A. Gray. *T. scopulorum* Rydb. Alpine regions: Colo.—Ida. *Mont.*—*Alp.* Jl—Au.

25. LACTUCA (Tourn.) L. LETTUCE.

Tall leafy-stemmed herbs, with paniculate heads. Involucre cylindric, or in fruit conic; bracts imbricate, in 3 or more series. Achenes obcompressed, 1-5-nerved on the faces, contracted into a beak dilated at the apex. Pappus of numerous capillary bristles, which fall off separately.

Achenes with a slender beak; pappus white.

Outer bracts (calyculum) not more than half as long as the bracts proper; flowers yellow, rarely tinged with blue.

Heads 6-15-flowered; achenes several-nerved, not rugose; leaves spinulose on the ribs.

Leaves sinuate-dentate; achenes dark.

Leaves sinuately pinnatifid; achenes light colored.

1. *L. virosa.*

2. *L. Scariola.*

Heads 12–20-flowered; achenes 1–3-nerved, transversely rugose.

Involucres about 1 cm. high.

Leaves linear-lanceolate, perfectly entire.

Leaves pinnatifid or lobed, at least some of them.

Involucres 1.2–2 cm. high.

Leaves obovate or oblanceolate in outline, with broad lobes, often spinulose on the midribs beneath.

Leaves linear or linear-lanceolate in outline, entire or with narrow lobes, never spinulose.

Bracts in 5–6 series, gradually increasing upwards, a distinct calyculum therefore not evident; flowers blue.

Achenes beakless; pappus tawny or brown.

Lobes of the leaves broadly triangular or ovate, sinuately and saliently dentate.

Lobes of the leaves lanceolate or linear, again 1–3-lobed.

3. *L. polyphylla*.

4. *L. canadensis*.

5. *L. ludoviciana*.

6. *L. graminifolia*.

7. *L. pulchella*.

8. *L. spicata*.

9. *L. multifida*.

1. ***L. virosa*** L. Biennial, with a branched root; stem erect, 5–20 dm. high, more or less hispid towards the base; leaves numerous, oblong or oblanceolate, obtuse or mucronate, horizontal, 1–3 dm. long, spinulose-denticulate, sessile and clasping; panicle loosely branched; involucres 10–12 mm. high, 4–6 mm. broad; bracts in about 4 series, lanceolate, thick; flowers light yellow, turning bluish; achenes with broader margins than those of the next. *L. integrata* A. Nels. Waste places and fields: Me.—Ga.—Calif.—B.C.; nat. or adv. from Eu. *Plain—Submont.* Je–S.

2. ***L. Scariola*** L. Biennial, with a branched root; stem 3–10 dm. high, sparingly prickly-bristly below; leaves pinnatifid or lobed, rarely merely sinuate, tending to turn edgewise into a vertical position; involucres ovoid-cylindric, about 10 mm. high, 4 mm. broad; bracts imbricate in about 4 series, lanceolate or the inner linear-lanceolate; flowers yellow, turning bluish; achenes elliptic-oblanceolate, slightly margined, 5-nerved on each side. Fields and waste places: Mass.—Tenn.—Calif.—B.C.; nat. from Eu. *JI—Au.*

3. ***L. polyphylla*** Rydb. Biennial; stem about 1 m. high, glabrous; leaves sessile, slightly auriculate-clasping, very numerous, linear-lanceolate, entire, acuminate, 1–2 dm. long, glabrous; involucre about 1 cm. high; outer bracts lanceolate, the inner linear-lanceolate; achenes nearly black, 3–4 mm. long, indistinctly 3-nerved, transversely rugose. Meadows: Ida. *Submont.* Au.

4. ***L. canadensis*** L. Biennial; stem 1–3 m. high, often mottled, glabrous or nearly so; basal leaves mostly spatulate or oblong, dentate or pinnatifid; stem-leaves 1–3 dm. long, sinuately pinnatifid; involucres 10–12 mm. high; outer bracts lanceolate, inner linear; flowers yellow; achenes oval-oblong, almost black, transversely rugose, 3-nerved. Moist places: N.S.—Fla.—Colo.—Sask.—Alta. *Plain—Submont.*

5. ***L. ludoviciana*** (Nutt.) DC. Biennial; stem 5–15 dm. high, glabrous; leaves oblong-oblanceolate in outline, sinuately lobed or pinnatifid, with rounded, ovate or lanceolate, spinulose-denticulate lobes; involucres 15–20 mm. high; outer bracts ovate, the inner linear-lanceolate, scarious-margined; flowers yellow; achenes brown or black, 4 mm. long, broadly oval or obovate, 3-ribbed, obscurely transversely rugose. River-banks and wet places: Minn.—Mo.—Tex.—Colo.—Mont. *Plain—Submont.* *JI—S.*

6. ***L. graminifolia*** Michx. Biennial or perhaps perennial; stem 5–15 dm. high, glabrous; leaves glaucous, elongated linear or linear-oblanceolate, 1–4 dm. long, entire or sinuately lobed or pinnatifid with narrow, spreading or deflexed lobes; involucres 12–15 mm. high; outer bracts lanceolate, the inner linear-lanceolate, scarious-margined; flowers yellowish, white or purplish; achenes elliptic, 4–5 mm. long, 3-nerved, black. Rich soil: N.C.—Fla.—Ariz.—Colo. *Son.—Submont.* Ap–S.

7. ***L. pulchella*** (Pursh) DC. Perennial, with a deep rootstock; stem 3–10 dm. high, glabrous; leaves linear-lanceolate, lanceolate, or oblong, acute, entire, dentate or even some of them pinnatifid, 5–20 cm. long, somewhat glaucous; panicle usually narrow; involucres 16–20 mm. high; flowers blue; achenes oblong-lanceolate, about 4 mm. long, rather strongly 3-nerved on the faces, gradually tapering into the short beak. *L. sylvatica* A. Nels. Wet meadows: Sask.—Mo.—N.M.—Calif.—B.C. *Plain—Submont.* My–Au.

8. *L. spicata* (Lam.) Hitchc. Annual or biennial; stem glabrous 5-35 dm. high; leaves deeply pinnatifid, more or less hispid on the veins beneath; lobes somewhat recurved; involucre campanulate, about 1 cm. high; bracts imbricate in about 4 series, lanceolate; flowers blue to nearly white; achenes elliptic, 5-nerved. *L. leucophaea* (Willd.) A. Gray. Moist ground: Newf.—N.C.—Colo.—Ida.—Man. *Submont.*—*Mont.* Jl—O.

9. *L. multifida* Rydb. Annual or biennial; stem 1-2 m. high, glabrous, somewhat glaucous; leaves deeply pinnatifid, glabrous and glaucous; involucre about 1 cm. high, campanulate; bracts purplish, in 3-4 series, lanceolate to linear-lanceolate, obtusish; flowers blue; achenes brown, 5-ribbed. Wet places: B.C.—*Mont.*—Ida.—Ore. *Submont.* Jl—Au.

26. *SŌNCHUS* (Tourn.) L. SOW-THISTLE.

Leafy-stemmed, mostly glaucous herbs, with cymose or umbellate heads. Involucre campanulate; bracts few, thin, with many shorter ones at the base. Flowers yellow. Achenes obcompressed, ribbed, not beaked. Pappus of numerous white, soft, fine bristles, mainly falling off together.

Perennial; achenes slightly compressed; involucre usually glandular-pubescent; heads about 2 cm. high.

Annual; achenes strongly compressed; involucre usually glabrous; heads about 15 mm. high.

Auricles of the leaves acute; achenes transversely wrinkled.

Auricles of the leaves rounded; achenes not transversely wrinkled.

1. *S. arvensis*.

2. *S. oleraceus*.

3. *S. asper*.

1. *S. arvensis* L. Stem 5-12 dm. high, leafy below; lower leaves runcinate-pinnatifid, spinulose-dentate, with short petioles, glabrous; upper leaves lanceolate, sessile, clasping, undivided or pinnatifid; bracts linear-lanceolate, in about 3 series; achenes oblong, slightly flattened, with thick ribs, transversely rugose. Fields and roadsides: Newf.—N.J.—Utah—Ida.—B.C.; nat. from Eu. Jl—O.

2. *S. oleraceus* L. Stem 5-30 dm. high, glabrous; lower leaves petioled, lyrate-pinnatifid, 1-2.5 dm. long; lobes lanceolate, spinulose-dentate, or the terminal one large and triangular or triangular-hastate; upper leaves similar but auriculate-clasping; involucral bracts linear-lanceolate, imbricate in about 4 series; achenes 2.5 mm. long, oblong, 3-ribbed. Fields and waste places: N.S.—Fla.—Calif.—Wash.; Mex., C. Am., and S. Am.; nat. from Eu. *Plain*—*Submont.* My—N.

3. *S. asper* (L.) All. Stem 5-30 dm. high, glabrous; lower leaves obovate or spatulate, petioled, the upper oblong or lanceolate, auriculate-clasping, undivided to deeply runcinate-pinnatifid, with broad lobes, spinulose-denticulate; bracts linear-lanceolate, imbricate in about 4 series, the outer with the midribs more or less thickened in age; achenes oblong, 3-ribbed, about 3 mm. long. Waste places and fields: N.S.—Fla.—Calif.—B.C.; W. Ind. and Mex.; nat. from Eu. *Plain*—*Submont.* My—N.

PTERIDOPHYTA*

FERNWORTS.

Plants of two distinct generations, in one consisting of a plant-body (sporophyte), which has stems containing vascular tissue and produces spores asexually, in the next, developing from the spore, consisting of a thalloid-body (gametophyte or prothallium), which bears the sexual reproductive organs (archegones and antherids). The plant-body develops from the oosphere within the archegone, after being fertilized by spirally coiled motile bodies (spermatozoids), produced by the antherids.

KEY TO THE FAMILIES.

	PAGE
Leaves usually broad, entire or dissected, not scale-like; fern-like plants.	
Spores of one kind, minute, borne in sporanges.	
Vernation not spirally coiled; sporangia ringless, leathery, opening by a transverse slit, arranged in spikes or panicles.	1. OPHIOGLOSSACEAE. 1038
Vernation spirally coiled; sporangia membranous, provided with a ring, which opens elastically.	2. POLYPODIACEAE. 1040
Spores of two kinds, minute microspores (male) and larger macrospores (female), borne in sporocarps.	
Plant rooting in the mud; leaves 4-foliolate, petioled.	3. MARSILLIACEAE. 1050
Plant minute, floating; leaves entire or 2-lobed.	4. SALVINIACEAE. 1051
Leaves scale-like or awl-like; moss-like or rush-like plants.	
Sporanges in an apical cone, borne under peltate bracts; stem usually hollow, rush-like.	5. EQUISETACEAE. 1051
Sporanges in the axils of small leaf-like bracts; stem solid.	
Leaves awl-like, elongate, borne on a short thick corm-like caudex; water plants.	6. ISOETACEAE. 1053
Leaves scale-like, flat, borne on a distinct stem; land plants.	
Spores uniform, minute.	7. LYCOPODIACEAE. 1054
Spores of two kinds, microspores and macrospores.	8. SELAGINELLACEAE. 1056

FAMILY 1. OPHIOGLOSSACEAE. ADDER'S TONGUE FAMILY.

Leafy succulent plants with fleshy rhizomes and fibrous, often fleshy, roots. Leaves (fronds) erect to reflexed, but not coiled in vernation, consisting of a sterile simple or compound leaf-blade and one or more stalked spore-bearing spikes or panicles (sporophylls), all borne on a common stalk. Sporanges bivalvular, formed from the interior tissue of the sporophylls. Prothallia underground, not green, monoecious. Spores of one kind.

1. BOTRYCHIUM Sw. MOONWORT.

Terrestrial plants, with erect rhizomes and usually only one frond. Roots clustered, fleshy. Common stalk with more or less of its length below ground, the bud of the frond of the following year enclosed within its hollow base. Veins free, forking. Sporophyll single. Sporangia distinct, globose, arranged in two rows.

Frond-bud without hairs.

Sporophyll and sterile leaf-blade not completely bent down in the bud.

Sporophyll erect in the bud, the sterile leaf-blade erect or with the apex bent over; segments of the sterile leaf commonly cuneiform or fan-shaped.

1. *B. simplex*.

* Contributed by Miss Margaret Slosson, except the families *Equisetaceae*, *Isoetaceae*, and *Selaginellaceae*, and the key to the families.

Sporophyll and sterile leaf-blade with the apex or upper part bent down in the bud.

Sterile leaf-blade sessile or subsessile, once pinnately divided, the segments
lunulate or fan-shaped. 2. *B. Lunaria*.

Sterile leaf-blade usually stalked, entire to twice pinnately divided, the seg-
ments mostly oblong or ovate. 3. *B. neglectum*.

Sporophyll and sterile leaf-blade completely bent down in the bud; sterile leaf-blade
deltoid. 4. *B. lanceolatum*.

Frond-bud hairy.

Common stalk open along one side at base, usually long; sterile leaf-blade sessile.

Common stalk completely closed at base, usually short; sterile leaf-blade stalked. 5. *B. virginianum*.

Sterile leaf-stalk 1-4 cm. long; plant very stout and fleshy. 6. *B. Coulteri*.

Sterile leaf-stalk usually 5 cm. long or more; plant not so fleshy, often slender.

7. *B. silaifolium*.

1. ***B. simplex*** Hitchc. Frond 3.5-20 cm. long; common stalk usually short; sterile leaf-blade with a stalk 0.2-0.5 cm. long, oblong or deltoid or deltoid-ovate, rounded, entire to twice pinnately or sometimes subternately subdivided; segments cuneiform or fan-shaped or rarely lunulate, rounded at apex; sporophyll usually long-stalked. In grassy places and open woods: "N.S."—Me.—"Md."—Wis.—Ont.; "Sask."—(?) "Alta."—Mont.—Colo.—Utah; Eu. *Submont.*—Mont.

2. ***B. Lunaria*** (L.) Sw. Frond 3-28 cm. long; sterile leaf-blade with the apex bent down and clasping the sporophyll in the bud, oblong or rarely ovate or deltoid-ovate, rounded above, once pinnately divided; segments fan-shaped or lunulate or reniform, often imbricate, entire, or rarely radially incised or cleft into cuneiform lobes; sporophyll with the apex bent down in the bud, 1-3 times divided. Woods and grassy places: Greenl.—P.E.I.—"Vt."—N.Y.—n Ohio—Mont.—Colo.—Utah—B.C.—Alaska; Calif., Old World. *Mont.*—*Submont.* The var. *onondagense* (*B. onondagense* Underw.), which is distinguished by its rather distant fan-shaped segments, is the form usually occurring in the United States.

3. ***B. neglectum*** Wood. Frond 5.5-32 cm. long; common stalk usually long; sterile leaf with the upper part bent down in the bud, with a stalk 0.2-1.7 cm. long, oblong or sometimes deltoid, subacute, the primary divisions oblong or ovate, the segments usually oblong, rounded at apex, entire or incised; sporophyll with the upper part bent down in the bud, commonly diffusely branched. Wooded places: Que.—Md.—"Ohio"—Wis.; (Black Hills) S.D.; Colo.; "B.C."; Eu. *Mont.*

4. ***B. lanceolatum*** (S. G. Gmel.) Ångstr. Frond 5-30 cm. long; common stalk long; sterile leaf-blade broadly deltoid, acute, 1-2 times pinnately or subternately divided, the primary divisions oblong to ovate or oblong-lanceolate, the segments ovate, ovate-lanceolate or suboval, entire or incised; stalk of sporophyll mostly shorter than the rather diffuse panicle; sporangia large, crowded, sessile or broadly short-pedicelled. Woods and damp hillsides: Alaska—"B.C."—Wash.—Wyo.; "Greenl."; Old World.

5. ***B. virginianum*** (L.) Sw. Frond 6.5-60 cm. long; sterile leaf-blade thin, 3-5 times divided, broadly deltoid, the subdivisions next to the last narrowly oblong or lanceolate to ovate or deltoid, pinnately divided, the segments oblong, blunt, incised; sporophyll mostly long-stalked. Wooded places: Que.—Fla.—Tex.—Colo.—Ore.—B.C.; trop. Am. and the Old World. *Plain*—*Mont.*

6. ***B. Coulteri*** Underw. Frond 12-26 cm. long; sterile leaf-blade broadly deltoid to pentagonal, obtuse, about 4 times pinnately or subternately divided, the primary divisions crowded and imbricate, oblong to deltoid, the subdivisions next to the last oblong, pinnately divided into 2-5 pairs of oblique, broadly oblong or ovate, mostly acute or subacute lateral segments, and with ovate to rhomboid subacute tips, the segments entire or undulate; panicle of the sporophyll short and compact. Very close to the next and possibly only a form of it. Mostly geyser formations: Ore.—Mont.—Wyo. *Mont.*

7. ***B. silaifolium*** Presl. Frond 9.5-60 cm. long; sterile leaf-blade broadly deltoid to pentagonal, acute or obtuse, 3-4 times pinnately or subternately divided, the primary divisions oblong or oblong-lanceolate to deltoid or pentagonal, the subdivisions next to the last oblong-lanceolate, pinnately divided into 2-5 pairs of oblique, oblong, narrowly elliptic, or sometimes ovate, decurrent lateral

segments, and with broader rhomboid tips, the segments crenulate; panicle of the sporophyll diffuse. Fields and open woods: Ont.—Que.—N.J.—Pa.—Wis.; Alaska—B.C.—Calif. *Submont.*—*Mont.*

FAMILY 2. POLYPODIACEAE. FERN FAMILY.

Sporophytes consisting of a rhizome and leaves (fronds) coiled in the bud. Sterile fronds leaf-like, fertile fronds (sporophylls) either leaf-like or partially or completely non-foliaceous, bearing the sporanges on their lower surface or at their margins, commonly in clusters (sori). Sori naked or furnished with a special covering (indusium). Sporangies stalked, furnished with an incomplete vertical ring of thickened cells (annulus), opening transversely. Prothallia green, above ground.

Fertile fronds, with contracted berry-like or necklace-like subdivisions, not foliaceous.

Veins of the sterile fronds netted.

1. ONOCLEA.

Veins of the sterile fronds free.

2. PTERETIS.

Fertile and sterile fronds foliaceous, alike or differing; veins free.

Sori on the under surface of the fronds, each provided with a special indusium not connected with the margin of the frond.

Sori roundish.

Indusia inferior or attached at base at one side of the sorus.

Indusia inferior, stellate or split into spreading lobes.

3. WOODSIA.

Indusia attached at base at one side of the sorus, at first arched over it,

finally thrown back or evanescent.

4. FILIX.

Indusia superior.

Indusia peltate.

5. POLYSTICHUM.

Indusia orbicular-reniform, adherent at the sinus.

Midveins and midribs united at a wide angle; fronds usually provided with true hairs, consisting of a single cell or a single row of cells.

6. THELYPTERIS.

Midveins and midrib united at a very acute angle; fronds lacking true hairs.

7. DRYOPTERIS.

Sori oblong or linear, or shaped like a horseshoe or shepherd's crook.

Sori all straight or rarely slightly curved, single on the sides of the veins.

8. ASPLENIUM.

Sori, at least in part, shaped like a horseshoe or shepherd's crook, crossing the fertile vein and more or less recurved upon it.

9. ATHYRIUM.

Sori naked, or protected, at least at first, by the revolute or reflexed margins or portions of the margins of the frond.

Margin of the frond flat or merely revolute, not modified.

Margin of the frond revolute; sori more or less confluent, forming a marginal band.

16. NOTHOLAENA.

Margin of the frond flat; sori dot-like on the veins.

Stipes jointed to the rhizome.

15. POLYPODIUM.

Stipes not jointed to the rhizome.

6. THELYPTERIS.

Margin of the frond reflexed over the sori, more or less modified.

Sori borne on the under side of reflexed lobes of the frond.

10. ADIANTUM.

Sori not borne on the under side of the reflexed portions of the margin of the frond.

Sori borne on a continuous vein-like receptacle connecting the ends of the veinlets.

11. PTERIS.

Sori borne on the veins at or near their tips.

Sori extending down the veins; edges of the fertile fronds finally opening out flat; sterile and fertile fronds markedly dissimilar.

12. CRYPTOGRAMMA.

Sori marginal or submarginal; sterile and fertile fronds alike or somewhat dissimilar.

Sori confluent, forming a submarginal band; segments of the fronds glabrous or nearly so.

13. PELLAEA.

Sori distinct or contiguous; segments usually pubescent, tomentose or scaly.

14. CHEILANTHES.

1. ONOCLEA L. SENSITIVE FERN.

Ferns, with coarse dimorphous fronds scattered on creeping rhizomes. Sterile fronds foliaceous. Fertile fronds with rigid, contracted ball-like subdivisions. Sori roundish, on elevated receptacles, partly covered by delicate hood-like indusia attached to the bases of the receptacles.

1. *O. sensibilis* L. Sterile fronds 3–13.5 dm. high, deltoid-ovate, pinnatifid; segments lanceolate-oblong, entire, undulate or sinuate-pinnatifid; rachis winged; veins anastomosing; fertile fronds 3–7.5 dm. high, bipinnate; pinnules

rolled into closed balls, finally dehiscent; veins free; sporangia dorsal on the simple or forked veinlets. Damp places: Newf.—Fla.—Tex.—S.D. (Black Hills)—Sask. *Plain*—*Submont.*

2. PTERËTIS Raf. OSTRICH FERN.

Plants with coarse dimorphous fronds, growing in crowns from stoloniferous rhizomes. Sterile fronds foliaceous. Fertile fronds contracted, with revolute margins covering the sori. Sori roundish, on elevated cylindrical receptacles partly covered by delicate lacerate fugacious indusia inferiorly attached. [*Struthiopteris* Mett., *Matteuccia* Todaro.]

1. **P. nodulosa** (Michx.) Nieuwland. Scales of base of stipe pale brown to cinnamon-colored, thin, membranous; fronds abruptly acuminate at apex, gradually reduced towards base; sterile fronds 0.6–3 m. long, broadly oblanceolate or spatulate, with lanceolate or linear, pinnatifid pinnae 5–18 cm. long; segments oblong, obtuse or acute; fertile fronds shorter, with rigid, upcurved, commonly pinnatifid necklace-shaped pinnae; veins free, pinnate; veinlets simple. *Onoclea nodulosa* Michx. Related to but distinct from the European *P. struthiopteris* (L.) Nieuwland [*Matteuccia struthiopteris* (L.) Todaro.] Wet places: Newf.—Va.—S.D.—B.C. *Mont.*—*Submont.*

3. WOÛDSIA R. Br.

Small plants with tufted pinnately compound fronds. Sori round, borne on the veins. Indusia placed under the sporangia, sometimes enclosing it at first, often variously divided. Veins free.

Stipe articulate near the base.

1. *W. glabella*.

Stipe not articulate.

Blades pulverulent, with flattened articulate hairs and stalked glands.

2. *W. scopulina*.

Blades without articulate hairs, unless at the ends of the indusia or segments, glabrous or minutely glandular.

Indusia very small, divided almost to the center into a few hair-like filaments.

3. *W. oregana*.

Indusia large, cleft more or less deeply into several lobes.

Lobes of the indusia divided at least halfway down into slender articulate flattened hairs.

4. *W. mexicana*.

Lobes of indusia merely jagged, rarely with an occasional jointed extension, often glandular.

5. *W. obtusa*.

1. **W. glabella** R. Br. Fronds tufted, 2.5–15.5 cm. long; stipes usually straw-colored; blades linear or narrowly lanceolate, somewhat narrowed toward base, smooth, pinnate; pinnae deltoid to roundish-ovate, crenately lobed; indusia divided into narrow jointed hair-like curving divisions. Moist rocks: Alaska—Greenl.—Que.—Alta.; N.H., N.Y.; “Minn.”; Eu. *Boreal*—*Subarctic*.

2. **W. scopulina** D. C. Eat. Fronds 5.5–35 cm. long; blades lanceolate, pinnate; pinnae mostly oblong-ovate, deeply pinnatifid; segments short, ovate or oblong, crenate-serrulate; indusia delicate, deeply cleft into laciniae which terminate in short hairs. On rocks: B.C.—Neb.—Ariz.—Calif.; (Gaspe Peninsula) Que. and (Great Craggy Mts.) N.C.; reported from Minn. and nw Ia. *Submont.*—*Mont.*

3. **W. oregana** D. C. Eat. Fronds 5–26.5 cm. long; blades lanceolate-oblong, pinnate; pinnae triangular-oblong, obtuse or subacute, pinnatifid; segments oblong or ovate, obtuse, toothed or crenate; teeth often reflexed over the sori; sori submarginal. On rocks: B.C.—Calif.—Ariz.—Colo.—(? S.D.)—Sask.—Que. *Submont.*—*Subalp.*

4. **W. mexicana** Fée. Fronds 5–30 cm. long; blades lanceolate, pinnate, minutely glandular; pinnae triangular-lanceolate or rarely suboblong, pinnately divided; segments finely toothed, the teeth ending in delicate semitransparent tips which are ciliated in young fronds; sori submarginal. (?) *W. Cathcartiana* B. L. Robins. Rocks: S.D.—Colo.—N.M.—Ariz.; Minn. and Mex. *Son.*—*Mont.*

5. **W. obtusa** Torr. Fronds 6–62 cm. long; blades broadly lanceolate, slightly reduced at base, pinnate to bipinnate, minutely glandular; pinnae oblong

or triangular-ovate, pinnately parted or pinnate below; segments oblong, obtuse, crenate-dentate or the lower pinnatifid with toothed lobes. "N.S."—N.H.—Ga.—N.M.—Wis.; Ariz. and (?) "B.C."

4. *FILIX* Adans.

Ferns, with pinnately compound fronds of rather thin texture. Sori roundish, indusiate, borne on the veins. Indusia delicate, hood-like or flattish, attached at one side of and partly under the sorus, at first arched over it, finally thrown back or withering. Veins free. [*Cystopteris* Bernh.]

Blades of the fronds deltoid-lanceolate or broadly lanceolate, twice or thrice pinnate.

Blades elongate deltoid-lanceolate, 3–12 dm. long; basal pair of pinnae the largest.

Blades broadly lanceolate, 2–4.5 dm. long; basal pair of pinnae usually slightly shortened.

Blades of the fronds deltoid-ovate, three to four times pinnate.

1. *F. bulbifera*.

2. *F. fragilis*.

3. *F. montana*.

1. *F. bulbifera* (L.) Underw. Rhizome short; fronds clustered; blades minutely more or less glandular beneath, especially on the rachises and midribs; pinnae oblong-ovate to lanceolate-oblong, pinnate; pinnules unequally oblong-ovate, obtuse, variously incised to deeply pinnatifid, more or less adnate or free; rachis and pinnae commonly bulbiferous beneath, the bulblets producing new plants after falling to the ground; indusia short, convex, truncate. *C. bulbifera* (L.) Bernh. Damp places, especially about rocks: "Newf."—N.S.—"Man."—Wis.—Ark.—Ga.; Utah—Ariz. *Boreal*—*Austr.*—*Son.*

2. *F. fragilis* (L.) Gilib. Rhizome creeping; fronds clustered or slightly scattered, glabrous; stipe and primary rachis slender, brittle, stramineous or brownish below; secondary rachises usually winged; pinnae deltoid-lanceolate or deltoid-ovate; segments decurrent, variable, roundish-oval or ovate or rhomboid-ovate or ovate-lanceolate, dentate, with short obtuse teeth or deeply toothed or cleft, with narrower teeth, or cleft or sometimes pinnatifid, with toothed segments; indusia delicate, convex, roundish or commonly pointed, often toothed or lacinate at apex. *Cystopteris fragilis* (L.) Bernh. Rocky places: Greenl.—Ga.—Okla.—Calif.—Alaska; trop. Am., and the Old World. *Plain*—*Alp.*

3. *F. montana* (Lam.) Underw. Rhizome slender, creeping; fronds scattered, 12–45 cm. long; stipes slender; blades often subternate; basal pair of pinnae much the largest, unequally deltoid-ovate; pinnules deeply divided; segments oblong, deeply toothed or divided; indusia convex, ovate, soon thrown back or evanescent. Lab.—Que.—Ont.; Colo.; B.C.—Alaska; Eurasia. *Mont.*—*Subalp.*

5. *POLYSTICHUM* Roth. HOLLY FERN, CHRISTMAS FERN.

Ferns of mostly rigid habit, with firm-textured pinnate to pinnately compound fronds usually with sharply toothed or spinulose margins. Sori round, indusiate, borne on the veins. Indusium peltate. Veins free.

Blades normally simply pinnate; pinnae auricled or the upper side at base, obliquely truncate at the lower.

Fronds very short-stalked; pinnae broadly lanceolate, falcate, on the lower triangular.

Fronds rarely very short-stalked; pinnae horizontal, slightly falcate, lanceolate or linear, acuminate.

Blades normally more compound.

Blades proliferous below the apex.

Blades not proliferous.

Pinnae serrate in the distal part, pinnately lobed at base.

Pinnae pinnately divided almost throughout the blade, commonly fully bipinnate.

1. *P. lonchitis*.

2. *P. munitum*.

3. *P. Andersoni*.

4. *P. scopulinum*.

5. *P. Braunii*.

1. *P. Lonchitis* (L.) Roth. Fronds growing in a crown, 8–22 cm. long; stipes and rachises chaffy with light brown scales; blades linear-lanceolate, gradually tapering toward base; pinnae 1–4.5 cm. long, densely spinulose-toothed, the teeth mostly spreading; sori medial or supramedial. Woods: Greenl.—N.S.—"Wis."—Alta.—Colo.—Calif.—Alaska. *Boreal*.

2. *P. munitum* (Kaulf.) Presl. Fronds growing in a crown, 22–152 cm. long; stipes densely chaffy at base, less so above; rachises chaffy; scales bright reddish

brown; blades lanceolate; pinnae 2-14 cm. long, sharply and often doubly serrate, the serrations spinescent, often incurved; sori mostly supramedial. Woods: Alaska—Mont.—Ida.—Ore.—Calif.

3. *P. Andersoni* Hopkins. Fronds 32-74 cm. long; stipes 2-21.5 cm. long; stipe and rachis densely chaffy, with bright golden-brown scales; blades elliptic-lanceolate, gradually narrowed both ways; pinnae lanceolate or the basal subdeltoid, acute or acuminate, the uppermost adnate-decurrent, those below sessile to short-stalked, obliquely pinnatifid, the basal segment, especially the upper, the largest; segments decurrent, suboval to oval-oblong, not auricled or only the basal auricled, long-spinescent, serrate-spinulose, with often incurved teeth, chaffy beneath, chaffy-fibrillose above; sori medial; indusia ciliate-erose. In thickets: Alaska—B.C.—Wash.

4. *P. scopulinum* Maxon. Fronds 6.5-43 cm. long; stipes and rachis conspicuously chaffy, with light brown scales; blades lanceolate or linear, commonly somewhat narrowed toward base; pinnae ovate or ovate-oblong, mostly obtuse, serrate in the outer part, with pointed or aculeate, not spinescent teeth, pinnately lobed at base, the superior basal lobe the largest, parallel to the rachis, the inferior oblique to the rachis; sori near the midvein; indusia large, smooth, somewhat irregularly lobed, not ciliate. Doubtful if distinct from *P. Lemmoni* Underw. Rocks: B.C.—n Utah—Ore.; s Calif., and (Gaspe Peninsula) Que. Mont.

5. *P. Braunii* (Spencer) Fée. Fronds in a crown, 1.5-8.5 dm. long; stipe and rachis chaffy, with bright brown scales; blades lanceolate, gradually narrowed toward base; pinnae oblong-lanceolate from a slightly broader base; segments ovate-oblong, produced on the upper side, obliquely cut away on the lower, commonly acute, sharply toothed, scaly; indusia small, entire. Rocky woods: Newf.—Mass.—Pa.—Mich.; "B.C." Boreal.

6. *THELYPTERIS* Schmidel.

Ferns with stipes not articulated to the rhizomes, and pinnatifid to bipinnatifid or rarely more compound fronds. Midveins and midribs united at a broad angle. Veins pinnate, the veinlets simple or occasionally forked, the lower ones ending above the sinus between segments of the blade or running to it, more or less connivent, or the basal pair uniting in the leaf-tissue and sending a common branch to the sinus. Sori borne on the veins, with or without indusia, round or, especially when nonindusiate, oblong or linear or rarely curved. Indusia reniform or rarely otherwise curved. Fronds usually hairy, often glandular, sometimes scaly also. Hairs whitish, one-celled or long, soft, thin, subulate, and consisting of a single row of cells (not reddish, short, articulated and cylindric), often hooked at the point, simple and single, or fascicled or branched and sessile (never branched at apex of a stalk). [*Dryopteris*, subgenera *Lastrea*, *Glaphyopteris*, *Steiropteris*, *Cyclosorus*, and *Leptogramma* C. Chr., *Phegopteris* Fée.]

Blades of the fronds bipinnatifid.

Blades broadest at base, or only the basal pair of pinnae slightly shortened.

Blades gradually much narrowed toward base.

Blades of the fronds ternate or subternate, once to twice pinnate.

Fronds glabrous, excepting a few scales on the stipe, or with only occasional microscopic trichomes resembling rudimentary glands.

Fronds distinctly glandular, especially the stipes and rachises; glands capitate.

1. *T. Phegopteris*.

2. *T. Oreopteris*.

3. *T. Dryopteris*.

4. *T. Robertiana*.

1. *T. Phegopteris* (L.) Slosson. Rhizome creeping; fronds scattered, 10-55 cm. long; blades triangular or nearly so, mostly longer than broad, sparingly hairy on both surfaces, especially on the veins; hairs unicellular; pinnae mostly linear-lanceolate, the basal pair deflexed and advanced; segments oblong, obtuse, entire or slightly crenate, the basal decurrent and adnate to the main rachis; rachises scaly beneath; sori submarginal. *Dryopteris Phegopteris* (L.) C. Chr. *Phegopteris polypodioides* (L.) Fée. Wooded places: Greenl.—Newf.—Va.—Minn.—Man.—Ore.—Alaska; Eu. Mont.—Subalp.

2. *T. Oreopteris* (Ehrh.) Slosson. Fronds in a crown; stipes rather short; stipe and rachis somewhat scaly; blades broadly lanceolate, tapering below, pin-

nate, glandular; pinnae broadest at base, deeply pinnatifid, noticeably short-hairy below on the midribs or both midribs and midveins; veins simple or forked; sori submarginal; indusia toothed. *Dryopteris Oreopteris* (Ehrh.) Maxon. *Polypodium montanum* Vogler. Alaska; Eu. Represented in our range by the variety *T. Oreopteris hesperia* Slosson, which differs chiefly in having the stipe and rachis conspicuously powdered with small light brown scales, a few occurring also on the midribs of the pinnae beneath, the fronds otherwise glabrous or occasionally with only a few scattered microscopic hairs on or near the rachis or midribs, and (?) the fronds smaller. Near streams: B.C.—Wash.—Alaska. *Mont.—Subalp.*

3. *T. Dryopteris* (L.) Slosson. Rhizome slender, creeping; fronds scattered, 8–69 cm. long; blades broadly triangular; the three primary divisions stalked, 1–2 pinnate; segments oblong, obtuse, entire or toothed; rachis not winged; sori submarginal. OAK FERN. Wood places: Greenl.—Newf.—Va.—Minn.—(Black Hills) S.D.—Mont.—Ida.—Ore.—Alaska; Colo., Ariz., and Eu.

4. *T. Robertiana* (Hoffm.) Slosson. Rhizome slender, creeping; fronds scattered, 13–62 cm. long, somewhat rigid; blades triangular-ovate, the three primary divisions stalked, the lateral smaller in proportion than in the preceding species; sori submarginal. Woods: Alaska—Yukon Terr.—Que.—Ida.—Minn.—(?) Ida.; Eu.

7. *DRYOPTERIS* Adans. SHIELD FERN, MALE FERN.

Ferns with stipes not articulated to the rhizomes and mostly bipinnate to decompound fronds. Midribs and midveins of the pinnae's subdivisions attached at a very acute angle. Veins pinnate, free, the veinlets usually forked. Sori borne on the veins, round, usually indusiate. Indusia reniform or occasionally resembling that in *Filix*. Fronds furnished with scales, at least on the stipes and rachises, often glandular, without true hairs consisting of a single cell or row of cells. Scales thin, entire or fimbriate, always consisting of 2 or more rows of cells, which are mostly long and narrow, with flexuose walls. [*Dryopteris*, subgenus *Eudryopteris* C. Chr.]

Indusia comparatively large, not dot-like.

Sori not close to the margin.

Rachis usually conspicuously chaffy; fronds 4.5–40 cm. long.

Rachis naked or not noticeably chaffy; fronds 16–110 cm. long.

Pinnae triangular-oblong, or the lowest nearly triangular-ovate.

Pinnae linear-lanceolate from a somewhat broader base.

Sori close to the margin.

Indusia minute, dot-like; blades bipinnatifid to tripinnate.

Pinnules decurrent on the narrowly-winged midribs; indusia glabrous.

Larger pinnules not decurrent.

Indusia, and frond when young, conspicuously glandular.

Indusia glabrous or with only a few glands.

1. *D. fragrans*.

2. *D. cristata*.

4. *D. Filix-mas*.

3. *D. marginalis*.

5. *D. spinulosa*.

6. *D. intermedia*.

7. *D. dilatata*.

1. *D. fragrans* (L.) Schott. Fronds borne in a crown, 4.5–40 cm. long, aromatic; stipe and rachis chaffy with bright brown scales; blades lanceolate to narrowly oblanceolate, somewhat narrowed toward base, nearly or quite bipinnate; pinnae oblong-lanceolate to deltoid-lanceolate; segments oblong, obtuse, adnate-decurrent, subentire to deeply incised; indusia very large, ragged and somewhat glandular at margin. On rocks: Alaska—Ellesmereland—Me.—Minn.; Russia.

2. *D. cristata* (L.) A. Gray. Fronds crowded at apex of a short stout creeping rhizome, the fertile erect, 2.5–10 dm. long, 7–15 cm. broad, much overtopping the sterile; scales of stipe and rhizome pale brown, one-colored; blades linear or lanceolate, bipinnatifid; segments rather broad, oblong or triangular-oblong, obtuse, finely, usually sharply, serrate or obscurely or more deeply cut into serrate lobes; sori about medial; indusia smooth. Swampy places and roadsides: "Mack."—n Ida.—Man.—Va.—Newf.; Neb.; Eu. *Submont.—Subalp.*

3. *D. marginalis* (L.) A. Gray. Rhizome with golden brown scales; fronds in a crown, 1.2–10 dm. long; blades evergreen, coriaceous, ovate-oblong or ovate-lanceolate, usually bipinnate or nearly so; lower pinnae unequally deltoid-

lanceolate, those above lanceolate to broadly oblong-lanceolate; segments oblong or lanceolate, mostly obtuse or subacute, falcate or subfalcate, subentire to crenately lobed; indusia smooth. Rocky places and old wood in swamps: Que.—N.S.—Ga.—Okla.—Sask.

4. *D. Filix-mas* (L.) Sw. Fronds borne in a crown, 1.5–10 dm. long, 6–30 cm. broad; blades broadly oblong-lanceolate, somewhat narrowed toward the base, bipinnatifid or bipinnate; pinnules oblong, obtuse, serrate at apex and obscurely so on the sides, the larger incisely lobed; sori nearer the midvein than the margin; indusia glabrous or glandular, often some with one or more glands and others glabrous on the same frond. Damp woods: B.C.—Ore.—Ida.—Ariz.—N.M.—(Black Hills) S.D.; Ont.—Que.—N.S.—Vt.; “Greenl.” Eu. *Submont.—Subalp.*

5. *D. spinulosa* (L.) Kuntze. Scale of stipe and rhizome light brown, one-colored; fronds 2–9.5 dm. long; blades ovate-lanceolate to oblong; pinnae oblique to the rachis, elongate-triangular, the lower broadly and unequally triangular; pinnules oblique to the midribs, connected by a very narrow wing, acute, incisely serrate or obliquely pinnatifid; segments incised; teeth mucronate, falcate, appressed; sori submarginal, terminal on the veinlets. Damp woods: Newf. Va.—“Ky.”—Wis.; B.C., Ida., and Eu. According to Macoun, throughout Canada. *Submont.—Mont.*

6. *D. intermedia* (Muhl.) A. Gray. Fronds in a crown, 2–9.5 dm. long; scales of the stipe light brown, mostly with darker centers; blades usually dark, often bluish green, ovate-lanceolate to oblong; pinnae usually nearly or quite at right angles to the rachis, the lower unequally lanceolate to ovate-lanceolate, the lowest inferior segment in the basal pair commonly shorter than the next; upper pinnae lanceolate to oblong; pinnules pinnately divided, the largest not decurrent; segments dentate. Wooded places: Newf.—N.C.—Tenn.—Wis.—Ont.; Tex. (? “Throughout Canada.”)

7. *D. dilatata* (Hoffm.) Underw. Fronds about 1–11 cm. or more long; blades triangular to ovate or broadly oblong, usually tripinnate; lower pinnae broadly and unequally ovate or triangular, the upper lanceolate to oblong or elliptic-lanceolate; pinnules lance-oblong; teeth mucronate, straight or falcate, usually not appressed; sori mostly subterminal on the veinlets; in the typical form with scales of the rhizome mostly heavily dark-striped, and indusia often somewhat glandular, often some glabrous and others with one or more glands on the same frond. Alaska—B.C.—Calif.; Eu. Intergrading with the form designated by Kunze as *Aspidium compylopterum*, having large light brown scales only somewhat or not darker at center, ample fronds with spreading pinnules, basal pinnae on the lower side much elongate, the upper pinnae often elliptic-lanceolate, and indusia always glabrous. Greenl.—N.C.—n Ida.—(?) Wash.—B.C.—Alaska; Calif. (rare); Eu.

8. *ASPLENIUM* L. SPLEENWORT.

Ferns varying in size, with simple or compound commonly pinnate fronds. Sori oblong or linear, single or rarely a few double, borne on the veins. Indusia superior, attached laterally to the vein, opening toward the midrib or midvein. Veins free or rarely a few uniting. Scales of rhizome with dark-walled cells.

Blade irregularly forking.

Blade not forking.

Blade simply pinnate.

Stipe brown below; rachis green.

Stipe and rachis chestnut-brown or blackish.

Pinnules not auricled.

Pinnules auricled at base on the upper or both sides.

Blade bi- to tripinnatifid.

1. *A. septentrionale*.

2. *A. viride*.

3. *A. Trichomanes*.

4. *A. platyneuron*.

5. *A. Adiantum-nigrum*.

1. *A. septentrionale* (L.) Hoffm. Fronds tufted, 3.5–20 cm. long; stipes brown below; segments 2–5, oblique, linear, tapering both ways, entire or with a few oblique long narrow teeth; sori elongate, mostly 2–3 to each segment, usually opposed in pairs; indusia entire or sparingly short-ciliate. *Belvisia septentrionalis* (L.) Mirb. On rocks: S.D.—N.M.—L. Calif.—Wyo.; Eurasia. *Submont.—Mont.*

2. *A. viride* Huds. Fronds tufted; blades 2.7–20 cm. long, 0.8–1.5 cm. broad, linear-lanceolate; pinnae roundish ovate or rhombic, obtuse, broadly cuneate at base, the lower side obliquely truncate; margins, excepting the basal parts, deeply crenate; sori near the margins; indusia entire or denticulate. On rocks: Newf.—Vt.—Sask.—(Black Hills) S.D.—Wyo.—Wash.—Alaska. *Mont.*

3. *A. Trichomanes* L. Fronds tufted; blades 4–18 cm. long, linear; rachis faintly alate, not fibrillose; pinnae mostly oval or oval-oblong, inequilateral; margins, except the basal sides, slightly crenate; veins on both sides of the mid-veins usually forked; indusia commonly slightly crenulate. On rocks: Hudson Bay—Ala.—Ariz.—Alaska; Eu., the Azores, and Canary Islands. *Submont.*—*Mont.*

4. *A. platyneuron* (L.) Oakes. Fronds tufted, the fertile erect, 20–50 cm. long, 2.5–6.3 cm. broad, the sterile rosulate much shorter; blades linear-oblanco- late, gradually reduced toward the base; pinnae auriculate-lanceolate, subfalcate, crenate, serrate, or incised, the lower oblong or deltoid; sori oblique, near the mid-veins. Among rocks or stones: s Ont.—Me.—Fla.—N.M.—Colo.; Africa. *Submont.*—*Mont.*

5. *A. Adiantum-nigrum* L. Fronds tufted; stipes and lower part of the rachis chestnut-brown, except in young plants; rachis winged; blades 3–33 cm. long, ovate-deltoid to elongate-deltoid; lower pinnae deltoid, or nearly so, those above mostly lanceolate-deltoid, gradually passing into the pinnatifid apex of the blade; segments ovate to spatulate, cuneate at base, sharply toothed or obliquely cleft into toothed lobes; veins very oblique; indusia entire or subentire. *A. Andrewsii* A. Nels. On rocks: Colo.; Eurasia, and Africa. *Submont.*

9. *ATHYRIUM* Roth. LADY FERN.

Various sized ferns, with more or less compound fronds. Scales of the rhizome with thin-walled cells. Veins free. Sori borne on the veins, indusiate, mostly oblong or linear-oblong and curved at one end over the vein, or bent back upon itself along the other side of the vein, often horseshoe-shaped, occasionally roundish. Indusia following the shape of the sorus, attached along its length at the side next the vein, opening outwardly, rarely vestigial and hidden.

Pinnules commonly somewhat cuneate at base, sometimes appearing short-stalked; indusia rarely seen, very minute and evanescent.

Pinnules more or less parallel at base down to the rachis, at least on the upper side; indusia evident.

Indusia straight or variously curved, often shaped like a shepherd's crook.

Indusia mostly curved so as to appear circular with a narrow sinus.

1. *A. alpestre* (Hoppe) Rylands. Rhizome short, stout; fronds in a crown, 25–95 cm. long; blades oblong-lanceolate, slightly narrowed toward the base, bi- or tripinnate; pinnae deltoid-lanceolate, their rachises commonly very narrowly winged; pinnules ovate-oblong or oblong-lanceolate or deltoid-lanceolate, somewhat obliquely incised or pinnatifid or occasionally pinnate below; segments sharply toothed. Alaska—Mont.—Colo.—Calif.; Que.; Eu.

2. *A. Filix-foemina* (L.) Roth. Rhizome short, creeping; fronds closely clustered, 1.3–12.5 dm. long; stipes straw-colored, brownish or pinkish red; blades firmly herbaceous to herbaceous-membranous, rather deep green, often with a bluish tinge, except when growing in sun, broadly oblong-ovate to oblong-lanceolate or broadly lanceolate, not or somewhat shortly narrowed at base; pinnae short-stalked or the upper sessile, lanceolate, acuminate, toward apex pinnatifid, below pinnate or nearly so; pinnules oblong-lanceolate or broadly elliptical, incised or serrate, the lobes or teeth often again toothed; sori oblong, linear or hamate or occasionally horseshoe-shaped; indusia subentire to ciliate, the cilia often jointed and occasionally gland-tipped; some at least of the sporangia with a flat, jointed gland-tipped hair on the pedicel. Woods and fields: Ont.—Newf.—Fla.—La.; Tex.—Ariz.; (Black Hills) S.D.; the Old World. Probably also extends farther north in Canada.

3. *A. cyclosorum* Rupr. Rhizome erect or oblique; fronds in a crown, 2.8–15 dm. long; blades somewhat softly herbaceous, olive or yellowish green, elliptic-lanceolate, decidedly and rather gradually narrowed toward the base; pinnae lanceolate or oblong-lanceolate or elliptic-lanceolate, acuminate, pinnatifid toward tip, below pinnate or nearly so; pinnules oblong to lanceolate or ovate-lanceolate, commonly broader than in *A. filix-foemina*, serrate or incised or deeply pinnatifid, the teeth or lobes often toothed, sometimes doubly so; indusia very short, usually curved so as to appear circular or irregular, nearly always fringed with long jointed cilia; sporangia without hairs on the pedicel. Woods and open places: Calif.—B.C.—Mont.—N.M.; Alaska and the Old World. Undoubtedly will be found more widely distributed in Canada.

10. ADIANTUM (Tourn.) L. MAIDEN-HAIR FERN,
VENUS'-HAIR FERN.

Ferns with compound fronds having segments in the form of small leaflets, and slender, usually dark-colored shining stipes. Lobes of the leaflets reflexed, indusiform, bearing the sori on the under side at the ends of the veins. Veins free.

Stipes forked into two rachises, which bear on upper side pinnae interspersed with single leaflets.

Stipes not forked at apex; blades alternately bipinnate or tripinnate.

Rachises wavy-flexuose; leaflets very short-stalked.

Rachises strongly divaricate-flexuose; leaflets mostly conspicuously stalked.

1. *A. pedatum*.

2. *A. modestum*.

3. *A. rimicola*.

1. *A. pedatum* L. Stipes and rachises dark chestnut-brown; fronds 2–5 dm. high; principal leaflets dimidiate-triangular-oblong, lobed on the upper side with unilateral midveins; branches of midveins several times forked. Damp woods and in shade near water: Newf.—Ga.—Kans.—(Black Hills) S.D.; Utah; Calif.—Mont.—Alaska; China, Japan, India.

2. *A. modestum* Underw. Rhizome creeping, chaffy with light brown scales; stipes and rachises purplish brown to ebeneous; blades 8–29 cm. long and 5–15 cm. broad, deltoid-lanceolate to deltoid-ovate, commonly tripinnate; pinnae commonly arched; leaflets 6–15 mm. wide or the terminal wider, nearly as long as wide, truncate, roundish or broadly cuneate at base, equilateral or inequilateral, rounded above, 2–5-lobed, mostly 3-lobed, the incisions shallow, the margin in sterile leaflets, with rare exceptions, evenly and finely serrate-denticulate, in fertile leaflets similarly toothed between the sori; stalks of pinnules and basal veins commonly greenish white or the stalks light brown; veins repeatedly forked; indusia largely oblong, entire to crenate. Wet places among rocks: Ariz.—s Utah—s Colo.—Tex.; (Black Hills) S.D.

3. *A. rimicola* Slosson. Stipes and rachises dark reddish brown; blades up to 17.5 cm. long and 12 cm. broad, ovate-oblong to ovate-deltoid, mostly broadest at base; leaflets up to 2 cm. long and 2.5 cm. broad, equilateral or inequilateral, narrowly cuneate below, above flabelliform and flaring, at base mostly edged by the first, usually dark brown, fork of the veins, cleft one-eighth to two-thirds of the way down into 2 or 3 lobes; lobes often shallowly incised, when fertile completely recurved between the notches, when sterile sharply serrulate; veins repeatedly forking; indusia transversely elongate, up to 8 mm. long, subentire or erose. Cliffs: Utah. *L. Son.*

11. PTÉRIS L. BRAKE, BRACKEN.

Large ferns, with coarse compound fronds and creeping rhizomes. Margins of the frond's divisions reflexed, forming an indusium. Sporangia borne on a continuous vein-like receptacle connecting the ends of the veins, with an obscure inner inferior indusium attached to the receptacle. Veins pinnate.

1. *P. aquilina* L. Stipes up to 9 dm. long; fronds to 12 dm. long, deltoid to ovate-deltoid, subternately decompound, the larger tripinnate below; pinnules entire, lobed, auricled or pinnatifid, the entire ones mostly oblong or linear, commonly spaced, rarely abruptly dilated at base; costae, midribs, and reflexed

margins slightly hairy; surfaces otherwise glabrous or with a few scattered hairs; hairs mostly pluricellular. Rare in the west, where it is replaced by the following variety. Woods: Newf.—Fla.—Colo. (?)—S.D.; Eu. *Submont.*—*Mont.*—*Boreal.* *Pteris aquilina pubescens* Kuntze. Pinnules more regularly pinnatifid, the entire ones often deltoid-oblong; midribs only slightly raised, not broad and conspicuously elevated; under surface pubescent or tomentose, the upper slightly hairy or glabrous; hairs slender, many, short, erect, setiform or hamate and unicellular, others longer, often tortuous and pluricellular. *Pteridium aquilina pubescens* Underw. *Pteris Feei* Schaffner. Woods: Alaska—*Mont.*—*N.M.*—*Calif.*; *Mex.*, *Guatemala*, and (?) *Eu.*

12. CRYPTOGRAMMA R. Br. ROCK-BRAKE.

Small ferns, with slightly dimorphous compound fronds. Margins of the blades' subdivisions reflexed over the sporangia, finally opening out flat. Sporangia without other indusia, on the upper part of the veins and extending down them. Veins free.

Fronds scattered; leaf-texture very delicate; stipes brown or brownish below or throughout.

Fronds tufted; leaf-texture firm.

Stipes straw-colored.

Stipes chestnut-colored.

1. *C. Stelleri*.

2. *C. acrostichoides*.

3. *C. densa*.

1. **C. Stelleri** (Gmel.) Prantl. Rhizome slender, creeping; fertile fronds 5.5–22 cm. long, the sterile usually shorter; blades ovate, bi-tripinnatifid; ultimate segments cuneate and decurrent at base, the fertile linear-oblong to lance-linear, the sterile ovate to obovate-flabelliform, crenulate. *Pellaea gracilis* Hook. On shaded, damp, mostly limestone, rock: *Que.*—*Ga.*—*Minn.*—*Sask.*—*Mont.*—*B.C.*; *Colo.*; *India.* *Submont.*—*Mont.*

2. **C. acrostichoides** R. Br. Fertile fronds 8–36 cm. long, long-stalked, commonly overtopping the sterile; blades ovate, the sterile tri-quadripinnatifid; sterile ultimate segments ovate-oblong or suboval, obtuse, serrulate, the fertile narrowly elliptical or linear, their reflexed margins scarcely altered. On rocks: *Baffin Bay*—*Mont.*—*Sask.*—*Colo.*—*Calif.*—*Alaska.* *Submont.*—*Subalp.*

3. **C. densa** (Brack.) Diels. Primary rachis, except in the upper part of the blade, and scales of rhizome chestnut-colored, like the stipe; fronds 6–29 cm. long; blades ovate or oblong-deltoid, densely tripinnate; sterile ultimate segments lance-linear, incisely serrate, the fertile linear, nearly sessile, their reflexed margins delicately indusiform, erose-toothed. *Pellaea densa* Hook. On rocks: *B.C.*—*Mont.*—*N.M.*—*Utah*—*Calif.*; se *Canada*.

13. PELLÆA Link. CLIFF-BRAKE.

Ferns, with compound fronds and usually dark-colored stipes, the fertile divisions usually narrower than the sterile. Sori borne on the upper part of the free veins, usually confluent in a submarginal line. Margins of the fertile segments reflexed over the sporangia, indusiform.

Segments of the blade obtuse or acute, rarely a few mucronate.

Blades once pinnate, the pinnæ mostly two-parted; stipes repeatedly marked with transverse crack-like depressions.

Blades once or twice pinnate; stipes not marked with transverse depressions.

Stipes and rachises reddish brown, entirely glabrous or with only few occasional long flaccid jointed hairs.

Stipe and rachises purplish black, rather thickly clothed with slender flaccid jointed hairs.

Segments sharp-pointed or mucronate; blades once pinnate above, bipinnate below.

4. *P. mucronata*.

1. **P. Breweri** D. C. Eat. Scales of rhizome rust-colored; fronds tufted, 5–20 cm. long; stipes brittle, breaking off above the scales, reddish brown; rachis reddish brown except near apex; blades oblong; pinnæ short-stalked, the superior segment the larger, segments obtuse or the fertile subacute; indusia pale. On rocks: *Ida.*—*Calif.*

2. *P. glabella* Mett. Scales of rhizome rust-colored; fronds tufted, 2.5–16.7 cm. long; stipes slender; blades ovate to oblong or ovate-lanceolate; pinnae simple and 0.7–1.9 cm. long, or commonly the lower pinnately trifoliate, those of the lowermost one or two pairs rarely with 4 or 5 segments; segments oblong to lanceolate or the smaller ovate-oblong or suboval, obtuse or abruptly acute; branches of midveins mostly once or twice forked; indusia entire or slightly erose. *P. pumila* Rydb. *P. atropurpurea occidentalis* A. Nels. *P. atropurpurea Bushii* Macoun. On dry rocks: Ariz.—Wyo.—Wash.—Minn.—Ark.—Kan.—N.Y.—Vt.—B.C. Undoubtedly of wider range, especially in the north. *Plain—Mont.*

3. *P. atropurpurea* Link. Scales of rhizome fulvous rust-colored; fronds tufted, 2.5–41.7 cm. long; stipes wiry; blades lanceolate or ovate-lanceolate, pinnate or usually bipinnate below; sterile segments commonly suboval; fertile segments mostly linear or sublinear, sometimes auricled, obtuse or acute; branches of midveins mostly about twice forked; indusia entire or slightly erose. On dry rocks, particularly limestone: “N.H.”—“R.I.”—Ga.—nw Mex.—Ariz.—S.D.; “B.C.”—“Athabasca.”

4. *P. mucronata* D. C. Eat. Scales of rhizome black-striped at center, with light tawny margins; fronds tufted, 8–60 cm. long; stipes and rachises dark mahogany-colored or purplish black, smooth; segments sessile or subsessile, the sterile roundish oval, sometimes subcordate at base, the fertile linear-oblong, with strongly revolute margins. *P. Wrightiana* Hook. *P. longimucronata* Hook. *P. truncata* Goodding. On rocks: Tex.—Kans.—Calif.—L. Calif. *Son.*

14. CHEILANTHES Sw. LIP-FERN.

Small ferns with compound, usually chaffy or hairy fronds. Indusium formed of the reflexed margins of the subdivisions, roundish and distinct or continuous. Sori roundish and distinct or more or less confluent, borne on the thickened apices of free veins.

Blades scaly, not tomentose.

Blades tomentose beneath, with or without scales.

Blades without scales.

Blades having scales.

Ultimate segments oblong-oval; upper surface at first scantily webby, soon glabrous.

Ultimate segments rounded, narrowed toward base; upper surface tomentose.

1. *C. Fendleri*.

2. *C. Feei*.

3. *C. gracillima*.

4. *C. Eatonii*.

1. *C. Fendleri* D. C. Eat. Rhizome creeping, chaffy with bright tawny scales without dark centers; fronds mostly scattered, 6–25 cm. long; blades ovate-lanceolate, tripinnate; stipes and primary rachises brown, chaffy with mostly slender scales; secondary and tertiary rachises chaffy, the scales imbricate, bright brown, usually white-margined, broadly ovate, entire or subentire, not ciliate or very sparingly ciliate at base; ultimate segments minute, subglobose, entire, or obovate and 2–3-lobed, smooth above, commonly with a single broad scale at the center beneath; indusia formed of the much recurved margins. Dry rocks: Colo.—“w Tex.”—Ariz. *Submont.—Mont.*

2. *C. Feei* Moore. Scales of the rhizome cinnamon-brown, mostly black-striped at center; fronds tufted, 5–16 cm. long; stipes and rachises dark brown or blackish; blades ovate-lanceolate, tripinnate or tripinnatifid, rarely bipinnate; lower pinnae deltoid, those above oblong-ovate; ultimate segments minute, the apical one slightly the largest, their lower surfaces densely tomentose; hairs whitish brown, soft, matted, flattened, jointed; indusium subcontinuous around the segment, formed of its scarcely altered margin. *C. lanuginosa* Nutt. On or among rocks: B.C.—Minn.—Ill.—Ark.—Ariz.; Mex. *Plain—Submont.*

3. *C. gracillima* D. C. Eat. Scales of the rhizome dark rusty brown with darker, not black, centers; fronds tufted, 4–24 cm. long; stipes and primary rachises dark brown or blackish; blades narrowly ovate-lanceolate, bipinnate or sometimes subtripinnate; tomentum consisting of scale-like branching hairs; rachises chaffy, with slender scales ciliate at base; indusium continuous around the segment. On rocks: B.C.—Mont.—Ida.—Calif.; Mex.

4. **C. Eatoni** Baker. Scales of the rhizome mostly with dark brown or blackish centers; fronds tufted, 6-38 cm. long; blades oblong-lanceolate, tripinnate; pinnae ovate-oblong; stipes and primary and secondary rachises chaffy, with white or pale rusty, imbricate, sub-appressed, lanceolate to linear scales; tomentum consisting of long slender ribbon-like hairs; ultimate segments about 1.5-2 cm. long, the terminal one often twice larger; indusium continuous around the pinnule, slightly membranous at margin. Rocky places: Utah—Ark.—Ariz.; Mex.

15. **NOTHOLAENA** R. Br.

Small ferns, with pinnately compound fronds lacking proper indusia and almost always farinose, hairy, or chaffy on the under surface. Margins of the blade sometimes inflexed at first over the sporangia. Sori roundish or oblong, marginal, borne near the ends of the free veins.

Blades tomentose, not farinose beneath.

Blades whitish-farinose beneath, not hairy.

Rachises divaricate-flexuose.

Rachises straight or nearly so, not divaricate-flexuose.

1. *N. Parryi*.

2. *N. Fendleri*.

3. *N. nivea*.

1. **N. Parryi** D. C. Eat. Scales of the rhizome dark reddish brown, mostly with narrow blackish midribs; fronds tufted, 4-26 cm. long; stipe and rachises dark reddish or purplish brown; blades oblong-lanceolate, tripinnate; ultimate segments roundish obovate, 2 mm. broad, crenately incised, densely coated on the upper surface with tangled, whitish or pale tomentum, and on the lower surface with light brown tomentum; tomentum consisting of slender articulated hairs. On rocks: Calif.—Utah—Ariz. *Son.*

2. **N. Fendleri** Kunze. Scales of the rhizome bright reddish brown, one-colored; fronds tufted, 7.5-23 cm. long; stipes and rachises dark brown; blades broadly deltoid-ovate, 4-5 pinnate below, gradually simpler above; ultimate segments oval or elliptical, simple or 3-lobed. On rocks: Colo.—“Tex.”—“Ariz.” *Son.—Mont.*

3. **N. nivea** Desv. Scales of the rhizome reddish brown, one-colored, fronds tufted, 3-20 cm. long; stipes and rachises dark brown or black; blades ovate, lanceolate, triangular-ovate or deltoid, 3-pinnate; pinnules long-stalked; ultimate segments green and smooth on the upper surface, roundish, nearly as broad as long, the terminal ones larger, entire or 3-lobed; sori often descending the veins. On rocks: Utah—N.M.—Ariz.; Mex. and S. Am. *Son.*

16. **POLYPODIUM** [Tourn.] L. POLYPODY.

Ferns varying in size and habit. Fronds entire to pinnately compound. Sori borne on the backs of the fronds, round to elliptical, non-indusiate, dorsal or terminal on the free or anastomosing veins, the veins free in our species.

1. **P. hesperium** Maxon. Rhizomes hard, liquorice-like, chaffy; stipes stramineous; blades 7.6-20 cm. long, 2.5-4.4 cm. broad, linear-oblong, deeply pinnatifid or below pinnate; segments elliptical or somewhat spatulate, narrowest just above the often dilated base, broadly rounded at apex, obscurely or evidently crenate; under surface slightly glandular; veins 1-3 times forked; sori large, medial, on the ends of the veinlets. B.C.—S.D.—N.M.—Ariz.—Wash.

FAMILY 3. **MARSILIACEAE**. MARSILIA FAMILY.

Perennial herbaceous plants rooting in mud, in ours with 2-4-foliolate stalked leaves borne on a creeping rhizome. Sporocarps containing both macrospores and microspores, borne on peduncles attached to the lower parts of petioles or to the rhizome close to them.

1. **MARSÍLEA** L.

Marsh or aquatic plants commonly growing in shallow water, with their leaves floating on its surface. Leaves 4-foliolate. Sporocarps crustaceous, ovoid

or bean-shaped, usually with 2 teeth near the base, divided vertically into two cells, which are subdivided into transverse compartments (sori).

Sporocarps with two distinct acute teeth separated by a rounded sinus, the upper tooth the longer, straight or curved.

Sporocarps with the lower tooth short and blunt, the upper a mere rounded papilla or wanting.

1. *M. vestita*.

2. *M. oligospora*.

1. ***M. vestita*** Hook. & Grev. Petioles 1–14 cm. long; leaflets broadly cuneate, usually hairy, entire; peduncles erect or ascending, distinct from the petioles, scarcely as long as the sporocarps; sporocarps solitary, hairy, with about 7–9 sori in each cell. B.C.—“Ia.”—Ark.—Calif.

2. ***M. oligospora*** Goodding. Petioles 1–12 cm. long; leaflets cuneate, spreading above, hairy or glabrescent; peduncles erect or ascending, each united at base with the base of a petiole, 0.4–1.7 cm. long; sporocarps solitary, somewhat deflexed, with 5–8 sori in each cell, clothed with lance-shaped, jointed, tuberculate hairs. Wyo.—Wash.; Calif.

FAMILY 4. **SALVINIACEAE.** SALVINIA FAMILY.

Aquatic, floating plants, bearing minute, apparently 2-ranked leaves on a more or less elongate, sometimes branching, axis. Sporocarps borne 2 or more on a common stalk, soft, one-celled, thin-walled, each containing a central often branched receptacle, which bears either macrosporangia containing solitary macrospores or microsporangia containing numerous microspores.

1. **AZÓLLA** Lam.

Small moss-like plants, with pinnately branched stems bearing rootlets on the under side. Leaves imbricate, 2-lobed. Sporocarps borne in pairs beneath the stem, some small, ovoid or acorn-shaped, containing at base a single macrospore with a few attached bodies of uncertain function above it, the others larger, globose, containing on a basal placenta numerous stalked microsporangia enclosing masses of microspores, which are usually furnished with anchor-shaped processes.

1. ***A. caroliniana*** Willd. Plants much branched, 6–25 mm. broad; lobes of leaves ovate, the lower reddish, the upper green, reddish margined; macrospores minutely granular, accompanied with three corpuscles; processes of the microspores rigid, septate. In still waters: “Ont.”—“Fla.”—Calif.—B.C.; trop. Am.

FAMILY 5. **EQUISETACEAE.** HORSETAIL FAMILY.

Rush-like, verticillately branched or unbranched plants, with rootstocks and mostly hollow, jointed stems, bearing sheaths at the nodes. Spores in a terminal cone formed of verticels of stalked peltate bracts bearing on the under side 6 or 7 sporanges, which open on the inner side. Prothallium in damp places, green, variously lobed.

1. **EQUISETUM.** HORSETAIL.

Characters of the family.

Stem annual; spike rounded at the top; stomata scattered in the grooves of the stem.

Stems of two kinds, the fertile ones succulent, appearing earlier than the sterile ones.

Fertile stems simple, soon withering, branchless.

Fertile stems, when older, producing branches, only the naked apex withering.

Branches compound; ridges with 2 rows of hooked spinules.

Branches simple; ridges with 3 rows of broad spinules.

Stems of one kind; branches simple or none.

Teeth of the sheaths persistent; plant usually branched, at least in age.

Sheaths loose; teeth grooved, black with white margins; central cavity one-sixth of the diameter of the stem.

1. *E. arvense*.

2. *E. sylvaticum*.

3. *E. pratense*.

4. *E. palustre*.

Sheath close; central cavity one-half of the diameter of the stem or more.

Sheaths 7-8 mm. long; stem stout, sparingly branched. 5. *E. fluviatile*.

Sheaths less than 5 mm. long; stem slender, much branched. (Autumnal forms of) 1. *E. arvense*.

Teeth of the sheaths deciduous; plant unbranched or nearly so.

6. *E. kansanum*.

Stem perennial, evergreen (except sometimes in *E. laevigatum*), mostly simple; spike apiculate, with a rigid tip; stomata in regular rows.

Central cavity present; stem more than 6-angled, except sometimes in *E. variegatum*.

Teeth of the sheaths deciduous; stem tall and stout, many-grooved.

Stem tubercled, rough.

Sheath close, usually with a black or dark ring near the base, then grayish and with a narrow dark border at the base of the teeth.

Stem 1-2 m. high, stout; sheaths as broad as long. 7. *E. robustum*.

Stem 0.3-1 m. high, slender; sheath longer than broad.

8. *E. affine*.

Sheaths more amplate above, green, with or without a narrow border, but no ring below.

9. *E. intermedium*.

Stem not tubercled, smooth; sheaths enlarged upwards, with or without a dark margin, but rarely with a ring below.

10. *E. laevigatum*.

Teeth of the sheaths persistent, white-margined; stem low, slender, 5-10-grooved.

11. *E. variegatum*.

12. *E. scirpoides*.

Central cavity wanting; stem 6-angled.

1. *E. arvense* L. Spore-bearing stems 1-2.5 dm. high, 3-5 mm. in diameter, with loose 8-12-toothed sheaths, rarely with a few branches; cones peduncled, 2-4 cm. long, 5-10 mm. thick; sterile stems decumbent to erect, 1-3.5 dm. high, 2-3 mm. thick, 10-14-furrowed, branched; branches 3-4-angled, solid; teeth of the sheaths lanceolate, acuminate. In the fall the sterile stems sometimes bear small cones 4-10 mm. long, mostly with sterile spores (var. *serotinum*). Wet banks: Greenl.—S.C.—Calif.—Alaska; Eurasia. *Plain—Alp.*

2. *E. sylvaticum* L. Stems 1-4.5 dm. high, 8-14-ridged, 3-4 mm. thick; both the fertile and the sterile ones branched; central cavity constituting half the diameter; sheaths brown, loose, the teeth more or less coherent; primary branches 4-5-angled, the secondary ones 3-angled; cones peduncled, 1-3 cm. long, 5-8 mm. thick. Wet shady places: Newf.—Va.—Ia.—B.C.—Alaska; Eurasia. *Submont.—Mont.* My-Je.

3. *E. pratense* Ehrh. Stems 2-4 dm. high, 3-5 mm. thick, 8-20-ridged, the fertile ones at first nearly unbranched, some developing short spreading branches, the sterile ones with long branches; central cavity one-third the diameter; sheaths green, loose; teeth lanceolate with dark middle; branches 3-ridged; teeth of the sheaths deltoid; cones peduncled, 1-2 cm. long, about 5 mm. thick. Alluvial soil: N.S.—N.J.—Colo.—Alaska; Eurasia. *Submont.—Subalp.* Ap-My.

4. *E. palustre* L. Stems 2-9 dm. high, 3-5 mm. thick, 5-10-angled; branches long, ascending, hollow, 4-7-angled; sheaths widened upwards; teeth lance-subulate; cones 1.5-2.5 cm. long, 5-6 mm. thick. Wet places: Newf.—Conn.—Wyo.—Wash.—Alaska; Eurasia. *Submont.—Mont.* Je-Au.

5. *E. fluviatile* L. Stems 3-15 dm. high, 4-8 mm. thick, 10-30-angled; central cavity four-fifths of the diameter; branches spreading or upcurved, long, 4-6-angled, hollow; sheaths appressed; teeth dark brown, distinct, narrow; cones short-peduncled, 1.5-2.5 cm. long, 5-7 mm. thick. *E. limosum* L. Shallow water: Newf.—N.Y.—Wyo.—Wash.—B.C. *Plain—Mont.* Je-Jl.

6. *E. kansanum* J. H. Schaffner. Stems 3-5 dm. high, 15-30-grooved, light green; sheaths long, dilated above, green, with a narrow black band at the top, rarely with a faint one below; cones short-peduncled, ovate or ovate-oblong, 1.5-2.5 cm. long, 7-8 mm. thick. Clay banks: Mo.—Utah—Mont. *Plain—Submont.*

7. *E. robustum* A. Br. Stems 1-3 m. high, 8-12 mm. thick, 16-48-angled, dark green; ridges rounded, rough, with 3 rows of tubercles; sheath tight, about as broad as long; teeth mostly persistent, lance-linear, sharply 3-angled, black, with white margins; spike sessile, 1.5-2.5 cm. long, 6-7 mm. thick, strongly apiculate. N.Y.—Md.—La.—Tex.—Calif.—B.C. *Plain—Submont.* Je-Au.

8. *E. affine* Engelm. Stems 3-10 dm. high, 4-8 mm. thick, 16-40-angled, dark green; ridges rounded, rough with 2 rows of tubercles; sheaths longer than

broad; teeth lance-linear, sharply 3-angled, persistent or coherent by their tips and torn off; cone 1-1.5 cm. long, about 5 mm. thick, sharply apiculate. *E. robustum* Engelm. *E. hyemales* Am. auth., not L. N.S.—N.Y.—Ariz.—Sask. *Plain*—*Submont.* Je—Au.

9. *E. intermedium* (A. A. Eaton) Rydb. Stems 3-12 dm. high, 5-8 mm. thick, 20-30-angled; ridges rough, with 2 rows of tubercles; sheath longer than broad, green, except a narrow black and white border, sometimes with a dark band beneath; teeth thin, brown, hyaline-margined, deciduous or persistent; cones sessile, about 1 cm. long and 5 mm. thick, apiculate. *E. laevigatum* Milde, not A. Br. Moist sandy soil: Mich.—Mo.—Calif.—Wash. *Plain*—*Submont.*

10. *E. laevigatum* A. Br. Stems 1-10 dm. high, 4-6 mm. thick, simple or with erect branches, 20-30-grooved; sheaths widened upwards, green, with a black limb; teeth mostly deciduous, with black triangular bases; cones sessile or nearly so, 1-1.5 cm. long, about 5 mm. thick, rather bluntly apiculate. Alluvial soil: Ohio—Tex.—Calif.—B.C. *Plain*—*Mont.* Je—Au.

11. *E. variegatum* Schleich. Stems 1.5-3 dm. high, 2-4 mm. thick, 5-10-grooved, tufted; central cavity one-third the diameter; sheaths loose, green below, with a dark ring above; teeth black, with broad white border, persistent, with a filiform deciduous tip; cones short-peduncled or sessile, 8-10 mm. long, about 3 mm. thick. Wet grounds: Lab.—N.Y.—Colo.—Alaska. *Plain*—*Mont.*

12. *E. scirpoides* Michx. Stems tufted, filiform, less than 1.5 dm. high, 1-2 mm. thick, flexuose-curving; sheaths short, with 3 subulate, persistent teeth; cones 3-5 mm. long, 2 mm. thick. Damp places: Lab.—Pa.—Mont.—Wash.—B.C.; Eurasia. *Submont.*—*Mont.*

FAMILY 6. ISOETACEAE. QUILLWORT FAMILY.

Small water or bog plants, with a corm-like short stem and numerous crowded subulate or nearly filiform leaves. Spores of two kinds, smaller microspores (male) and larger macrospores (female), in axillary sporangia covered by the enlarged bases of the leaves, the macrospores spherical, with an equatorial ring-like ridge and three other ridges meeting at the apex, the microspores obliquely oblong, triangular in cross-section.

1. ISOËTES. QUILLWORT.

Characters of the family.

Submerged species; leaves without peripheral bast-bundles.

Stomata absent; macrospores marked with confluent crests, more or less honey-combed. 1. *I. occidentalis*.

Stomata present; macrospores spinulose or tubercled.

Macrospores spinulose.

Macrospores with low tubercles.

2. *I. Braunii*.

3. *I. Bolanderi*.

Amphibious or terrestrial species; leaves with peripheral bast-bundles and stomata.

Macrospores, with low blunt isolated or confluent crests; peripheral bast-bundles 4.

4. *I. Howellii*.

Macrospores, with numerous minute tubercles or almost smooth; peripheral bast-bundles 3.

5. *I. Nuttallii*.

1. *I. occidentalis* Henders. Leaves rigid, spreading, quadrangular, dark green, 5-20 cm. long; ligule narrowly triangular; velum covering about one-third of the sporangium; macrospores about 0.4 mm., finely crested, with simple or confluent crests; microspores papillose to echinulate. *I. lacustris paupercula* Engelm., a depauperate form. In water: Ore.—Wyo.—Colo.—Calif. *Plain*—*Mont.* Jl—O.

2. *I. Braunii* Durieu. Leaves erect or spreading, green or reddish green, tapering, 7-20 cm. long; velum covering one-half to three-fourths of the spotted sporangia; macrospores 0.4-0.5 mm., with broad retuse spinules; microspores smooth. *I. echinospora Braunii* Engelm. In water: Greenl.—N.J.—Calif.—B.C.

3. I. Bolanderi Engelm. Leaves erect, soft, bright green, tapering to a fine point, 5-10 cm. long, thin-walled; stomata few; ligule triangular; velum narrow; sporangia unspotted; macrospores 0.3-0.45 mm. thick; microspores deep brown, spinulose. In water and mud: Wash.—Wyo.—Colo.—Calif. *Plain*—*Mont.* Au-S.

4. I. Howellii Engelm. Leaves 5-20 cm. long; stomata numerous; bast-bundles 4; velum narrow, densely spotted; ligule short triangular to 4 mm. long; macrospores 0.48 mm., with low blunt crests; microspores light brown, with low tubercles or spines. *I. nuda* Engelm. *I. Underwoodii* Henders. Borders of ponds: B.C.—*Mont.*—*Ida.*—*Calif.* *Plain*—*Submont.* Je—Au.

5. I. Nuttallii A. Br. Trunk almost globose, 3-lobed; leaves slender, bright green, 7-20 cm. long; stomata many; bast-bundles 3; velum broad, covering the sporangia; macrospores 0.25-0.5 mm.; microspores brown, papillose. *I. opaca* Nutt. *I. Suksdorfii* Baker. Mud: B.C.—*Ida.*—*Calif.* *Son.*—*Plain.* Mr—Jl.

FAMILY 7. LYCOPODIACEAE. CLUB-MOSS FAMILY.

Low, erect or trailing plants, somewhat resembling mosses, with leafy, usually branched, often elongate stems. Leaves small, lanceolate or subulate or sometimes oblong or roundish, some bearing on their axils or on their upper surfaces solitary 1-3-celled sporanges. Spores minute, of one kind.

1. LYCOPÏDIUM L. CLUB-MOSS, GROUND PINE.

Perennial plants, with evergreen, usually stiff, commonly imbricate, one-nerved, 4-16-ranked leaves. Main stems usually creeping, with aerial branches. Sporangia flattened, coriaceous, usually reniform, 1-celled, opening by a transverse slit around the margin, borne in the axils of ordinary or modified and bract-like leaves. Spores sulphur-colored.

Sporanges borne in the axils of ordinary leaves, which are not arranged in distinct spikes. Leaves hollow at base, all or mostly all ascending, of nearly one length.

Leaves flattened, not hollow at base, spreading or deflexed, longer and shorter in alternating zones.

Sporanges borne in the axils of bracts arranged in spikes on the aerial branches.

Spikes sessile, or with stalks not more than 1 cm. long.

Aerial branches all simple.

Aerial branches, at least in part, branched.

Leaves of the ultimate divisions of the aerial branches in 4 rows.

Leaves of the ultimate divisions of the aerial branches in more than 4 rows.

Aerial branches tree-like.

Aerial branches not tree-like, mostly loosely forking or forming compact tufts.

Leaves of the ultimate divisions of the aerial branches in 5 rows.

Leaves of the ultimate divisions of the aerial branches in 6 rows.

Leaves of the ultimate divisions of the aerial branches in 7 rows.

Leaves of the ultimate divisions of the aerial branches in 8 rows.

Spikes borne on bracteate peduncles more than 2 cm. long.

Leaves of the divisions of the aerial branches in 4 rows.

Leaves of the divisions of the aerial branches in many rows.

1. L. Selago L. Main stems very short, dichotomously branching into upcurved or erect forking branches forming a tuft 2.5-24 cm. high; leaves crowded, appressed or ascending or rarely a few reflexed, triangular to linear-acuminate or aciculate, acute, entire; sporophylls shorter than the leaves, triangular; plant often bearing gemmae. Rocks: Greenl.—Newf.—Me.—N.Y.—Ont.—Alaska—*Mont.*—Wash.—Va.—N.C.—Tenn.; Mex.; Eu.

2. L. porophyllum Lloyd & Underw. Main stems short, upcurved, dichotomously branching into upcurved or erect forking branches forming a tuft 3-35 cm. high; leaves crowded, spreading or reflexed, linear or nearly so, entire or rarely very minutely denticulate, those in the zones of the longer slightly broadened above the middle and similarly contracted toward the base, those in the zones of the shorter broadest at the base, but very gradually tapering; sporophylls entire or minutely denticulate above the middle, acuminate; plant often

bearing gemmae.* On rocks, especially sandstone: "Newf."—"Que."—Pa.—Ind.—Minn.—Ala.—B.C.—Wash. Probably of wider range.

3. *L. inundatum* L. Main stems very slender, simple or slightly forked, creeping above ground, oftenest arched, leafy; aerial branches 1 or 2 to each division of the main stem, erect, 1–8 cm. high, the sterile portion commonly shorter or not longer than the spikes; leaves of the main stem linear-lanceolate, entire or rarely a few slightly toothed, upcurved, leaves of the aerial branches more slender, spreading, entire; spikes solitary; sporophylls spreading, linear-deltoid, entire or toothed just above the base. Sandy bogs: Ont.—Newf.—N.J.—Pa.—Ida.—Wash.—Alaska; Old World.

4. *L. alpinum* L. Main stem creeping at or near the surface of the ground; aerial stems ascending, 2.5–11 cm. high, repeatedly branched; fertile branches the longer, terete, with subulate leaves, sterile branches dorsiventral with 4-ranked leaves, those of the upper row narrowly ovate, acute, those of the lateral rows thick, asymmetrical, falcate, acute, with decurved tips, those of the under row trowel-shaped; spikes sessile; sporophylls ovate, acute, erose. Woods: Alaska—B.C.; Que.—Lab.—Greenl.; Old World.

5. *L. obscurum* L. Main stems creeping, buried in the ground; aerial branches 9–42 cm. long, the leaves of their divisions 8-ranked on the lower, 6-ranked on the terminal, linear-lanceolate, spreading, upcurved, twisted, acute, or mucronate; spikes sessile; sporophylls broadly ovate, papery and erose-margined, acuminate, with a subulate apex. Woods: "Lab."—Newf.—N.C.—Tenn.—Mich.—"Sask."—Mont.—B.C.—Alaska; Asia.

6. *L. sitchense* Rupr. Main stems creeping on or near the surface of the ground; aerial branches dichotomously branching, forming tufts, 2.5–25 cm. high, their branches terete, the fertile the longer; leaves of the branchlets appressed or spreading and upcurved, linear, thick, entire, acute; spikes sessile or short-stalked, the peduncles with minute bracts; sporophylls broadly ovate, long-acuminate-subulate, erose. Cold woods: Lab.—Newf.—N.Y.—w Ont.; Alaska—B.C.—"Ida."—Wash.

7. *L. annotinum* L. Main stems creeping above ground, leafy; aerial stems 2–39 cm. high, simple or 1–3 times forked; leaves spreading or reflexed, upcurved at apex, lanceolate or linear-lanceolate, serrulate, tipped with a rigid point; spikes 1-several; sporophylls broadly ovate-serrulate, erose. Wooded places: Greenl.—W.Va.—Mich.—Alta.—Colo.—Wash.—Alaska.

8. *L. complanatum* L. Main stems creeping on or slightly below the surface of the ground; aerial branches yellowish green, 4–47 cm. high, irregularly forked, their branches few, glaucous, flattened, mostly making annual growths at their tips, with minute, decurrent leaves, the lateral leaves broad, little or not spreading at the tip, the upper narrow, incurved, the lower diminished, deltoid-cuspidate; peduncles mostly 1–2 times forked at summit; sporophylls broadly ovate, acuminate. Wooded places: Lab.—Newf.—N.Y.—Minn.—B.C.—Mont.—Ida.—Wash.; Alaska; Eu.

9. *L. clavatum* L. Main stems creeping above ground, leafy; aerial branches ascending, 4–33 cm. high, simply or pinnately branched; leaves many-ranked, linear, mostly bristle-tipped, entire or denticulate, on the main stems denticulate; peduncles simple or forked at apex, their bracts whorled or scattered, mostly bristle-tipped; sporophylls deltoid-ovate, acuminate or bristle-tipped, with membranous erose margins. Woods: "Lab."—N.C.—Mich.—Wis.—Ont.—Sask.—Ida.—Ore.—Alaska; trop. Am. and Old World.

FAMILY 8. **SELAGINELLACEAE.** LITTLE CLUBMOSS FAMILY.

Leafy terrestrial plants, with branching stems and 4–6-ranked leaves. Sporangies solitary in the axils of the leafy bracts, some containing macrospores, others microspores, the macrospores with a hemispheric base and a triangular-pyramidal apex.

*Closely related to *L. lucidulum*, which has leaves broadening and erose denticulate above the middle, and is apparently not found in the Rockies.

1. **SELAGINÉLLA.** LITTLE CLUBMOSS, SELAGINELLA.

Characters of the family.

Stem rooting only at the base; bracts of the spike broad, thin, spreading; macrospores spinulose.

Stem rooting mostly their whole length; bracts of the spike narrower and thicker, appressed and closely imbricate.

Leaves without an apical bristle.

Leaves with a distinct apical bristle.

Macrospores smooth or nearly so.

Macrospores with a network of thickened ridges.

Leaves abruptly acute; plant dense and tufted.

Apical bristle yellowish green.

Apical bristle white.

Apical bristle 0.3–0.4 mm. long.

Apical bristle 0.6–1.5 mm. long.

Leaves gradually tapering towards the apex; stem long, loose and spreading;

apical bristle 0.5–1 mm. long.

1. *S. selaginoides*.

2. *S. mutica*.

3. *S. montanensis*.

4. *S. Watsonii*.

5. *S. Wallacei*.

6. *S. densa*.

7. *S. Underwoodii*.

1. ***S. selaginoides*** (L.) Link. Stems prostrate, creeping, slender; leaves lanceolate, acute, spreading, sparsely spinulose-ciliate; spikes thicker, ascending, 3–7 cm. high; bracts lax, ascending, lanceolate or ovate-lanceolate, strongly ciliate. Mountains: Greenl.—N.H.—Colo.—B.C. *Boreal*—*Mont.*

2. ***S. mutica*** D. C. Eaton. Stems creeping, rigid, pinnately branched; leaves 6-ranked, closely imbricate, 1 mm. long, oblong-ovate, obtuse, without terminal bristle; marginal cilia 8–15 on each side, spreading; spikes scarcely thicker than the branches, quadrangular; bracts broader than the leaves, pointed. Mountains: N.M.—Colo.—Ariz. *Son.*—*Submont.*

3. ***S. montanensis*** Hieron. Stems prostrate, creeping, 4 cm. long; leaves sessile, imbricate, pale glaucous when young, yellowish cinerascenscent in age, linear-oblong, slightly tapering at the apex, obtuse, cuspidate-setaceous; bristle 0.3–0.4 mm. long; marginal cilia 6–9 on each side, about 0.1 mm. long; bracts ovate-triangular, pale glaucous, thick, obtusish; bristle 0.25–0.4 mm. long; marginal cilia 15–20, tooth-like. *S. columbiana* A. A. Eat. Mountains: Mont.—Wash.—B.C. Au—O.

4. ***S. Watsoni*** Underw. Stems short, 4–6 cm. long, creeping, sparingly branched; leaves short, deeply channeled, abruptly contracted into the bristle; apical bristle 0.25–0.33 mm. long; marginal cilia few or none; spikes 1.5–2.5 cm. long, quadrangular; bracts lance-ovate to ovate, with shorter and stouter bristles. Mountains: Colo.—Calif. *Mont.*—*Alp.* JI—S.

5. ***S. Wallacei*** Hieron. Stems up to 3–10 cm. long, sparsely rooting, pinnately branched; leaves imbricate, pale glaucous when young, yellowish cinerascenscent in age, thick, plane above, linear-oblong, contracted at the apex, 2.5 mm. long or less; apical bristle 0.3–0.4 mm. long; marginal cilia 7–12 on each side, nearly 0.1 mm. long; spike up to 1.5 cm. long; bracts ovate-triangular, acute, thick; apical bristle 0.3–0.4 mm. long; marginal cilia 15–20. Rock: B.C.—Ida.—Calif. *Submont.*

6. ***S. densa*** Rydb. Stems densely cespitose, 4–12 cm. long, creeping, densely branched; leaves densely imbricate, pale glaucous when young, dark-cinerascenscent in age, linear-oblong, 2–3.5 mm. long; apical bristle 0.6–1.5 mm. long; marginal cilia 2–12, nearly 0.1 mm. long; spike 1–3 cm. long; bracts ovate-triangular, 0.3 mm. long or less; apical bristle nearly 1 mm. long; cilia 10–20 on each side, less than 0.1 mm. long. *S. Engelmannii*, *S. Bourgeauii*, and *S. Haydeni* Hieron. Hills and mountains: Man.—N.M.—Utah—Wash.—B.C. *Plain*—*Alta.*

7. ***S. Underwoodii*** Hieron. Stem elongate, creeping, up to 15 cm. long, sparsely pinnately branched; leaves densely imbricate, appressed, dark glaucous when young, reddish or cinerascenscent in age, elongate-triangular, up to 2 mm. long; cilia 5–7 on each side, 0.05 mm. long; spike 5–20 mm. long; bracts elongate-triangular; bristle 0.2–0.3 mm. long; cilia 12–15. *S. Fendleri* (Underw.) Hieron., not Baker. Mountains: N.M.—Colo.—Calif. *Submont.*—*Mont.*

SUMMARY

Number of genera and species described in this book, compared with the number given in older floras of the Rocky Mountain region.*

* The columns under the heading "Rydberg" give the number of genera and species admitted in this book; those under "Coul. & Nels." give those in the New Manual of Botany of the Central Rocky Mountains, by Coulter and Nelson, 1909; and those under "Coulter," in Manual of Botany of the Rocky Mountain Region, by John M. Coulter, 1885. The geographical area covered by the present book is, however, about half larger than that of the old Coulter's Manual, and nearly twice as large as that of Coulter & Nelson's.

NEW GENERA AND SPECIES AND NEW COMBINATIONS PUBLISHED IN THIS FLORA *

	PAGE
Strobilus monticola.	13
<i>Pinus monticola</i> Dougl.; Lamb. <i>Pinus</i> 3 : pl. 87. 1837.	
Agrostis reptans.	54
<i>A. exarata stolonifera</i> Vasey, Bull. Torrey Club 13 : 54. 1886.	
Calamagrostis luxurians.	57
<i>C. Suksdorfii luxurians</i> Kearney, Bull. U. S. Div. Agrost. 11 : 24. 1898.	
Calamagrostis elongata.	58
<i>C. hyperborea elongata</i> Kearney, Bull. U. S. Div. Agrost. 11 : 40. 1898.	
Deschampsia ciliata.	60
<i>D. elongata ciliata</i> Vasey; Beal, Grasses 2 : 371. 1896.	
Grappophorum Brandegei.	61
<i>Trisetum Brandegei</i> Scribn. Bull. Torr. Club 10 : 64. 1883.	
Poa pratensisiformis.	79
<i>P. pseudopratensis</i> Scribn. & Rydb. Contr. U. S. Nat. Herb. 3 : 531. 1896, not <i>P. pseudopratensis</i> Beyer. 1891.	
Panicularia rigida.	83
<i>P. nervata rigida</i> Nash, Mem. N. Y. Bot. Gard. 1 : 54. 1900.	
Bromus latior.	89
<i>B. marginatus latior</i> Shear, Bull. U. S. Div. Agrost. 23 : 55. 1900.	
Bromus paniculatus.	90
<i>B. polyanthus paniculatus</i> Shear, Bull. U. S. Div. Agrost. 23 : 57. 1900.	
Leucocoma alpina.	108
<i>Eriophorum alpinum</i> L. Sp. Pl. 53. 1753.	
Carex incurviformis Mackenzie, sp. nov.	120
Type: National Park, Banff, Alta., July 31, 1891, <i>Macoun.</i> (N.Y.)	
Carex angustior (Carey) Mackenzie.	124
<i>Carex stellulata angustata</i> Carey; Gray, Manual 544. 1848.	
Carex leptopoda Mackenzie, sp. nov.	124
Type: Elk Rock, near Oswego, Clackamas County, Oregon, <i>Heller</i> 10052. (Herb. K. K. Mackenzie.)	
Carex Nelsonii Mackenzie, sp. nov.	137
Type: La Plata Mines, Wyoming, August 30, 1898, <i>A. & E. Nelson</i> 5264. (Herb. K. K. Mackenzie.)	
Carex albo-nigra Mackenzie, sp. nov.	137
Type: Needle Mountain, Wyoming, July 11, 1910, <i>Merritt Cary</i> 613. (U. S., 858, 947.)	
Carex epapillosa Mackenzie.	138
Type: Marysvale, Utah, June 1, 1874, <i>M. E. Jones</i> 5345. (Herb. K. K. Mackenzie.)	
Carex substricta (Kukenthal) Mackenzie.	139
<i>Carex aquatilis substricta</i> Kukenthal, Pflanzenreich 4 ²⁰ : 309. 1909.	
Juncus ater.	151
<i>J. balticus montanus</i> Engelm. Trans. Acad. Sci. St. Louis 2 : 442. 1866.	
Juncus vallicola.	152
<i>J. balticus vallicola</i> Rydb. Bull. Torrey Club 31 : 399. 1904.	

* In this list, after the citation of a type specimen, the words "(N.Y.," mean that the type is preserved in the herbarium of the New York Botanical Garden, "(C.U.," that it is in the herbarium of Columbia University, and "(U.S.," the United States National Herbarium.

	PAGE
Juncus Jonesii , sp. nov.	153
Type: Alta, Wasatch Mountains, Utah, Au. 6, 1879, <i>M. E. Jones</i> (N.Y.).	
Juncus Tracyi , sp. nov.	155
Type: Ogden, Utah, 1887, <i>S. M. Tracy</i> 389 (C.U.).	
Allium aridum , sp. nov.	159
Type: Green River, Wyoming, June 25, 1895, <i>Rydberg</i> 2605 (N.Y.).	
Allium cuspidatum .	160
<i>A. acuminatum cuspidatum</i> Fernald, <i>Zoe</i> 4: 380. 1894.	
OCHROCODON , gen. nov.	164
Type species:	
Ochrocodon pudicus .	164
<i>Lilium pudicum</i> Pursh, Fl. Am. Sept. 228. 1814.	
<i>Fritillaria pudica</i> Spreng, Syst. 2: 64. 1825.	
Erythronium utahense , sp. nov.	165
Type: Salt Lake, Utah, <i>Captain Stansbury</i> (N.C.).	
Erythronium leptopetalum sp. nov.	165
Type: Near Boise, Idaho, June, 1892, <i>Isabel Mulford</i> (C.U.).	
Yucca Gilbertiana .	170
<i>Y. Harrimaniae Gilbertiana</i> Trelease, Rep. Mo. Bot. Gard. 18: 225. 1917.	
Clistoyucca brevifolia .	170
<i>Yucca brevifolia</i> Engelm.; <i>S. Wats. Bot. King. Exp.</i> 496. 1871.	
Salix idahoensis .	197
<i>S. Wolfii idahoensis</i> Ball, Bot. Gaz. 40: 378. 1905.	
Celtis rugulosa .	207
<i>C. rugosa</i> Rydb. Bull. Torrey Club 39: 304. 1912. Not Newberry.	
Humulus neomexicanus .	208
<i>H. Lupulus neomexicanus</i> Nels. & Cockerell, Proc. Biol. Soc. Wash. 16: 45. 1903.	
Eriogonum chrysops , sp. nov.	220
Type: Stony top of northern Stein's Mountains, June 10, 1901, <i>Cusick</i> 2558 (N.Y.).	
Eriogonum medium , sp. nov.	220
Type: Mount Nebo, Utah, Aug. 15, 1905, <i>Rydberg & Carlton</i> 7594 (N.Y.).	
Eriogonum Brandegei , sp. nov.	220
Type: Southern Colorado, Sept. 1, 1873, <i>T. S. Brandegee</i> (N.Y.).	
Eriogonum mancum , sp. nov.	220
Type: Beaver Head County, Mont., July, 1888, <i>F. Tweedy</i> 106 (C.U.).	
Eriogonum lachnostegium .	221
<i>E. strictum lachnostegium</i> Benth. in DC. Prod. 14: 16. 1857.	
Eriogonum lagopus , sp. nov.	222
Type: Dayton, Wyo., Sept., 1899, <i>Tweedy</i> 2624 (N.Y.).	
Eriogonum nebraskense , sp. nov.	224
Type: Kimball County, Nebr., July 12, 1891, <i>Rydberg</i> 337 (N.Y. and C.U.).	
Aconogonum phytolaccaefolium (Meisn.) Small.	238
<i>Polygonum phytolaccaefolium</i> Meisn.; Small, Bull. Torrey Club 19: 360. 1892.	
Atriplex subconferta , sp. nov.	248
Type: Twin Falls and Shoshone Falls, July 27, 1911, <i>Nelson & Macbride</i> 1379 (N.Y.).	
Claytonia multiscapa .	263
<i>C. multicaulis</i> A. Nels. Bull. Torrey Club 27: 259. 1900. Not Kuntze. 1891.	
MONTIASTRUM , gen. nov.	265
<i>Claytonia</i> § <i>Montiastrum</i> A. Gray, Proc. Am. Acad. 22: 283. 1887.	
Montiastrum lineare .	265
<i>Claytonia linearis</i> Dougl.; Hook. Fl. Bor. Am. 1: 224. 1832.	
Delphinium canmoreense , sp. nov.	312
Type: Canmore, B.C., July 1, 1885, <i>John Macoun</i> (C.U.).	

	PAGE
Aconitum divaricatum , sp. nov.	314
Type: City Creek Cañon, Utah, Aug. 9, 1884, <i>Leonard 204/182</i> (N.Y.)	
Aconitum patens , sp. nov.	315
Type: Latah County, Idaho, July 14, 1896, <i>Elmer 13</i> (N.Y.).	
Arabidopsis Richardsonii .	341
<i>Pilosella Richardsonii</i> Rydb. <i>Torreyana</i> 7 : 159. 1907.	
Arabidopsis virgata .	342
<i>Sisymbrium virgatum</i> Nutt.; T. & G. <i>Fl. N. Am.</i> 1 : 93. 1838.	
Arabidopsis stenocarpa .	342
<i>Pilosella stenocarpa</i> Rydb. <i>Torreyana</i> 7 : 161. 1907.	
Arabidopsis glauca .	342
<i>Sisymbrium glaucum</i> Nutt.; T. & G. <i>Fl. N. Am.</i> 1 : 93. 1838.	
Dentaria rupicola .	348
<i>Cardamine californica rupicola</i> O. E. Schulz, <i>Bot. Jahrb.</i> 32 : 388. 1903.	
Arabis Egglestonii , sp. nov.	361
Type: Clover Mountain, Colo., July 31, 1910, <i>Eggleston 6013</i> [fr.], <i>6016</i> [fl.] (N.Y.).	
Arabis spatifolia , sp. nov.	361
Type: Estes Park, Colo., July 20, 1903, <i>Osterhout 2808</i> (N.Y.).	
Arabis Stokesiae , sp. nov.	361
Type: Parley's Cañon, Utah, June 8, 1901, <i>Miss S. G. Stokes</i> (N.Y.).	
Phoenicaulis Huddelliana .	363
<i>Parrya Huddelliana</i> A. Nels. <i>Bot. Gaz.</i> 54 : 139. 1912.	
STREPTANTHELLA , gen. nov.	364
Type species:	
Streptanthella longirostris .	364
<i>Arabis longirostris</i> S. Wats. <i>Bot. King Exp.</i> 17. 1871.	
Peritoma angustum .	371
<i>Cleome integrifolia angusta</i> M. E. Jones, <i>Proc. Calif. Acad. II</i> , 5 : 625. 1895.	
LIMNOBOTRYA , gen. nov.	396
Type species: <i>Ribes lacustre</i> (Pers.) Poir.	
Limnobotrya lacustris .	396
<i>Ribes oxyacanthoides lacustre</i> Pers. <i>Syn. Pl.</i> 1 : 252. 1805.	
<i>R. lacustre</i> Poir. in <i>Lam. Encycl. Suppl.</i> 2 : 856. 1812.	
Limnobotrya echinata .	396
<i>Ribes echinatum</i> Dougl. <i>Trans. Hort. Soc. London</i> 7 : 517. 1830.	
Limnobotrya parvula .	397
<i>Ribes lacustre parvulum</i> A. Gray, <i>Bot. Calif.</i> 1 : 206. 1876.	
<i>R. parvulum</i> Rydb. <i>Mem. N. Y. Bot. Gard.</i> 1 : 203. 1900.	
Limnobotrya montigena .	397
<i>Ribes montigenum</i> McClatchie, <i>Erythea</i> 5 : 38. 1897.	
Chrysobotrya odorata .	399
<i>Ribes odoratum</i> Wendl. in <i>Bartl. & Wendl. Beitr.</i> 2 : 15. 1825.	
Chrysobotrya aurea .	399
<i>Ribes aureum</i> Pursh, <i>Fl. Am.</i> , Sept. 164. 1814.	
Rosa collaris , sp. nov.	441
Type: Pinehurst, Idaho, August 17, 1911, <i>J Francis Macbride 1676</i> (N.Y.)	
Rosa puberulenta , sp. nov.	443
Type: Montezuma Canyon, east of Monticello, August 13, 1911, <i>Rydberg & Garrett 9705</i> (N.Y.)	
Rosa pyrifera , sp. nov.	445
Type: Lake Pend d'Oreille, Idaho, August 7, 1892, <i>Sandberg, MacDougal & Heller 871</i> (N.Y.).	
Sorbus angustifolia , sp. nov.	448
Type: Cedar Mountain, Ida., July, 1898, <i>C. V. Piper</i> (N. Y.).	
Prunus valida .	451
<i>Padus valida</i> Woot. & Standl. <i>Contr. U. S. Nat. Herb.</i> 16 : 134. 1913.	

	PAGE
Lupinus glabratus.	465
<i>Lupinus ornatus glabratus</i> S. Wats. Proc. Am. Acad. 8 : 528. 1873 (as to the type: <i>Fremont 578</i>).	
Anisolatus longebracteatus.	479
<i>Lotus longebracteatus</i> Rydb. Bull. Torrey Club 30 : 254. 1903.	
Parosela alopecuroides.	483
<i>Dalea alopecuroides</i> Willd. Sp. Pl. 3 : 1336. 1803.	
Parosela carnescens.	483
<i>Dalea nana elatior</i> Port. & Coult. Syn. Fl. Colo. 22 . 1874. Not A. Gray. 1852.	
<i>Parosela rubescens</i> Coult. & Nels. Man. Rocky Mt. Reg. 298 . 1909. Not <i>Dalea rubescens</i> S. Wats. 1882.	
Phaca allochroa.	487
<i>Astragalus allochrous</i> A. Gray, Proc. Am. Acad. 13 : 366. 1878.	
Phaca lutosa.	488
<i>A. lutosus</i> M. E. Jones, Cont. W. Bot. 13 : 7. 1910.	
Cystium heliophilum , sp. nov.	491
Type: Lima, Mont., July 1, 1895, <i>C. L. Shear 3430</i> (N.Y.).	
Cystium salinum.	492
<i>A. salinus</i> Howell, Erythea 1 : 111. 1893.	
Hamosa amplexa.	496
<i>A. amplexus</i> Payson, Bot. Gaz. 60 : 378. 1915.	
Hamosa malaca.	496
<i>A. malacus</i> A. Gray, Proc. Am. Acad. 7 : 336. 1868.	
Tium obscurum.	498

Coryphantha radiosa.	581
<i>M. radiosa</i> Engelm. Bost. Journ. Nat. Hist. 6 : 196. 1850.	
Epilobium MacDougalii , sp. nov.	587
Type: Eastern shore of Flathead Lake, Mont., July 29, 1901, <i>MacDougal</i> 793 (N.Y.).	
CORDYLOPHORUM , gen. nov.	590
<i>Epilobium</i> § <i>Cordyllophorum</i> Nutt.; T. & G. Fl. 1 : 488. 1840. Type species:	
Cordyllophorum suffruticosum.	590
<i>E. suffruticosum</i> Nutt.; T. & G., Fl. N. Am. 1 : 488. 1840.	
Zauschneria crassifolia , sp. nov.	590
Type: D. A. Adams Ranch, Ariz., Oct. 8, 1900, <i>D. Griffiths</i> 1842 (N.Y.).	
Anogra perplexa , sp. nov.	596
Type: Near Dolores, Colo., 1901, <i>Vreeland</i> 880 (N.Y.).	
Anogra Bradburiana.	596
<i>Oenothera Bradburiana</i> Nutt.; T. & G. Fl. 1 : 494. 1840.	
Pachylophus Johnsoni.	598
<i>O. Johnsoni</i> Parry, Am. Natur. 9 : 270. 1875.	
Pachylophus crinitus.	598
Type: Rabbit Valley, Utah, Aug. 6, 1875, <i>L. F. Ward</i> 526 (U. S. 140110, in part).	
Chylisma parviflora.	603
<i>O. brevipes parviflora</i> Parry Am. Natur. 9 : 271. 1875.	
Orogenia Leibergii.	611
<i>O. fusiformis Leibergii</i> Coult. & Rose, Rev. N. Am. Umbell. 92. 1888.	
Ligusticum brevilibum , sp. nov.	613
Type: Aquarius Plateau, Utah, Aug. 5, 1905, <i>Rydberg & Carlton</i> 7473 (N.Y.).	
Phellopterus Jonesii.	619
<i>Rhysopterus Jonesii</i> Coult. & Rose, Cont. U. S. Nat. Herb. 7 : 186. 1900.	
Coriophyllus basalticus.	620
<i>Cymopterus basalticus</i> M. E. Jones, Contr. W. Bot. 12 : 16. 1908.	
Pteryxia Elrodi.	621
<i>Cymopterus Elrodi</i> M. E. Jones, Bull. Univ. Mont. Biol. Ser. 15 : 41. 1910.	
Pseudocymopterus versicolor , sp. nov.	623
Type: Aquarius Plateau, at the head of Poison Creek, Utah, 1905, <i>Rydberg & Carlton</i> 7426 (N.Y.).	
Pseudopteryxia Hendersoni.	624
<i>Pseudocymopterus Hendersoni</i> Coult. & Rose, Cont. U. S. Nat. Herb. 7 : 190. 1900.	
Cogswellia lapidosa.	627
<i>Peucedanum lapidosum</i> M. E. Jones, Zoe. 2 : 246. 1891.	
<i>Cymopterus lapidosus</i> M. E. Jones, Cont. W. Bot. 8 : 31. 1838.	
Cynomarathrum megarrhizum.	629
<i>Peucedanum megarrhiza</i> A. Nels. Bull. Torrey Club 26 : 130. 1899.	
Cynomarathrum brecciarum.	630
<i>Cogswellia brecciarum</i> M. E. Jones, Cont. W. Bot. 12 : 37. 1908.	
Angelica Piperi , sp. nov.	631
Type: Blue Mountains, Walla Walla County, Wash., 1896, <i>Piper</i> 2336 (N.Y.).	

	PAGE
Svida instolonea.	635
<i>Cornus instolonea</i> A. Nels. Bot. Gaz. 53 : 224. 1912.	
Chamaepericlymenum unalaskense.	635
<i>Cornus unalaskensis</i> Ledeb. Fl. Ross. 2 : 378. 1844-6.	
CYANOCOCCUS , gen. nov.	645
<i>Vaccinium</i> § <i>Cyanococcus</i> A. Gray, Mem. Am. Acad. II. 3 : 53. 1846.	
Type species: <i>Vaccinium pennsylvanicum</i> Lam.	
Cyanococcus canadensis.	645
<i>Vaccinium canadense</i> Kalm; Richards. in Franklin, Journ. ed. 2 : 12. 1823.	
Cyanococcus pennsylvanicus.	845

<i>G. filifolia diffusa</i> A. Gray, Proc. Am. Acad. 8 : 272. 1870.	
Welwitchia floccosa.	688
<i>G. floccosa</i> A. Gray, Proc. Am. Acad. 8 : 272. 1870.	
Gilia tridactyla.	696
<i>G. trifida</i> A. Brand, Pflanzenreich 4 ²⁵⁰ : 120. 1907. Not Nutt. 1848.	
Linanthus Dactylophyllum.	698
<i>G. Dactylophyllum</i> Torr. in Ives Bot. Colo. Riv. 22 . 1860.	
<i>G. demissa</i> A. Gray, Proc. Am. Acad. 8 : 263. 1870.	
TINTINABULUM , gen. nov.	698
Type species:	
Tintinabulum filiforme.	698
<i>Gilia filiformis</i> Parry, Proc. Am. Acad. 10 : 75. 1875.	

	PAGE
GILIASTRUM , gen. nov.	699
<i>Gilia</i> § <i>Giliastrum</i> A. Brand. Pflanzenreich 4 ²⁵⁰ : 147. 1907.	
Type species: Giliastrum rigidulum . <i>Gilia rigidula</i> Benth. in DC. Prod. 9 : 312. 1845.	
Giliastrum acerosum .	699
<i>Gilia rigidula acerosa</i> A. Gray, Proc. Am. Acad. 8 : 280. 1870.	
Eucrypta pinetorum .	701
<i>Phacelia pinetorum</i> M. E. Jones, Zoe 4 : 279. 1893.	
Triquiliopsis Palmeri .	711
<i>Coldenia Palmeri</i> A. Gray, Proc. Am. Acad. 8 : 292. 1870.	
Amsinckia rugosa , sp. nov.	729
Type: Lewiston, Ida., April 27, 1896, A. A. & E. G. Heller 2975 (C.U.).	
PYCNOSPHERE , gen. nov.	747
<i>Salvia</i> § <i>Pycnosphace</i> Benth. Lab. Gen. & Sp. 302. 1833. Type species:	
Pycnosphace Columbariae .	747
<i>Salvia Columbariae</i> Benth. Lab. Gen. & Sp. 302. 1833.	
Hedeoma camporum .	750
<i>H. longiflora</i> Rydb. Bull. Torrey Club 36 : 685. 1909. Not Briq. 1896.	
Pentstemon puberulentus , sp. nov.	774
Type: Long Valley, Ida., July 6, 1895, Henderson 3169 (U. S. & N.Y.).	
Pentstemon pachyphyllus A. Gray, in herb.	770
<i>P. nitidus major</i> Benth. in DC. Prod. 10 : 323. 1846.	
Pentstemon virens Pennell.	773
Type: Stony hillsides, foothills north of Morrison, Colo., 1915, Pennell 5821 (N.Y.).	
<i>P. humile</i> A. Gray, Am. Jour. Sci. II, 34 : 253. 1862. Not Nutt.	
Pentstemon leptophyllus , sp. nov.	773
Type: Rush Creek, Washington Co., Ida. 1899. M. E. Jones 6493 (N.Y.).	
PENTSTEMONOPSIS , gen. nov.	777
Type species:	
Pentstemonopsis Tweedyi .	777
<i>Pentstemon Tweedyi</i> Canby & Rose, Bot. Gaz. 15 : 66. 1890.	
Castilleja subpurpurascens .	791
<i>C. purpurascens</i> Rydb. Bull. Torrey Club 34 : 38. 1907. Not Greenm. 1906.	
Adenostegia bicolor .	797
<i>Cordylanthes bicolor</i> Nels. Bot. Gaz. 54 : 416. 1912.	
Galium columbianum , sp. nov.	808
Type: Wood on St. Joseph River, Kootenai Co., Ida., July 8, 1892, Sandberg, MacDougal & Heller 600 (N.Y.).	
Galium asperulum .	809
<i>G. asperrimum asperulum</i> A. Gray, Bot. Calif. 1 : 284. 1876.	
Galium filipes , sp. nov.	809
Type: City Creek Cañon, Utah, 1883, Leonard 166/65 (N.Y.).	
Comandra linearis , sp. nov.	818
Type: Green River, Utah, Aug. 19, 1887, S. M. Tracy 716 (N.Y.).	
Plectritis macroptera .	818
<i>Aligera macroptea</i> Suksd. Deuts. Bot. Monats. 15 : 146. 1897.	
Coleosanthus Watsonii .	843
<i>Brickellia Watsonii</i> B. L. Robinson, Mem. Gray Herb. 1 : 42. 1917.	
Grindelia laciniata , sp. nov.	848
Type: Montezuma Cañon, east of Monticello, Utah, Aug. 13, 1911, Rydberg & Garrett 9692 (N.Y.).	
Grindelia columbiana .	849
<i>Grindelia nana columbiana</i> Piper, Contr. U. S. Nat. Herb. 11 : 556. 1906.	
Ericameria paniculata .	853
<i>Linosyris viscidiflora paniculata</i> A. Gray in Torr. Bot. Mex. Bound. Surv. 80 , 1859.	
<i>Bigelovia paniculata</i> A. Gray, Proc. Am. Acad. 8 : 644. 1873.

 Oakes. **Oakes**, William, 1799-1848.
 Oeder. **Oeder**, Georg Christian von, 1728-1791.
 Olin. **Olin**, Emil Hjalmar Fredrik, 1869-1914.
 Olney. **Olney**, Stephen Thayer, 1812-1878.
 Opiz. **Opiz**, Philipp Maximilian, 1787-1858.
 Ort. **Ortega**, Casimiro Gomez, 1740-1818.
 Osterh. **Osterhout**, George Everett, 1858-
 Pall. **Pallas**, Peter Simon, 1741-1811.
 Pammel. **Pammel**, Louis Hermann, 1862-
 Parish. **Parish**, Samuel Bonsall, 1838-
 Parl. **Parlatore**, Filippo, 1816-1877.
 Parry. **Parry**, Charles Christopher, 1823-1890.
 Patrin. **Patrin**, Eugène Louis Melchior, 1742-1815.
 Pax. **Pax**, Ferdinand, 1858-
 Payson. **Payson**, Edwin Blake, 1893-
 Pennell. **Pennell**, Francis Whittier, 1886-
 Pers. **Persoon**, Christiaan Hendrik, 1755-1837.
 Petrak. **Petrak**, Franz, 18--
 Philippi. **Philippi**, Rudolf Amandus, 1808-1904.
 Pickering. **Pickering**, Charles, 1805-1878.
 Piper. **Piper**, Charles Vancouver, 1867-
 Piper & Brodie. **Piper**, Charles Vancouver, 1867- ; **Brodie**, David Arthur, 1868-
 Planch. **Planchon**, Jules Emile, 1823-1888.
 Plum. or Plumier. **Plumier**, Charles, 1646-1704.
 Poir. **Poiret**, Jean Louis Marie, 1755-1834.
 Poll. **Pollich**, Johann Anton, 1740-1780.
 Pollard. **Pollard**, Charles Louis, 1872-
 Porter. **Porter**, Thomas Conrad, 1822-1901.
 Porter & Coult. **Porter**, Thomas Conrad, 1822-1901 ; **Coult**, John Merle, 1851-
 Prantl. **Prantl**, Karl Anton Eugen, 1849-1893.
 Prescott. **Prescott**, John D., 17--1836.
 Presl. **Presl**, Karel Boriwog, 1794-1852.
 Presl, J. **Presl**, Jan Swatopluk, 1791-1849.
 Presl, J. & C. **Presl**, Jan Swatopluk, 1791-1849 ; **Presl**, Karel Boriwog, 1794-1852.
 Pritzel. **Pritzel**, Georg August, 1815-1874.
 Prov. **Provancher**, Léon, 1820-1892.
 Purdy. **Purdy**, Carl, 18--
 Purpus. **Purpus**, Joseph Anton, 1860-
 Pursh. **Pursh**, Frederick, 1774-1820.
 Pylaie. **La Pylaie**, Auguste Jean Marie Bachelot de, 1786-1856.
 R. & P. **Ruiz Lopez**, Hipolito, 1754-1815 ; **Pavon**, José, 175--1844.
 R. & S. **Roemer**, Johann Jacob, 1763-1819 ; **Schultes**, Joseph August, 1773-1831.
 Raf. **Rafinesque**, Constantine Samuel, 1783-1840.
 Raim. **Raimann**, Rudolf, 1863-1896.
 Ramaley. **Ramaley**, Francis, 1870-
 Ray. **Ray**, John, 1627-1705.
 Regel. **Regel**, Eduard August von, 1815-1892.
 Regel & Tiling. **Regel**, Eduard August von, 1815-1892 ; **Tiling**, Heinrich Sylvester Theodor, 18--1871
 Reich. **Reichenbach**, Heinrich Gottlieb Ludwig, 1793-1879.
 Reichard. **Reichard**, Johann Jacob, 1743-1782.
 Retz. **Retzius**, Anders Johan, 1742-1821.
 Rich. **Richard**, Louis Claude Marie, 1754-1821.
 Richards. **Richardson**, John, 1787-1865.
 Ricker. **Ricker**, Percy Leroy, 1878-
 Riddell. **Riddell**, John Leonard, 1807-1865.
 Riv. **Rivinus**, Augustus Quirinus, 1652-1723.
 Robbins. **Robbins**, James Watson, 1801-1879.
 Robins. & Greenm. **Robinson**, Benjamin Lincoln, 1864- ; **Greenman**, Jesse More, 1867-
 Robinson, B. L. **Robinson**, Benjamin Lincoln, 1864-
 Robson. **Robson**, Stephen, 1741-1779.
 Roem. **Roemer**, Johann Jacob, 1763-1819.
 Rose. **Rose**, Joseph Nelson, 1862-
 Rostk. & Schmidt. **Rostkovius**, Friedrich Wilhelm Theophil, 1770-1848 ; **Schmidt**, Wilhelm Ludwig Ewald, 1804-1843.
 Roth. **Roth**, Albrecht Wilhelm, 1757-1834.
 Rothr. **Rothrock**, Joseph Trimble, 1839-
 Rottb. **Rottböll**, Christen Friis, 1727-1797.
 Rowland. **Rowland**, Verner Hawsbrook, 18--
 Rowlee. **Rowlee**, Willard Winfield, 1861-
 Royen. **Royen**, Adrian van, 1704-1779.
 Royle. **Royle**, John Forbes, 1800-1858.
 Rudolphi. **Rudolphi**, Friedrich Karl Ludwig, 1801-1849.
 Rümpl. **Rümpler**, Theodor, 1817-1891.
 Rupp. **Ruppius**, Heinrich Bernhard, 1688-1719.
 Rupr. **Ruprecht**, Franz Josef, 1814-1870.

- Rydb. **Rydb.**, Per Axel, 1860—
 Rylands. **Rylands**, Thomas Glazebrook, 1818—1900.
 Salisb. **Salisbury**, Richard Anthony, 1761—1829.
 Sarg. **Sargent**, Charles Sprague, 1841—
 Scepin. **Scepin**, Constantin, 17—17—
 Schaffn. **Schaffner**, Wilhelm, 18—1883.
 Schaffn., J. H. **Schaffner**, John Henry, 1866—
 Scheele. **Scheele**, Adolf, 1808—1864.
 Scheutz. **Scheutz**, Nils Johan Wilhelm, 1836—1889.
 Schk. **Schkuhr**, Christian, 1741—1811.
 Schlecht. **Schlechtendal**, Diederich Franz Leonhard von, 1794—1866.
 Schlecht. & Cham. **Schlechtendal**, Diederich Franz Leonhard von, 1794—1866;
Chamisso, Ludolf Adalbert von, 1781—1838.
 Schleich. **Schleicher**, Johann Christoph, 1768—1834.
 Schleiden. **Schleiden**, Matthias Jacob, 1804—1881.
 Schmidel. **Schmidel**, Casimir Christoph, 1718—1792.
 Schmidt, F. W. **Schmidt**, Franz Wilibald, 1764—1796.
 Schneid., C. K. **Schneider**, Camillo Karl, 1876—
 Schott. **Schott**, Heinrich Wilhelm, 1794—1865.
 Schrad. **Schrader**, Heinrich Adolph, 1767—1836.
 Schrank. **Schrank**, Franz von Paula von, 1747—1835.
 Schreb. **Schreber**, Johann Christian Daniel von, 1739—1810.
 Schult. **Schultes**, Joseph August, 1773—1831.
 Schultz, F. **Schultz**, Friedrich Wilhelm, 1804—1876.
 Schultz-Bip. **Schultz**, Carl Heinrich, 1805—1867.
 Schulz, O. E. **Schulz**, Otto Eugen, 18—
 Schum., K. **Schumann**, Karl Moritz, 1851—1904.
 Schur. **Schur**, Philipp Johann Ferdinand, 1799—1878.
 Schw. or Schwein. **Schweinitz**, Lewis David de, 1780—1834.
 Schweinf. **Schweinfurth**, Georg August, 1836—
 Scop. **Scopoli**, Johann Anton, 1723—1788.
 Scribn. **Scribner**, Frank Lamson, 1851—;
 Scribn. & Ball. **Scribner**, Frank Lamson, 1851—;
Ball, Carleton Roy, 1873—
 Scribn. & Merr. **Scribner**, Frank Lamson, 1851—;

 T. & G. **Torrey**, John, 1796—1873; **Gray**, Asa, 1810—1888.
 Tausch. **Tausch**, Ignaz Friedrich, 1793—1848.
 Tenore. **Tenore**, Michele, 1780—1861.
 Thal. **Thal**, Johann, 154—1583.
 Thellung. **Thellung**, Albert, 1881—
 Thornber. **Thornber**, John James, 1872—
 Thouars. **Aubert du Petit-Thouars**, Aubert, 1758—1831.
 Thuill. **Thuillier**, Jean Louis, 1757—1822.
 Thunb. **Thunberg**, Carl Peter, 1743—1828.
 Thurb. **Thurber**, George, 1821—1890.
 Tidest. **Tidestrom**, Ivar, 1865—
 Tiling. **Tiling**, Heinrich Sylvester Theodor, 18—1871.

- Todaro. **Todaro**, Agostino, 1818-1892.
 Torr. **Torrey**, John, 1796-1873.
 Torr. & Frém. **Torrey**, John, 1796-1873; **Frémont**, John Charles, 1813-1890.
 Tourn. **Tournefort**, Joseph Pitton de, 1656-1708.
 Trautv. **Trautvetter**, Ernst Rudolf von, 1809-1889.
 Trel. **Trelease**, William, 1857-
 Trev. **Treviranus**, Ludolf Christian, 1779-1864.
 Trew. **Trew**, Christoph Jakob, 1695-1769.
 Trin. **Trinius**, Karl Bernhard von, 1778-1844.
 Trin. & Rupr. **Trinius**, Karl Bernhard von, 1778-1844; **Ruprecht**, Franz Josef, 1814-1870.
 Tuckerm. **Tuckerman**, Edward, 1817-1886.
 Turcz. **Turczaninow**, Nicolaus, 1796-1864.
 Uline & Bray. **Uline**, Edwin Burton, 1867- ; **Bray**, William L, 1865- .
 Underw. **Underwood**, Lucien Marcus, 1853-1907.
 Urv. **Dumont d'Urville**, Jules Sébastien César, 1790-1842.
 Vahl. **Vahl**, Martin, 1749-1804.
 Vail. **Vail**, Anna Murray, 1863- .
 Vaill. **Vaillant**, Sébastien, 1669-1722.
 Vasey. **Vasey**, George, 1822-1893.
 Vasey & Scribn. **Vasey**, George, 1822-1893; **Scribner**, Frank Lamson, 1851- .
 Vent. **Ventenat**, Etienne Pierre, 1757-1808.
 Vest. **Vest**, Lorenz Chrysanth von, 1776-1840.
 Vill. **Villars**, Dominique, 1745-1814.
 Vogel. **Vogel**, Julius Rudolph Theodor, 1812-1841.
 Vogler. **Vogler**, Johann Andreas, 17—1—
 Wahl. **Wahlenberg**, Göran, 1780-1851.
 Waldst. & Kit. **Waldstein**, Franz de Paula Adam von, 1759-1823; **Kitabel**, Paul, 1757-1817.
 Wallr. **Wallroth**, Carl Friedrich Wilhelm, 1792-1857.
 Walp. **Walpers**, Wilhelm Gerhard, 1816-1853.
 Walt. **Walter**, Thomas, 1740-1788.
 Wats., S. **Watson**, Sereno, 1826-1892.
 Wats. & Coult. **Watson**, Sereno, 1826-1892; **Coulter**, John Merle, 1851-
 Weber. **Weber**, Georg Heinrich, 1752-1828.
 Weinm. **Weinmann**, Johann Anton, 1782-1858.
 Wendl. **Wendland**, Heinrich Ludolph, 1792-1869.
 Wettst. **Wettstein**, Richard von, 1862-
 Wheelock. **Wheelock**, William Efner, 1852- .
 White. **White**, Theodore Greely, 1872-1901.
 Wieg. **Wiegand**, Karl McKay, 1873-
 Wight, W. **Wight**, William Franklin, 1874-
 Wikst. **Wikström**, Johan Emanuel, 1789-1856.
 Willd. **Willdenow**, Carl Ludwig, 1765-1812.
 Williams. **Williams**, Thomas Albert, 1865-1900.
 With. **Withering**, William, 1741-1799.
 Wolf. **Wolf**, Dr., 1738-1825.
 Wood. **Wood**, Alphonso, 1810-1881.
 Woot. **Wooton**, Elmer Ottis, 1865-
 Woot. & Standl. **Wooton**, Elmer Ottis, 1865- ; **Standley**, Paul Carpenter, 1884- .
 Wormsk. **Wormskjöld**, Morten, 1783-1845.
 Wulfen. **Wulfen**, Franz Xaver von, 1728-1805.
 Wylie. **Wylie**, Robert Bradford, 1870-
 York. **York**, Harlan Harvey, 1875-
 Zucc. **Zuccarini**, Joseph Gerhard, 1797-1848.
 Zuccagni. **Zuccagni**, Attilio, 1754-1807.

GLOSSARY

- Abnormal.* Differing from the usual structure.
- Abortion.* Imperfect development or non-development of an organ.
- Abortive.* Imperfectly formed, rudimentary, or barren.
- Abruptly pinnate.* Pinnate without an odd leaflet at the end.
- Acaulescent.* Stemless or apparently so.
- Accrescent.* Growing larger after flowering.
- Accumbent* (cotyledon). Having the edges against the radicle or hypocotyl.
- Acerose.* Needle-shaped, as the leaves of pines.
- Achene.* A small, dry and hard, 1-celled, 1-seeded, indehiscent fruit.
- Acicular.* Slender needle-shaped.
- Aculeate.* Prickly; beset with prickles.
- Acuminate.* Tapering at the end.
- Acute.* Sharp-pointed, but less so than acuminate.
- Adnate.* An organ adhering to a different one; united, as the inferior ovary with the calyx-tube. *Adnate anther*, one attached for its whole length to the filament.
- Adsurgent*=*assurgent*.
- Adventitious.* Out of the usual place.
- Adventive.* Not indigenous, but apparently becoming naturalized.
- Aequilalateral.* Equal-sided.
- Aerial.* Growing in or pertaining to the air; hence above the ground or the water.
- Aestivation.* The arrangement of the parts in a flower bud.
- Alate.* Winged.
- Albumen.* See Endosperm.
- Alliaceous.* Onion-like, in aspect or odor, or taste.
- Alternate.* Not opposite to each other.
- Alveolar.* Containing sockets or pits.
- Alveolate.* Honeycombed; having angular depressions separated by thin partitions.
- Ament.* A catkin, or peculiar scaly unisexual spike.
- Amentaceous.* Catkin-like, or catkin-bearing.
- Amphitropous* (ovule or seed). Half-inverted and straight, with the hilum lateral.
- Amplexicaul.* Clasping the stem.
- Anastomosing.* Connecting so as to form a well-defined network.
- Anatropous* (ovule). Inverted and straight, with the micropyle next the hilum.
- Androecium.* The whole set of stamens.
- Androgynous.* Having both staminate and pistillate flowers in the same inflorescence, or in *Carex* in the same spikelet, the former above the latter.
- androus* (in compounds). Having stamens.
- Angiospermous.* Having the seeds borne within a pericarp.
- Annual.* Of only one year's duration.
- Winter annual*, a plant from autumn-sown seed which blooms and fruits in the following spring.
- Annular.* In the form of a ring.
- Annulate.* Furnished with a ring or annulus.
- Annulus.* A ring, like that of the spore-case of most ferns.
- Anterior* (in the flower). The side towards the bract (external).
- Anther.* The part of the stamen which contains the pollen.
- Antherid, Antheridium* (-a). The male organ of reproduction in ferns and mosses.
- Antheriferous.* Anther-bearing.
- Anthesis.* The time of expansion of a flower.
- Apetalous.* Having no petals.
- Aphyllopodic.* Without leaves at the base.
- Aphyllous.* Destitute of leaves, at least of green leaves.
- Apical.* Situated at the apex or tip.
- Apiculate.* With a minute point.
- Appressed.* Lying close and flat against.
- Approximate.* Near together.
- Arachnoid.* Cobwebby; of slender entangled hairs.
- Arborescent.* Tree-like, in size or shape.
- Archegone, or Archegonium* (plural *archegonia*). The female organ in mosses and ferns.
- Arcuate.* Bent or curved like a bow.
- Areola* (-ae). A little, usually angular, space on the surface.
- Areolate.* Marked out into little areas; reticulate.
- Aril.* A fleshy organ growing about the hilum.
- Ariliform.* Resembling an aril.
- Arillate.* Having an aril.
- Aristate.* Tipped by an awn or bristle.
- Aristulate.* Diminutive of aristate.
- Articulate.* Jointed; having a node or joint.
- Ascending.* Growing obliquely upward, or upcurved.
- Asexual.* Without sex.
- Assurgent.* Ascending.
- Attenuate.* Slenderly tapering; becoming very narrow.
- Auricle.* An ear-shaped appendage.
- Auriculate.* Furnished with auricles.
- Awl-shaped.* Sharp-pointed from a broader base.
- Awn.* A slender bristle-like organ.
- Axial*=*Axile*.
- Axil.* The upper angle formed by a leaf or branch with the stem.
- Axile.* In the axis of an organ.
- Axillary.* Borne at or pertaining to an axil.
- Axis.* The central line of any organ or support of a group of organs; a stem, etc.
- Baccate.* Berry-like.
- Banner.* Upper petal of the papilionaceous flower; vexillum or standard.
- Barbed.* Furnished with rigid points or short bristles, usually reflexed like the barb of a fish-hook.
- Barbellate.* Finely barbed.
- Barbulate.* Finely bearded.

- Basal, Basilar.* At or pertaining to the base.
- Basifixed.* Attached by the base.
- Bast.* The fibrous portion of the inner bark.
- Beaked.* Ending in a beak or prolonged tip.
- Bearded.* With long or stiff hairs of any sort; awns of grasses are sometimes called beard.
- Berry.* A fruit with pericarp wholly pulpy.
- Bi- or Bis-.* A Latin prefix signifying two, twice, or doubly.
- Biconvex.* Convex on both sides; lens-shaped.
- Bidentate.* Having two teeth.
- Bidentulate.* Diminutive of bidentate.
- Biennial.* Of two years' duration.
- Bifid.* Two-cleft.
- Bilabiate.* Two-lipped.
- Bilocular.* Two-celled.
- Binate.* Two together.
- Bipinnate (leaf).* Twice pinnate.
- Bipinnatifid.* Twice pinnatifid.
- Biseriate, Biseriate.* Occupying two rows, one within the other.
- Bisexual.* Having both stamens and pistils.
- Biternate.* Twice ternate (principal divisions 3, each with 3 leaflets).
- Bivalvular.* Two-valved.
- Bladdery.* Thin and inflated.
- Blade.* The flat expanded part of a leaf.
- Bract.* A leaf, usually small, subtending a flower or flower-cluster, or a sporange.
- Bracteate.* With bracts.
- Bracteolate.* Having bractlets.
- Bracteose.* With numerous or conspicuous bracts.
- Bractlet.* A secondary bract, borne on a pedicel, or immediately beneath a flower; sometimes applied to minute bracts.
- Bristle.* A stiff hair or any similar outgrowth.
- Bulb.* A subterranean leaf-bud with fleshy scales or coats.
- Bulbiferous.* Bearing bulbs.
- Bulblet.* A small bulb, especially one borne upon the stem.
- Bulbose, Bulbous.* Bulb-like in form.
- Caducous.* Dropping off very early.
- Calcarate.* Produced into or having a spur.
- Callus.* An extension of the inner scale of a grass spikelet; a protuberance.
- Calyculate.* Having bracts around the calyx imitating an outer calyx.
- Calyptrate.* Furnished with a calyptra, or coming off as a lid or extinguisher.
- Calyx.* The outer of two series of floral leaves.
- Campanulate.* Bell-shaped.
- Campylotropous* (ovule or seed). So curved as to bring the apex and base nearly together.
- Canaliculate.* Channelled; longitudinally grooved.
- Cancellate.* Reticulated, with the meshes sunken.
- Canescent.* With gray or hoary fine pubescence.
- Capillary.* Hair-like in form; as fine as hair or slender bristles.
- Capitate.* Shaped like a head; collected into a head or dense cluster.
- Capitellate.* Diminutive of *capitate*.
- Capitulum.* A little head.
- Capsular.* Belonging to or of the nature of a capsule.
- Capsule.* A dry dehiscent fruit, composed of more than one carpel.
- Carinate.* Keeled; with a longitudinal ridge.
- Carpel.* The modified leaf forming the ovary, or a part of a compound ovary.
- Carpophore.* The slender prolongation of the floral axis which in the Umbelliferae supports the pendulous ripe carpels.
- Cartilaginous.* Of the texture of cartilage; firm and tough.
- Caruncle.* An appendage to a seed at the hilum.
- Carunculate.* With a caruncle.
- Caryopsis.* The grain; fruit of grasses, with a thin pericarp adherent to the seed.
- Catkin.* A scaly deciduous spike of flowers; an ament.
- Caudate.* With a slender tail-like appendage.
- Caudex.* The persistent base of an otherwise annual herbaceous stem.
- Caudicle.* Stalk of a pollen-mass in the Orchid and Milkweed families.
- Caulescent.* Having a manifest stem.
- Cauline.* Pertaining to the stem.
- Cell.* A cavity, of an anther or ovary.
- Chaff.* Thin dry scales.
- Chaffy.* Furnished with chaff, or of the texture of chaff.
- Channelled.* Deeply grooved longitudinally, like a gutter.
- Chartaceous.* Papery in texture.
- Chlorophyll.* Green coloring matter of plants.
- Choripetalous.* Applied to a corolla whose petals are distinct.
- Chorisepalous.* Applied to a calyx whose sepals are distinct.
- Ciliate* (foliar organs). Beset on the margin with a fringe.
- Ciliolate.* Minutely ciliate.
- Cinereous.* Ash-grayish; the color of ashes.
- Circinate.* Coiled downward from the apex.
- Circumscissile.* Transversely dehiscent, the top falling away as a lid.
- Clavate.* Club-shaped.
- Claw.* The narrow or stalk-like base of some petals.
- Cleft.* Cut about half-way to the midvein.
- Cleistogamous.* Fertilized in the bud, without the opening of the flower.
- Coalescence.* The union of parts or organs of the same kind.
- Cochleate.* Coiled or shaped like a snail shell.
- Cohesion.* The union of one organ with another.
- Columella.* A term applied to the persistent axis of the capsule.
- Columnar.* Like a column.
- Coma.* Tuft of hairs at the ends of some seeds.
- Commisure.* The surface by which one carpel joins another, as in the Umbelliferae.
- Composite.* A plant belonging to Carduaceae, Cichoriaceae, or Ambrosiaceae (constituting the old Compositae).
- Concave.* With the surface curved in.
- Conduplicate.* Folded lengthwise.
- Conglomerate.* Densely clustered.
- Coniferous.* Cone-bearing.
- Connate.* Similar organs more or less united.

- Connective*. The end of the filament between the anther-sacs.
- Connivent*. Converging.
- Convolute*. Rolled up longitudinally.
- Coralloid*. Resembling coral.
- Cordate*. Heart-shaped with the point upward.
- Coriaceous*. Leathery in texture.
- Corm*. The enlarged fleshy base of a stem, bulb-like but solid.
- Corniculate*. Furnished with a small horn or spur.
- Corolla*. The inner of two series of floral leaves.
- Coroniform*. Shaped like a crown.
- Corrugate*. Wrinkled or in folds.
- Corymb*. A convex or flat-topped flower-cluster of the racemose type, with pedicels or rays arising from different point on the axis.
- Corymbose*. Borne in corymbs; corymb-like.
- Costa*. A rib; the midrib of a leaf, etc.
- Costate*. Ribbed.
- Cotyledon*. A rudimentary leaf of the embryo.
- Crateriform*. In the shape of a saucer or cup, hemispherical or more shallow.
- Creeping* (stems). Growing flat on or beneath the ground and rooting.
- Crenate*. With rounded teeth.
- Crenulate*. Diminutive of crenate.
- Crested, Cristate*. Bearing any elevated appendage like a crest.
- Crinile*. Bearded with long hairs, etc.
- Crown*. An inner appendage to a petal, or to the throat of a corolla.
- Crucifer*. A member of *Brassicaceae*, or Mustard Family, from the cross-like corolla.
- Crustaceous*. Hard and brittle in texture; crust-like.
- Cucullate*. Hooded, or resembling a hood.
- Culm*. The stem of grasses and sedges.
- Cuneate, Cuneiform*. Wedge-shaped.
- Cupulate*. Cup-shaped.
- Cusp*. A sharp stiff point.
- Cuspidate*. Sharp-pointed; ending in a cusp.
- Cyme*. A convex or flat flower-cluster of the determinate type, the central flowers first unfolding.
- Cymose*. Arranged in cymes; cyme-like.
- Cymule*. A small cyme.
- Deciduous*. Falling away at the close of the growing period.
- Decomposed*. More than once compound or divided.
- Decumbent*. Reclining, but with the summit ascending.
- Decurrent* (leaf). Extending down the stem below the insertion.
- Decussate*. Alternating in pairs at right angles, or in threes.
- Deflexed*. Turned abruptly downward.
- Delicence*. The opening of an ovary, anther-sac, or sporangium to emit the contents.
- Dehiscent*. Opening to emit the contents.
- Demidiate*. Appearing as if cut in half.
- Dentate*. Toothed, especially with outwardly projecting teeth.
- Denticulate*. Diminutive of dentate.
- Dentiform*. Tooth-like.
- Depressed*. Somewhat flattened from above.
- Dextrorse*. Turned to the right.
- Di-*, as a prefix in compounds, means two or twice.
- Diadelphous* (stamens). United by filaments in two sets.
- Diandrous*. Having two stamens.
- Diarpellary*. Composed of two carpels.
- Dichotomous*. Forking regularly by pairs.
- Dicotyledonous*. Having two cotyledons.
- Didymous*. Twin-like.
- Didynamous*. With two stamens longer than the other two.
- Diffuse*. Loosely spreading.
- Digitate*. Diverging, like the fingers spread.
- Digynous* (flower). Having two pistils.
- Dimerous*. In two parts. Referring to a flower constructed on the numerical plan of two.
- Dimorphism* (in flowers). Possessing two forms of flowers, one with short styles and long stamens, the other with long styles and short stamens.
- Dimorphous*. Of two forms.
- Diocious*. Bearing staminate flowers or antherids on one plant, and pistillate flowers or archegones on another of the same species.
- Disciform, Disk-shaped*. Flat and circular, like a disk or quoit.
- Discoid*. Heads of *Compositae* composed only of tubular flowers; rayless; like a disk.
- Disk*. A development of the receptacle at or around the base of the pistil. In *Compositae*, the tubular flowers of the head as distinct from the ray.
- Dissected*. Cut or divided into numerous segments.
- Dissepiment*. A partition-wall of an ovary or fruit.
- Distichous*. In two vertical ranks.
- Distinct*. Separate; not united; evident.
- Divaricate*. Widely divergent.
- Divided*. Cleft to the base or to the midrib.
- Dorsal*. On the back, pertaining to the back.
- Dorsiventral*. In the plane, running through the axis from above to below; contrary to lateral.
- Drupeaceous*. Drupe-like.
- Drupe*. A simple fruit, usually indehiscent, with fleshy exocarp and bony endocarp.
- Drupelet*. Diminutive of drupe.
- E-* or *Ex-*, as a prefix in compounds, means destitute of.
- Echinate*. Prickly.
- Ellipsoid*. A solid body, elliptic in section.
- Elliptic*. With the outline of an ellipse; usually narrowly oval.
- Emarginate*. Notched at the apex.
- Embryo*. A rudimentary plant in the seed.
- Emersed*. Raised out of water.
- Endocarp*. The inner layer of the pericarp.
- Endogenous*. Forming new tissue within.
- Endogens*. Monocotyledons.
- Endosperm*. The substance surrounding the embryo of a seed; albumen.
- Ensiform*. Sword-shaped, as the leaves of *Iris*.
- Entire*. Without divisions, lobes, or teeth.
- Ephemeral*. Continuing for only a day or less.
- Epicarp*. The outer layer of the pericarp.
- Epigynous*. Upon the ovary.
- Epiphyte*. A plant that grows upon another plant, but does not derive its sustenance from it.

- Epiphytic*. Growing on other plants, but not parasitic.
- Equitant*. Astride, used of conduplicate leaves which enfold each other in two ranks, as in *Iris*.
- Erose*. Irregularly margined, as if gnawed.
- Evanescent*. Early disappearing.
- Evergreen*. Bearing green leaves throughout the year.
- Excurrent*. With a tip projecting beyond the main part of the organ.
- Exfoliating*. Peeling off in layers.
- Erocarp*. The outer layer of the pericarp.
- Exogenous*. Forming new tissue outside the older.
- Exogens*. Dicotyledons.
- Exserted*. Prolonged past surrounding organs.
- Extravaginal innovation*. Where the new shoot breaks through the basal sheath and produces a horizontal stolon.
- Extrorse*. Facing outward.
- Falcate*. Scythe-shaped.
- Farinaceous*. Mealy in texture.
- Farinose*. Covered with a mealy powder.
- Fascicle*. A dense cluster.
- Fastigate*. Stems or branches which are nearly erect and close together.
- Faveolate, Favose*. Honeycombed; same as alveolate.
- Fenestrate*. With window-like markings.
- Fenestration*. Transparent spots or openings.
- ferous* (in composition). Bearing.
- Ferruginous*. Color of iron-rust.
- Fertile*. Bearing spores, or bearing seed.
- Fetid*. Ill-smelling.
- Fibrillate, Fibrillose*. Furnished with or abounding in fine fibres.
- Fibro-vascular*. Composed of woody fibres and ducts.
- Filament*. The stalk of a stamen; also any slender thread-shaped appendage.
- Filamentose, Filamentous*. Bearing or formed of slender threads.
- Filiform*. Thread-like.
- Fimbriate*. Fringed.
- Fimbriate*. Minutely fringed.
- Fistular, Fistulose*. Cylindrical and hollow, as the leaves of an onion.
- Flabellate, or Flabelliform*. Fan-shaped; applied to leaves, etc.
- Flaccid*. Without rigidity; lax and weak.
- Flagellate*. Producing slender runners.
- Flagelliferous*. Bearing flagella.
- Flagellum (-a)*. A slender runner as in the strawberry plant.
- Flexuous*. Zigzag; bending alternately in opposite directions.
- Floccose*. With loose tufts of wool-like hairs.
- Floret*. A small flower, usually one of a dense cluster.
- Foliateous*. Leaf-like in texture or appearance.
- foliate*. Having leaves.
- Foliolate*. With separate leaflets.
- foliolate*. Having leaflets.
- Foliose*. Leafy.
- Follicle*. A fruit consisting of a single carpel, dehiscing by the ventral suture.
- Follicular*. Like a follicle.
- Fornicate*. Arched over, as the corona of some Boraginaceae, closing the throat of the corolla.
- Fornix (-ces)*. Small arching crest in the throat of the corolla.
- Foreate, Foreolate*. More or less pitted.
- Free*. Not adnate to other organs.
- Froned*. The leaf of ferns and some other cryptogams; in Lennaceae, the thallus-like stem which functions as foliage.
- Frutescent, Fruticose*. More or less shrub-like.
- Fugacious*. Soon falling off or perishing.
- Funiculus*. The stalk of an ovule or seed.
- Funneliform, Funnel-shaped*. Expanding gradually upwards, like a funnel.
- Furfuraceous*. Resembling bran; scurfy.
- Fuscous*. Grayish brown.
- Fusiform*. Spindle-shaped; swollen in the middle and narrowing toward each end.
- Galea*. A hood-like part of a perianth or corolla; upper lip of a two-lipped corolla.
- Galeate*. Helmet-shaped; having a galea.
- Gamopetalous*. With united petals; same as *monopetalous* and *sympetalous*.
- Gamosepalous*. With united sepals; same as *monosepalous*.
- Geminate*. Like twins.
- Geniculate*. Bent abruptly, like a knee, as many stems.
- Gibbous*. Enlarged or swollen on one side.
- Glabrate*. Becoming glabrous with age, or almost glabrous.
- Glabrous*. Devoid of hairs.
- Gland*. A secreting cell, or group of cells.
- Glandular*. With glands, or gland-like.
- Glaucous*. Covered or whitened with a bloom.
- Globose*. Spherical or nearly so.
- Glochidiate*. Barbed at the tip.
- Glomerate*. In a compact cluster.
- Glomerule*. A dense capitate cyme.
- Glumaceous*. Resembling glumes.
- Glume*. The scaly bracts of the spikelets of grasses and sedges.
- Glutinous*. Covered with a sticky exudation.
- Granuliferous*. Bearing or covered with small granules.
- Gregarious*. Growing in groups or colonies.
- Gymnospermous*. Bearing naked seeds, without an ovary.
- Gynacandrous*. Having staminate and pistillate flowers in the same spikelet, the latter above the former.
- Gynandrous*. Having the stamens and pistils more or less united.
- Gynobase*. A prolongation or enlargement of the receptacle supporting the ovary.
- Gynaphore*. An elongation of the receptacle bearing the pistil; a stalk of the pod made up from a part of the receptacle; compare stipe.
- Gynoeceum*. The whole set of pistils.
- Gynophore*. A stalk raising a pistil above the insertion of the stamens.
- Habit*. The general aspect of a plant, or its mode of growth.
- Habitat*. The situation in which a plant grows in a wild state.
- Halberd-shaped*. The same as hastate.
- Hamate*. Crooked, hooked.
- Hastate*. Halberd-shaped; like sagittate; but with the basal lobes diverging.
- Head*. A dense cluster of sessile or nearly sessile flowers on a very short axis or receptacle.
- Hemispheric*. Shaped like half a globe.
- Herb*. A plant with no persistent woody stem above ground.
- Herbaceous*. Leaf-like in texture and color; pertaining to an herb.

- Hermaphrodite* (flower). Having both stamens and pistils; same as perfect.
- Heterogamous*. Producing more than one kind of flowers.
- Heteromorphous*. Having flowers of different forms as regards the size or relative position of the essential organs.
- Hexa-*, in compounds, means six.
- Hexamerous*. Consisting of six parts or members. Applied to a flower that is constructed on the numerical plan of six.
- Hilum*. The scar or area of attachment of a seed or ovule.
- Hirsute*. With rather coarse stiff hairs.
- Hirtellous*. Minutely hirsute.
- Hispid*. With bristly stiff hairs.
- Hispidulous*. Diminutive of hispid.
- Hoary*. Grayish white; see *canescent*.
- Homogamous*. A head or cluster with flowers all of one kind.
- Hyaline*. Thin and translucent.
- Hybrid*. A cross between two species.
- Hydrophilous*. Water-loving.
- Hydrophyte*. A water-plant.
- Hypanthium*. A calyx-like enlargement of the flower-axis or receptacle, often surrounding or enclosing the pistils and bearing the calyx and corolla and often the stamens on its margin.
- Hypocotyl*. The rudimentary stem of the embryo; also termed *radicle*.
- Hypogynous*. Inserted under the pistil.
- Imbricate*. Overlapping (as shingles on a roof).
- Immersed*. Growing wholly under water.
- Imperfect flowers*. Wanting either stamens or pistils.
- Inaequalateral*. Unequal-sided, as the leaf of *Begonia*.
- Incised*. Cut sharply and irregularly, more or less deeply.
- Incision*. A cut; a narrow opening between two lobes.
- Included*. Not at all protruded from the surrounding envelope.
- Incumbent* (embryo). Cotyledons with the back of one of them against the hypocotyl.
- Indehiscent*. Not splitting open.
- Indigenous*. Native to the country.
- Induplicate*. Valvate aestivation in which the margins of the leaves are inflexed or folded inward.
- Indurated*. Hardened.
- Indusiate*. With an indusium.
- Indusium*. The proper (often shield-shaped) covering of the sorus or fruit-dot in Ferns.
- Inequilateral*. Unequal-sided.
- Inferior*. Lower or below; outer or anterior.
- Inferior ovary*, one that is adnate to the hypanthium.
- Inflated*. Turgid and bladdery.
- Inflexed*. Bent inwards.
- Inflorescence*. The flowering part of plants; its mode of arrangement.
- Infrac-* (in compound words). Below, being below.
- Infracillary*. Inserted some distance below the axils.
- Innocuous*. Harmless, hence unarmed or spineless.
- Innovation*. An offshoot from the stem.
- Inserted*. Attached to or growing out of.
- Insertion*. The place or the mode of attachment of an organ to its support.
- Inter- or intra-*. In composition, between.
- Internerve*. Space between the nerves.
- Internode*. Portion of a stem or branch between two nodes.
- Interval*. Space between ridges.
- Intramarginal*. Within and near the margin.
- Intravaginal innovation*. Where the new shoot starts inside a basal sheath and continues to grow, remaining between it and the stem.
- Introrse*. Facing inward.
- Involucre*. A secondary involucre.
- Involucrate*. With an involucre, or like one.
- Involucre*. A whorl of bracts subtending a flower or flower-cluster.
- Involute*. Rolled inwardly.
- Irregular*. A flower in which one or more of the organs of the same series are unlike the rest.
- Isabel-colored*. Dirty yellowish white.
- Keel*. A projecting ridge on a surface, like the keel of a boat; the two anterior petals of a papilionaceous corolla.
- Labellum*. The odd (lower) petal of orchids.
- Labiate*. Lipped; belonging to the Labiatae or LAMIACEAE.
- Lacerate*. Irregularly cleft, as if torn.
- Lacinia* (-ae). Lobe.
- Laciniate*. Cut into narrow lobes or segments.
- Lamina*. A plate or blade; the blade of a leaf or a petal.
- Lanate*. Woolly; clothed with long and soft entangled hairs.
- Lanceolate*. Considerably longer than broad, tapering upward from the middle or below; lance-shaped.
- Lanose*. Densely lanate.
- Lanuginous*. Cottony or woolly.
- Lateral*. Belonging to or borne on the side.
- Latic*. The milky sap of certain plants.
- Lax*. Loose and slender.
- Leaflet*. One of the divisions of a compound leaf.
- Legume*. A simple dry fruit, dehiscent along both sutures.
- Leguminosae*. Plants of the families Fabaceae, Caesalpinaceae, and Mimosaecae.
- Leguminous*. Pertaining to a legumⁿ or to the Leguminosae.
- Lenticels*. Small oval dots which appear upon the branches of cork-forming Dicotyledons during the first year's growth, and which, by further growth during the early part of the second year, rupture the epidermis.
- Lenticular*. Lens-shaped.
- Lepidoite*. Bese^t with small scurfy scales.
- Ligneous*. Woody, or having a woody texture.
- Ligulate*. Provided with or resembling a ligule.
- Ligule*. A strap-shaped corolla, as in the ray-flowers of Compositae; a thin scarious projection from the summit of the sheath in grasses.
- Limb*. The expanded part of a petal, sepal, or gamopetalous corolla.
- Linear*. Long and narrow, with parallel margins.
- Lip*. The principal lobes of a bilabiate corolla or calyx; the odd and peculiar petal in the orchis family; the labellum.
- locular*. In composition, having cells.

Loculicidal (dehiscence). Splitting down through the middle of the back of each cell.

Lodicules. Minute hyaline scales subtending the flower in grasses.

Loment. A jointed legume, usually constricted between the seeds.

Lunate. Crescent-shaped.

Lunulate. Diminutive of lunate.

Lurid. Dirty brown.

Lutescent. Yellowish, or becoming yellow.

Lyrate. Pinnatifid, with the terminal lobe or segment considerably larger than the others.

Macrosporangium. Sporangium containing macrospores.

Macrospore. The larger of two kinds of spores borne by a plant, usually giving rise to a female prothallium.

Magenta. A glaring red.

Mammillate. Furnished with nipple-shaped processes.

Marcascent. Withering, but remaining attached.

Medullary. Pertaining to the pith or medulla.

Membranaceous, *Membranous*. Thin and rather soft and more or less translucent. -*merous*. In composition, having parts, as 2-merous, having two parts of each kind.

Mesa. Dry tableland.

Mesocarp. The middle layer of a pericarp.

Microphyle. Orifice of the ovule, and corresponding point on the seed.

Microsporangium. Sporangium containing microspores.

Microspore. The smaller of two kinds of spores borne by a plant, usually giving rise to a male prothallium; pollen-grain.

Midrib, *Midrib*. The central vein or rib of a leaf or other organ.

Monadelphous. Stamens united by their filaments into one set.

Moniliform. Like a string of beads.

Monocephalous. Bearing only one head.

Monocotyledonous (embryo). Having only one cotyledon.

Monoecious. Bearing stamens and pistils on the same plant, but in different flowers.

Mucro. A short and small abrupt tip.

Mucronate. With a short sharp abrupt tip.

Mucronulate. Diminutive of mucronate.

Multicellular. Consisting of many cells.

Multifid. Cleft into many lobes or segments.

Multilocular. Possessing many loculi or cavities.

Muricate. Roughened with short hard processes.

Muriculate. Very finely muricate.

Muticous. Pointless, or blunt.

Napiform. Turnip-shaped.

Naturalized. Plants not indigenous to the region, but so firmly established as to have become part of the flora.

Nectariferous. Nectar-bearing; having a nectary.

Nectary. An organ which secretes nectar.

Nerve. A simple or unbranched vein or slender rib.

Nigrescent. Becoming black or blackish.

Node. The place upon a stem which normally bears a leaf or whorl of leaves.

Nodose. Furnished with knots or nodes.

Nodulose. Diminutive of nodose.

Nut. An indehiscent one-seeded fruit with a hard or bony pericarp.

Nutlet. Diminutive of nut.

Ob-, as a prefix, signifies inversion, as follows:

Obcompressed. Flattened the opposite of the usual way.

Obconic. Conical, but with the point of attachment at the apex.

Obcordate. Inversely heart-shaped.

Ob lanceolate. Inverse of lanceolate.

Oblong. Longer than broad, with the sides nearly parallel, or somewhat curving.

Obovate. Inversely ovate.

Obovoid. Inversely ovoid.

Obpyramidal. Inverted pyramidal, i. e., pyramidal with the base uppermost.

Obsolete. Imperfectly developed or rudimentary.

Obtuse. Blunt, or rounded.

Ochroleucous. Yellowish white.

Ocrea. A sheathing stipule.

Ocreate. Having sheathing stipules.

Offset. Short branch next the ground which takes root.

Opaque. Not transparent.

Operculate. With an operculum.

Operculum. A lid.

Orbicular. Approximately circular in outline.

Orthotropous (ovule or seed). Erect, with the orifice or micropyle at the apex.

Oral. Broadly elliptic.

Ovary. The part of the pistil that contains the ovules.

Ovate. In outline like a longitudinal section of a hen's egg.

Ovoid. Shaped like a hen's egg.

Ovule. The macrosperme of flowering plants, becoming the seed after fertilization.

Ovuliferous. Bearing ovules.

Palate. A rounded projection of the lower lip of a personate corolla, closing the throat.

Palea (plural *paleae*). Chaff; the chaff or bracts on the receptacle of many Compositae.

Paleaceous. Chaffy.

Palet. The upper thin chaffy or hyaline bract which with the lemma encloses the flowers in Grasses.

Pallid. Pale.

Palmate. Diverging radiately like the fingers.

Palmately. In a palmate manner.

Panduriform. Same as fiddle-shaped.

Panicle. A compound flower-cluster of the racemose type.

Panicle, *Paniculate*. Borne in a panicle; resembling a panicle.

Pannose. Of the appearance or texture of felt.

Papilionaceous (corolla). Having a standard, wings, and keel, as in the peculiar corolla of the Pea Family.

Papilla. A little nipple-shaped protuberance.

Papillate, *Papillose*. Covered with papillae.

Pappiferous. Pappus-bearing.

Pappus. The modified calyx-limb in Compositae, forming a crown of very various character at the summit of the achene.

Papyraceous. Having a papery texture.

- Parasitic.* Growing on and deriving nourishment from another plant.
- Parietal.* Borne on or pertaining to the wall or inner surface of a capsule.
- Parted.* Cleft nearly, but not quite to the base.
- Pectinate.* Pinnatifid with narrow, closely set segments; comb-like.
- Pedate.* Palmately divided or parted, with the lateral segments 2-cleft.
- Pedicel.* The stalk of a single flower in a flower-cluster.
- Pedicellate, Pedicelled.* Furnished with a pedicel.
- Peduncle.* A primary flower-stalk, supporting either a cluster or a solitary flower.
- Peduncled, Pedunculate.* Furnished with a peduncle.
- Peltate.* Shield-shaped; a flat organ, with a stalk on its lower surface.
- Pendulous.* More or less hanging or declined. *Pendulous ovule*, one that hangs from the side of the cell.
- Penicillate.* With a tuft of hairs or hair-like branches.
- Penta-*, in compounds, means five.
- Pentagonal.* Five-angled.
- Perennial.* Lasting from year to year.
- Perfect (flower).* Having both stamens and pistils.
- Perforated.* With holes.
- Perialth.* The floral envelopes of the flower, especially used when calyx and corolla cannot be distinguished.
- Pericarp.* The wall of the fruit, or seed-vessel.
- Perigynium (-a).* The more or less inflated sac-like organ surrounding the pistil in *Carex*.
- Perigynous.* Borne around the ovary.
- Persistent.* Long-continuous, as a calyx upon the fruit, leaves through winter, etc.
- Personate.* Masked; bilabiate, and the throat closed by a prominent palate.
- Petal.* One of the leaves of the corolla.
- Petaloid.* Petal-like; resembling or colored like petals.
- Petiolate.* Having a petiole.
- Petiole.* The leaf-stalk.
- Petioled.* Furnished with a petiole.
- Petiolulate.* With a petiolule (leaflet).
- Petiolule.* The stalk of a leaflet.
- Phaenogamous.* Having flowers with stamens and pistils and producing seeds.
- Phyllode, Phyllodium (-a).* A somewhat dilated petiole having the form of and serving as a leaf-blade.
- Phyllopodic.* With a leafy base.
- phyllous* (in composition). With leaves as *gamophyllous*, with united leaves, and *diphylous*, with two leaves, etc.
- Pilose.* Hairy, with soft hairs.
- Pinna* (pl. *Pinnæ*). One of the primary divisions of a pinnate or compoundly pinnate frond or leaf.
- Pinnate* (leaf). Compound, with the leaflets arranged on each side of a common petiole.
- Pinnatifid.* Pinnately cleft.
- Pinnatisect.* Pinnately divided.
- Pinnule.* A division of a pinna.
- Pistil.* The central organ of a flower containing the macrosporanges (ovules).
- Pistillate.* Provided with pistils, and, in its more proper sense, without stamens.
- Pitted.* Marked with small depressions or pits.
- Placenta.* An ovule-bearing surface.
- Plane.* With a flat, not curved surface.
- Planoconvex.* Plane on one side and convex on the other.
- Plicate.* Folded into plaits, like a fan.
- Plumose.* Having fine hairs on each side, like the plume of a feather.
- Plumule.* The rudimentary terminal bud of the embryo.
- Pod.* Any dry and dehiscent fruit.
- Pointed.* Acuminate.
- Pollen.* Pollen grain. See *Microspore*.
- Pollinia.* The pollen-masses of the Orchid and Milkweed Families.
- Polliniferous.* Bearing pollen.
- Poly-*, in compounds, means many.
- Polyadelphous.* Applied to stamens which are united by their filaments into many sets.
- Polygamous.* Bearing both perfect and imperfect flowers.
- Polymorphous.* Of several forms.
- Polypetalous.* Possessing many petals. Applied by the older botanists to flowers having the petals distinct or ununited.
- Polysepalous.* When the sepals are distinct.
- Pome.* The fleshy fruit of the Apple Family.
- Posterior.* On the side towards the axis; see *anterior*.
- Prickles.* Sharp elevations of the bark, and coming off with it, as in the rose.
- Prismatic.* Of the shape of a prism, angular, with flat sides, and of nearly uniform size throughout.
- Procumbent.* Trailing on the ground.
- Proliferous.* Bearing offsprings; a shoot, a branch, a rosette, or a flower producing a shoot ending in a similar organ.
- Prostrate.* Lying flat upon the ground.
- Prothallium.* The sexual generation of *Pteridophyta*.
- Pruinose.* Frosted; covered with a powder like hoar-frost.
- Pseudo* (in combinations). Falsely.
- Pteridophytes.* Fern-plants; ferns and their allies.
- Puberulent.* Minutely pubescent.
- Pubescent.* Covered with hairs.
- Pulverulent.* Dusted; covered apparently with fine powder.
- Pulvinate.* Cushioned, or shaped like a cushion.
- Punctate.* Dotted with depressions or with translucent internal glands or colored dots.
- Puncticulate.* Minutely punctate.
- Pungent.* Terminating in a rigid sharp point; acrid.
- Pustular, Pustulate.* With blister-like elevations.
- Pustule.* Blister or blister-like process.
- Putamen.* The bony part of a stone-fruit.
- Pyiform.* Pear-shaped.
- Pyris.* A capsule whose dehiscence is circumscissile, or which opens by a circular, horizontal line, so that the upper part comes off like a lid.
- Quadrate.* Nearly square in form.
- Raceme.* An elongated indeterminate flower-cluster with each flower pedicelled.
- Racemose.* In racemes, or resembling a raceme.
- Rachilla.* The axis of the spikelet in grasses.
- Rachis.* The axis of a compound leaf, or of a spike or raceme.
- Radially.* Spreading from a common center.

- Radiant.** With the marginal flowers enlarged and ray-like.
- Radiate.** Bearing ray-flowers; spreading from or arranged around a common center.
- Radical.** Belonging to the root, or apparently coming from the root.
- Radicle.** The rudimentary stem of the embryo; hypocotyl.
- Rameal.** Belonging to a branch.
- Ramification.** Branching.
- Ray.** One of the peduncles or branches of an umbel; the flat marginal flowers in Compositae.
- Receptacle.** The end of the flower stalk, bearing the floral organs; or, in Compositae, bearing the flowers; also in some ferns, an axis bearing sporanges.
- Reclined.** Turned or curved downwards.
- Recurved.** Curved backwards.
- Reflexed.** Bent backward abruptly.
- Regular.** Having the members of each part alike in size and shape.
- Reniform.** Kidney-shaped.
- Repand.** With a somewhat wavy margin.
- Replicate.** That form of veneration in which the apex of the leaf is bent backward toward the base.
- Replum.** The septum of certain pods that persists after the valves have fallen away.
- Resiniferous.** Producing resin.
- Reticulate.** In the form of network.
- Retorse.** Directed back or downward.
- Retuse.** With a shallow notch at a rounded apex.
- Revolute.** Rolled backward.
- Rhaccola.** The prolongation of the secondary axis at the spikelets of sedges, within the perigynium; compare *rachilla*.
- Rhachis.** See *Rachis*.
- Rhizome.** See *Rootstock*.
- Rhombic, Rhomboidal.** Somewhat lozenge-shaped; obliquely four-sided.
- Rib.** A primary or prominent vein of a leaf.
- Ringent.** Gaping, as the mouth of an open bilabiate corolla.
- Rostellum.** Beak of the style in Orchids.
- Rostrate.** Bearing a beak or a prolonged appendage.
- Rosulate.** In the form of a rosette.
- Rosuliferous.** Bearing rosettes.
- Rotate (corolla).** Wheel-shaped; flat and circular in outline.
- Rotund.** Rounded in outline.
- Rudiment.** A very partially developed organ; a vestige.
- Rudimentary.** Imperfectly developed, or in an early stage of development.
- Rufous.** Reddish brown.
- Rugose.** Wrinkled.
- Runcinate.** Sharply pinnatifid or incised, the lobes or segments turned backward.
- Runner.** A filiform or very slender stolon.
- Sac.** A pouch, especially the cavities of anthers.
- Saccate.** Like a sac or pouch; furnished with a sac.
- Sagittate.** Like an arrow-head, with the lobes turned downward.
- Salver-shaped (corolla).** Having a slender tube abruptly expanded into a flat limb.
- Samara.** An indehiscent winged fruit.
- Saprophyte.** A plant which grows on dead organic matter.
- Scabrous.** Rough to the touch.
- Scale.** A minute, rudimentary, or vestigial leaf.
- Scape.** A peduncle rising from the ground, naked or without proper foliage.
- Scapose.** Bearing or resembling a scape.
- Scarious.** Thin, dry, and translucent, not green.
- Scorpioid.** Coiled up in the bud, or in the beginning of growth, unrolling in expanding.
- Scrobiculate.** Possessing minute or shallow depressions.
- Secund.** Borne along one side of an axis.
- Segment.** One of the parts of a leaf or other like organ that is cleft or divided.
- Semi-** (in compounds) means half.
- Sepal.** One of the leaves of a calyx.
- Septate.** Divided in compartments by cross-partitions.
- Septicidal (capsule).** Dehiscing through the partitions and between the cells.
- Septum (plural *septa*).** A partition, as of a pod, etc.
- Sericeous.** Silky; clothed with satiny pubescence.
- Serrate.** Having teeth pointing forward.
- Serrulate.** Finely serrate.
- Sessile.** Without a stalk.
- Seta (-ae).** A bristle, or a slender body resembling a bristle.
- Setaceous.** Bristle-like.
- Setose.** Bristly.
- Setulose.** Having minute bristles.
- Sheath.** A tubular envelope, as the lower part of the leaf in grasses.
- Sheathing.** Enclosing as by a sheath.
- Silicle.** A short silique.
- Silique.** The peculiar pod of Brassicaceae.
- Sinuate.** Strongly wavy.
- Sinus.** The cleft or recess between two lobes.
- Smooth.** Without roughness.
- Sobol, Sobole.** A creeping underground stem.
- Soboliferous.** Bearing underground mostly horizontal branches.
- Sorus (pl. *Sori*).** A heap or cluster, applied to the fruit-dots of ferns.
- Spadiceous.** Like or pertaining to a spadix.
- Spadix.** A fleshy spike of flowers.
- Spathaceous.** Resembling a spathe, furnished with a spathe.
- Spathe.** A bract, usually more or less concave, subtending a spadix.
- Spatulate.** Shaped like a spatula; spoon-shaped.
- Spermatozoid.** A motile ciliated male reproductive cell.
- Spicate.** Arranged in or resembling a spike.
- Spiciform.** Spike-like.
- Spike.** An elongate flower-cluster, with sessile or nearly sessile flowers.
- Spikelet.** Diminutive of spike; especially applied to flower-clusters of grasses and sedges.
- Spine.** A sharp woody or rigid outgrowth from the stem.
- Spinescent.** Tipped by or degenerating into spines or thorns.
- Spinose.** Thorny; with spines or similar to spines.
- Spiricle.** Delicate coiled thread on the surface of seeds and achenes.
- Spirilliferous.** Bearing or having spiricles.
- Spirillum (-a).** A little coil, spiricle.
- Sporange, Sporangium (-a).** A sac containing spores.
- Spore.** The reproductive organ in Cryptogams which corresponds to a seed.

- Sporocarp*. The fruit-cases of certain Cryptogams containing sporangia or spores.
- Sporophyll*. A spore-bearing leaf.
- Sporophyte*. The asexual generation of plants.
- Spreading*. Diverging nearly at right angles; nearly prostrate.
- Spur*. A hollow projection.
- Squamella* (-ae). A scale-like member of the pappus of some composites.
- Squamiform*. Resembling a scale.
- Squarrose*. With spreading or projecting parts.
- Stamen*. The organ of a flower which bears the microspores (pollen-grains).
- Staminate*. Possessing stamens. Applied to flowers which have stamens but not pistils.
- Stameniferous*. Bearing stamens.
- Staminodium*. A sterile stamen, or other organ in the position of a stamen.
- Standard*. The upper, usually broad, petal of a papilionaceous corolla.
- Stellate*. Star-like.
- Sterigmata*. The projection from twigs, bearing the leaves, in some genera of Pinaceae.
- Sterile*. Without spores, or without seed.
- Stigma*. That part of a pistil through which fertilization by the pollen is effected.
- Stigmatic*. Belonging to or characteristic of the stigma.
- Stipe*. The stalk-like lower portion of a pistil; the leaf-stalk of a fern.
- Stipitate*. Provided with a stipe.
- Stipular*. Belonging to stipules.
- Stipulate*. Having stipules.
- Stipules*. The appendages on each side of the base of certain leaves.
- Stolon*. A basal branch rooting at the nodes.
- Stoloniferous*. Producing or bearing stolons.
- Stoma* (pl. *Stomata*). An orifice in the epidermis of a leaf communicating with internal air-cavities.
- Stramineous*. Straw-colored.
- Striate*. Marked with slender longitudinal grooves or channels.
- Strict*. Very straight and upright.
- Strigillose*. Diminutive of strigose.
- Strigose*. With appressed stiff hairs.
- Strobilaceous*. Like a pine-cone.
- Strobile*. An inflorescence marked by imbricated bracts or scales, as in the pine-cone.
- Stropholate*. With a strophiole.
- Strophiole*. An appendage to a seed at the hilum.
- Style*. The usually attenuated portion of the pistil connecting the stigma and ovary.
- Stylopodium*. A disk-like expansion at the base of a style, as in Umbelliferae.
- Sub-* (in compound words). Somewhat, almost, in a subordinate grade, of inferior rank, beneath.
- Submarginal*. Near the margin; situated under the margin.
- Subulate*. Awl-shaped.
- Succulent*. Soft and juicy.
- Sucker*. A shoot from subterranean branches.
- Suffrutescent*. Slightly or obscurely shrubby.
- Suffruticose*. Very low and woody; diminutively shrubby.
- Sulcate*. Grooved longitudinally.
- Supra-* (in compound words). Above, being above.
- Supra-axillary*. Inserted some distance above the axils.
- Surculose*. Producing shoots from the rootstock.
- Superior* (ovary). Free from the calyx or hypanthium.
- Suspended* (ovule). Hanging from the apex of the cell.
- Suture*. A line of splitting or opening.
- Symmetrical*. Applied to a flower with the different series of its parts of equal numbers.
- Sympetalous*. With united petals.
- Syngeneious*. With stamens united by their anthers.
- Synonym*. A superseded or unused name.
- Taproot*. A stout vertical root which continues the main axis of the plant.
- Tawny*. Dull yellowish, with a tinge of brown.
- Tendril*. A thread-shaped process used for climbing.
- Terete*. Circular in cross-section.
- Ternary*. Consisting of three.
- Ternate*. Divided into three segments, or arranged in threes.
- Tesellate*. Checkered.
- Testa*. The outer coat or covering of the seed.
- Tetra-* (in compounds) means four.
- Tetradynamous*. Applied to stamens when there are six in the flower, four of them longer than the other two.
- Tetragonal*. Four-angled.
- Tetramerous*. Applied to flowers constructed on the numerical plan of four.
- Thalloid*. Resembling a thallus.
- Thallus*. A usually flat vegetative organ.
- Throat*. The orifice of a gamopetalous corolla or calyx; the part between the proper tube and the limb.
- Thyrsoid*. Like a thyrus.
- Thyrus*. A congested cyme.
- Tomentose*. Covered with tomentum.
- Tomentulose*. Diminutive of tomentose.
- Tomentum*. Dense matted wool-like hairs.
- Torose*. Cylindrical with contractions at intervals.
- Torsion*. Twisting of an organ.
- Tortuous*. Twisted or bent.
- Torulose*. Diminutive of Torose.
- Torus*. The receptacle of a flower.
- Transverse*. Across; in a right and left direction.
- Tri-* (in composition) three or thrice.
- Triandrous*. Having three stamens.
- Trichotomous*. Three-forked.
- Tridentate*. Three-toothed.
- Trifoliate*. Having three leaflets.
- Trigonous*. Three-angled.
- Triquetrous*. Having three salient angles, the sides concave or channelled.
- Truncate*. Ending abruptly, as if cut off transversely.
- Tuber*. A thickened and short subterranean branch, having numerous buds.
- Tubercle*. The persistent base of the style in some Cyperaceae; a small projection.
- Tuberculate*. With rounded projections.
- Tuberiferous*. Bearing tubers.
- Tuberous*. Resembling a tuber.
- Tumid*. Swollen.
- Tumidate*. Coated; invested with layers, as an onion.
- Turbinate*. Top-shaped.
- Turion*. A scaly shoot from a subterranean bud.
- Turioniferous*. Bearing turions or suckers like the shoots of Asparagus.

- Twining.** Ascending by coiling round a support.
- Umbel.** A determinate, usually convex flower-cluster, with all the pedicels arising from the same point.
- Umbellate.** Borne in umbels; resembling an umbel.
- Umbellet.** A secondary umbel.
- Umbellifer.** A member of *Umbelliferae*, or Carrot Family.
- Umbonate.** Bearing a stout projection in the center; bossed.
- Unarmed.** Destitute of spines, prickles, and the like.
- Uncinate.** Hooked, or in form like a hook.
- Undulate.** With a wavy surface; repand.
- Unguiculate.** Contracted at base into a claw.
- Uni-** (in compounds) means one.
- Unicellular.** One-celled.
- Unifoliate.** Applied to a compound leaf that has but one leaflet, as the leaves of the Orange and Lemon.
- Unilocular.** Possessing one locule or cell.
- Uniserial.** Arranged in one series. Applied to parts that are arranged in one horizontal whorl.
- Unisexual.** Having only one kind of sex-organs; applied also to flowers having only stamens or pistils.
- Urceolate.** Urn-shaped.
- Utricle.** A small, thin-walled, one-seeded fruit.
- Utricular.** Like a small bladder.
- Vaginate.** Surrounded by a sheath.
- Valvate.** Meeting by the margins in the bud, not overlapping; dehiscent by valves.
- Valve.** One of the pieces into which a dehiscent pod, or any similar body, splits.
- Veint.** The smaller ramifications of veins.
- Veins.** Threads of fibro-vascular tissue in a leaf or other organ, especially those which branch (as distinguished from nerves).
- Velum.** A fold of the inner side of the leaf-base in *Isocetes*.
- Velutinous.** Velvety; with dense fine pubescence.
- Venation.** The veining of leaves, etc.
- Ventral, Ventrally.** Being on the side next the axis.
- Ventricose.** Swelling unequally, or inflated on one side.
- Venulose.** Finely veiny.
- Vernation.** The arrangement of leaves in the bud.
- Verrucose.** Warty; covered with protuberances.
- Versatile.** An anther attached at or near its middle to the filament.
- Verticil.** A whorl.
- Verticillaster.** A pair of opposite cymes that occur in the axils of the leaves of Mints.
- Verticillate.** Whorled.
- Vesicle.** A small bladder or air-cavity.
- Vespertine.** Belonging to the evening; applied to flowers that open at night-fall.
- Verillum.** The standard of a papilionaceous flower.
- Villous.** Bearing long and soft hairs.
- Virgate.** Wand-shaped; slender, straight and erect.
- Viscid.** Glutinous; sticky.
- Whorl.** A group of three similar organs or more, radiating from a node. Verticil.
- Wing.** Any membranous expansion.
- Woolly.** Clothed with long and entangled soft hairs.
- Zoospore.** Literally, an animal spore; a vegetable spore endowed with the power of locomotion, and therefore appearing like an animal.
- Zygomorphous, Zygomorphic.** Flowers which are divisible in only one plane into similar halves are called zygomorphous.

INDEX

The Latin names of genera and species are printed in common type, the synonyms are indicated by *italic*, the common or English names are in SMALL CAPITALS and the family names in CAPITALS. The species of only the larger genera are indexed.
